

01 General Requirements

- 01 22 16 00 No Specification Required
- 01 29 73 00 Schedule Of Values

02 Existing Conditions

- 02 82 00 00 Removal Of Friable Asbestos-Containing Materials
- 02 82 00 00a Removal Of Nonfriable Asbestos-Containing Materials
- 02 82 00 00b Encapsulation (Lock-Down) Of Asbestos-Containing Materials
- 02 83 19 13 Lead Paint Related Abatement Procedures
- 02 83 19 13a XRF Testing For Lead-Based Paint
- 02 83 19 13b Lead Dust Wipe, Air and TCLP Sampling and Analysis
- 02 83 33 13 Removal And Disposal Of Lead-Containing Paint
- 02 84 16 00 Removal of Fluorescent Light Ballasts/Capacitors and Fluorescent Light Tubes
- 02 85 00 00 Mold Remediation
- 02 87 00 00 Bird And Bird Waste Abatement

03 Concrete

- 03 01 30 71 Rehabilitation of Cast-in-Place Concrete
- 03 30 00 00 Cast-In-Place Concrete
- 03 53 00 00 Concrete Floor Topping
- 03 54 16 00 Hydraulic Cement Underlayment

04 Masonry

- 04 01 20 52 Masonry Restoration and Cleaning
- 04 20 00 00 Unit Masonry
- 04 23 13 00 Glass Unit Masonry Vertical Assemblies

05 Metals

- 05 12 00 00 Structural Steel Framing
- 05 12 23 00 Structural Steel for Buildings
- 05 21 00 00 Steel Joists Framing
- 05 31 00 00 Steel Decking
- 05 40 00 00 Cold-Formed Metal Framing
- 05 50 00 00 Metal Fabrications
- 05 52 13 00 Pipe And Tube Railings
- 05 53 00 00 Metal Gratings
- 05 70 00 00 Decorative Metal

06 Wood, Plastics, and Composites

- 06 10 00 00 Rough Carpentry
- 06 10 53 00 Miscellaneous Rough Carpentry
- 06 11 13 00 Rough Carpentry Renovation
- 06 20 13 00 Exterior Finish Carpentry
- 06 20 23 00 Interior Finish Carpentry
- 06 41 00 00 Architectural Wood Casework

07 Thermal And Moisture Protection

SECTION 01 29 73 00 - SCHEDULE OF VALUES**1.1 GENERAL****A. Description Of Work**

1. This specification covers the preparation, content and submittal of the schedule of values. The Schedule of Values is an itemized list that establishes the value or cost of each part of the Work. It shall be used as the basis for preparing progress payments.

B. Preparation

1. Schedule shall show breakdown of labor, materials equipment and other costs as approved by The University.
2. Costs shall be in sufficient detail to indicate separate amounts for each major subsection of the Work. The Contractor may include an item for bond, insurance, temporary facilities and job mobilization.
3. Schedule of Values shall be prepared on 8-1/2-inch by 11-inch white paper.
4. Use the major subsections of the Detailed Scope of Work as the basis for Schedule format. List sub-items of major products or systems as appropriate or when requested by The University.
5. When requested by The University, support values with data that will substantiate their correctness.
6. The sum of the individual values shown on the Schedule of Values must equal the total Job Order Price.
7. Schedule shall show the purchase and delivery costs for materials and equipment that the Contractor anticipates he shall request payment for prior to their installation.

- C. Submittal:** Submit two copies of Schedule, or any other number of copies as approved by The University, to The University for approval at least 20 days prior to submitting first application for a progress payment. After review by The University, revise and resubmit Schedule as required until it is approved.

SECTION 02 82 00 00 - REMOVAL OF FRIABLE ASBESTOS-CONTAINING MATERIALS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for removal of friable asbestos-containing materials. Products shall be as follows or as approved by the ODR or UTHSCSA consultant. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Description

1. Furnish all labor, materials, facilities, equipment, services, employee training and testing, permits and agreements necessary to perform the work required for asbestos removal, encapsulation, repair, clean-up, decontamination, re-insulation and all other work in accordance with these specifications, in accordance with the latest regulations from the U.S. Environmental Protection Agency (EPA), the Occupational Safety and Health Administration (OSHA), the recommendations of National Institute of Occupational Safety and Health (NIOSH), and any other applicable federal, state and local government regulations. Whenever there is a conflict or overlap of the above references, the most stringent provision is applicable.
2. The work specified herein shall be performed by competent persons trained, knowledgeable and qualified in the state-of-the-art techniques of asbestos abatement, handling and subsequent cleaning of contaminated areas.

C. Scope

1. The quantities of materials and limits of abatement work area(s) shall be verified by the asbestos contractor.

D. Asbestos Hazard

1. Asbestos-containing material when damaged or disturbed is subject to fiber releases. Wet methods are a primary means of controlling fiber release.
2. Strict compliance with each of the provisions outlined in these specifications for the encapsulation, repair and handling of asbestos-containing material is of great importance, because:
 - a. The inhalation of airborne asbestos fibers can cause a very serious and often fatal disease.
 - b. Workers may not be aware they are inhaling asbestos fibers.
 - c. Symptoms of the disease do not appear for many years.
 - d. Only the Contractor and his employees can prevent the inhalation of asbestos fibers, which can lead to the development of asbestos-related disease.
 - e. No insurance is available to provide for asbestos-related disease.

E. Other Hazardous Material

1. Contractor shall comply with OSHA 29 CFR 1926.62 - Lead in Construction when demolishing any equipment or architectural component identified as lead-containing or lead-based paint. The work of this project is considered a demolition activity.
2. The University anticipates that a substantial amount of the Project will involve lead paint.

F. Qualifications

1. The University and The University's Representative will verify and approve the experience of the Asbestos Abatement Contractor based upon submission at the time of bidding by Contractor evidence of the following:
 - a. Experience: Provide the names and locations of at least three asbestos abatement projects of comparable size and complexity comparable with this work. Provide the names and telephone numbers of contact person at previous projects. Provide the final air monitoring decontamination fiber levels achieved.

- b. Personnel: Provide the name(s) of "Competent Person" as defined by OSHA 29 CFR 1926.32(f) - Asbestos. Demonstrate the education and specialized training with successful completion of examination of an EPA approved course. Provide evidence of participation in five projects of complexity comparable with this project.
- c. Licensing and Certification: The Contractor must hold a current, valid asbestos license issued by the State in which the work is to be performed.

G. Notices And Record Keeping

1. Contractor shall maintain for at least 30 years, a record for each asbestos project in which the Contractor engages. Each record shall include the following information: name, address, and social security number of all personnel involved with the project, the name address and social security number of the OSHA "Competent Person" who will supervise the work, the amount of asbestos material that was removed, repaired, encapsulated or disturbed, the commencement and completion date of the work, copies of Hazardous Waste Manifest(s), personal air monitoring results and any other appropriate information.
2. The Contractor shall send written notification as required by USEPA National Emission Standards for Hazardous Air Pollutants (NESHAPS) Asbestos Regulations (40 CFR 61, Subpart M) to the ODR or UTHSCSA consultant, at least 10 working days prior to beginning any work on asbestos-containing materials.
3. Include the following information:
 - a. Name and address of Owner or operator.
 - b. Description of the facility being demolished or renovated, including the size, age, and prior use of the facility.
 - c. Estimate of the approximate amount of asbestos material present in the facility in terms of linear feet of pipe, and surface area on other facility components. For facilities in which the amount of asbestos materials is less than 80 linear meters (260 linear feet) on pipes and less than 15 square meters (160 square feet) on other facility components, explain techniques of estimation.
 - d. Location of the facility being demolished or renovated.
 - e. Scheduled starting and completion dates of demolition or renovation.
 - f. Nature of planned demolition or renovation and method(s) to be used.
 - g. Procedures to be used to comply with the requirements of USEPA National Emission Standards for Hazardous Air Pollutants (NESHAPS) Asbestos Regulations (40 CFR 61 Subpart M).
 - h. Name and location of the waste disposal site where the asbestos waste material will be deposited.
4. Prior to commencement of work, the Contractor shall submit the following documents to The University's Representative. No work will be allowed to start until these documents have been approved:
 - a. The schedule of the work, including manpower, length and number of work shifts. Schedule shall be coordinated with The University's full occupancy of all areas of the building.
 - b. Satisfactory proof that written notification has been provided to the EPA regional office and The University.
 - c. Proof that all required permits, disposal site locations, and arrangements for transportation and disposal of asbestos-contaminated materials, supplies and the like have been obtained.
 - d. Complete a worker certificate indicating that all employees have had instruction and training on the hazards of asbestos exposure, the use and fitting of respirators, protective dress, wet and dry decontamination procedures, entry and exit from work areas, and all aspects of work procedures and protective measures.
 - e. Documentation indicating that all employees have received appropriate medical examinations and have successfully passed fit testing for the respirator to be worn. As a minimum, medical exams must be consistent with OSHA 29 CFR 1926.1101(K)(9)(viii)(G)-Asbestos Regulation.

- f. Samples of signs to be used in and around the work area to comply with OSHA 29 CFR 1926.1101(K)(9)(viii)(I)- Asbestos regulations and as required by federal, state and municipal regulations.
- g. Material Safety Data Sheets (OSHA form 174 or equivalent) for all chemicals used during work performed under this section.
- h. Encapsulation data and encapsulation procedures.
- i. Design of pressure differential system including calculation used to arrive at the number of machines necessary to achieve one air change per every 10 minutes.
- j. Location of personnel and material decontamination units for each work area.
5. Contractor shall provide written notification to The University's Representative of his intent to start work at least five days in advance. In no case will the Contractor start work until authorization to proceed is given.
6. During the work, Contractor shall maintain a daily log which will be kept at the job site. Items to be included in the daily log shall include but are not limited to the following:
 - a. Meetings, purpose, attendees, discussions, items of resolution.
 - b. Visitations, authorized and unauthorized.
 - c. Sign-in sheets of all personnel entering and leaving the work area.
 - d. Special or unusual events (i.e., barrier breaching equipment failures).
 - e. Personal air monitoring results.
 - f. Two copies of the daily log are required for Project Closeout.

H. Terminology (Definitions)

1. Abatement - Procedures to control fiber release from asbestos-containing materials. Includes removal, enclosure or encapsulation.
2. Air Lock - A system for permitting ingress or egress without permitting air movement between any two adjacent areas consisting of two curtained doorways. The air lock must be maintained in an uncontaminated condition at all times.
3. Air Monitoring; - The process of measuring the asbestos fiber content of a specific volume of air in a stated period of time using methods approved or recommended by OSHA, EPA, NIOSH or other method approved by The University or The University's Representative.
4. Amended water - Water to which a surfactant has been added.
5. Asbestos - A generic name given to a number of naturally occurring hydrated mineral silicates that possess a unique crystalline structure, are incombustible in air, and are separable into fibers. Asbestos includes the asbestiform varieties of Chrysotile (serpentine), Crocidolite (Riebeckite), Amosite (Cummingtonite-Grunente), Anthophyllite, Actinolite, and Tremolite.
6. Asbestos-containing material (ACM) - Any material that contains more than 1 percent asbestos by weight as determined by Polarized Light Microscopy (PLM).
7. Authorized Visitor - The University or his designated representative, or a representative of any regulatory or other agency having jurisdiction over the project.
8. Class I - Asbestos work means activities involving the removal of thermal systems insulation (TSI) and surfacing ACM and PACM.
9. Class II - Asbestos work means activities involving the removal of ACM which is not TSI or surfacing material. This includes, but is not limited to, the removal of asbestos-containing wallboard, floor tile and sheeting, roofing and siding shingles, and construction mastics.
10. Class III - Asbestos work means repair and maintenance operations where "ACM" including TSI and surfacing ACM and PACM is likely to be disturbed.
11. Class IV - Asbestos work means maintenance and custodial activities during which employees contact but do not disturb ACM or PACM and activities to clean-up dust, waste and debris resulting from Class I, II and III activities.
12. Critical Barrier - A unit of temporary construction which provides the only separation between an asbestos work area and an adjacent, potentially occupied, space. The critical barrier is composed of at least one intact sheet of polyethylene sheeting.
13. Decontamination Enclosure System - A series of connected rooms with curtained doorways between any two adjacent rooms, for the decontamination of workers or of materials and equipment. A decontamination system contains at least two air locks.

14. Disposal - All procedures necessary to transport and deposit the asbestos-contaminated material stripped and removed from the building in a waste disposal site in compliance with applicable federal, state, and local regulations.
15. Disposal Site - A site approved by the EPA for the disposal of asbestos-containing wastes.
16. Encapsulant - A liquid which can be applied to asbestos-containing materials and which controls the possible release of fibers from the materials.
17. Encapsulation - The use of an agent to seal the surface (bridging encapsulant) or penetrate the bulk (penetrating encapsulant) of the asbestos-containing material.
18. HEPA -High Efficiency Particulate Air - A type of filter which is 99.97% efficient at filtering particles of 0.3 micrometers in diameter.
19. HEPA Vacuum Equipment - Vacuuming equipment equipped with a HEPA filter in the exhaust outlet, and so designed and maintained that 99.97% of all particles of 0.3 micrometer in diameter in the inlet air are collected and retained.
20. Negative Pressure Respirators - Respirators which function by the wearer breathing in air through a filter.
21. NIOSH - National Institute of Occupational Safety and Health.
22. Owner's Representative - Authorized Consultants
23. Permissible Exposure Level (PEL) - A level of airborne fibers specified by OSHA as an occupational exposure standard for asbestos. It is 0.1 f/cc of air, eight-hour TWA, as measured by Phase Contrast Microscopy.
24. Repair - The restoration of damaged or deteriorated asbestos-containing material to intact condition.
25. Respirator Protection Program - A set of procedures and equipment required by OSHA if employees wear negative pressure respirators or if fiber levels are above the PEL.
26. Surfactant - Chemical wetting agent added to water to improve penetration, thus reducing the amount of water required for a given operation or area, and enhancing the effect of the water in reducing fiber release.
27. Thermal Systems Insulation - Material applied to pipes, fittings, boilers, breeching, tanks, ducts or other interior structural components to prevent heat loss or gain, or water condensation, or for other purposes.
28. Wet Cleaning - The process of eliminating asbestos contamination from building surfaces and objects by using cloths and mops or other cleaning tools that have been dampened with clean water and afterwards disposing of these cleaning tools as asbestos-contaminated waste.

I. Permits And Licenses:

1. The Contractor must maintain current licenses as required by applicable state or local jurisdictions for the removal, transporting, disposal or other regulated activity relative to the work of this contract.

J. Regulations

1. This section sets forth governmental regulations and industry standards which are included and incorporated herein by reference and made a part of the specifications. This section also sets forth those notices and permits which are known to The University and which either must be applied for and received, or which must be given to governmental agencies before start of work.
2. Except to the extent that more explicit or more stringent requirements are written directly into the contract documents, all applicable codes, regulations, and standards have the same force and effect (and are made a part of the contract documents by reference) as if copied directly into the contract documents, or as if published copies are bound herewith.
3. The Contractor shall assume full responsibility and liability for the compliance with all applicable federal, state, and local regulations pertaining to work practices, hauling, disposal, and protection of workers, visitors to the site, and persons occupying areas adjacent to the site. The Contractor is responsible for providing medical examinations and maintaining medical records of personnel as required by the applicable federal, state, and local regulations. The Contractor shall hold The University and The University's Representative harmless for failure to comply with any applicable work, hauling, disposal, safety, health or other regulation on the part of himself, his employees, or his Sub-Contractors.

4. Federal requirements which govern asbestos abatement work or hauling and disposal of asbestos waste materials include but are not limited to the following regulations:
 - a. U.S. Department of Labor, Occupational Safety and Health Administration, (OSHA), including but not limited to:
 - 1) U.S. Department of Labor, OSHA, including, but not limited to:
 - a) Occupational Exposure to Asbestos, Tremolite, Anthophyllite and Actinolite; Final Rules
Title 29, Part 1910, Section 1001
Part 1926, Section 1101 of the Code of Federal Regulations
 - b) Respiratory Protection
Title 29, Part 1910, Section 134 of the Code of Federal Regulations
 - c) Construction Industry
Title 29, Part 1926.1011, of the Code of Federal Regulation
 - d) Access to Employee Exposure and Medical Records
Title 29, Part 1910, Section 2 of the Code of Federal Regulations
 - e) Hazard Communication
Title 29, Part 1910, Section 1200 of the Code of Federal Regulations
 - f) Specifications for Accident Prevention Signs and Tags
Title 29, Part 1910, Section 145 of the Code of Federal Regulations
 - 2) U.S. Environmental Protection Agency (EPA) including, but not limited to:
 - a) Asbestos Abatement Projects Rule
40 CFR Part 762
CPTS 62044, FRL 2843-9
Federal Register, Vol. 50 No. 134, July 12, 1985
P28530-28540
 - b) Regulation for Asbestos
Title 40, Part 61, Subpart A of the Code of Federal Regulations
 - c) National Emission Standard for Asbestos
Title 40, Part 61, Subpart M (Revised Subpart B) of the Code of Federal Regulations
 - 3) State requirements which govern asbestos abatement work and/or hauling and disposal of asbestos waste materials.
 - 4) Contractor shall abide by all local requirements which govern asbestos abatement work or hauling and disposal of asbestos waste materials including the following:
 - a) American National Standards Institute (ANSI)
1430 Broadway
New York, NY 10018
(212) 354-3300
 - b) Fundamentals Governing the Design and Operation of Local Exhaust Systems
Publication Z9.2-79
 - c) Practices for Respiratory Protection Publication Z288.2-80
 - d) American Society for Testing and Materials (ASTM)
1916 Race Street
Philadelphia, PA 19103
(215) 299-5400
 - e) Specification for Encapsulants for Friable Asbestos-Containing Building Materials
 - f) Safety and Health Requirements Relating to Occupational Exposure to Asbestos

K. Owner's Representative

1. The University's Representative is authorized by The University to perform the following:
 - a. Have free access to all asbestos work areas.
 - b. To assist in interpretation of procedures.
 - c. To advise on all provisions of the contract documents pertaining to the control of asbestos.
 - d. To stop work if, in the course of performing their monitoring duties, an instance of substantial nonconformance with the contract documents is observed.

- e. To stop work if a situation presenting a health hazard to workers or The University's employees or occupants of the building is observed.
- f. To act as The University's liaison in technical matters involving the asbestos-related work.
- g. To perform air sampling inside and outside the asbestos work area during the project. The Contractor shall cooperate fully with Owner's Representative, its agents and employees, and ensure cooperation of his/her workers during collection of air samples and work area inspections.
- h. The University's Representative role in advising The University on environmental health matters does not relieve the Contractor's obligation to comply with all applicable health and safety regulations. Air monitoring results generated by Owner's Representative shall not be used by the Contractor to represent compliance with regulatory agency requirements for monitoring of worker's exposure to airborne asbestos, nor shall any other activity on the part of Owner's Representative represent the Contractor's compliance with applicable health and safety regulations.

L. Pre-Construction Conference

- 1. An initial progress meeting recognized as "Pre-Construction Conference" shall be held prior to start of any work. Contractor shall meet at project site, with General Superintendent, The University, The University's Representative, and other entities concerned with asbestos abatement work. Record discussions and agreements and furnish copy to each participant. Provide at least 72 hours advance notice to all participants prior to convening Pre-Construction Conference.
- 2. This is an organizational meeting, to review responsibilities and personnel assignments, to locate the containment and decontamination areas; and temporary facilities including power, light, water, etc.
- 3. Submit waivers on forms, and executed in a manner acceptable to The University. Administrative requirements that must proceed or coincide with Contractor's submittal for final payment shall consist of the following:
 - a. Completion of project closeout requirements.
 - b. Completion of items specified for completion beyond time of substantial completion (regardless of whether special payment application was previously made).
 - c. Assurance, satisfactory to The University, that unsettled claims will be settled and that work not actually completed and accepted will be completed without undue delay.
 - d. Transmittal of required project construction records to The University.
 - e. Landfill receipts for all asbestos-containing material.
 - f. Proof, satisfactory to The University, that taxes, fees and similar obligations of Contractor have been paid.
 - g. Removal of temporary facilities, services, surplus materials, rubbish and similar elements.
 - h. Consent of surety for final payment.

M. Project Closeout

- 1. Project closeout is the term used to describe certain collective project requirements that indicate completion of the work to be fulfilled near the end of the contract time. Also, in preparation for final acceptance of the work by The University, as well as, final payment to the Contractor and the normal termination of the Contract.
- 2. Include supporting documentation for completion as indicated in these contract documents.
- 3. Submit a statement on accounting of changes to the Contract Sum.
- 4. Advise The University of pending insurance change-over requirements.
- 5. Submit specific warranties, workmanship and maintenance bonds, maintenance agreements, final certifications and similar documents.
- 6. Obtain and submit releases enabling The University's full, unrestricted use of the work area and access to services and utilities. Where required, include occupancy permits, operating certificates and similar releases.
- 7. Results of the completed inspection will form the initial "punch-list" for final acceptance.
- 8. A complete record, certified by the testing laboratory, of all personal air monitoring results.

9. Complete the following cleaning operations as outlined in Paragraph "Decontamination Procedures" before requesting The University's Representative inspection for certification of substantial completion.
 - a. Remove exposed labels in finished spaces which are not required as permanent labels on materials supplied as part of the work, except for "Asbestos", "Asbestos Free", or Thermal Insulation Labels specified elsewhere.
 - b. Clean transparent materials, affected by the work including mirrors and window/door glass, to a polished condition, removing substances which are noticeably vision-obscuring materials. Replace broken glass and damaged transparent materials.
 - c. Clean exposed hard-surfaced finishes affected by the work, to a dirt-free condition, free of dust, stains, films and similar distracting substances. Except as otherwise indicated, avoid disturbance of natural weathering of exterior surfaces. Restore reflective surfaces to original reflective condition.
 - d. Clean plumbing fixtures affected by the work to a sanitary condition, free of stains including those resulting from water exposure.
 - e. Replace all HVAC filters using materials supplied by The University or clean non-replaceable filters after minimum of two days of operation of HVAC equipment.
 - f. Clean light fixtures and lamps, which have been affected by the work so as to function with full efficiency. Replace lamps where inoperable.
 - g. Repair any damage to wall, ceiling and floor surfaces caused by installation and removal of the polyethylene sheeting.

N. Personnel Protection

1. Prior to commencement of work, the workers shall be instructed and be knowledgeable in the areas described in Paragraph "Submittals and Notices" having to do with employees.
2. Worker Protection - shall comply with 29 CFR 1910.134 (Respiratory Protection).
 - a. Because there is no known safe level of exposure to asbestos, it is prudent to reduce worker's exposures to as low a level as possible. Proper respiratory protection is critical in minimizing exposure.
 - b. Workers shall be provided, as a minimum, with personally issued and marked respirators equipped with high efficiency particulate filters approved by NIOSH to be worn in the designated work area and/or whenever a potential exposure to asbestos exists. Sufficient filters shall be provided for replacement as required by the workers or applicable regulations. Disposable respirators shall not be used.
 - c. No worker shall be exposed to levels greater than 0.01 f/cc as determined by the protection factor of the respirator worn and the work area fiber levels.
 - d. Whenever powered purifying respirator protection is used, a sufficient supply of replacement batteries and HEPA filter cartridges shall be provided to the workers.
 - e. Air monitoring required by OSHA is work of the Contractor and not covered in this specification. Contractor shall post, on a daily basis, results of the air monitoring results from the previous shift. A complete record, certified by the testing laboratory, of all personal air monitoring tests and results will be furnished to The University and The University's Representative prior to Contractor's Request for Final Payment.
 - f. During encapsulation operations or usage of other organic base aerosols (e.g., spray glue, expanding foam), workers shall be provided with combination cartridges consisting of organic vapor and HEPA sections.
 - g. Workers shall be provided with sufficient sets of protective full-body clothing to be worn in the designated work area and/or whenever potential exposure to asbestos exists. Such clothing shall include, but not be limited to, full-body coveralls, headgear and gloves. Workers shall assure that hoods covering their hair are worn in the designated work areas at all times. Eye protection and hard hats shall be provided as required by applicable safety regulations. Eye protection shall be worn during encapsulation operations. Non-disposable type protective clothing and footwear shall be left in the work area until the end of the asbestos abatement work, at which time such items will be disposed of as asbestos waste.
 - h. Non-skid footwear shall be provided to all abatement workers. Disposable clothing shall be adequately sealed to the footwear to prevent body contamination.
 - i. Protective clothing shall not be worn in lieu of street clothing outside the work area.

- j. Visitor Clothing: The Contractor shall provide authorized visitors with suitable respirator, protective clothing, headgear, eye protection, and footwear as described herein, whenever they enter the work area.
3. Decontamination and Work Procedures: The decontamination and work procedures to be followed by workers shall be posted as described in these specifications.
4. Worker and Authorized Visitor Protection Procedures:
 - a. Each worker and authorized visitor shall, upon entering the job site, remove street clothes in a designated clean change area and put on a respirator with new filters and clean protective clothing before entering the work area.
 - b. The Contractor's employees shall perform a positive/negative respirator fit test each time he enters the work area. If leakage occurs, the respirator must be re-adjusted or replaced.
 - c. Workers shall maintain their respirators in a safe operating condition. The condition of respirators shall be checked daily.
 - d. Workers and visitors shall complete the decontamination procedures as outlined in the specification upon exiting the work area.
 - e. Workers shall not eat, drink, smoke, or chew gum or tobacco in or near the asbestos work areas.
 - f. Workers shall be fully protected with respirators and protective clothing immediately prior to the first disturbance of asbestos-containing or contaminated materials and until final cleanup is completed.

O. Air Monitoring

1. The airborne fiber counts outside the work area will be monitored to detect faults in the work area isolation such as contamination of the building outside of the work areas with airborne asbestos fibers, failure of filtration or rupture in the negative pressure system.
Should any of the above occur, the Contractor shall immediately cease asbestos abatement activities until the fault is corrected. Work shall not recommence until authorized by Owner's Representative. In the case of mini-enclosures The University's Representative will monitor air in a remote location of the residence to determine the baseline of asbestos.
2. The airborne fiber counts in the work area will be monitored. The purpose of this air monitoring will be to detect airborne fiber counts which may significantly challenge the ability of the work area isolation procedures to protect the balance of the building or outside of the building from contamination by airborne fibers. In the case of mini-enclosures The University's representative may monitor air outside of several enclosures if they are in close proximity.
3. Contractor shall maintain an average airborne count inside the work area of less than 0.5 f/cc. If the fiber counts rise above this figure for any sample taken, revise work procedures to lower fiber counts. If the TWA fiber count for any work shift or eight-hour period exceeds 0.5 f/cc, stop all work, leave pressure differential system in operation and notify Owner's Representative. Do not recommence work until authorized in writing by Owner's Representative.
4. If airborne fiber counts exceed 1.0 f/cc for any period of time cease all work until fiber counts fall below 0.5 f/cc and notify Owner's Representative. Do not recommence work until authorized in writing by The University's Representative.
5. If any air sample taken outside of the work area exceeds the 0.01 f/cc of air, Contractor shall immediately and automatically stop all work. If this air sample was taken inside the building and outside of critical barriers around the work area, immediately erect new critical barriers to isolate the affected area from the balance of the building. Erect Critical Barriers at the next existing structural isolation of the involved space (e.g., wall, ceiling, and floor). Leave Critical Barriers in place until completion of work and insure that the operation of the negative pressure system in the work area results in a flow of air from the balance of the building into the affected area.
6. If the exit from the clean room of the personnel decontamination unit enters the affected area, establish a temporary decontamination facility consisting of a shower room and changing room. After cleaning and decontamination of the affected area remove the shower room and leave the changing room in place as an air lock.
7. After certification of visual inspection in the work area, remove critical barriers separating the work area from the affected area. Final air samples will be taken within the entire area.

8. The following procedure will be used to resolve any disputes regarding fiber types when a project has been stopped due to excessive airborne fiber counts. "Airborne Fibers" referred to above include all fibers regardless of composition as counted in the Phase Contrast Microscopy (PCM) NIOSH 7400 Method procedures. If work has stopped due to high airborne fiber counts, air samples will be secured in the same area by The University's Representative for analysis by electron microscopy. "Airborne fibers" counted in samples analyzed by Scanning or Transmission Electron Microscopy (TEM) shall be only asbestos fibers, but of any diameter and length. Subsequent to analysis by Electron Microscopy the number of airborne fibers shall be determined by multiplying the number of fibers, regardless of composition, counted by the PCM NIOSH 7400 Method procedure by a number equal to asbestos fibers counted divided by all fibers counted in the electron microscopy analysis.
9. If electron microscopy is used to arrive at the basis for determining airborne fiber counts in accordance with the above paragraph, and if the average of airborne asbestos fibers in all samples taken exceeds 0.1 f/cc, or if any one sample exceeds 0.2 f/cc, then the cost of such analysis will be born by the Contractor, at no additional cost to The University.
10. The University's Representative will secure at least the following air samples to establish a base line before start of work involving large enclosures:

Location Sampled	Number of Samples	Analysis Method	Detection Limit f/cc	Minimum Volume Liters	Rate LPM
Each Work Area	1	PCM	0.01	1,900	2-16
Outside Each Work Area	1-3	PCM	0.01	1,900	2-16

11. Base Line is an action level expressed in f/cc, which is ten percent greater than the largest of the following:
 - a. Average of the samples collected on cellulose ester filters outside each work area.
 - b. Average of the samples collected on cellulose ester filters outside the building.
 - c. 0.01 fibers per cubic centimeter.
12. Daily: From start of work of Paragraph "Temporary Enclosure" through the work of Paragraph "Project Decontamination," The University may be taking the following samples on a daily basis. The location of each air sample will be determined by The University's Representative.
 - a. Baseline
 - b. Work Area
13. For larger enclosures samples will be collected on 25 mm cassettes with the following filter media:

PCM: 0.8 micrometer mixed cellulose ester.

Location Sampled	Number of Samples	Analysis Method	Detection Limit f/cc	Minimum Volume Liters	Rate LPM
Each Work Area	2	PCM	0.01	1,900 as required by conditions	2-16
Outside Each Work Area Critical Barrier	1	PCM	0.01	1,900	2-16
Clean Room	1	PCM	0.01	1,900	2-16
Equip Decon	1	PCM	0.01	1,900	2-16

14. Additional samples may be taken at The University or The University's Representative discretion. If airborne fiber counts exceed allowed limits, additional samples will be taken as necessary to monitor fiber levels.
15. The services of a testing laboratory will be employed by The University to perform laboratory analysis of the air samples. Samples will be sent daily so that verbal reports on air samples can be obtained in a timely manner. A complete record, certified by the testing laboratory, of all air monitoring tests and results will be furnished to The University's Representative, The University and the Contractor.

16. Air samples may be analyzed on site by The University's Representative, if they are to be analyzed by the NIOSH 7400 Method.
17. Cellulose ester filters will be analyzed using the PCM NIOSH 7400 Method. Thus analysis will be carried out at a laboratory located off the job site.
18. At the completion of the work in occupied areas and prior to the dismantling of the isolation system, final air clearance will be conducted by Owner's Representative.
19. Decontamination of the work area will be considered complete when all samples indicate fiber levels are less than 0.01 f/cc of air as analyzed by PCM NIOSH 7400 Method or an average of less than 70 structures per square millimeter of filter area as analyzed by TEM; Level II AHERA Method.
20. The Contractor may conduct his own air monitoring and laboratory testing. If he elects to do this the cost of such air monitoring and laboratory testing shall be included in the Contract Sum.

P. Equipment Removal Procedures

1. Clean all external surfaces of contaminated waste containers and equipment thoroughly by wet sponging or HEPA vacuuming before moving such items into the equipment decontamination enclosure system washroom for final cleaning and removal to uncontaminated areas. Ensure that personnel do not leave the work areas through the equipment decontamination enclosure system.

Q. Disposal Activities

1. It is the responsibility of the Contractor to comply with current federal, state and local regulations concerning the waste handling, transportation, and disposal of asbestos-containing material (ACM) and accompanying solvents or residues.
2. The Contractor will document actual disposal of the waste at the designated landfill by completing Disposal Certificate or submitting proof of landfill receipt.

1.2 PRODUCTS

A. Materials

1. All Contractor's equipment delivered to the site shall be free of asbestos contamination.
2. Store all materials subject to damage off the ground, away from wet or damp surfaces, and under cover sufficient to prevent damage or contamination.
3. Damaged or deteriorating materials shall not be used and shall be removed from the premises. Materials that become contaminated shall be disposed of in accordance with applicable regulations.
4. Polyethylene flame retardant sheet of 6-mil thickness shall be used unless otherwise specified. Polyethylene sheeting shall be sized to minimize the frequency of joints. Polyethylene sheeting must satisfy the National Fire Prevention Association Standard 701, "Small Scale Fire Test for Flame Resistant Textile and Film."
5. Adhesive tape shall be capable of sealing joints of adjacent sheets of polyethylene and for use in attachment of polyethylene sheet to finished or unfinished surfaces of similar materials and shall be capable of adhering under dry and wet conditions, including use of amended water. Contractor shall use adhesive tape compatible with finished surfaces.
6. Protective devices such as, but not limited to, disposable clothing, respirators, gloves, hard hats, etc. shall be used.
7. Wetting agent shall be a mixture of 50/50 polyoxyethylene ether and polyglycol ester or equivalent commercial product.
8. Encapsulant materials shall be the bridging and penetrating type and conform with the following characteristics:
 - a. Encapsulants shall not be solvent-based or utilize a hydrocarbon in the liquid in which the solid parts of the encapsulant are suspended.
 - b. Encapsulant shall not be flammable.
9. A non-hardening lagging sealer for enclosing and sealing raw exposed edges and surfaces of asbestos-containing materials.

10. Pre-mixed or job mixed insulating plaster manufactured for use on plumbing equipment shall be used when repairing damaged thermal insulation material.
11. Non-woven fibrous glass mat and open weave glass fiber mat cloth for repair of thermal systems insulation.
12. Fire retardant sealant shall prevent fire, smoke, water and toxic fumes from penetrating through sealants. Sealant shall have a flame spread, smoke and fuel contribution of zero, and shall be ASTM and Underwriter's Laboratory (UL) rated for three hours for standard method of fire test for fire stop systems.

B. Tools And Equipment

1. Provide suitable tools for repair and encapsulation of asbestos-containing materials and for removal of asbestos-containing materials that are beyond repair. Wire brushes shall not be used as a means of removing or cleaning asbestos-containing materials from surfaces, if they are used as the surface is being sprayed with water or amended water.
2. Provide sufficient number of HEPA-filtered vacuum cleaners equipped with pick-up adapters, steel floor wands, crevice tools, and carpet tools.
3. Airless sprayers capable of spraying amended water shall be provided in sufficient number to allow continuous uninterrupted work.
4. Asbestos filtration devices shall utilize high efficiency particulate air (HEPA) filtration systems.
5. Transportation equipment, as required, shall be suitable for loading, temporary storage, and unloading of contaminated waste without exposure to persons or property, and shall be quiet in motion if used within the building.

1.3 EXECUTION

A. Safety Procedures For Power And Lighting

1. The use of wet methods for removal, repair, encapsulation or cleaning procedures increases the potential for electrical shock when working around electrical panels, conduit, light fixtures, alarm systems, junction boxes, transformers, etc. In coordination with The University, de-energize as much electrical equipment as possible to prevent electrical shock to employees performing the work. The Contractor shall use the following precautions:
 - a. Use non-conductive tools and vacuum attachments.
 - b. Utilize "hot line" covers over energized cables and power lines when possible.
 - c. Ensure all electrical equipment in use is properly grounded before the job starts. Check outlets, wiring, extension cords and power pickups.
 - d. Avoid stringing wiring across floors. Elevate wiring if possible.
 - e. Ensure electrical outlets are tightly sealed and taped to avoid water spray.
 - f. Determine operating voltages of equipment and lines before working on or near energized parts.
 - g. Energized parts must be insulated or guarded from employee contact and other conductive objects. Extension cords must be three-wire type and connected to a Ground Fault Interrupter (GFI) circuit.
 - h. Lock or secure de-energized circuits at panel and post warning signs.
 - i. Seal heating vents with two layers of polyethylene sheeting prior to the start of work. The Contractor shall repair any damage caused by Contractor's operations to duct work, grilles, dampers, louvers or HVAC equipment at the completion of the work at Contractor's expense. Coordinate all lock out and or de-energizing with Owner.

B. Temporary Facilities

1. Use qualified tradesmen for installation of temporary services and facilities. Locate temporary services and facilities where they will serve the entire project adequately and result in minimum interference with the performance of the work and operations of the building. Coordinate all installations and shut downs with building owner.
2. Relocate, modify and extend services and facilities as required during the course of work so as to accommodate the entire work of the project.

3. Provide new or used materials and equipment that are undamaged and in serviceable condition. Provide only materials and equipment that are recognized as being suitable for the intended use, by compliance with appropriate standards.
4. During the erection and/or moving of scaffolding, care must be exercised so that the polyethylene floor covering is not damaged.
5. Clean, as necessary, debris from non-slip surfaces.
6. At the completion of abatement work, clean all construction aids within the work area, wrap in one layer of 6-mil polyethylene sheet and seal before removal from the work area.
7. Temporary water service connections to The University's water system shall include back flow protection. Valves shall be temperature and pressure rated for operation of the temperatures and pressures encountered.
8. Employ heavy-duty abrasion-resistant hoses with a pressure rating 50 percent greater than the maximum pressure of the water distribution system to provide water into each work area and to each Decontamination Unit. Provide fittings as required to allow for connection to existing wall hydrants or spouts, as well as temporary water heating equipment, branch piping, showers, shut-off nozzles and equipment.
9. Electrical Services shall comply with applicable NEMA, NECA and UL standards and governing regulations for materials and layout of temporary electric service.
10. Provide a weatherproof, grounded temporary electric power service and distribution system of sufficient size, capacity, and power characteristics to accommodate performance of work during the construction period. Install temporary lighting adequate to provide sufficient illumination for safe work and traffic conditions in every area of work.
11. Provide receptacle outlets equipped with ground fault circuit interrupters, reset button and pilot light, for plug-in connection of power tools and equipment.
12. Use only grounded extension cords; use "hard-service" cords where exposed to abrasion and traffic. Use single lengths or use waterproof connectors to connect separate lengths of electric cords, if single lengths will not reach areas of work. All cords shall be elevated off the floor inside the containment area.
13. Temporary wiring in the work area shall be type UL non-metallic sheathed cable located overhead and exposed for surveillance. Do not wire temporary lighting with plain, exposed (insulated) electrical conductors. Provide liquid tight enclosures or boxes for wiring devices.
14. Provide Type "A" fire extinguishers for temporary offices and similar spaces where there is minimal danger of electrical or grease-oil-flammable liquid fires. In other locations provide type "ABC" dry chemical extinguishers, or a combination of several extinguishers of NFPA recommended types for the exposures in each case.
15. Use of The University's existing toilet facilities, as indicated, will be permitted, so long as these facilities are properly cleaned and maintained in a condition acceptable to The University. At substantial completion, restore these facilities to the condition prevalent at the time of initial use. All provisions of these specifications regarding leaving the work area must be met.
16. When mini-enclosures area being used all of the requirements above will be enforced by The University's Representative. The construction and set-up of the mini-enclosures may be done by the Abatement Contractor.

C. Pressure Differential System

1. Before start of work Contractor shall submit design of pressure differential system to The University's Representative for review. Do not begin work until system has been approved by Owner's Representative. Include in the submittal the following:
 - a. Number of pressure differential machines required and the calculations necessary to determine the number of machines.
 - b. Description of projected air-flow within work area and methods required to provide adequate air flow in all portions of the work area.
2. If the enclosure is not a mini-enclosure, the Contractor must supply the required number of asbestos air filtration units to the site in accordance with these specifications. Each unit shall include the following:
 - a. Cabinet constructed of steel or other durable materials able to withstand damage from rough handling and transportation. The width of the cabinet should be less than 30 inches

- to fit through standard-size doorways. Cabinet shall be factory sealed to prevent asbestos-containing dust from being released during use, transport, or maintenance. Access to and replacement of all air filters shall be from intake end. Unit shall be mounted on casters or wheels.
- b. Rate capacity of fan according to useable air-moving capacity under actual operating conditions. Use centrifugal-type fan.
 - c. The final filter shall be the HEPA type. The filter media (folded into closely pleated panels) must be completely sealed on all edges with a structurally rigid frame.
 - d. A continuous rubber gasket shall be located between the filter and the filter housing to form a tight seal.
 - e. Provide HEPA Units that are individually tested and certified on site by an independent testing agency to have an efficiency of not less than 99.97 percent when challenged with 0.3 μ m dioctylphthalate (DOP) particles when tested in accordance with Military Standard Number 2182 and Army Instruction Manual 136-300-175A. Provide filters that bear a UL586 label to indicate ability to perform under specified conditions.
 - f. Pre-filters, which protect the final filter by removing the larger particles, are required to prolong the operating life of the HEPA filter. Two stages of pre-filtration are required. The first-stage pre-filter shall be a low-efficiency type (e.g., for particles 10 microns and larger). The second-stage (or intermediate) filter shall have a medium efficiency (e.g., effective for particles down to 5 microns). Pre-filters and intermediate filters shall be installed either on or in the intake grid of the unit and held in place with special housings or clamps.
 - g. Each unit shall be equipped with a Magnahelic gauge or manometer to measure the pressure drop across filters and indicate when filters have become loaded and need to be changed. A table indicating the useable air-handling capacity for various static pressure readings on the Magnahelic gauge shall be affixed near the gauge for reference, or the Magnahelic reading indicating at what point the filters should be changed, noting Cubic Feet per Minute (CFM) air delivery at that point. Provide units equipped with an elapsed time meter to show the total accumulated hours of operation.
 - h. The unit shall have an electrical (or mechanical) lockout to prevent fan from operating without a HEPA filter. Units shall be equipped with automatic shutdown system to stop fan in the event of a major rupture in the HEPA filter or blocked air discharge. Warning lights are required to indicate normal operation, too high a pressure drop across the filters (i.e., filter overloading), and too low of a pressure drop (i.e., major rupture in HEPA filter or obstructed discharge).
 - i. Electrical components shall be approved by the National Electrical Manufacturers Association (NEMA) and Underwriters' Laboratories (UL). Each unit shall be equipped with overload protection sized for the equipment. The motor, fan, fan housing, and cabinet shall be grounded.
 - j. If a mini-enclosure is used the air filtration unit may be a HEPA filtered vacuum with a flow rate of at least 100 cubic feet per minute (CFM).
3. Provide a fully operational pressure differential system within the work area maintaining continuously a pressure differential across work area enclosures of 0.02 inches of water for glove bag operations and mini-containments. Demonstrate to The University's Representative the pressure differential by use of pressure differential meter or a manometer, before disturbance of any asbestos-containing materials. In the case of a mini-enclosure visual evidence of pressure differential through the use of a smoke generation tube shall be sufficient as in paragraph C.13 of this section.
 4. Continuously monitor and record the pressure differential between the work area and the building outside of the work area.
 5. Provide fully operational negative pressure systems supplying a minimum of one air change every ten minutes (six changes per hour), less in the instance of a mini-enclosure. Determine the volume in cubic feet of the work area by multiplying floor area by ceiling height. Determine total ventilation requirement in cubic feet per minute (cfm) for the work area by dividing this volume by the air change rate.
 6. Ventilation Required (CFM) = Volume of work area (cu. ft.)/10 min.
 7. Determine number of units needed to achieve ten-minute change rate by dividing the ventilation requirement (CFM) above capacity of exhaust unit(s) used. Capacity of a unit for purposes of this

section is the capacity in cubic feet per minute with fully loaded filters (pressure differential which causes loaded filter warning light to come on) in the machines labeled operating characteristics.

8. Add one additional unit as a backup in case of equipment failure or machine shutdown for filter changing.
9. Locate exhaust unit(s) so that makeup air enters work area primarily through decontamination facilities and traverses work area as much as possible. This may be accomplished by positioning the unit(s) at a maximum distance from the worker access opening or other makeup air sources.
10. Vent to outside of building, unless authorized in writing by The University's Representative.
11. Each unit shall be serviced by a dedicated minimum 115v-20A circuit with overload device tied into an existing building electrical panel which has sufficient spare capacity to accommodate the load of all pressure differential units connected. Dedication of an existing circuit may be accomplished by shutting down existing loads on the circuit.
12. Test pressure differential system before any asbestos-containing material is wetted or removed. After the work area has been prepared, the decontamination facility set up, and the exhaust unit(s) installed, start the unit(s) (one at a time). Demonstrate operation and testing of pressure differential system to The University's Representative.
13. Demonstrate of operations of the pressure differential system to The University's Representative will include, but not be limited to, the following:
 - a. Plastic barriers and sheeting move lightly in toward work area.
 - b. Curtain of decontamination units move lightly in toward work area.
 - c. There is a noticeable movement of air through the decontamination unit. Use stroke tube to demonstrate air movement from clean room, and from equipment room to work area.
 - d. Use smoke tubes to demonstrate a positive motion of air across all area in which work is to be performed.
 - e. Use a differential pressure meter or manometer to demonstrate a pressure difference of at least 0.02 inches (as allowed) of water across every barrier separating the work area from the balance of the building or outside. This is not required in the case of a mini enclosure.
14. Start exhaust units before beginning work (before any asbestos-containing material is disturbed). After abatement work has begun, run units continuously to maintain a constant negative pressure until decontamination of the work area is complete. Do not turn off units at the end of the work shift or when abatement operations temporarily stop.
15. Do not shut down pressure differential system during encapsulating procedures, unless authorized by The University's Representative in writing. Start abatement work at a location farthest from the exhaust units and proceed toward them. If an electric power failure occurs, immediately stop all abatement work and do not resume until power is restored and exhaust units are operating again.
16. At completion of abatement work, allow exhaust units to run as specified to remove airborne fibers that may have been generated during abatement work and cleanup and to purge the work area with clean makeup air. The units may be required to run for a longer time after decontamination, if dry or only partially wetted asbestos material was encountered during any abatement work. In the case of a mini-enclosure the vacuum may be removed and the entrance sealed following encapsulation until the clearance sample is collected.
17. Prior to final air test, remove pre-filter and wipe out inside lip of negative air machine.
18. When a final inspection and the results of final air tests indicate that the area has been decontaminated, exhaust units may be removed from the work area. Before removal from the work area, remove and properly dispose of pre-filter, and seal Intake to the machine with 6-mil polyethylene to prevent environmental contamination from the filters.

D. Work Area Preparation

1. The work area is the location where asbestos-abatement work occurs. It is a variable of the extent of work of the contract. It may be a portion of a room, a single room, or a complex of rooms. A "work area" is considered contaminated during the work, and must be isolated from the balance of the building, and decontaminated at the completion of the asbestos-control work.
2. Pre-clean fixed objects, walls and floor surfaces within the proposed work areas using HEPA filtered vacuum equipment and wet cleaning methods as appropriate.

3. Seal all openings, supply and exhaust vents, and convectors within ten feet of the work area with 6-mil polyethylene sheeting secured and completely sealed with plastic adhesion tape.
4. Contact fire control agencies to review procedures prior to start of work.
5. Provide flame resistant polyethylene sheeting that conforms to requirements set forth by the National Fire Protection Association Standard 701, Small Scale Fire Test for Flame-resistant Textiles and Films. Provide largest size possible to minimize seams, four- or six- mils thick, frosted or black.
6. Provide spray adhesive in aerosol cans which is specifically formulated to stick tenaciously to sheet polyethylene and supporting surface.
7. Completely isolate the work area from other parts of the building so as to prevent asbestos-containing dust or debris from passing beyond the isolated area. Should the area beyond the work area(s) become contaminated with asbestos-containing dust or debris as a consequence of the work, clean those areas in accordance with the procedures indicated in Paragraph "Decontamination Procedures." All such required cleaning or decontamination shall be performed at no additional cost to The University.
8. Place all tools (i.e., scaffolding, staging) necessary for the work in the area to be isolated prior to erection of plastic sheeting temporary enclosure.
9. Disable ventilation systems or any other system bringing air into or out of the work area. Disable system by disconnecting wires, removing circuit breakers, by lockable switch or other positive means that will prevent accidental premature restarting of equipment.
10. Remove and dispose of all electrical and mechanical items, such as lighting fixtures, clocks, diffusers, registers, escutcheon plates, etc., which cover any part of the surface on which work is to be performed.
11. All general construction items such as cabinets, casework, doors and window trim, moldings, ceilings, trim, etc., which cover the surface of the work as required to prevent interference with the work. To be performed by The University: clean, decontaminate and reinstall all such materials, upon completion of all removal work with materials, finishes, and workmanship to match existing installations before start of work.
12. Permit Access to the work area only through the Decontamination Unit. All other means of access shall be closed off and sealed and warning signs displayed on the clean side of the sealed access.
13. Provide Warning Signs at each visual and physical barriers reading as follows in both English and Spanish:

<u>Legend</u>	<u>Notation</u>
KEEP OUT	3" Sans Serif Gothic or Block
BEYOND THIS POINT	1" Sans Serif Gothic or Block
ASBESTOS ABATEMENT WORK	1" Sans Serif Gothic or Block
IN PROGRESS	1" Sans Serif Gothic or Block
BREATHING ASBESTOS DUST MAY BE	14 Point Gothic
HAZARDOUS TO YOUR HEALTH	

14. Alternate methods of containing the work area may be submitted to The University's Representative for approval. Do not proceed with any such method(s) without prior written approval of The University's Representative.
15. Individually seal all ventilation openings (supply and exhaust), lighting fixtures, clocks, doorways, windows, convectors and speakers, and other openings into the work area with plastic adhesion tape alone or with polyethylene sheeting at least 4-mil in thickness, taped securely in place with plastic adhesion tape. Maintain seal until all work including Project Decontamination is completed. Take care in sealing off lighting fixtures to avoid melting or burning of sheeting.
16. Provide sheet plastic barriers at least 6-mil in thickness as required to completely seal openings from the work area into adjacent areas. Seal the perimeter of all sheet plastic barriers with plastic adhesion tape or spray cement.
17. Where applicable, construct framing of the containment out of fire treated wood or aluminum studs. Mini-enclosure frames may be constructed of Polyvinyl Chloride (PVC) tubing.

18. Cover all walls in work area extending to the underside of the ceiling grid system with one layer of polyethylene sheeting, at least 6-mil in thickness, mechanically supported and sealed with plastic adhesion tape or spray-glue in the same manner as "Critical Barrier" sheet plastic barriers. Tape all joints with plastic adhesion tape. Contractor shall be responsible for repair of damaged wall finishes.
19. Cover floor with two layers of 6-mil polyethylene sheeting (exclude for floor tile and adhesive).
20. Provide Pressure Differential System per Paragraph "Pressure Differential System."
21. If the enclosure barrier is breached in any manner that could allow the passage of asbestos debris or airborne fibers, then add the affected area to the work area, enclose it as required by this section of the specification and decontaminate it as described in Paragraph "Decontamination Procedures."
22. Establishing a Mini-Containment area:
 - a. Establish work area so that unauthorized entry is prevented; Construct a two-compartment fire treated wood frame around work area; install one layer 6-mil polyethylene sheeting to structural members and two layers 6 mil polyethylene sheeting to the floor. Exception: no floor required if mini-containment is being constructed to perform a floor tile activity. Seal all edges to wall, ceiling, and floor surfaces with duct tape. Install viewing inspection windows, where feasible.
 - b. Seal all penetrations with duct tape such as pipes, electrical conduit, or ducts contained within the mini-containment.
 - c. Install triple 6-mil polyethylene flaps at both doorways. Place portable sprayer with clean water, disposable towels, and pre-labeled disposal bag in air lock.
 - d. Install appropriate signs on outside of mini-containment area.
 - e. Install HEPA vacuum; extend hose into mini-containment area for general vacuuming, negative air, and cleaning of disposal suit.
 - f. Accumulate all loose materials for disposal. Place in approved container. Apply appropriate labels. Adequately wet clean all wall, floor, tool and equipment surfaces.
 - g. Abatement worker must wear two disposable suits. Remove outer suit in work area and place in a plastic bag. Enter air lock.
 - h. In air lock, wet wipe respirator and wash hands with clean water. Remove respirator and place in a clean plastic bag. Proceed to remote shower unit where inner suit may be removed.

E. Worker Protection

1. This section describes the equipment and procedures required for protecting workers against asbestos contamination and other work place hazards except for respiratory protection.
2. Respiratory Protection is specified in Paragraph "Respiratory Protection."
3. Train in accordance with EPA's Model Accreditation Plan, 40 CFR 763 - Asbestos, all workers in the dangers inherent in handling asbestos and breathing asbestos dust and in proper work procedures and personal and area protective measures. Include but do not limit the topics covered in the course to the following:
 - a. Methods of recognizing asbestos.
 - b. Health effects associated with asbestos.
 - c. Relationship between smoking and asbestos in producing lung cancer.
 - d. Nature of operations that could result in exposure to asbestos.
4. Importance of and instruction in the use of necessary protective controls, practices and procedures to minimize exposure including:

Engineering controls
 Work practices
 Respirators
 Housekeeping procedures
 Hygiene facilities
 Protective clothing
 Decontamination procedures
 Emergency procedures

Waste disposal procedures
 Appropriate work practices for the work
 Requirements of medical surveillance program
 Review of OSHA 29 CFR 1926.1101(k)(9)(viii)(G) - Asbestos
 Pressure differential systems
 Work practices including hands on or on job training
 Personal decontamination procedures
 Air monitoring, personal and area

5. Provide medical examinations for all workers who may encounter an airborne fiber level of 0.1 f/cc or greater for an 8 hour time weighted average. In the absence of specific airborne fiber data, provide medical examination for all workers who will enter the work area for any reason. Examination shall, at minimum, meet OSHA requirements as set forth in 29 CFR 1926.1101(k)(9)(viii)(G) - Asbestos. In addition, provide an evaluation of the individual's ability to work in environments capable of producing heat stress in the worker.
6. Before start of work Contractor shall submit the following to The University's Representative for review. Do not start work until receipt of Owner's Representative.
 - a. An original signed copy of the Certificate of Worker's Acknowledgement found at the end of this specification, for each worker who is to be at the job site or enter the work area.
 - b. Courses outline or name of institution providing the worker training course.
 - c. Report from medical examination conducted within last 12 months as part of compliance with OSHA medical surveillance requirements for each worker who is to enter the work area.
7. Provide disposable full-body coveralls and disposable head covers, and require that they be worn by all workers in the work area. Provide a sufficient number for all required changes, for all workers in the work area.
8. Provide work boots with non-skid soles, and where required by OSHA, foot protectives, for all workers. Provide boots at no cost to workers. Paint uppers of all boots red with water proof enamel. Do not allow boots to be removed from the work area for any reason, after being contaminated with asbestos-containing material. Dispose of boots as asbestos contaminated waste at the end of the work.
9. Provide head protectives (hard hats) as required by OSHA for all workers, and provide four spares for use by Owner's Representative, and Owner. Label hats with same warning labels as used on disposal bags. Require hard hats to be worn at all times that work is in progress that may potentially cause head injury. Provide hard hats with plastic strap type suspension. Require hats to remain in the work area throughout the work. Thoroughly clean, decontaminate and bag hats before removing them from work area at the end of the work.
10. Provide eye protectives (goggles) as required by OSHA for all workers involved in scraping, spraying, or any other activity which may potentially cause eye injury.
11. Provide work gloves to all workers and require that they be worn at all times in the work area. Do not remove gloves from work area. Dispose of gloves as asbestos contaminated waste at the end of the work.
12. Respirators, disposable coveralls, head covers, and footwear covers shall be provided by the contractor for The University, Owner's Representative, and other authorized representatives who may inspect the job site.
13. Provide worker protection as required by the most stringent OSHA and/or EPA standards applicable to the work. The following procedures are minimums to be adhered to regardless of fiber count in the work area.
14. Each time work is entered, remove all street clothes in the changing room of the Personnel Decontamination Unit and put on new disposable coverall, new head cover, and a clean respirator. Proceed through shower room to equipment room and put on work boots.
15. In the event a mini-enclosure is used refer to Paragraph "Work Area Preparation" for personal decontamination procedures.

F. Respiratory Protection

1. Instruct and train each worker involved in asbestos abatement or maintenance and repair of friable asbestos-containing materials in proper respiratory use and require that each worker

always wear a respirator, properly fitted on the face in the work area from the start of any operation which may cause airborne asbestos fibers until the work area is completely decontaminated. Use respiratory protection appropriate for the fiber level encountered in the work place or as required for other toxic or oxygen-deficient situations encountered.

2. Except to the extent that more stringent requirements are written directly into the Contract Documents, the following regulations and standards have the same force and effect (and are made a part of the Contract Documents by reference) as if copied directly into the Contract Documents, or as if published copies were bound herewith. Where there is a conflict in requirements set forth in these regulations and standards meet the more stringent requirement.
 - a. OSHA - U.S. Department of Labor Occupational Safety and Health Administration, Safety and Health Standards 29 CFR 1910, Section 1001 and Section 1910.134.29 CFR 1926.
 - b. ANSI - American National Standard Practices for Respiratory Protection. ANSI Z88.2-1980.
 - c. NIOSH - National Institute for Occupational Safety and Health.
 - d. MSHA - Mine Safety and Health Administration.

G. Type Of Respiratory Protection Required

1. Provide Respiratory Protection as indicated in paragraph below. Where paragraph below does not apply, determine the proper level of protection by dividing the expected or actual airborne fiber count in the work area by the "protection factors" given below. The level of respiratory protection which supplies an airborne fiber level inside the respirator, at the breathing zone of the wearer, at or below 0.01 fibers/cubic centimeter is the minimum level of protection allowed.
2. Eight-hour Time Weighted Average (TWA) of asbestos fibers to which any worker may be exposed shall not exceed 0.1 fibers/cubic centimeter.
3. For purposes of this section fibers are defined as all fibers regardless of composition as counted in the OSHA Reference Method (ORM), NIOSH P&CAM 239 or 7400 procedure, or asbestos fibers of any size as counted using either a scanning or transmission electron microscope.
4. Require that respiratory protection be used at all times that there is any possibility of disturbance of asbestos-containing materials whether intentional or accidental.
5. Require that a respirator be worn by anyone in a work area at all times, regardless of activity, during a period that starts with any operation which could cause airborne fibers until the area has been cleared for re-occupancy.

H. Respiratory Protection Factor

<u>Respirator Type</u>	<u>Protection Factor</u>
Air purifying:	10
Negative pressure respirator	
High efficiency filter	
Half facepiece	
Air purifying:	50
Negative pressure respirator	
High efficiency filter	
Full facepiece	
Powered-air purifying (PAPR):	100
Positive pressure respirator	
High efficiency filter	
Half or Full facepiece	
Type C supplied air:	100
Positive pressure respirator continuous-flow	
Half or full facepiece	
Type C supplied air:	1000

Positive pressure respirator pressure demand
Full facepiece

Type C supplied air: over 1000
Positive pressure respirator pressure demand
Full facepiece
Equipped with an auxiliary positive pressure
Self-contained breathing apparatus (SCBA)

Self-contained breathing apparatus (SCBA): over 1000
Positive Pressure respirator
Pressure demand
Full facepiece

I. Air Purifying Respirator

1. Provide half face or full face type respirators. Equip full-face respirators with a nose cup or other anti-fogging device as would be appropriate for use in air temperatures less than 32 degrees Fahrenheit.
2. Provide, at a minimum, HEPA type filters labeled with NIOSH and MSHA certification for "Radionuclides, Radon Daughters, Dust, Fumes, Mists including Asbestos-Containing Dusts and Mists" and color coded in accordance with ANSI Z228.2 (1980). In addition, a chemical cartridge section may be added, if required, for solvents, etc., in use. In this case, provide cartridges that have each section of the combination canister labeled with the appropriate color code and NIOSH/MSHA Certification.
3. Supply with a sufficient quantity of respirator filters approved for asbestos, so that workers can change filters during the work day. Require that respirators be wet-rinsed, and filters discarded, each time a worker leaves the work area. Require that new filters be installed each time a worker re-enters the work area. Store respirators and filters at the job site in the changing room and protect totally from exposure to asbestos prior to their use. Do not use single use, disposable or quarterface respirators.

J. Powered Air Purifying Respirator (PAPR)

1. Provide full-facepiece type respirators. Provide nose-cups for full-facepiece respirators. Provide, at a minimum, HEPA type cartridges approved by NIOSH/MSHA and certified for use in atmospheres containing asbestos dusts.
2. Provide, at a minimum, one extra battery pack for each respirator so that one can be charging while one is in use.
3. Provide non-cloth belts capable of being decontaminated in shower.
4. Supply with a sufficient quantity of high efficiency respirator filters approved for asbestos so that workers can change filters at any time that flow through the face piece decreases to the level at which the manufacturer recommends filter replacement. Require that regardless of flow, filter cartridges be replaced after 40 hours of use. Require that HEPA elements in filter cartridges be protected from wetting during showering. Require entire exterior housing of respirator including blower unit, filter cartridges, hoses, battery pack, face mask, belt, and cords to be washed each time a worker leaves the work area. Caution should be used to avoid shorting battery pack during washing.

K. Required Respiratory Protection

1. Regardless of airborne fiber levels, require the following minimum level of respiratory protection:
 - a. Half-face air purifying respirators may be used during set-up of the containment and removal of the material so long as fiber counts inside the respirator do not exceed .01 f/cc fibers per cubic centimeter.

L. Decontamination Units -Three-Stage

1. Provide a Personnel Decontamination Unit consisting of a serial arrangement of rooms or spaces, Changing Room, Shower Room, Equipment Room adjacent to each full containment area.

2. Require all persons without exception to pass through this decontamination unit for entry into and exiting from the work area for any purpose. Do not remove equipment or materials through Personnel Decontamination Unit.
3. Changing (Clean) Room:
 - a. Provide a room that is physically and visually separated from the rest of the building for the purpose of changing into protective clothing.
 - b. Locate so that access to work area from changing room is through shower room.
 - c. Separate changing room from the building by a double-sheeted polyethylene flapped doorway.
 - d. Provide sub-panel at changing room to accommodate all removal equipment. Power sub-panel directly from a building electrical panel. Connect all electrical branch circuits in decontamination unit and particularly any pumps in shower room to a ground-fault circuit protection device.
4. Shower Room:
 - a. Provide a completely water tight operational shower to be used for transit by cleanly dressed workers heading for the work area from the changing room, or for showering by workers headed out of the work area after undressing in the equipment room.
 - b. Construct room by providing a shower pan and two shower walls in a configuration that will cause water running down walls to drip into pan. Install a freely draining wood floor in shower pan at elevation of top of pan.
 - c. Separate this room from rest of building, drying room and airlock with airtight walls fabricated of 6-mil polyethylene.
 - d. Provide splash proof entrances to Drying Room and Airlock.
5. Equipment Room (contaminated area):
 - a. Require work equipment, footwear and additional contaminated work clothing to be left here. This is a change and transit area for workers. Separate this room from the work area by a 6-mil polyethylene flap doorway.
 - b. Separate this room from the rest of the building, the shower room and work area with air tight walls fabricated of 6-mil polyethylene.
6. Clean Room: Provide Clean Room to isolate the holding room from the building exterior.
7. Load-out Area:
 - a. The load-out area is the transfer area from the building to a truck or dumpster.
 - b. Wet wipe bags before they are passed through the equipment decon-chamber.
 - c. When cleaning is complete pass items into holding room. Close all doorways except the doorway between the holding room and the Clean Room.
 - d. Workers from the area outside the containment area enter holding area and remove decontaminated equipment and/or containers for disposal.
 - e. Require these workers to wear full protective clothing and appropriate respiratory protection.
 - f. At no time is a worker from an uncontaminated area to enter the enclosure when a removal worker is inside.
 - g. Post an approximately 20 inch x 14 inch manufactured caution sign at each entrance to the work area displaying the following legend with letter sizes and styles of a visibility required by OSHA 29 CFR 1926.1101(k)(9)(viii)(J) - Asbestos.

LEGEND
DANGER

ASBESTOS

CANCER AND LUNG DISEASE HAZARD
RESPIRATORS AND PROTECTIVE CLOTHING ARE REQUIRED
IN THIS AREA

- h. Provide spacing between respective lines at least equal to the height of the respective upper line.

- i. Additional Signage: Shall also be posted in accordance with OSHA 29 CFR 1926.1101(k)(9)(viii)(J) - Asbestos

DANGER
ASBESTOS
CANCER AND LUNG DISEASE HAZARD

AUTHORIZED PERSONNEL ONLY
RESPIRATORS AND PROTECTIVE CLOTHING
ARE REQUIRED IN THIS AREA
DANGER
ASBESTOS
CANCER AND LUNG HAZARD
KEEP OUT

- j. Post an approximately 10 inch by 14 inch manufactured sign at each entrance to each work area displaying the following legend with letter sizes and styles of a visibility at least equal to the following:

LEGEND

NOTATION

No Food, Beverages or Tobacco Permitted	3/4 inch Block
All Persons Shall Don Protective Clothing (Coverings) Before Entering the Work Area	3/4 inch Block
All Persons Shall Shower Immediately After Leaving Work Area and Before Entering the Changing Area	3/4 inch Block

M. Decontamination Procedures

1. Contractor shall require all workers and visitors to adhere to the following personal decontamination procedures whenever they leave the work area:
 - a. Require that all workers use the following decontamination procedure as a minimum requirement whenever leaving the work area.
 - b. When exiting area, remove disposable coveralls, disposable head covers, and disposable footwear covers or boots in the Equipment Room.
 - c. Still wearing respirators, proceed to showers. Showering is mandatory. Care must be taken to follow reasonable procedures in removing the respirator to avoid asbestos fibers while showering. The following procedure is required as a minimum:
 - 1) Thoroughly wet body including hair and face. If using a PAPR, hold blower unit above head to keep canisters dry.
 - 2) With respirator still in place thoroughly wash body, hair, respirator face piece, and all parts of the respirator except the blower unit and battery pack on a PAPR. Pay particular attention to seal between face and respirator and under straps.
 - 3) Take a deep breath, hold it and/or exhale slowly, completely wet hair, face, and respirator. While still holding breath, remove respirator and hold it away from face before starting to breathe.
 - 4) Carefully wash face-piece of respirator inside and out.
 - d. If using PAPR, shut down in the following sequence, first cap inlets to filter cartridges, then turn off blower unit (this sequence will help keep debris which has collected on the inlet side of filter from dislodging and contaminating the outside of the unit). Thoroughly wash blower unit and hoses. Carefully wash battery pack with wet rag. Be extremely cautious of getting water in battery pack as this will short out and destroy battery.
 - 1) Shower completely with soap and water.
 - 2) Rinse thoroughly.

- 3) Rinse shower room walls and floor prior to exit.
- 4) Proceed from shower to changing room and change into street clothes or into new disposable work items.
- e. Require that all workers use the following decontamination procedure as a minimum requirement whenever leaving the work area with a half or full face cartridge type respirator:
 - 1) When exiting area, remove disposable coveralls, disposable headcovers, and disposable footwear covers or boots in the equipment room.
 - 2) Still wearing respirators, proceed to showers. Showering is mandatory. Care must be taken to follow reasonable procedures in removing the respirator and filters to avoid asbestos fibers while showering. The following procedure is required as a minimum:
 - 3) Thoroughly wet body from neck down.
 - 4) Wet hair as thoroughly as possible without wetting the respirator filter if using an air purifying type respirator.
 - 5) Take a deep breath, hold it and/or exhale slowly, complete wetting of hair, thoroughly wetting face, respirator and filter (air purifying respirator). While still holding breath, remove respirator and hold it away from face before starting to breath.
 - 6) Dispose of wet filters from air purifying respirator.
 - 7) Carefully wash facepiece of respirator inside and out.
 - 8) Shower completely with soap and water.
 - 9) Rinse thoroughly.
 - 10) Rinse shower room walls and floor prior to exit.
 - 11) Proceed from shower to changing room and change into street clothes or into new disposable work items.

N. Project Decontamination

1. If the asbestos abatement work is on damaged or friable materials, then the building space is deemed contaminated before start of the work and in need of decontamination. In this case, the procedure includes two cleanings of the primary barrier plastic prior to its removal and two cleanings of the room surfaces to remove any new or existing contamination.
2. Work of this section includes the decontamination of air in the work area which has been, or may have been contaminated by the elevated airborne asbestos fiber levels generated during abatement activities, or which may previously have had elevated fiber levels due to friable materials in the space.
3. Work of this section also includes the cleaning, decontamination, and removal of temporary facilities installed prior to abatement work and decontamination of all surfaces (ceiling, walls, floor) of the work area, and all furniture or equipment in the work area.
4. First Cleaning
 - a. Carry out a first cleaning of all surfaces of the work area including items of remaining sheeting, tools, scaffolding and/or staging by use of damp-cleaning and mopping, and/or a HEPA filtered vacuum. (Note: A HEPA vacuum will fail if used with wet material). Do not perform dry dusting or dry sweeping. Use each surface of a cleaning cloth one time only and then dispose as contaminated waste. Continue this cleaning until there is no visible debris from removed materials on plastic sheeting or other surfaces. Upon authorization of Owner's Representative proceed with encapsulation of substrate.
 - b. Perform encapsulation of substrate where required at this time. Maintain pressure differential system in operation during encapsulation work. Allow encapsulant to dry before proceeding with removal of Secondary layer of plastic.
5. Second Cleaning
 - a. Upon authorization of Owner's Representative, remove all Primary Barrier sheeting and Material Decontamination Unit, if there is one, leaving only the following:
 - 1) Critical Barrier which forms the sole barrier between the work area and other portions of the building or outside.
 - 2) Critical Barrier Sheeting over lighting fixtures and clocks, ventilation openings, doorways, convectors, speakers and other openings.
 - 3) Personnel Decontamination Unit.
 - 4) Pressure Differential System in continuous operation.

- b. Remove all filters in Air Handling System(s) and dispose of as asbestos-containing waste.
 6. Final Cleaning: Carry out a final cleaning of all surfaces in the work in the same manner as the first cleaning immediately after removal of primary plastic. This cleaning is now being applied to existing room surfaces. Take care to avoid water marks or other damage to surfaces.
 7. Visual Inspection: Perform a complete visual inspection with Owner's Representative of the entire work area including decontamination unit, all plastic sheeting, seals over ventilation openings, doorways, windows, and other openings; look for debris from any sources, residue on surfaces, dust or other matter. If any such debris, residue, dust or other matter is found repeat cleaning and continue decontamination procedure from that point. When the area is visually clean, complete the certification at the end of this section.
 8. Final Air Sampling
 - a. After the work area is found to be visually clean, air samples will be taken and analyzed in accordance with the procedures set forth in Paragraph "Powered Air Purifying Respirator (PAPR).
 - b. If Release Criteria are not met, repeat cleaning and continue decontamination procedure from that point.
 - c. If Release Criteria is met, remove the interior of the decontamination unit leaving in place only the Critical Barriers separating the work area from the rest of the building and the operating negative pressure system.
 - d. Any small quantities of residual material found upon removal of the plastic sheeting shall be removed with a HEPA filtered vacuum cleaner and local area protection. If significant quantities, as determined by The University's Representative, are found then the entire area affected shall be decontaminated as specified herein for the cleaning.
- O. Work Area Clearance
 1. Air Monitoring
 - a. Visual Inspection is required as a prerequisite of air testing.
 - b. To determine if the elevated airborne asbestos structure concentration during abatement operations have been reduced to the specified level, The University's Representative will secure samples and analyze them according to the following procedures.
 2. Aggressive Sampling
 - a. All air samples will be taken using aggressive sampling techniques as follows. (There are no standards available for flow rate of leaf blowers or large fans. However, this information is not critical to the success of the procedure).
 - b. Before sampling pumps are started, the exhaust from forced-air equipment (leaf blower with at least 1 horsepower electric motor) will be swept against all walls, ceilings, floors, ledges and other surfaces in the room. This procedure will be continued for five minutes per 10,000 cubic feet of room volume.
 - c. Air samples will be collected in areas subject to normal air circulation away from room corners, obstructed locations, and sites near windows, doors or vents.
 3. Schedule of Air Samples
 - a. General: The number and volume of air samples taken and analytical methods used by The University's Representative will be in accordance with the following schedule. Sample volumes given may vary depending upon the analytical instruments used. In each homogeneous work area after completion of all cleaning work, samples will be taken and analyzed by either PCM or TEM analysis.
 - b. Transmission Electron Microscopy (TEM) Samples:
 - 1) In each homogeneous work area after completion of all cleaning work, samples will be taken and analyzed by either PCM or TEM analysis as follows:
 - 2) Samples will be collected on 25 mm cassettes with filter media: TEM - 0.45 micrometer mixed cellulose ester or 0.40 micrometer polycarbonate, with 5.0 micron mixed cellulose ester backing filter.

Location Sampled	Number of Samples	Detection Limit (f/cc)	Minimum Volume (Liters)	Rate LPM
Each Work Area	5	0.005	1,300	2-10

- 3) TEM Analysis will be performed using the analysis method set forth in the AHERA Regulation 40 CFR Part 763 Appendix A.
- 4) Asbestos Structures referred to in this Section include asbestos fibers, bundles, clusters, or matrices, as defined by method of analysis.
- 5) Decontamination of the work site is complete when all the sample results are below 0.01 fibers per cubic centimeters (f/cc) of air or 70 structures per square millimeter.
- c. Phase Contrast Microscopy (PCM) Samples:
 - 1) In each homogeneous work area after completion of all cleaning work, samples may be taken and analyzed as follows:
 - 2) Samples will be analyzed by PCM for clearance in areas where ceiling tile and/or pipe insulation are removed
 - 3) Samples will be collected on 25 mm cassettes with filter media: PCM - 0.8 micrometer mixed cellulose ester.

Location Sampled	Number of Samples	Detection Limit (s/cc)	Minimum Volume (Liters)	Rate LPM
Each Work Area	1-5	0.01	2,400	2-10

- 4) PCM Analysis: Fibers on each filter will be measured using the NIOSH 7400 Method entitled "Fibers" published in the NIOSH Manual of Analytical Methods, 3rd Edition, Second Supplement, August 1987.
- 5) Fibers: Referred to in this section include fibers regardless of composition as counted by the phase contrast microscopy method used
- 6) Decontamination of the work site is complete when all the sample results are below 0.01 fibers per cubic centimeters (f/cc) of air or 70 structures per square millimeter.
4. Failure of Clearance Sampling: Should results from analysis of final clearance air samples not meet the specified criteria, Contractor will be responsible for the payment of all costs, including Consultant's time for subsequent clearance air sampling. The costs associated with subsequent re-sampling for final clearance shall be deducted from the Contractor's final payment of the contract amount.

P. Removal Of Pipe Insulation

1. The work of this section applied to the removal of asbestos-containing Pipe Insulation.
 - a. Place one layer of 6-mil fire retardant polyethylene sheeting directly below the work. The sheet shall be of sufficient size to completely wrap the pipe once it has been removed.
 - b. Thoroughly wet the ends of the pipe with amended water and scrape off a minimum of 6 inches of asbestos wrap from both ends of the pipe. Immediately place the wetted material into pre-labeled asbestos disposal bag(s).
 - c. Detach the pipe at each scraped end and place the pipe onto one sheet of 6-mil fire retardant polyethylene sheeting. Wrap the pipe with the 6-mil fire retardant polyethylene sheeting. Contractor shall wrap the pipe with a second sheet of 6-mil, fire retardant polyethylene sheeting and label as asbestos-containing material. Dispose of the bag(s) and duct in accordance with the Paragraph "Handling and Disposal of Asbestos Contaminated Waste" of this specification.
 - d. Upon clearance from The University's Representative, Contractor shall remove the 6-trail, fire retardant polyethylene sheeting from the openings.

Q. Glove Bag Removal

1. The work of this section applies to full containment or glovebag removal.
2. Isolate the area in accordance with Paragraph "Temporary Facilities."
3. Construct a decontamination unit as described in Paragraph "Decontamination Units" and attach to the work area.
4. Set up pressure differential isolation and ventilation of the work area in accordance to Paragraph "Pressure Differential System."

- a. Upon approval of the enclosure by The University's Representative, Contractor may proceed to remove the material using the following method.
- b. Thoroughly wet to satisfaction of Owner's Representative, asbestos-containing insulation to be removed prior to stripping and/or tooling to reduce fiber dispersal into the air. Accomplish wetting by a fine spray (mist) of amended water or removal encapsulant. Saturate material sufficiently to wet the substrate without causing excess dripping. Allow time for removal encapsulant to penetrate material thoroughly. If amended water is used, spray material repeatedly during the work process to maintain a continuously wet condition. If a removal encapsulant is used, apply in strict accordance with manufacturer's written instructions. If insulation is covered with canvas, Contractor will wet the exterior covering and slice it with utility knife while saturating the material.
- c. Mist work area continuously with amended water whenever necessary to reduce airborne fiber levels using commercially available "foggers."
- d. Remove saturated asbestos-containing material in small sections from all areas. Do not allow material to dry out. As it is removed, simultaneously pack material while still wet into disposal bags. Twist neck of bags, bend over and seal with minimum three wraps of duct tape. Clean outside and move to wash down station adjacent to material decontamination unit.
- e. Evacuate air from disposal bags with a HEPA filtered vacuum cleaner before sealing.
- f. Contractor must always clean area of visible asbestos debris prior to end of shift.
5. These procedures shall be followed to remove pipe insulation elbows:
 - a. Install critical barriers to isolate the work site. Install 2 or 3 Stage Decontamination Units.
 - b. HEPA vacuum the work site.
 - c. Provide negative air machine in addition to those required, in the vicinity of the work. Arrange so that exhaust is into the work area, oriented in a direction away from the work. Extend a 2-inch diameter flexible non-collapsing duct from the intake end to a point no more than 4'-0" from any scraping or brushing activity.
 - d. Locate intake of duct so that airflow is horizontally and slightly downward into intake. Replace primary filter on negative air machine at an interval of no greater than 30 minutes. Allow no more than one scraping or brushing activity per negative air machine.
 - e. Check pipe where the work will be performed. Wrap damaged (broken lagging, hanging, etc.), pipe in 6 mil plastic and "candy-stripe" with duct tape. Place one layer of duct tape around undamaged pipe at each end where the glovebag will be attached.
 - f. Place necessary tools into pouch located inside glovebag. This will usually include: bone saw, utility knife, rags, scrub brush, wire cutters, tin snips and pre-wetted cloth.
 - g. Place one strip of plastic adhesion tape along the edge of the open top slit of glove bag for reinforcement.
 - h. Place the glove bag around section of pipe to be worked on and staple top together through reinforcing tape. Next, tape the ends of glovebag to pipe itself, where previously covered with plastic or tape.
 - i. Use smoke tube and aspirator bulb to test seal. Place tube into water sleeve (two-inch opening to glovebag) squeezing bulb and filling bag with visible smoke. Remove smoke tube and twist water sleeve closed. While holding the water sleeve tightly, gently squeeze glovebag and by using a flashlight, look for smoke leaking out, (especially at the top and ends of the glovebag). If leaks are found, tape closed using plastic adhesion tape and re-test.
 - j. Insert wand from garden sprayer through water sleeve. Plastic adhesion tape water sleeve tightly around the wand to prevent leakage.
 - k. One person places his hands into the long-sleeved gloves while the second person directs garden sprayer at the work.
 - l. Use bone saw, if required, to cut insulation at each end of the section to be removed. A bone saw is a serrated heavy gauge wire with ring-type handles at each end. Throughout this process, spray amended water or removal encapsulant on the cutting area to keep dust to a minimum.
 - m. Remove insulation using putty knives or other tools. Place pieces in bottom of bag without dropping.
 - n. Rinse all tools with water inside the bag and place back into pouch.

- o. Using scrub brush, rags and water, scrub and wipe down the exposed pipe. (Inexpensive horse rub-down mittens work well for this).
 - p. Remove water wand from water sleeve and attach the small nozzle from HEPA-filtered vacuum. Turn on the vacuum only briefly to collapse the bag.
 - q. Remove the vacuum nozzle, twist water sleeve closed and seal with plastic adhesion tape.
- R. Handling And Disposal Of Asbestos-Containing Waste
- 1. All waste and asbestos contaminated waste shall be double bagged in pre-labeled 6-mil airtight puncture resistant bags. Labeling shall be in accordance with OSHA and EPA requirements.
 - a. Bags of asbestos-containing waste shall be sealed with tape in the work area. Asbestos waste shall not be allowed to dry out prior to sealing bags. While in the work area, bags shall be decontaminated of any bulk debris by wet wiping. Bags shall be pre-labeled in accordance with OSHA and EPA.
 - b. The Contractor shall ensure that the sealed bags are transported to the waste disposal site.
 - 2. The Contractor shall establish a manifest system to enable The University to report the quantity of asbestos waste being deposited at the landfill. Contractor shall report the quantity of waste in pounds or tons as appropriate. The Contractor must be able to demonstrate custody over all asbestos waste from the time it is removed from the work area until it is deposited at the land fill.
 - a. Copies of the manifest and any receipts generated during the handling and disposal process shall be provided to Owner's Representative and The University.
 - b. Final manifest and documents must be provided to Owner's Representative and The University within two weeks of the removal of the asbestos materials from the site by the waste hauler.
- S. Encapsulation Of Asbestos-Containing Materials
- 1. General provisions of Contract, including General and Supplementary Conditions and Division 01, apply to work of this section.
 - a. The work includes the sealing of all piping or vessels from which asbestos-containing insulation has been removed with one coat of a lock down encapsulant.
 - b. Where repair work is being performed, the end will be sealed with a minimum of one coat of bridging encapsulant.
 - 2. Submittals
 - a. Product Data: Submit manufacturer's technical information including label analysis and application instructions for each material proposed for use.
 - b. Installation Instructions: Submit manufacturer's installation instructions with specific project requirements noted.
 - c. Performance Warrantee: Submit manufacturer's performance guarantee.
 - d. Certification: Submit written approval of entity installing the encapsulant from encapsulant manufacturer.
 - e. Material Safety Data Sheet: Submit the Material Safety Data Sheet, or equivalent, in accordance with the OSHA Hazard Communication Standard (29 CFR 1910.1200) for each surfactant and encapsulating material proposed for use on the work. Include a separate attachment for each sheet indicating the specific worker protective equipment proposed for use with the material indicated.
 - 3. Deliver materials to the job site in original, new and unopened packages and containers bearing manufacturer's name and label, and following information:
 - a. Name or title of material
 - b. Manufacturer's stock number and date of manufacture
 - c. Manufacturer's name
 - d. Thinning Instructions
 - e. Application Instructions
 - 4. Deliver materials together with a copy of the OSHA Material Safety Data Sheet for the material.
 - 5. Job Conditions
 - a. Apply encapsulating materials only when environmental conditions in the work area are as required by the manufacturer's instructions.
 - 6. Quality Assurance

- a. Installation of Spray-on Encapsulation Materials: Install spray-on materials by a firm and personnel approved by the manufacturer of the primary materials.
- b. Testing: Test material to be encapsulated using methods set forth in ASTM E1494 "Standard Practice for Encapsulants Spray-or-Trowel-Applied for Friable Asbestos-Containing Building Materials."
- c. Performance Warranty: Submit written Performance Warranty, executed by the manufacturer and co-signed by the Contractor, agreeing to repair/replace spray-on work which has cracked, fallen from substrate, or otherwise deteriorated to a condition where it would not perform effectively for its intended purposes due substantially to defective materials or workmanship and not due to abuse by occupants, improper maintenance, non-foreseeable ambient exposures or other causes beyond anticipated conditions and manufacturer's/contractor's control.
- d. Compatibility: Selection and use of encapsulant shall be compatible with replacement materials. Submit manufacturer's data indicating compatibility with replacement materials.
7. Product Selection
 - a. Encapsulants: Provide penetrating or bridging type encapsulants specifically designed for application to asbestos-containing material.
 - b. Standards: Product shall be rated as acceptable for use intended when field tested in accordance with ASTM E1494 "Standard Practice for Encapsulants Spray-or-Trowel-Applied for Friable Asbestos-Containing Building Materials."
 - c. Fire Safety: Use only materials that have a flame spread index of less than 25, when dry, when tested in accordance with ASTM E84.
8. Manufacturers
 - a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products, which may be incorporated in the work, include, but are not limited to the following:
 - 1) Penetrating Encapsulants: As currently accepted by the EPA. Refer to most recent EPA approval list.
 - 2) Bridging Encapsulants: As currently accepted by the EPA. Refer to most recent EPA approval list.
9. General
 - a. Prior to applying any encapsulating material, ensure that application of the sealer will not cause the base material to fail and allow the sealed material to fall of its own weight or separate from the substrate. Should Contractor doubt the ability of the installation to support the sealant, request direction from The University's Representative before proceeding with the encapsulating work.
 - b. Do Not Commence Application of encapsulating materials until all removal work within the work area has been completed.
10. Worker Protection
 - a. Before beginning work with any material for which a Material Safety Data Sheet has been submitted, provide workers with the required protective equipment. Require that appropriate protective equipment be used at all times.
 - b. In addition to protective breathing equipment required by OSHA requirements or by this specification, use painting pre-filters on respirators to protect the dust filters when organic solvent based encapsulants are used.
11. Substrate
 - a. Apply lock down encapsulant to all substrate after all asbestos-containing materials have been removed. Apply in strict accordance with the manufacturer's printed instructions for use of the encapsulation as an asbestos coating. Any deviations from such printed instructions shall be approved by The University's Representative in writing prior to commencing work.
 - b. Apply encapsulant with an airless spray gun with air pressure and nozzle orifice as recommended by the encapsulant manufacturer.

T. Removal Of Floor Tile

1. This section applies to the removal of floor tile.
 - a. Prior to start of work, wet wipe all surfaces including floor tile to remove any visible dust.

- b. Isolate the room by sealing hallway or doors and installing critical barriers on all ducting, windows and other penetrations of the room, in the specified area. Install a splash guard a minimum of 4 feet high on the walls of the room with one layer of 6-mil fire retardant poly.
- c. Install a two-stage decontamination configuration contiguous (under certain conditions may be remote) with the work in accordance with Paragraph "Decontamination Units."
- d. Using water or amended water in a Hudson-type sprayer or garden sprayer, lightly mist the area where the material is to be removed. This may take several passes with the hose of the sprayer. Allow time for the water to soak into the material.
- e. Immediately place individual tiles in proper asbestos disposal bags. Vacuum collapse the bag, twist the neck of the bag, tape with duct tape, fold the twisted portion over onto itself and tape again. Wipe the outside of the bag with clean damp cloths and place the bag into a second prelabeled disposal bag. Tape shut the second bag.

U. Removal Of Fireproofing

1. The work of this section applies to the removal of all asbestos containing fireproofing including all over-spray that may be located on concrete block, columns, metal deck, beams, fixtures conduit and ducting.
 - a. Isolate the floor per Paragraph "Temporary Enclosure."
 - b. Construct a decontamination unit as described in Paragraph "Decontamination Units" and attach to the work area.
 - c. Set up pressure differential isolation and ventilation of the work area in accordance to Paragraph "Temporary Pressure Differential and Air Circulation System."
 - d. Upon approval of the enclosure by The University's Representative, contractor may proceed to remove the material using the following method.
 - e. Pre-clean columns, beams, electrical, mechanical and plumbing systems in the work area using wet wipe and HEPA vacuuming methods. Mask off with flame retardant polyethylene sheeting to protect from contamination during bulk abatement.
 - f. Thoroughly wet to satisfaction of Owner's Representative, asbestos-containing fireproofing to be removed prior to stripping and/or tooling to reduce fiber dispersal into the air. Accomplish wetting by a fine spray (mist) of amended water or removal encapsulant. Saturate material sufficiently to wet the substrate without causing excess dripping. Allow time for removal encapsulant to penetrate material thoroughly. If amended water is used, spray material repeatedly during the work process to maintain a continuously wet condition. If a removal encapsulant is used, apply in strict accordance with manufacturer's written instructions.
 - g. Mist work area continuously with amended water whenever necessary to reduce airborne fiber levels using commercially available "foggers."
 - h. Remove saturated asbestos-containing material in small sections from all areas. Do not allow material to dry out. As it is removed, simultaneously pack material while still wet into disposal bags. Twist neck of bags, bend over and seal with minimum three wraps of duct tape. Clean outside and move to wash down station adjacent to material decontamination unit.
 - i. Evacuate air from disposal bags with a HEPA filtered vacuum cleaner before sealing.
 - j. Provide Pressure Differential Machine in addition to those required in Paragraph "Pressure Differential System," in the vicinity of the work. Arrange so that exhaust is into the work area, oriented in a direction away from the work. Extend a 12" diameter flexible non-collapsing duct from the intake end to a point no more than 4'-0" from any scraping or brushing activity.
 - k. Locate intake of duct so that air flow is horizontally and slightly down-ward into intake. Replace primary filter on pressure differential machine at an interval of no greater than 30 minutes. Allow no more than one scraping or brushing activity per pressure differential machine.

V. Removal Of Wall Plaster: HEPA vacuum work site.

1. Place two layers of 6-mil flame retardant polyethylene sheeting on the floor adjacent to the wall to be demolished. Pull the wall down in manageable sections onto the polyethylene sheeting. Control

- dust and fiber release by misting the air and lightly wetting the material with amended water from a Hudson-type sprayer or garden sprayer as it is demolished.
2. Wrap the first layer of polyethylene sheeting around the material and seal with duct tape. Wrap the second layer of polyethylene sheeting around the bundle and seal with duct tape.
 3. Label and dispose of the entire bundle.
 4. Provide Pressure Differential Machine in addition to those required in Paragraph "Pressure Differential System," in the vicinity of the work. Arrange so that exhaust is unto the work area, oriented in a direction away from the work. Extend a 12-inch diameter flexible non-collapsing duct from the intake end to a point no more than 4'-0" from any scraping or brushing activity.
 5. Locate intake of duct so that air flow is horizontally and slightly down-ward into intake. Replace primary filter on negative air machine at an interval of no greater that 30 minutes.
- W. Clean-Up Of Asbestos-Containing Debris On Ceiling Tile Or Solid Ceiling
1. This section applies to the decontamination of the entire plaster ceiling, removal of existing fiberglass on duct work and removal of all batt insulation covering the existing plaster ceiling.
 - a. Isolate the floor per Paragraph "Temporary Facilities."
 - b. Construct a decontamination unit as described in Paragraph "Decontamination Units" and attach to the work area. General Contractor will give direction regarding exact location of decontamination unit(s).
 - c. Set up pressure differential isolation and ventilation of the work area in accordance to Paragraph "Temporary Pressure Differential and Air Circulation System."
 - d. Upon approval of the enclosure by The University's Representative, contractor may proceed to remove the material using the following method:
 2. These procedures shall be followed to for clean up of asbestos-containing debris on existing plaster ceiling:
 - a. This work will be performed prior to the removal of fireproofing. The isolation of the work area is considered essential to the pre-cleaning activities for the total area. Isolate the area in accordance with Paragraph "Temporary Facilities."
 - b. Remove asbestos-containing debris and fiberglass batt and duct insulation and decontaminate the area using the following procedures:
 - 1) Remove all small debris with the HEPA vacuum.
 - 2) Gently mist all fiberglass insulation, remove from ducts and ceiling and place into pre-labeled hazardous disposal bags and dispose of in accordance with Paragraph "Disposal of Asbestos Containing Waste Material."
 - 3) Exposure of ducting will expose all fireproofing overspray, this material may be removed during the removal of fireproofing from decks and beams.
 - 4) Pick up all large visible debris on the ceiling or any horizontal surfaces and place in the bottom of a 6-mil polyethylene disposal bag conforming to the requirements of Paragraph "Disposal of Asbestos-Containing Waste." Place pieces in the bag without dropping and avoiding unnecessary disturbance and release of material.
 - 5) HEPA vacuum the entire plaster ceiling surface.
 - c. Upon completion of the decontamination of the area request a visual inspection of the ceiling and other horizontal surfaces. This area will be considered a portion of work area for the duration of the work and will be included in the final encapsulation of the area.
- X. Removal Of Adhesive: This section applies to the removal of all asbestos-containing floor tile and adhesive, sheet vinyl flooring, vinyl floor tile, and baseboard adhesive, etc.
1. Ensure that workers are equipped with proper respiratory protection. In addition to the HEPA cartridges, respirators must also be equipped with organic solvent cartridges.
 2. Provide HEPA filtered fan units in the vicinity of the work. Arrange so that units exhaust outside the building. Replace primary filters on HEPA filtered fan units at an interval of no greater than 30 minutes.
 3. Apply adhesive removal solvent as recommended by manufacturer after removal of floor tile has been completed.
 4. Provide tile adhesive (mastic) remover that meets the following criteria:
 - a. Flash Point: 122E or greater.
 - b. Special Precautions: No heavy smoke generated if ignited.

- c. Health Effects: Limited to mild skin rash or eye irritation.
- d. Respiratory Protection: MSHA - NIOSH approved Organic vapor cartridges in conjunction with standard HEPA filters.
- e. Petroleum Distillates: None.
- f. Odor: Pine, Citrus or none.

Use of diesel fuel in the removal of tile and baseboard adhesive is strictly prohibited.

- 5. Remove adhesive in small sections from all areas. Do not allow material to dry out. As adhesive is removed, simultaneously pack rags contaminated with adhesive material into disposal bags. Twist neck of bags, bend over and seal with minimum three wraps of duct tape. Clean outside of bag and move to material decontamination unit.
- 6. Upon completion of adhesive removal, thoroughly clean bare substrate of all solvent residue.
- 7. Place adhesive residue in proper asbestos disposal bags. Vacuum collapse the bag, twist the neck of the bag, tape with duct tape, fold the twisted portion over onto itself and tape again. Wipe the outside of the bag with clean damp cloths and place bag into second prelabeled disposal bag. Tape shut the second bag.

CERTIFICATE OF WORKER'S ACKNOWLEDGEMENT

PROJECT NAME: _____

PROJECT ADDRESS: _____

CONTRACTOR: _____

WORKING WITH ASBESTOS CAN BE DANGEROUS. INHALING ASBESTOS FIBERS HAS BEEN LINKED WITH VARIOUS TYPES OF CANCER IF YOU SMOKE AND INHALE ASBESTOS FIBERS, THE CHANCE THAT YOU WILL DEVELOP LUNG CANCER IS GREATER THAN THAT OF THE NON-SMOKING PUBLIC.

Your employer's contract with The University for the above project requires that: You be supplied with the proper respirator and be trained in its use. You be trained in safe work practices and in the use of the equipment found on the job. You receive a medical examination. These things are to have been done at no cost to you. By signing this certification you are assuring The University that your employer has met these obligations to you.

RESPIRATORY PROTECTION: I have been trained in the proper use of respirators, and informed of the type respirator to be used on the above referenced project. I have a copy of the written respiratory protection manual issued by my employers. I have been equipped at no cost with the respirator to be used on the above project.

TRAINING COURSE: I have been trained in the dangers inherent in handling asbestos and breathing asbestos dust and in proper work procedures and personal and area protective measures. The topics covered in the course included the following:

- Physical characteristics of asbestos
- Health hazards associated with asbestos
- Respiratory protection
- Use of protective equipment
- Pressure differential systems
- Work practices including hands-on or on-the-job training
- Personal decontamination procedures
- Air monitoring, personal and area

MEDICAL EXAMINATION: I have had a medical examination within the last 12 months which was paid for by my employer. This examination included: health history, pulmonary function tests and may have included an evaluation of a chest x-ray.

Signature _____ Witness _____

Printed Name _____ Social Security Number _____

CERTIFICATION OF VISUAL INSPECTION**AREA** _____

In accordance with Paragraph "Project Decontamination" the Contractor hereby certifies that he has visually inspected the work area (all surfaces including pipes, beams, ledges, walls, ceiling and floor, Decontamination Unit, sheet plastic, etc.) and has found no dust, debris or residue.

By: _____

Signature _____ Date _____

Print Name _____

Print Title _____

OWNER'S REPRESENTATIVE CERTIFICATION

The University's Representative hereby certifies that he has accompanied the Contractor on his visual inspection and verifies that this inspection has been thorough and to the best of his knowledge and belief, the Contractor's certification above is a true and honest one.

Signature _____ Date _____

Print Name _____

Print Title _____

RESPIRATORY PROTECTION PROGRAM

Project Name _____

Location _____

Date _____

Based upon airborne asbestos-fiber counts encountered on previous projects of similar type working on materials similar to those found on the above referenced project. The following level of respiratory protection is proposed for the indicated operations to maintain an Airborne Fiber Count (as measured by the NIOSH 7400 Method) below the specified Permissible Exposure Limit (PEL) inside the respirator face piece.

Operation	Anticipated f/cc	Respiratory Protection	Protection Factor	f/cc in Mask
Installing sheet plastic				
Removing trim in contact with asbestos-containing material				
Removal of architectural finish or fireproofing				
Removal of pipe insulation				
Removal of fitting insulation				
Encapsulation of pipe and boiler insulation				
Gross debris removal				
Cleaning "primary" sheet plastic				
Cleaning "critical" barrier				
Removing Decontamination Unit				
Other				

The Contractor certifies that to the best of his knowledge and belief the above represent a true and accurate representation of Airborne Fiber Counts to be expected for the operations indicated, and are based upon airborne fiber data from past projects with similar materials and operations.

END OF SECTION 02 82 00 00

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 82 00 00a - REMOVAL OF NONFRIABLE ASBESTOS-CONTAINING MATERIALS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for removal of nonfriable asbestos-containing materials. Products shall be as follows or the ODR or UTHSCSA consultant. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Definitions

1. ACM: Asbestos Containing material which is any material containing more than one percent asbestos.
2. Amended Water: Water containing a wetting agent or surfactant with a maximum surface tension of 2.9 Pa 29 dynes per centimeter when tested in accordance with ASTM D 1331.
3. Area Sampling: Sampling of asbestos fiber concentrations which approximates the concentrations of asbestos in the theoretical breathing zone but is not actually collected in the breathing zone of an employee.
4. Asbestos: The term asbestos collectively refers to a naturally occurring mineral known by the following specific names: chrysotile, amosite, crocidolite, tremolite, anthophyllite, and actinolite.
5. Asbestos control Area: That area where asbestos removal operations are performed. The area shall be isolated by physical boundaries to assist in the prevention of the uncontrolled access by non-qualified persons.
6. Asbestos Fibers: Those fibers having an aspect ratio of at least 3:1 and longer than-5 micrometers as determined by National Institute for Occupational Safety and Health (NIOSH) Method 7400.
7. Asbestos Permissible Exposure Limit: 0.1 fibers per cubic centimeter of air as an e-hour time weighted average measured in the breathing zone as by defined 29 CFR 1926.1101 or other Federal legislation having legal jurisdiction for the protection of workers health.
8. Background: The ambient airborne asbestos concentration in an uncontaminated area as measured prior to any asbestos hazard abatement efforts. Background concentrations for contaminated areas are measured in similar but asbestos free locations.
9. Contractor: The Contractor is that individual, or entity under contract to The University to perform the herein listed work.
10. Contractor/Supervisor (Asbestos abatement): A person who has successfully completed training and is therefore accredited as a Contractor/Supervisor under a State Model Accreditation Plan or EPA Model Accreditation Plan as described in 40 CFR 763.
11. Critical Barrier: The layer of polyethylene sheeting that covers an opening or penetration in a room or area that is to become a negative pressure enclosure.
12. Encapsulation: The abatement of an asbestos hazard through the appropriate use of chemical encapsulants.
13. Encapsulants: Specific materials in various forms used to chemically or physically entrap asbestos fibers in various configurations to prevent these fibers from becoming airborne. There are four types of encapsulants as follows which must comply with performance requirements as specified herein.
 - a. Removal Encapsulant (can be used as a wetting agent)
 - b. Bridging Encapsulant (used to provide a tough, durable surface coating to asbestos containing material)
 - c. Penetrating Encapsulant (used to penetrate the asbestos containing material encapsulating all asbestos fibers and preventing fiber release due to routine mechanical damage)
 - d. Lock-Down Encapsulant (used to seal off or "lock-down" minute asbestos fibers left on surfaces from which asbestos containing material has been removed).
14. Friable Asbestos Material: Any material containing more than one percent asbestos that can be crumbled, pulverized, or reduced to powder by hand pressure when dry.

15. **Glovebag Technique:** Those asbestos removal and control techniques put forth in 29 CFR 1926.1101.
16. **HEPA Filter Equipment:** High efficiency particulate air (HEPA) filtered vacuum and/or exhaust ventilation equipment with a filter system capable of collecting and retaining asbestos fibers. Filters shall retain 99.97 percent of particles 0.3 microns or larger as indicated in UL 586.
17. **The ODR or UTHSCSA consultant:** That qualified person employed directly by The University to monitor, sample, inspect the work, and advise The University.
18. **Negative Pressure Enclosure (NPE):** That engineering control technique described as a negative pressure enclosure in 29 CFR 1926.1101.
19. **Non-friable Asbestos Material:** Material that contains asbestos in which the fibers have been immobilized by a bonding agent, coating, binder, or other material so that the asbestos is well bound and will not normally release asbestos fibers during any appropriate use, handling, storage or transportation. It is understood that asbestos fibers may be released under other conditions such as demolition, renovation, removal, or mishap.
20. **Personal Sampling:** Air sampling which is performed to determine asbestos fiber concentrations within the breathing zone of a specific employee, as performed in accordance with 29 CFR 1926.1101.
21. **Competent Person (CP):** A person who has successfully completed training and is therefore accredited under a legitimate State Model Accreditation Plan or EPA Model Accreditation Plan as described in 40 CFR 763 as a Contractor/Supervisor and shall be appropriately licensed according to the Statutes of the State in which the work is to be performed.
22. **TEM:** Refers to Transmission Electron Microscopy.
23. **Time Weighted Average (TWA):** The TWA is an 8-hour time weighted average airborne concentration of asbestos fibers.
24. **Wetting Agent:** A chemical added to water to reduce the water's surface tension thereby increasing the water's ability to soak into the material to which it is applied. An equivalent wetting agent must have a surface tension of at most 2.9 Pa 29 dynes per centimeter when tested in accordance with ASTM D 1331.

C. Requirements

1. **Description of Work:** The work covered by this section includes the handling and control of asbestos containing materials and describes some of the resultant procedures and equipment required to protect workers, the environment and occupants of the building or area, or both, from contact with airborne asbestos fibers. The work also includes the disposal of any asbestos containing materials generated by the work. More specific operational procedures shall be outlined in the Asbestos Hazard Abatement Plan called for elsewhere in this specification. The asbestos work includes the use of non-friable removal technique(s) which is governed by 40 CFR 763 as indicated. Provide non-friable removal technique(s) as outlined in this specification for the locations indicated.
2. **Medical Requirements:** Provide medical requirements including but not limited to medical surveillance and medical record keeping as listed in 29 CFR 1926.1101.
 - a. **Medical Examinations:** Before exposure to airborne asbestos fibers, provide workers with a comprehensive medical examination as required by 29 CFR 1926.1101 or other pertinent State or local directives. This requirement must have been satisfied within the 12 months prior to the start of work on this contract. The same medical examination shall be given on an annual basis to employees engaged in an occupation involving asbestos and within 30 calendar days before or after the termination of employment in such occupation. Specifically identify x-ray films of asbestos workers to the consulting radiologist and mark medical record jackets with the word "ASBESTOS."
 - b. **Medical Records:** Maintain complete and accurate records of employees' medical examinations, medical records, and exposure data for a period of 30 years after termination of employment and make records of the required medical examinations and exposure data available for inspection and copying to: The Assistant Secretary of Labor for Occupational Safety and Health (OSHA), or authorized representatives of them, and an employee's physician upon the request of the employee or former employee.

- c. Medical Certification: Submit written certification for each worker and contractor/supervisor, signed by a licensed physician indicating that the worker and contractor/supervisor has met or exceeded all of the medical prerequisites listed herein and in 29 CFR 1926.1101 and 29 CFR 1910.134 as prescribed by law.
3. Training: Train all personnel involved in the asbestos control work in accordance with United States Environmental Protection Agency (USEPA) Asbestos Hazard Emergency Response Act (AHERA) training criteria or State training criteria whichever is more stringent. The Contractor shall document the training by providing a copy of a current training certification to the ODR or UTHSCSA consultant for each person assigned to work on this project. Furnish each employee with respirator training and fit testing documentation as required by 29 CFR 1910.134. Provide instruction on the engineering and other hazard control techniques and procedures to be used on this project.
 - a. Employee Training: Submit copies of training certificates for each employee indicating that the employee has received training at the appropriate level in accordance with 40 CFR 763.
4. Permits, Licenses, and Notifications: Notify the local air pollution control district/agency and the ODR or UTHSCSA consultant in writing 10 working days prior to commencement of work in accordance with 40 CFR 61-SUBPART M or applicable state and local regulations. Obtain necessary permits or licenses in conjunction with asbestos removal, encapsulation, hauling, and disposal. Post the permit and/or license at the work site, visible from a non-controlled area. Notify the local fire department 3 days prior to removing fire-proofing material from the building including notice that the material contains asbestos.
5. Environment, Safety and Health Compliance: Comply with the applicable requirements of the current issue of 29 CFR 1926.1101, 40 CFR 61-SUBPART A, and 40 CFR 61-SUBPART M or applicable State or local regulations regarding handling, storing, transporting, and disposing of asbestos waste materials. Submit matters of interpretation of standards to the appropriate administrative agency for resolution before starting the work. Where the requirements of this specification, applicable regulations, or referenced documents vary, the most stringent requirement shall apply.
 - a. Site Inspection: While performing asbestos engineering control work, the Contractor shall be subject to on-site inspection by the Federal, State, or local regulatory agencies and the Contracting Officer or his designated representative. If the work is found to be in violation of Federal, State, or local regulations or this specification, the Contracting Officer or his representative will issue a stop work order to be in effect immediately and until the violation is resolved. All related costs including standby time required to resolve the violation shall be at the Contractor's expense.
6. Respiratory Protection Program: Establish and implement a respirator program as required by ANSI 288.2 and 29 CFR 1910.134. Submit a written program manual or operating procedure including methods of compliance with regulatory statutes.
 - a. Respirator Program Records: Submit records of the respirator program as required by ANSI 288.2 and 29 CFR 1910.134.
7. Contractor/Supervisor (Asbestos Abatement): The Contractor shall be represented on-site by a trained contractor/Supervisor. This person shall be on-site at all times when asbestos work is in progress. The Qualified Person, as defined herein, can be the Contractor/Supervisor.
8. Hazard Communication: Adhere to all parts of 29 CFR 1910.1200 and 29 CFR 1926.59. Provide the Contracting Officer with a copy of the Material Safety Data Sheets (MSDS) for all materials brought to the site. Review the Asbestos Survey Report(s) provided by the ODR or UTHSCSA consultant, if any.
9. Asbestos Hazard Abatement Plan: Submit a detailed plan of the safety precautions such as lockout, tag-out, tryout, fall protection, and confined space entry procedures and equipment and work procedures to be used in the removal of materials containing asbestos. The plan shall be prepared by the Contractor (and reviewed and signed by an asbestos consultant (LAC) licensed according to the Statutes of the State in which the work is to be performed) for review and recommendation for approval by the ODR or UTHSCSA consultant. The plan shall be forwarded to the ODR or UTHSCSA consultant for final approval at least 10 days prior to beginning abatement activities. The plan shall include but not be limited to the detailed description of personal protective equipment and work practices to be used including, but not limited to, respiratory protection, type of whole-body protection, the location of asbestos control areas

including clean and dirty areas, buffer zones, showers, storage areas, change rooms, removal method, interface of trades involved in the construction, sequencing of asbestos related work, disposal plan, type of wetting agent and asbestos encapsulant to be used, locations of local exhaust equipment, planned air sampling strategies, and a detailed description of the method to be employed in order to control environmental pollution. The plan shall also include both fire and medical emergency response plans. The Asbestos Hazard Abatement Plan must be approved in writing prior to starting any asbestos work.

10. Testing Laboratory: Submit the name, address, and telephone number of each testing laboratory selected for the sampling, analysis, and reporting of airborne concentrations of asbestos fibers along with evidence that each laboratory selected holds the appropriate State license and/or permits and certification that each laboratory is American Industrial Hygiene Association (AIHA) accredited and that persons counting the samples have been judged proficient by current inclusion on the AIHA Asbestos Analysis Registry (AAR) and successful participation of the laboratory in the Proficiency Analytical Testing (PAT) Program. Where analysis to determine asbestos content in bulk materials or transmission electron microscopy is required, submit evidence that the laboratory is accredited by the National Institute of Science and Technology (NIST) under National Voluntary Laboratory Accreditation Program (NVLAP) for asbestos analysis.
11. Landfill Approval: Submit written evidence that the landfill for disposal is approved for asbestos disposal by the USEPA and State and local regulatory agency(s).
12. Waste Shipment Records/Asbestos Waste Manifest: Submit waste shipment records and/or asbestos manifest records, prepared in accordance with applicable Federal, State, or local regulations, signed and dated by an agent of the landfill, certifying the amount of asbestos materials delivered to the landfill, within 3 days after delivery.
13. Negative Exposure Assessment: Submit objective data demonstrating that the method(s) used for the specified non-friable ACM removal does not release airborne concentrations of asbestos fibers exceeding the TWA PEL or excursion limit. This data may be from previous work within the last 12 months or from initial exposure assessments on this project. Data from previous work must have been gathered by the firm employed on this contract, using workers trained to the same level, with the ACM and workplace conditions "closely resembling" the conditions for this contract.
14. Contractor Daily Reports: Prepare a written report for each day that asbestos work is being accomplished. The report should be submitted to the ODR or UTHSCSA consultant monthly. The report as a minimum shall include the following, where applicable:
 - a. Daily Visual Inspection Reports: Prepare a written report documenting compliance with the Asbestos Hazard Abatement Plan and Federal, State, or local regulations.
 - b. Air Sampling Reports: Complete fiber counting within 24 hours of the "time off" of the sample pump. Notify the ODR or UTHSCSA consultant immediately of any airborne levels of asbestos fibers in excess of the acceptable limits. Sampling results shall be submitted to the ODR or UTHSCSA consultant the day following receipt. The affected employees will be provided copies of the results where required by law within 3 working days. These results shall be signed by the air sampler and the testing laboratory employee that analyzed the sample.
 - c. Pressure Differential Recordings for Local Exhaust System-Not Used
 - d. Asbestos Disposal Quantity Report: The Contractor shall record and report daily the amount of asbestos containing material removed and the amount transported for disposal. Deliver the report for the previous day and cumulative totals with amounts of material removed reported in linear meters or square meters linear feet or square feet as described initially in this specification and the amounts of material transported for disposal reported in cubic meters yards.

D. Submittals

1. Submit the following in accordance with Section "Submittal Procedures."
 - a. Vacuums and tools
 - b. Respirators
 - c. Wetting Agent

- d. Material Safety Data Sheets (MSDS) for all materials proposed for transport to the project site
- e. Local exhaust system
- f. Pressure differential automatic recording instrument
- g. Daily Reports
- h. Asbestos hazard abatement plan
- i. Testing laboratory
- j. Training Certificates
- k. Landfill approval
- l. Employee training
- m. Medical certification requirements
- n. Waste shipment records/Asbestos waste manifest
- o. Respiratory Protection Program
- p. Negative Exposure Assessment
- q. Local Exhaust system
- r. Show compliance with ANSI Z9.2 by providing manufacturers' certifications.
- s. Permits, licenses, and Notifications
- t. Rental equipment
- u. Respirator program records
- v. Protective clothing decontamination quality control records
- w. Protective clothing decontamination facility notification.

E. Quality Assurance

- 1. Glovebags-Not Used
- 2. Rental Equipment: Provide a copy of the written notification to the rental company concerning the intended use of the equipment and the possibility of asbestos contamination of the equipment.
- 3. Protective Clothing Decontamination Quality Control Records: Provide all records that document quality control for the decontamination of reusable outer protective clothing.
- 4. Protective Clothing Decontamination Facility Notification: Submit written evidence that persons who decontaminate, store, or transport asbestos contaminated clothing used in the performance of this contract were duly notified in accordance with 29 CFR 1926.1101.

1.2 PRODUCTS

A. Encapsulants

- 1. See Division 21 Section "Facility Fire-suppression Water-service Piping".

1.3 EXECUTION

A. Equipment

- 1. Respirators: Select respirators from those approved by the National Institute for Occupational Safety and Health (NIOSH). Provide personnel engaged in pre-cleaning, cleanup, handling, and removal of asbestos containing materials with the appropriate respiratory protection as specified in 29 CFR 1910.134.
- 2. Exterior Whole Body Protection
 - a. Outer Protective Clothing: Provide personnel exposed to asbestos with disposable "non-breathable," or reusable "non-breathable" whole body outer protective clothing, head coverings, gloves, and foot coverings. Provide disposable plastic or rubber gloves to protect hands. Cloth gloves may be worn inside the plastic or rubber gloves for comfort, but shall not be used alone. Make sleeves secure at the wrists, make foot coverings secure at the ankles, and make clothing secure at the neck by the use of tape. Reusable whole body outer protective clothing shall be either disposed of as asbestos contaminated waste upon exiting from the asbestos regulated work area or be properly decontaminated.
 - b. Work Clothing-Not Used

- c. Decontamination of Reusable Outer Protective Clothing: When reusable outer protective clothing is used, transport the double bagged clothing to a previously notified commercial/industrial decontamination facility for decontamination. Perform non-destructive testing to determine the effectiveness of asbestos decontamination. If representative sampling is used, ensure the statistical validity of the sampling results. If representative sampling is used, reject any entire batch in which any of the pieces exceed 40 fibers per square millimeter. Inspect reusable protective clothing prior to use to ensure that it will provide adequate protection and is not or is not about to become ripped, torn, deteriorated, or damaged, and that it is not visibly contaminated. Notify, in writing, all personnel involved in the decontamination of reusable outer protective clothing as indicated in 29 CFR 1926.1101.
- d. Eye Protection: Provide goggles to personnel engaged in asbestos abatement operations when the use of a full face respirator is not required.
- 3. Warning Signs and Labels: Provide bilingual warning signs printed in English and Spanish at all approaches to asbestos control areas. Locate signs at such a distance that personnel may read the sign and take the necessary protective steps required before entering the area. Provide labels and affix to all asbestos materials, scrap, waste, debris, and other products contaminated with asbestos.
 - a. Warning Sign: Provide vertical format conforming to 29 CFR 1926.1101 minimum 20 by 14 inches (500 by 355 mm) displaying the following legend in the lower panel:

<u>Legend</u>	<u>Notation</u>
Danger	25 mm one inch Sans Serif Gothic or Block
Asbestos	25 mm one inch Sans Serif Gothic or Block
Cancer and Lung Disease Hazard	6 mm 1/4 inch Sans Serif Gothic or Block
Authorized Personnel only Respirators and Protective Clothing are Required in this Area	6 mm 1/4 inch Gothic 6 mm 1/4 inch Gothic

Spacing between lines shall be at least equal to the height of the upper of any two lines.

- b. Warning Labels: Provide labels conforming to 29 CFR 1926.1101 of sufficient size to be clearly legible, displaying the following legend:

DANGER
CONTAINS ASBESTOS FIBERS
AVOID CREATING DUST
CANCER AND LUNG DISEASE HAZARD
BREATHING ASBESTOS DUST MAY
CAUSE SERIOUS BODILY HARM

- 4. Vacuums and Tools: Vacuums shall be leak proof to the filter and equipped with HEPA filters. Filters on vacuums shall conform to ANSI Z9.2 and UL 586. Do not use power tools to remove asbestos containing materials unless the tool is equipped with effective, integral HEPA filtered exhaust ventilation systems. Remove all residual asbestos from reusable tools prior to storage or reuse.

B. General

- 1. Pre-Asbestos Work Conference: The Contractor and the Contractor/Supervisor shall meet with the Contracting officer prior to beginning work, to discuss in detail the Asbestos Hazard Abatement Plan, including work procedures and safety precautions. Once approved by The Universitys Engineer, the plan will be enforced as if a part of this specification. Any changes required in the specification as a result of the plan shall be identified specifically in the plan to allow for free discussion and approval by The Universitys Engineer prior to starting work.

2. Asbestos Control Area Requirements: The Contractor shall demarcate the asbestos control area(s) using physical barriers and signs to prevent access by unauthorized personnel. This area is defined by 29 CFR 1926.1101 as the regulated area.
 3. Work Procedure: Perform asbestos related work in accordance with 29 CFR 1926.1101, 40 CFR 61-SUBPART M, applicable State or local regulation, and as specified herein. Use wet removal procedures. Personnel shall wear and utilize protective clothing and equipment as specified herein. Eating, smoking, drinking, chewing gum or tobacco, or applying cosmetics shall not be permitted in the asbestos control area(s). Personnel of other trades not engaged in the removal of asbestos containing material shall not be exposed at any time to airborne concentrations of asbestos. If an asbestos fiber release or spill, stop work immediately, correct the condition to the satisfaction of The University's Engineer, including clean-up and clearance sampling, if appropriate, prior to resumption of work.
 4. Furnishings: Furniture will be removed from the area of work by The University before asbestos work begins.
 5. Pre-cleaning: Wet wipe and HEPA vacuum all surfaces potentially contaminated with asbestos prior to establishment of an enclosure.
- C. Removal Procedures: Wet asbestos containing material with a fine spray of amended water during removal, cutting, or other handling so as to reduce the emission of airborne fibers. Remove material and immediately place in 0.15 mm 6 mil plastic disposal bags. Remove asbestos containing material in a gradual manner, with continuous application of the amended water in such a manner that no asbestos material is disturbed prior to being adequately wetted. Where unusual circumstances prohibit the use of 0.15 mm 6 mil plastic bags, submit an alternate proposal for containment of asbestos fibers to The University's Engineer for approval. Asbestos containing material shall be containerized while wet. At no time shall asbestos containing material be allowed to accumulate or become dry. Handle asbestos containing material as indicated in 40 CFR 61-SUBPART M, applicable State or local regulation, and 29 CFR 1926.1101.
1. Exposed Pipe Insulation Edges-Not Used
 2. Negative Pressure Enclosure: Block and seal openings in areas where the release of airborne asbestos fibers can be expected. Establish an asbestos negative pressure enclosure with the use of curtains, portable partitions, or other enclosures in order to prevent the escape of asbestos fibers from the contaminated asbestos work area.
 - a. Personnel/Equipment Decontamination Unit: Provide a temporary facility with a separate equipment/dirty change room and clean change room. Provide a shower that complies with 29 CFR 1926.51 in between the dirty room and clean room for personnel required to wear whole body protective clothing. Provide two separate lockers for each asbestos worker, one in each locker room. Keep street clothing and street shoes in the clean locker. HEPA vacuum and remove asbestos contaminated disposable protective clothing while still wearing respirators at the boundary of the asbestos work area and seal in impermeable bags or containers for disposal. Do not wear work clothing between home and work. All employees shall shower before changing into street clothes. Collect used shower water and filter with approved water filtration equipment to remove asbestos contamination. Dispose of filters and residue as asbestos waste. Discharge clean water to the sanitary system. Dispose of asbestos contaminated work clothing as asbestos contaminated waste or properly decontaminate as specified in the Asbestos Hazard Abatement Plan.
 - b. Waste Load-Out Unit: Provide a separate temporary area expressly for short-term storage of bagged asbestos containing material that is ready for disposal. The unit shall be the only port used to transfer waste to a truck, dumpster, or other approved on-site storage facility. It shall not be used for personnel egress. A waste load-out unit shall be integral to each negative pressure enclosure.
 3. Non-friable Removal Procedures:
 - a. Under normal conditions EPA Category II, non-friable asbestos containing materials may not be considered hazardous; however, this material may release airborne asbestos fibers during demolition and removal; therefore it must be handled in a manner to prevent the release of asbestos fibers. At no time will this material be mechanically chipped, sawed, sanded, or ground.

- b. Prior to beginning removal, establish an Asbestos Control Area and install Critical Barriers as specified elsewhere in this section. Submit a Negative Exposure Assessment which is less than 12 months old to the ODR or UTHSCSA consultant for approval or conduct air sampling as specified elsewhere in this section to establish the exposure levels for the exact removal method being used. The Contractor will establish the correct level of Personal Protective Equipment required.
- c. Acceptable methods of removal include, but are not limited to, the use of dry ice, a heat gun or lamp, citrus-based solvents, and hand tools with amended water. Removal shall be accomplished to keep the ACM substantially intact. Breakage into small pieces is an unacceptable work practice. The method shall be detailed in the Asbestos Abatement Plan and shall not be changed during the removal without Contracting Officer approval.
- d. Upon completion of the removal and clean-up, but prior to removal of critical barriers, the Contractor Testing company shall conduct a visual inspection of all areas affected by the removal. Re-clean as required.

D. Field Quality Control Requirements

- 1. Visual Inspections: The ODR or UTHSCSA consultant will conduct periodic inspections of all areas where asbestos removal and activities are in progress to ensure compliance with the approved Asbestos Hazard Abatement Plan and Federal/State regulatory requirements. This inspection shall include confirmation of proper control/containment/enclosure, worker protection, housekeeping, exhaust equipment operation, decontamination procedures, proper wetting and disposal, and inspection of work progress and work practices. Each activity will be documented as acceptable or noted as unacceptable with justification for the non-compliance.
- 2. Air Sampling: Sampling of airborne concentrations of asbestos fibers shall be performed in accordance with 29 CFR 1926.1101 and as specified herein. Unless otherwise specified, use NIOSH Method 7400 for sampling and analysis. Air Sampling may be duplicated by the Government at the discretion of the Contracting Officer. If the air sampling results obtained by the Government differ from those results obtained by the Contractor, the Government will determine which results predominate.
 - a. Sampling Prior to Asbestos Work (Not Used)
 - b. Sampling During Asbestos Work
 - 1) The Contractor's testing company shall perform area sampling as indicated in 29 CFR 1926.1101 and governing environmental regulations. Perform area sampling at least once every week close to the work inside the enclosure, outside the personnel/equipment decontamination unit entrance to the enclosure.
 - 2) If sampling outside the enclosure shows airborne levels have exceeded background or 0.01 fibers per cubic centimeter, whichever is greater, stop all work, correct the condition(s) causing the fiber release, and notify the ODR or UTHSCSA consultant immediately. Determine by testing if adjacent areas are contaminated. If so the Contractor shall clean the contaminated areas, visually inspect, and sample the areas as specified herein.
 - 3) The Contractor shall conduct personal sampling of at least 25% of the workers engaged in asbestos handling (removal, disposal, transport and other associated work) throughout the duration of the project. If the quantity of airborne asbestos fibers monitored at the breathing zone of the workers at any time exceeds 0.1 fibers per cubic centimeter, notify the PQP immediately, evaluate work practices, and take corrective action to reduce airborne asbestos fibers.

E. Clean-Up And Disposal

- 1. Housekeeping
 - a. Essential parts of asbestos dust control are housekeeping and clean-up procedures. Maintain surfaces of the asbestos control area free of accumulations of asbestos fibers. Give meticulous attention to restricting the spread of dust and debris; keep waste from being distributed over the general area. Use HEPA filtered vacuum cleaners. DO NOT BLOW DOWN THE SPACE WITH COMPRESSED AIR. All asbestos waste shall be placed in an approved on-site storage facility or transported for disposal daily. When asbestos

- removal is complete, all asbestos waste is removed from the work-site, and final clean-up is completed, the PQP shall visually inspect the asbestos control area for cleanliness. After final clean-up and acceptable pre-clearance airborne concentrations are attained but before the local exhaust system is turned off and the negative pressure enclosure removed), remove all pre-filters on the building HVAC system and provide new pre-filters.
- b. Dispose of filters as asbestos contaminated materials. Reestablish HVAC,. mechanical, and electrical systems in proper working order.
2. Title to Materials: All waste materials, except as specified otherwise, shall become the property of the Contractor and shall be disposed of as specified in applicable Federal, State, and local regulations and herein.
 3. Disposal of Asbestos
 - a. Collect all removed asbestos containing material, contaminated materials, contaminated water, scrap, debris, bags, containers, expendable equipment, and asbestos contaminated clothing which may produce airborne asbestos fibers and place in sealed fiber-proof, waterproof, non-returnable containers (e.g. double plastic bags 0.15 mm 6 mils thick, cartons, drums or cans). Wastes within the containers must be adequately wet in accordance with 40 CFR 61-SUBPART M. Affix a warning and Department of Transportation (DOT) label to each container including the bags or use at least 0.15 mm 6 mils thick bags with the approved warnings and DOT labeling preprinted on the bag.
 - b. Each container or bag shall clearly indicate that the waste generator is The University and the development at which the waste is generated, and the Job Order number of the project.
 - c. Prevent contamination of the transport vehicle (especially if the transport vehicle is a rented truck likely to be used in the future for non-asbestos purposes). These precautions include lining the vehicle cargo area with plastic sheeting (similar to work area enclosure) and thorough cleaning of the cargo area after transport and unloading of asbestos debris is complete. Dispose of waste asbestos material at an Environmental Protection Agency (EPA) or State-approved asbestos landfill off The University's property. For temporary storage, store sealed impermeable bags in asbestos waste drums or skids. An area for interim storage of asbestos waste-containing drums or skids will be coordinated with the ODR or UTHSCSA consultant. Procedure for hauling and disposal shall comply with 40 CFR 61-SUBPART M, State, regional, and local standards. Sealed plastic bags may be dumped from drums into the burial site unless the bags have been broken or damaged. Damaged bags shall remain in the drum and the entire contaminated drum shall be buried. Uncontaminated drums may be recycled. Workers unloading the sealed drums shall wear appropriate respirators and personal protective equipment when handling asbestos materials at the disposal site.

END OF SECTION 02 82 00 00a

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 82 00 00b - ENCAPSULATION (LOCK-DOWN) OF ASBESTOS-CONTAINING MATERIALS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for encapsulation (lock-down) of asbestos-containing materials. Products shall be as follows or as approved by the ODR or UTHSCSA consultant. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Product Data: Manufacturers technical information including label analysis and application instructions for each material proposed for use.
2. Installation Instructions: Manufacturer's installation instructions with specific project requirements noted.
3. Performance Warrantee: Manufacturers performance guarantee.
4. Material Safety Data Sheet: Material Safety Data Sheet in accordance with the OSHA Hazard Communication Standard (29 CFR 1910.1200) for each surfactant and encapsulating material proposed for use on the work. Include a separate attachment for each sheet indicating the specific worker protective equipment proposed for use with the material indicated.

C. Delivery And Storage: Deliver materials to the job site in original, new and unopened packages and containers bearing manufacturer's name and label, and following information:

1. Name or title of material
2. Manufacturer's stock number and date of manufacture
3. Manufacturer's name
4. Thinning instructions
5. Application instructions
6. Deliver materials together with a copy of the OSHA Material
7. Safety Data Sheet for the material.

D. Job Conditions: Apply encapsulating materials only when environmental conditions in the work area are as required by the manufacturer's instructions.**E. Quality Assurance**

1. Testing: Test material to be encapsulated using methods set forth in ASTM E1494 "Standard Practice for Encapsulants for Spray-or-Trowel-Applied Friable Asbestos- Containing Building Materials."

F. Warranty

1. Performance Warranty: Contractor shall submit written Performance Warranty, executed by the contractor, agreeing to repair/replace spray-on work which has cracked, fallen from substrate, or otherwise deteriorated to a condition where it would not perform effectively for its intended purposes due substantially to defective materials or workmanship and not due to abuse by occupants, improper maintenance, unforeseeable ambient exposures or other causes beyond anticipated conditions and contractors control. Warranty period shall be for at least one year after date of substantial completion.

1.2 PRODUCTS**A. Materials**

Encapsulation (Lock-Down) Of Asbestos-Containing Materials

1. Encapsulant system shall be an acrylic, elastomeric type, spray, brush or roller-applied, tinted penetrating or tinted bridging type, specifically designed for application to asbestos-containing material. System shall be equal to Global Encasement System as manufactured by GLOBAL Encasement Inc., 132-32nd Street, Union City, NJ 07087 U.S.A., Tel. (800) 266-3982/(201) 902-9770.
 - a. All encasement topcoat materials shall be warranted to be heavy-bodied, from the same manufacturer, and shall be long lasting, highly-pure (low VOC) materials that remain flexible, chalk resistant and resist cracking, peeling, algae and fungus that can cause future indoor air quality concerns.
 - b. To allow for building movement without cracking or disturbing fibrous materials, coating systems shall have passed testing to ASTM standards for adhesion, permeability, aged flexibility and with aged elasticity for the encasement system of over 250%.
 - c. Coatings shall be Class A Fire Rated, water-based, non-toxic, safe and easy to use, contain no hazardous ingredients by OSHA definition, comply with all known building codes and be non-flammable.
 - d. Coating materials shall have low VOC (Volatile Organic Compound) content.
 - e. Coating materials shall not release health threatening toxic smoke and fumes in a fire and shall comply with all known building codes.
 - f. Coating materials shall have passed the following testing standards:
 - 1) ASTM E 119 fire tests demonstrating that applying a multi-layer system over fireproofing does not adversely affect the fireproof rating of the fireproofing (3 hour test).
 - 2) UPITT Combustion Toxicity Test proving nothing toxic is released in a fire.
 - 3) ASTM E 84 and E162 fire tests for "Class A" - Surface Flammability and Burning Characteristics (Flame Spread = 0, Smoke Developed = 5).
 - 4) "Pull-off Adhesion" test per ASTM E736 equals or exceeds 9,950 lbs./sq. ft. (89.1 lbs./sq. in.).
 - 5) ASTM D 1653 and E96 "Water Vapor Permeability" (showing the rate that water vapor can pass through the system).
 - 6) Impact Resistance, "Tensile Strength" shall exceed 150 psi; "Elongation" shall exceed 250%.
 - 7) System shall be mildew resistant, impact resistant, scrub resistant, non-yellowing, non-chalking, highly blister resistant, rust resistant, highly chemical resistant and shall remain flexible after 1000 hour ASTM Accelerated Weather testing.
 - 8) Water-Based materials (low VOC) Volatile Organic Content of Primer-Sealer-Neutralizer = 0.1 g/L (0.001 lb./gal.) and Encasement Top Coat = 0.1 g/L (0.001 lb./gal.) as tested by EPA Method 24.
 - 9) Materials comply with applicable standards for installation on interior and/or exterior surfaces of a building.
 - 10) Encasement Systems shall provide additional water-proofing protection.

B. Related Materials:

1. Elastomeric architectural sealants, caulking compounds, primers, and similar materials shall be approved by the manufacturer of the encasement coatings. All materials used shall be applied in accordance with its manufacturer's recommendations.

C. Applicable Standards

1. Product shall be rated as acceptable for use intended when field tested in accordance with ASTM E 1494.

1.3 EXECUTION

A. General

1. Prior to applying any encapsulating material in Work Areas, Contractor shall obtain final visual inspection approval by the Project Administrator.
 2. Prior to applying any encapsulating material, Contractor shall ensure that application of the sealer will not cause the base material to fail and allow the sealed material to fall of its own weight or separate from the substrate. Should Contractor doubt the ability of the installation to support the sealant, request direction from The University's Representative before proceeding with the encapsulating work.
 3. Do Not Commence Application of encapsulating materials until all removal work within the work area has been completed.
- B. Worker Protection
1. Before beginning work with any material for which a Material Safety Data Sheet has been submitted provide workers with the required protective equipment. Require that appropriate protective equipment be used at all times.
- C. Application
1. Comply with all manufacturer's instructions for particular conditions of installation. Consult with manufacturer's technical representative for conditions not covered.
 2. Encapsulate all surfaces in full compliance with manufacturer's procedures.
 3. At completion of Encapsulation and before removal of Work Area enclosures and Pressure Differential System, decontaminate space in accordance with requirements of manufacturer's instructions.
 4. Remove all debris from the project site and restore area to proper conditions by cleaning all surfaces in accordance with manufacturer's written recommendations.
 5. At completion of work submit manufacturer's record of inspection of completed work and Manufacturers Performance Guarantee executed by both manufacturer and Contractor.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 83 19 13 - LEAD PAINT RELATED ABATEMENT PROCEDURES**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for lead paint related abatement procedures. Products shall be as follows or as approved by the ODR or UTHSCSA consultant. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. General Provisions

1. The site of this work will be occupied while work is being done. Perform the abatement work with the least inconvenience to the residents.
2. Take all necessary precautions to protect the property of the ODR or UTHSCSA consultant and its residents. Damaged property shall be repaired and restored to its original condition. If the damage is beyond repair, the Contractor shall replace it with new materials to match existing, at the Contractor's expense.
3. Hazardous waste generated during the abatement process (including lead-base paint) when carted away from the developments shall not be transferred from one vehicle to another except at a licensed transfer station.
4. Develop a work plan to be performed as requested by the ODR or UTHSCSA consultant. The detailed plan shall include sequencing of abatement work in a manner that will be least disruptive to the normal use of the non-work areas in the building. The plan should also include emergency procedures in case of fire.
5. The Contractor shall include all supplementary miscellaneous items not specified but implied or required in order to complete the work.
6. Workmanship required in the execution of the work herein specified shall be of good quality and subject to the approval of the ODR or UTHSCSA consultant.
7. Make in a timely fashion all applicable and necessary notifications to relevant Federal, State and Local authorities. The Contractor shall indemnify the ODR or UTHSCSA consultant and the ODR or UTHSCSA Consultant's representative from, and pay all claims resulting from failure to adhere to these provisions.
8. The ODR or UTHSCSA consultant may retain an independent Monitoring Contractor to monitor the abatement contract and conduct all wipe sampling and clearance tests.
9. Contractor performing lead-based paint abatement or renovation activities involving lead-based paint shall be a Certified Lead Abatement Contractor and shall ensure that supervisors and workers are trained and certified by U.S. EPA approved state program or equivalent, to perform lead paint removal operations.
10. Establish and implement a Chemical Hazard Communication Program as required by OSHA regulations 29 CFR 1926.59.
11. Provide workers with a comprehensive medical examination as required by OSHA regulations 29 CFR 1926.62 before exposure to lead contaminated dust. The medical examination shall be conducted to approve use of appropriate respirators and shall include biological monitoring. NIOSH/MSHA approved respirators shall be utilized.
12. For employees required to wear a negative pressure respirators: conduct a respirator fit test at the time of initial fitting and at least once every six (6) months thereafter as required by OSHA regulations 29 CFR 1926.62.
13. Determine if any worker will be exposed to lead at or above the action level in accordance with OSHA regulation 29 CFR 1926.62 and 29 CFR 1910.1025. Conduct an exposure assessment to identify the level of exposure a worker would be subjected to without respiratory protection. Assess the exposure level by obtaining personal monitoring samples representative of a full shift of at least an 8-hour TWA.

14. Furnish appropriate respirators approved by NIOSH/MSHA for use in atmospheres containing lead aerosols. Instruct workers in all aspects of respiratory protection. Maintain an adequate supply of HEPA filter elements and spare parts on site for all types of respirators in use.
15. For manual demolition, scraping, sanding, use of heat gun or power tool paint removal with HEPA collection systems, workers shall minimally use the half-mask negative pressure respirator with high efficiency filters (for airborne concentrations not in excess of 500µg/m³).
16. Ensure that work area preparation, work practices, and clean-up procedures comply with these specifications and applicable Federal, State and Local regulations.
17. Notify all applicable agencies five days prior to the date the abatement will begin and provide evidence of notifications to the ODR or UTHSCSA consultant at the pre-start meeting.

C. Submissions

1. Within ten (10) consecutive calendar days calculated from the date of the ODR or UTHSCSA consultant's Job Order, the Contractor shall tender all required submissions. Six (6) sets of each submission are required. Where physical samples are required two (2) physical samples shall be submitted for each item. In general, items shall include but not be restricted to the following:
 - a. Paint remover - corner cutter/Vac-Pac System by Pentek Inc; Decontamination Products Division 1026 Fourth Avenue, Corapolis, PA. 15108. Telephone No. (412) 262-0725 or approved equal.
 - b. Description of removal method to be used on each substrate condition including manufacturer's operating instructions and recommendation for equipment usage.
 - c. Copies of current training certificates of Staff to be assigned to the contract.
 - d. List of three previous lead abatement jobs performed successfully by Contractor and name, address, and telephone number of contact person for verification.
2. In the event that all or any portion of the submitted material is rejected by the ODR or UTHSCSA consultant, the Contractor shall tender new submissions. All submissions returned for corrections shall be resubmitted with the required corrections within ten (10) consecutive calendar days calculated from the date of rejection, until final submissions are obtained that require no further correction. In no event shall the Contractor be permitted to tender submissions hereunder beyond twenty (20) days from the ODR or UTHSCSA consultant's Job Order, unless duly extended in writing by the ODR or UTHSCSA consultant.
3. No work shall begin, nor shall the materials be ordered or delivered to the site until final approval of all submissions.

D. Applicable Regulations

1. 24 CFR Part 35
2. HUD "Guidelines For the Evaluation and Control of Lead-Based Paint Hazards in Housing"
3. Abatement work shall also be in accordance with applicable regulations of the Environmental Protection Agency (EPA), Occupational Safety & Health Agency (OSHA) and any State or Local LBP standards. Where there is a conflict between Federal, State or Local regulations, the more stringent requirement shall prevail.
4. OSHA Standards
 - a. 29 CFR 1926.20 General safety and health provisions;
 - b. 29 CFR 1926.21 Safety training and education;
 - c. 29 CFR 1925.25 Housekeeping;
 - d. 29 CFR 1926-28 Personal protective equipment;
 - e. 29 CFR 1926.51(f) Washing facilities;
 - f. 29 CFR 1926.55 Gases, vapors, fumes, dusts, and mists;
 - g. 29 CFR 1926.57 Ventilation
 - h. 29 CFR 1926.59 Hazardous Communication Standards;
 - i. 29 CFR 1926.103 Respiratory protection, and
 - j. 29 CFR 1926.62 Lead in Construction
5. The Contractor must comply with all applicable requirements of the Resource Conservation & Recovery Act (RCRA) of 1976 as amended in 1980 and 1984 by the Hazardous & Solid Waste Amendments (HSWA).
6. These Specifications refer to many requirements found in the preceding references but in no way is it intended to cite or reiterate all provisions therein or elsewhere. It is the Contractor's

responsibility to obtain a copy, and know, understand and abide by all such regulations, guidelines and common practices.

1.2 PRODUCTS – (not used)

1.3 EXECUTION

A. Abatement

1. Have risk assessment or paint inspection performed by certified risk assessor or a certified inspector technician who is independent of the abatement contractor.
2. Develop a site specific lead hazard control plan, reviewed and signed by an asbestos consultant (LAC) who is licensed in the State in which the work is to be performed, and submit for review and approval to the ODR or UTHSCSA consultant.
3. Obtain any necessary building or waste permits, notify local authorities as required by applicable codes and laws.
4. Select specific building component replacement items, enclosure materials, paint removal equipment and/or chemicals, tools, and cleaning supplies. Consider waste management and historical preservation implications of selected treatment.
5. Develop project specific specifications.
6. Schedule other work so that leaded surfaces are not inadvertently disturbed and unprotected workers are not place at risk. Include time for clearance examinations and laboratory dust sample analysis in the scheduling process.
7. Select a certified abatement subcontractor.
8. Conduct a pre-construction conference to ensure that the subcontractor fully understands the work involved.
9. Notify residents of the dwelling and adjacent dwellings of the work and date it will begin. Coordinate this with the ODR or UTHSCSA consultant.
10. Correct any existing conditions that could impede the abatement work (i.e. trash removal, structural deficiencies).
11. Post warning signs and restrict entry to work area to authorized personnel. Implement worksite preparation procedures.
 - a. Place proper warning signs required by OSHA regulations at all entrances to the work area. Signage shall be minimum of 12" x 20" and shall state the following:

**WARNING
LEAD WORK AREA
POISON
NO SMOKING OR EATING**

12. Coordinate test, pilot or sample portion approach to the project with the ODR or UTHSCSA consultant.
13. Shut-down forced air heating, ventilation and air conditioning systems and cover all vents, diffusers, windows etc., with a single layer six-mil polyethylene sheet secured with duct tape. Exceptions shall be for minor disturbances of area less than 2 square feet and where if vents, diffusers, and windows are more than 5 feet away from surface being disturbed, they need not be covered.
14. Collect preabatement soil samples, which may not have to be analyzed until post abatement soil samples have been collected, analyzed, and compared to clearance standards. If postabatement soil levels are below applicable limits, the preabatement samples need not be analyzed.
15. Cover entrances to the work area with a single layer of 6 mil polyethylene sheets taped to the top and weighted at bottom.
16. Rig a containment non-flammable polyethylene sheet underneath the work area. This containment method should catch all stripped paint for proper disposal.
17. Execute abatement work.

18. Avoid spreading dust and debris outside the work area.
19. Store all waste in a secure area and make sure it is properly labeled with an accumulation start date.
20. Conduct daily and final cleanup.
21. Execute waste disposal procedures.
22. Maintain appropriate records.

B. Paint Removal

1. Do not use the following prohibited paint removal methods:
 - a. Dry scraping or sanding (except for limited areas)
 - b. Use of heat gun over 1,100°F
 - c. Open flame burning or torching
 - d. Machine sanding or grinding without HEPA vacuum exhaust tool
 - e. Abrasive blasting or sandblasting without HEPA vacuum exhaust tool
 - f. Uncontained hydro blasting or high-pressure wash
 - g. Use of chemical strippers containing Methylene chloride.
2. Select the appropriate worksite preparation level.
3. For heat gun work, provide fire extinguishers in the work area and ensure that adequate electrical power is available. Use for limited areas only. Train workers to avoid gouging or abrading the substrate.
4. For mechanical removal methods, use tools equipped with HEPA exhaust capability. Be sure workers keep the shroud against the surface being treated. Vacuum blasting and needle guns should not be used on wood, plaster, drywall, or other soft substrates. Observe all manufacturers directions for the amount of vacuum airflow required.
5. For wet scraping, use a spray bottle or wet sponge attached to the scraper to keep the surface wet while scraping. Apply enough water to moisten the surface completely, but not so much that large amounts of water run onto the ground or floor. Do not moisten areas near electrical circuits.
6. For chemical paint removers, determine if the building component can be removed and stripped offsite. Offsite stripping is generally preferred to onsite paint removal. Observe all manufacturers' directions for use of paint removers.
7. For offsite stripping, determine how to remove the component. Score the edges with a knife or razor blade to minimize the damage to adjacent surfaces. Punch or tag the building component, if similar building components are also being stripped offsite (i.e. doors). This will ensure that the individual component is reinstalled in the same location. Inform the offsite paint remover that the lead-based paint component is present for shipping. Wrap the component in plastic and send to the offsite stripping location. Clean all surfaces before reinstallation and remove any lead residue by HEPA vacuuming all surfaces, cleaning with other lead-specific cleaners, or phosphate detergents, and HEPA vacuuming again.
8. For onsite paint removal, first test the product on a small area to determine its effectiveness. Chemical paint removers may not be effective or desirable on exterior, deteriorated wood surfaces, aluminum, and glass. Provide neoprene, nitrile, rubber, or polyvinyl chloride (PVC) gloves (or other type of glove recommended by the manufacture); face shields; respirators with combination filter cartridges for lead dust and organic vapors (if appropriate); and chemically resistant clothing. Be sure to select the right type of organic vapor filter cartridge, gloves, and clothing for the specific chemical being used. Portable eyewash stations capable of providing a 15-minute flow must be on-site. Apply the chemical and wait the required period of time. Securely store chemical s overnight. For caustic chemical paint removers, neutralize the surface before repainting using glacial acetic acid (not vinegar). Repaint.
9. Make sure all debris is caught in the containment sheet for proper disposal.
10. Mark and legally dispose of waste in accordance with all applicable Federal, State and Local regulations. Most wastes from paint removal projects, such as paint chips and paint remover sludge, will need to be managed as hazardous waste.
11. Conduct clean-up
12. Have a certified risk assessor or inspector technician conduct a clearance examination and provide documentation and a Statement of Lead-Based Paint Compliance.

C. Building Component Replacement

1. Prepare work area by selecting proper worksite preparation level.
2. Prepare the hazardous material building component for removal. Turn off and disconnect any electrical circuits inside or near the building component to be removed.
3. Lightly mist the component to be removed (unless electrical circuits are located nearby).
4. Score all painted seams with a sharp knife.
5. Remove any screw, nails, or other fasteners.
6. Use flat pry instrument and hammer to pry component from the substrate.
7. Remove or bend back all nails.
8. Wrap and seal all bulk components in plastic and take them to a covered truck or secured waste storage area along a pathway covered in plastic. Shovel any debris. Dispose of properly.
9. HEPA vacuum any dust or chips in the area where the component was located.
10. Conduct cleaning and clearance activities.

D. Soil and Exterior Dust Abatement

1. Determine if soil lead hazard exists. For hazard to exist, a total of at least 9 square feet of soil in a single yard or area must be bare and soil concentrations must exceed 2,000µg/gram lead for the yard or building perimeter or 400µg/gram of lead for small, high-contact play areas (pending the development of an EPA soil standard). Bare soil above these levels shall be treated by either interim controls or abatement. Soil abatement is most appropriate when levels of lead are extraordinarily high (greater than 5,000µg/gram lead) and when use patterns indicate contact frequency and exposure will be high.
2. Collect Preabatement soil samples to determine baseline levels. These samples need not be analyzed if post abatement samples are below applicable clearance levels.
3. Determine the method of soil abatement (soil removal and replacement, soil cleaning, or paving). Soil cultivation (rototilling or turning over the soil) is not permitted.
4. If paving, use a high quality concrete or asphalt. Observe normal precautions associate with traffic load weight and thermal expansion and contraction. Obtain necessary permits. Keep soil cultivation to a minimum.
5. If removing and replacing soil.
 - a. Determine if waste soil will be placed in an offsite burial pit. Prepare vehicle operation and soil movement plan. Test new replacement soil (should not contain more than 200 µg/gram lead).
 - b. Contact local utilities to determine location of underground utilities including water, gas, cable TV, electric, telephone, and sewer. Mark all locations to be avoided
 - c. Remove fencing, if necessary to allow equipment access and define set limits with temporary fencing, signs, or yellow caution tape.
 - d. Tie and protect existing trees, shrubs, and bushes.
 - e. Have enough tools to avoid handling clean soil with contaminated tools.
 - f. Remove soil.
 - g. Clean all walkways, driveways, and street areas near abatement area.
 - h. Replace soil at proper grade to allow drainage. Replacement soil should be at least 2 inches above existing grade to allow for settling.
 - i. Install new soil covering (grass or sod) and maintain it through the growing season.
 - j. Determine if soil waste is hazardous and manage it accordingly
 - k. Conduct clean-up and clearance.
 - l. Provide walk-off doormats.
 - m. Maintain proper documentation.

E. Encapsulation

1. Determine if the applicable regulations allow encapsulation to be used. Do not encapsulate the following surfaces:
 - a. Friction surfaces, such as window jambs and door jambs.
 - b. Surfaces that fail patch tests.
 - c. Surfaces with substrates or existing coatings that have a high level of deterioration.
 - d. Surfaces in which there is a known incompatibility between two existing paint layers.
 - e. Surfaces that cannot support the additional weight stress of encapsulation due to existing paint thickness.

- f. Metal surfaces that are prone to rust or corrosion.
2. Conduct field tests of surfaces to be encapsulated for paint film integrity.
3. Consider special use and environmental requirements (i.e. abrasion resistance and ability to span base substrate cracks).
4. Provide to the ODR or UTHSCSA consultant, encapsulant test data provided by the manufacturer.
5. Conduct at least one test patch on each type of building component where the encapsulant will be used. Report the results to the ODR or UTHSCSA consultant.
6. For both nonreinforced and reinforced coatings, use a 6" x 6" test patch area. Prepare the surface in the manner selected to complete the job. Prepared surfaces for patch testing should be at least 2" larger in each direction than the patch area.
7. For fiber-reinforced wall coverings, use 3" x 3" patch. For rigid coatings that cannot be cut with a knife, use soundness test. For all encapsulants, carry out the appropriate adhesion tests.
8. For liquid coating encapsulants, allow coating to cure, then visually examine it for wrinkling, blistering, cracking, bubbling, or other chemical reaction with the underlying paint.
9. Record results of all patch tests and provide to ODR or UTHSCSA consultant.
10. Implement proper work site preparation level.
11. Repair all building components and substrates as needed (i.e. caulk cracks and repair sources of water leaks).
12. Prepare surfaces. Remove all dirt, grease, chalking paint, mildew and other surface contaminants, remnants of cleaning solutions, and loose paint. All surfaces should be deglossed, as needed.
13. Ventilate the contaminated area whenever solvents or chemicals are used.
14. During encapsulant application or installation, monitor temperature and humidity. For liquid coatings monitor coating thickness to ensure that the encapsulant manufacturer's installation/application specifications are followed.
15. Conduct clean up and clearance.
16. Provide the ODR or UTHSCSA consultant information on how to care for the encapsulation system properly.
17. Maintain records on the exact detailed locations of encapsulant applications, patch test specifications and results, product name, subcontractor, date of application, a copy of the product label and material Data Safety sheet (MSDS) for the product and provide to the ODR or UTHSCSA consultant.

F. Enclosure

1. Stamp, label or stencil all lead-based painted surfaces that will be enclosed with a warning approximately every 2 feet both horizontally and vertically on all components. The Warning shall read "**Danger Lead-Based Paint**". Deteriorated paint should not be removed from the surface to be enclosed.
2. Select the proper worksite preparation level.
3. Attach a durable drawing to the utility room closet showing where lead-based paint has been enclosed in the dwelling.
4. An independent inspector or technician or risk assessor should evaluate the integrity of the enclosure.
5. Repair any unsound substrates and structural members that will support the enclosure, if necessary.
6. Utilize appropriate enclosure material (drywall or fiberboard, wood paneling, laminated products, ridged tile and brick veneers, vinyl, aluminum m, or plywood).
7. Install extension rings for all electrical switches and outlets that will penetrate the enclosure.
8. If enclosing floors, remove all dirt with a HEPA vacuum to avoid small lumps in the new flooring.
9. Seal and back-caulk all seams and joints. Back-caulk means applying caulk to the underside of the enclosure.
10. When installing enclosure directly to painted surfaces, use adhesive and then anchor with mechanical fasteners (screws or nails).
11. Conduct clean up and clearance activities.
12. Maintain proper records and submit a Statement of Lead-Based Paint Compliance.

G. Final Cleaning Procedures

1. Use the following step-by-step procedures
 - a. Assign responsibilities to specific workers for cleaning and for maintaining the cleaning equipment.
 - b. Have sufficient cleaning equipment and supplies before beginning work.
 - c. If contamination is extensive, conduct precleaning of the dwelling unit.
 - d. Conduct ongoing cleaning during the job, including regular removal of large and small debris and dust. Decontamination of all tools, equipment and worker protection gear is required before it leaves contaminated areas. Electrical equipment should be wiped and high-efficiency particulate air (HEPA) vacuumed, not wetted down, to minimize electrocution hazards.
 - e. Schedule sufficient time (usually 30 minutes to an hour) for complete daily cleaning, starting at the same time near the end of every workday after lead hazard control activity has stopped.
 - f. For final cleaning, wait at least 1 hour after active lead hazard control activity has ceased to let dust particles settle.
 - g. Use a vacuum cleaner equipped with a HEPA exhaust filter. HEPA vacuum all surfaces in the room (ceilings, walls, trim, and floors). Start with the ceiling and work down, moving toward the entry door. Completely clean each room before moving on.
 - h. Wash all surfaces with lead-specific detergent, high-phosphate detergent, or other suitable cleaning agent to dislodge any ground-in contamination, then rinse. Change the cleaning solution after every room is cleaned.
 - i. Repeat step g above. To meet clearance standards consistently, a HEPA vacuum, wet wash, and HEPA vacuum cycle is recommended. For interim control projects involving dust removal only, the final HEPA vacuuming step is usually not needed. Other cleaning methods are acceptable, as long as clearance criteria are met and workers are not over exposed.
 - j. After final cleaning perform visual examination to ensure that all surfaces requiring lead hazard control have been addressed and all visible dust and debris have been removed. Record findings and correct any incomplete work.
 - k. If other construction work will disturb the lead-based paint surfaces, it should be completed at this point. If those surfaces are disturbed, repeat the final cleaning step after construction work has been completed.
 - l. Paint and otherwise seal treated surfaces and interior floors.
 - m. Conduct clearance examination.
 - n. If clearance is not achieved, repeat final cleaning.
 - o. Continue clearance testing and repeated cleanings until dwelling unit achieves compliance with all clearance standards. The cost of repeated cleaning, after failure to achieve clearance is to be borne by the contractor.
 - p. Do not allow residents to enter work area until final cleaning is completed and clearance is established.
 - q. Cleaning equipment list is as follows:
 - 1) HEPA Vacuums
 - 2) Detergent
 - 3) Waterproof gloves
 - 4) Rags
 - 5) Sponges
 - 6) Mops
 - 7) Buckets
 - 8) HEPA vacuum attachments (crevice tools, beater bar for cleaning rugs)
 - 9) 6-mil plastic bags
 - 10) Debris containers
 - 11) Waste water containers
 - 12) Shovels
 - 13) Rakes
 - 14) Water-misting sprayers
 - 15) 6-mil polyethylene sheeting (or equivalent)

2. Order of execution for final cleaning steps should be as follows:
 - a. As the first stage in final cleaning, floor plastic shall be misted and swept.
 - b. Upper level plastic, such as on cabinets and counters should be removed first, after it has been misted and cleaned. All plastic should be carefully folded from the corners/ends to the middle to trap any remaining dust. Next remove both layers of plastic from the floor.
 - c. Plastic sheets used to isolate contaminated rooms from noncontaminated rooms should remain in place until after cleaning and removal of other plastic sheeting, these sheets may then be misted, cleaned and removed last.
 - d. Removed plastic should be placed into double 4-mil or single 6-mil plastic bags, or plastic bags with equivalent (or better) performance characteristics, which are sealed and removed from the premises. As with daily cleanings, this plastic removal process usually requires workers to use protective clothing and respirators.
 - e. After plastic has been removed from the contaminated area, the entire area should be cleaned using the HEPA/wet wash/HEPA cycle.

H. Waste Testing And Disposal

1. General: All materials, whether hazardous or non-hazardous shall be properly disposed of. The ODR or UTHSCSA consultant, may hire an independent Monitoring Consultant to perform TCLP test to determine which of the wastes are hazardous. Contractor shall cooperate in this test. If less than 100kg (200 lbs) or 1/2 of a 55 gallon drum of hazardous waste per month will be generated, it is considered "conditionally exempt" abatement waste, and may be managed as solid non-hazardous waste. The RCRA hazardous waste manifest is not required when shipping this waste to an offsite disposal facility.
2. Separate Abatement Waste into The Following Four Categories:
 - a. Category I. Low lead waste (typically non-hazardous) e.g. Filtered personal and commercial wash water.
 - b. Category II. Architectural components - (painted finish carpentry items) e.g. Doors, windows, window trim and sills, baseboards, railings, moldings. (May do a TCLP to determine if they are hazardous).
 - c. Category III. Concentrated lead waste e.g. sludge from stripping, lead-base paint chip and dust, HEPA vacuum debris and filter, unfiltered wash waste, any waste included in EPA's list of hazardous waste.
 - d. Category IV. Material that cannot be determined to be either hazardous or non-hazardous must be tested by TCLP.

If the hazardous waste generated is greater than 100kg per month, dispose according to the referenced guidelines and RCRA hazardous waste management requirements including those listed below.

3. Disposal Requirements: Contact the regional EPA, state, local and all other pertinent authorities to determine lead-based paint debris disposal requirements. Comply with requirements of the Resource Conservation and Recovery Act (RCRA) and with applicable federal, state, county, or local waste requirements.
4. EPA ID Numbers: Obtain a Generator RCRA Hazardous Material ID number and coordinate this action through the State and secure any additional number as required.
5. Storage Requirements: Keep all hazardous items in a secure area or lockable container that is inaccessible to all persons other than the Contractor's personnel. Label all hazardous waste "Hazardous Waste" with the date that the Contractor began to collect the waste in that container. Keep hazardous and non-hazardous waste in separate containers. Until TCLP testing is completed, considered all items hazardous and store in a secured area or lockable container.
6. Waste Transportation: Transport hazardous waste using a RCRA/DOT/EPA certified Hazardous Waste Transporter. Submit names and qualifications of certified transporter/hauler for the ODR or UTHSCSA consultant approval. The Contractor shall be responsible for all actions of the waste hauler as pertaining to waste removal and disposal under these procedures and all EPA, DOT and other applicable regulations.
7. Disposal Facility: Supply documents that detail the site(s) to be used for ultimate disposal. Submit documents from these sites proving that they are licensed/permitted to accept such waste and shall accept the waste proposed by the Contractor for treatment or ultimate disposal.

8. Waste Containers: Comply with EPA and DOT regulations for waste containers. Contact the state and local authorities to determine their criteria for containers. In the case of any conflict in regulations, the more stringent shall apply.
 9. Emergencies: Contact local fire, police, hospitals or local emergency response teams and inform them of the type of hazardous waste activity and ask for assistance in the event of any accident. Additionally, the container shall provide the following:
 - a. Keep and properly maintain a suitable fire extinguisher(s) on site.
 - b. Have an immediate means of communication with the regulatory agency in the event of an emergency.
 - c. Keep a list of phone numbers of regulatory agencies on site.
 - d. Appoint an emergency coordinator and ensure that he is on site to supervise emergency procedures to be carried out in the event of an emergency.
 - e. Keep and maintain a "right to know" manual that is in an easily accessible location and in an area that is known to all employees.
 10. Transporting Waste: Provide certifications that the transporter is registered with the U.S. Department of Transportation is required by 49 CFR Part 107(a) transport hazardous waste.
 - a. Provide certifications that each vehicle dedicated to haul hazardous waste has been assigned a "U.S. DOT Hazardous Material Registration Number" as required by 49 CFR Part 107.
 - b. Be responsible for all other applicable permits pertaining to hauling, transport, reduction, and disposal of hazardous waste as they may apply to this project.
 - c. Vehicle: Ensure that all non-hazardous waste is transported in covered vehicles to a landfill, or lined landfill, if required.
 - d. Container Handling: Carefully place the containers into the truck or dumpster used for disposal. At no time shall debris or containers be thrown or dropped.
 - e. Liquid Wastes: Contain and properly dispose of all liquid wastes, including lead-contaminated wash water.
 - f. Containers: HEPA vacuum the exterior of all waste containers prior to removing the waste containers from the work area. Wet wipe the containers to ensure that there is no residual contamination. Then move containers out of the work area into the designated storage area.
- I. Clearance
1. Clearance on all abatement projects must be done by an independent certified risk assessor or inspector technician. Follow all jurisdictional law with regard to licensure requirements for personnel conducting clearance activities.
 2. Clearance step-by-step procedures are as follows:
 - a. Finish the lead hazard control clean-up effort. Seal floors before clearance (if necessary).
 - b. Wait 1 hour to allow any airborne dust to settle. Do not enter work area during that hour.
 - c. Conduct visual examination
 - 1) Determine if all required work has been completed and all lead-based paint hazards have been controlled.
 - 2) Determine if there is visible settled dust, paint chips, or debris in the interior or around the exterior.
 - d. Complete the Visual Clearance Form required by the ODR or UTHSCSA consultant; if all work is not completed inform the ODR or UTHSCSA consultant and order completion of the work and repeat cleanup, if necessary.
 - e. Conduct clearance dust sampling of the floors, interior window sills, and window troughs using approved protocol.
 - f. Conduct soil sampling if bare soil is present that was not sampled previously, or if exterior paint work was completed as part of the lead hazard control effort. Whenever exterior work has been done, it may be necessary to take samples from the soil that is not bare to determine if contamination has occurred. If results are above 1,000 µg/g (or 400 µg/g in high contact play area), compare the results to baseline soil sampling results to determine what additional measures are needed.
 - g. Complete the Dust and Soil Sampling Clearance Form required by the ODR or UTHSCSA consultant.

- h. Submit samples to a U.S. Environmental Protection Agency (EPA) recognized laboratory participating in the National Lead Laboratory Accreditation program (NLLAP) for analysis.
- i. Interpret results by comparing them to Interim Clearance Standards as listed below:

1) Floors	400 µg/ft ²
2) Window sills	250 µg/ft ²
3) Window Troughs	800 µg/ft ²
4) Soils (Play area with children under 6 years of age)	400 µg/gram
- j. If clearance is achieved go to step N.
- k. Order repeated cleanings or soil treatments if results are above applicable standards. Clean all surfaces the sample represents.
- l. Continue sampling and repeated cleanings until the dwelling achieves compliance with all applicable clearance standards.
- m. Complete any related construction work that does not disturb a surface with lead-based paint (all work that does disturb painted surfaces or that could generate lead dust should be completed as part of the lead hazard control effort).
- n. Issue any necessary statements of lead-based paint compliance or releases and maintain appropriate records.

J. Labels

1. Use the following labels on drums used for disposal.

HAZARDOUS WASTE	
FEDERAL LAW PROHIBITS IMPROPER DISPOSAL. IF FOUND, CONTACT THE NEAREST POLICE OR PUBLIC SAFETY AUTHORITY OR THE U.S. ENVIRONMENTAL PROTECTION AGENCY.	
GENERATOR INFORMATION:	
NAME _____	
ADDRESS _____ PHONE _____

K. Disposal of lead-based paint waste.

1. Follow the RCRA and HUD recommended practices as defined in the table below:

Waste Management Practices	Category I: Low Lead Waste	Category II: Architectural Components	Category III: Concentrated Lead Waste	Category IV: Other waste
RCRA Requirements	Manage as nonhazardous Waste	Depending upon knowledge or TCLP testing results, manage as solid hazardous or nonhazardous waste	If more than 100 kg/ month, manage as hazardous waste. If less than 100 kg/month manage as solid waste.	Use TCP to determine if waste is hazardous.
HUD Recommended Practices	Applicable	Applicable, if knowledge or TCLP testing indicates that it is nonhazardous.	Applicable if less than 100 kg/month otherwise subject to full RCRA regulations	Only applicable if TCLP testing shows waste is nonhazardous
Wrapped in plastic; seal all seams with tape (if acceptable to the disposal facility).	X	X	X	X
Stored in designated, secure area.	X	X	X	X
Covered During Transport	X	X	X	X
Prohibit cutting/breaking outside work area.	X	X	X	X
Cover ground with 6-mil plastic if handling outside.	X	X	X	X
Prohibit disposal in solid waste incinerators and reuse recycling for mulch	X	X	X	X
Recommended disposal in State licensed/permitted solid waste landfill.	X	X	If appropriate.	X

L. Safety Requirements

1. To protect the health and safety of all persons involved, it is of the utmost importance that deleading is safely and correctly done in a timely manner. The following specific safety requirements are the responsibility of the Deleading Contractor.

K. General Safety:

1. General

- a. NO ONE is to be allowed in the work area without an approved respirator except for methods that have been documented not requiring a respirator.
- b. Each work area must be sealed from the remainder of the dwelling by taping plastic sheets (6 mil thick). Work areas must remain sealed off until both work and clean-up are completed.
- c. Cover all floors, carpets, furniture and appliances with 6 mil plastic within the work area. Use automotive masking tape (2 inches wide) to seal all edges and seams.
- d. Make certain all electrical connections are properly grounded.
- e. At least three days prior to the start of any deleading work, post appropriate warning signs at all entrances and exits of work areas and leave in place until all clearance testing indicates that these areas are safe for re-occupancy. The signs must include the following phrase: "CAUTION LEAD HAZARD-KEEP OUT". Post bilingual signs when necessary.

2. Worker Safety: The Deleading Contractor shall take the following minimum precautions to protect the health of all individuals involved in the deleading process.

- a. Pre-Abatement Medical Exam: Each employee shall undergo a medical examination to determine both respiratory fitness capability and also pre-existing/current blood lead level. Said results shall be provided to the employee and also to the ODR or UTHSCSA consultant within 3 days of receipt of same, and in all cases, prior to employee's commencement to active abatement. Records of same are required to be kept by the Contractor for 40 years.
- b. Medical Surveillance is the monitoring of worker blood levels. It is required that the Contractor have blood level monitoring of all active abatement and clean-up workmen and on-site supervisors performed and said results provided to the ODR or UTHSCSA consultant.
 - 1) Before assignment to active abatement activity for each worker.
 - 2) 30 days after active abatement has begun.
 - 3) At least every two months during the first six months and every six months throughout the deleading job.
 - 4) At least every two months for each employee whose blood lead analysis indicated a blood lead level at or above 25 micrograms per deciliter. (20 micrograms per deciliter for women of child bearing age).
 - 5) At termination of employment.
 - 6) Contractor shall reassign any employee whose blood lead has reached 25 µg/dl (20 µg/dl for women of child bearing age) to a job function deemed safe from lead exposure. Said employee shall remain away from active abatement until such time as 2 consecutive months' blood tests indicate µg/dl below 20 µg/dl.
- c. Respiratory Protection Programs must be established by the Contractor in accordance with OSHA regulations and qualitative respirator fit testing must be conducted daily by the on-site supervisor. Medical examinations must be performed by a physician prior to fit testing and at anytime when a worker demonstrates any difficulty breathing during the use of or the fit testing of respirators. The following are minimal acceptable respiratory protection program requirements as set up and administered by the Contractor:
 - 1) Written standard operating procedures which oversees the selection and use of respirators.
 - 2) Selection of respirators on the basis of hazards to which the worker is exposed.
 - 3) Worker training on the limitations and use of respirators (includes fit testing).
 - 4) Individual workers assigned respirators for their exclusive use only.
 - 5) Daily cleaning and disinfecting of respirators.

- 6) Proper storage of all respirators.
- 7) Proper inspection of all respirators for wear and tear.
- 8) Continual surveillance of work area conditions and level of worker exposure or stress.
- 9) Use of approved respirators only, modified as needed by the weekly exposure monitoring results.
- 10) Supply weekly report covering items 1-9 to the ODR or UTHSCSA consultant or its Lead Consultant.
- d. Exposure Monitoring is the measured concentration of lead in the workers breathing zones. The Contractor shall perform personnel monitoring during active abatement using the NIOSH 7072 method and shall be responsible for:
 - 1) Monitoring the level of worker protection needed during the abatement process;
 - 2) Evaluating, modifying and improving any engineering and work practice control(s) as needed;
 - 3) Evaluating each employee's personal quality of work and any need for additional worker training or safety instruction;
 - 4) Providing the ODR or UTHSCSA consultant, results of all personnel monitoring tests within 10 days of testing; and
 - 5) Providing half-face APR respirators with HEPA filters unless said monitoring test results dictate differently. OSHA guidelines shall be used to determine respirator PEL protection factors.
- e. Protective Clothing Equipment must be provided to all workers to help assure that lead dust is contained to the work areas. The following must be supplied/enforced by the Deleading Contractor:
 - 1) Full body protective clothing and shoe covers of appropriate sizes on a daily basis or as needed.
 - 2) Clean changing areas separated from the dirty/contaminated clothes storage area.
 - 3) Water and wash facilities for washing of hands and face and shower facilities if deemed necessary by the ODR or UTHSCSA consultant's Lead Advisor.
 - 4) Instructing worker on proper maintenance of clothing and equipment.
 - 5) Proper disposal of disposable clothing and proper permanent work clothes.
 - 6) Enforcing the removal of protective clothing at the end of each work day and before eating, drinking and smoking.
 - 7) Enforcement of the removal of protective shoe covers before leaving work area.
3. Contractor/Worker Daily Safe-Work Procedures
 - a. Daily Start-Up:
 - 1) Workers to put on protective gear prior to entering work areas.
 - 2) All garment seams to be sealed with duct tape.
 - 3) All non-working garments must be stored in designated changing area.
 - 4) Respirators, as required, must be properly fitted before entering work area. Perform qualitative fit test.
 - b. Temporary depart:
 - 1) All protective clothing to be HEPA vacuumed while still being worn.
 - 2) All shoe covers to be removed and left in the work area (immediate departure upon removing).
 - 3) Remove all protective gear in designated "contaminated" changing area before eating, drinking, and smoking or before leaving work site.
 - 4) Wash hands and face.
 - 5) Clean respirators.
 - c. Daily Shut-Down:
 - 1) Dispose of protective clothing with abatement waste by sealing in a 6 mil poly bag.
 - 2) Laundered clothes must be placed in closed container.
 - 3) Wash hands and face.
 - 4) Shower if facilities allow and circumstances dictate.
 - 5) Clean all protective gear (respirators included).
4. Tenant's Safety: Temporary relocation of the tenants is necessary if the lead paint surface is broken. Temporary relocation of the tenants and their belongings is the responsibility of the ODR

or UTHSCSA consultant. However, the Contractor has the joint responsibility to administer and enforce the following safety practices on behalf of the occupants:

- a. Adults
 - 1) NO OCCUPANT is allowed to enter the work area during paint removal and initial clean-up. A three day clean-up and settlement period may be imposed depending upon the abatement procedures used, at the discretion of the ODR or UTHSCSA consultant or their Lead Consultant.
 - 2) The ODR or UTHSCSA consultant shall notify all occupants in writing when they are allowed to return to their post-abated residence. Contractor shall abide by these notices.
 - 3) Every resident who has received prior notice of abatement is responsible for placing all personal items (clothing, dishes, linens, etc.) in closed, easy to handle containers; and move such items to the center of each room as requested.
 - 4) As long as visible dust remains, occupants may not occupy dwelling, and all surfaces within the dwelling must be re-washed with trisodium phosphate and HEPA vacuumed by deleading contractor.
 - 5) Persons reoccupying dwellings following abatement are required to report any visible dust or debris to the ODR or UTHSCSA consultant immediately for additional Contractor clean-up.
- b. Pregnant Women and Children
 - 1) Absolutely no pregnant women or children under the age of twelve years of age may be allowed in the building while any part of the abatement process is going on.

END OF SECTION 02 83 19 13

SECTION 02 83 19 13a - XRF TESTING FOR LEAD-BASED PAINT**DESCRIPTION OF WORK**

This specification covers the furnishing and installation of materials for XRF testing for lead-based paint. Products shall be as follows or as approved by the ODR or UTHSCSA consultant. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

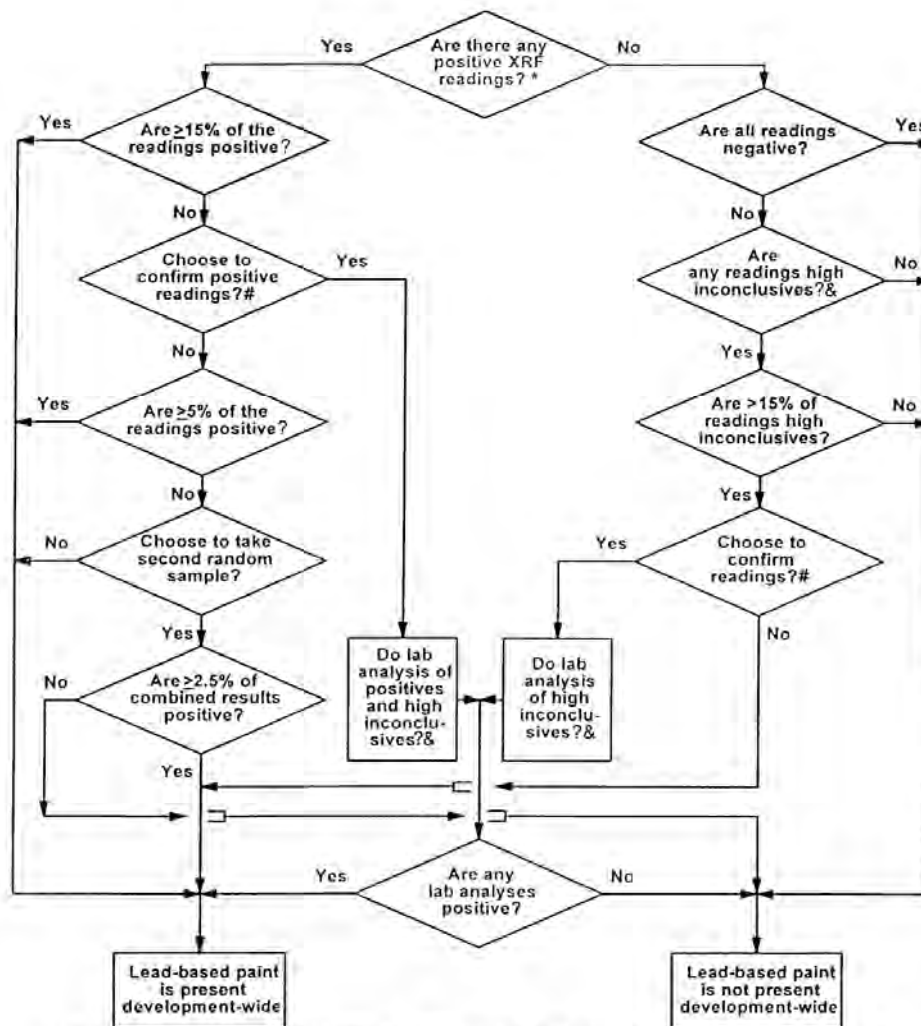

GENERAL

Inspection Rules: The Contractor will be required to comply with the following inspection rules. These inspection rules (the "Inspection Rules"), which appear in this section for the various XRF machines, are also known as "IP-4". The Inspection rules are subject to modification upon written notice by the ODR or UTHSCSA consultant.

1. Random Sampling Program - Multi-family housing testing rules.
 - a. In order to use the Multi-family housing testing rules, there must be:
 - 1) 21 or more units (pre-1960 construction) and all must have a similar construction and original painting history, or
 - 2) 10 or more units (construction from 1960-1977) and all must have a similar construction and original painting history.
 - b. Determine the number of randomly selected units to be tested from Table 7.3, Chapter 7, in the HUD guidelines. Chapter 7 of the HUD Guidelines also describes how to select the units randomly. If a unit or units which were selected as part of the original random sample cannot be entered for a particular reason, a replacement unit(s) must be randomly selected in accordance with the HUD Guidelines.
 - c. All testing must be done in strict accordance with the HUD guidelines except as such Guidelines are modified by the ODR or UTHSCSA consultant in writing in this Agreement. As per the HUD Guidelines, an assessment on each tested component must note four attributes, also called a testing combination.
 - 1) The room equivalent (where the testing took place i.e. bedroom, bathroom, etc.)
 - 2) The component type (door, wall #1 - upper left, etc.)
 - 3) The substrate (brick, wood, concrete, drywall, plaster or metal).
 - 4) The color of the paint.
 - d. These attributes must be included as part of the report.
 - e. For each testing combination, the condition of the painted surfaces should be noted as either intact, fair or poor.
 - f. One reading with the X-ray fluorescence (XRF) instrument on each testing combination is all that is required.
 - g. At least 40 components of a given type must be tested to obtain the desired level of confidence in the results throughout the multi-family development. If less than 40 components of a given type exist in the buildings to be tested i.e. they are unique components, then the measurement should be taken using single family testing rules (described below). If less than 40 components of a given type exist in the units to be tested, additional components of this type can be identified in other units in the complex and tested to bring the total up to 40 so that multi-family testing rules can be used. The decision of which option the Contractor should use will be made by the ODR or UTHSCSA consultant.
 - h. To increase the number of tested components of a given type, testing combinations with different colors on the same component and substrate may be combined into a single component type. For example, if "wood doors" is the component type, all wood doors tested for lead-based paint could belong to the same component type, regardless of color.

- i. A component type may be differentiated by color as long as there are 40 tested and there is a good reason for differentiation.
- j. The XRF measurements, corrected for substrate contribution, if required by the Performance Characteristic Sheet ("PCS") for the particular type of instrument being used, should be sorted by the inspector by component type into the following categories:
 - 1) Positive- A positive XRF reading in accordance with the XRF's Performance Characteristic Sheet.
 - 2) Negative- A negative XRF reading in accordance with the XRF's Performance Characteristic Sheet.
 - 3) High Inconclusive- An inconclusive XRF reading equal to or greater than the midpoint of the XRF's inconclusive range, in accordance with the XRF's Performance Characteristic Sheet.

- k. The following Decision analyses will be used to determine which components are positive or negative:

- l. If there are readings on a component type(s) equal to or greater than 1.0 mg/cm² and paint chip samples are submitted to the laboratory, there are two possible results:
- 1) If all lab samples on a component type are below 0.5% lead by weight, the component type can be classified as negative throughout the development.
 - 2) If one or more lab results are positive, (equal to or greater than 0.5% lead by weight for a component) the ODR or UTHSCSA consultant will take one of three options:
 - a) Treat the component type as positive throughout the development, or
 - b) Test the component type throughout the development, or
 - c) If 5% or less of the component type are positive, take a second random sample, just testing that component type.

- 3) If option 2)c) above is selected by the ODR or UTHSCSA consultant and the combined results of the first and second random sample are less than 2½% positive, the following additional options are available depending on the results.
 - a) If no positives are found in the second sample, no further testing is necessary. Those positives in the first random sample will be monitored/abated (not by this Agreement), but the rest of the component type can be classified as negative.
 - b) If positives are found on a component type in the second sample, the ODR or UTHSCSA consultant has the option to classify the component type as positive throughout the development or comprehensively test it.
 - c) If the combined results of the two random samples are equal to or greater than 2½%, the ODR or UTHSCSA consultant also has the option to comprehensively test the remaining components of that type or classify them as positive.
- m. Paint Chip Sample Size: The Paint chip samples should be taken from a 4 square inch (25 square centimeter) area that is representative of the paint on the testing combination, as close as possible to any XRF reading locations and, if possible, unobtrusive. This area may be a 2" x 2" (5 x 5 centimeters) square, or a 1" x 4" (2.5 x 10 centimeters) rectangle, or have any other dimensions that equal at least 4 square inches (25 square centimeters). Regardless of shape, the dimensions of the surface area must be accurately measured (to the nearest millimeter or 1/16th of an inch) so that the laboratory results can be reported in mg/cm². Results should be reported as percent by weight if the surface area cannot be measured accurately or if all paint within the sampled area cannot be removed. In these cases, lead should be reported in ppm or percent weight, not in mg/cm². Smaller surface area can be used if acceptable to the laboratory. (See ASTM E 1729). In all cases those who take the samples should consult with the NLAAP recognized laboratory selected regarding the requirements for the submission samples for lead-based paint analysis.
- n. If the ODR or UTHSCSA consultant decides to test in search of these hard-to-find components coated with lead based paint, the inspector must use the single family testing rules described in the next section.
2. Single Family Testing Rules
 - a. If the housing development has less
 - 1) than 10 units built between 1960-1970 or
 - 2) 20 units built before 1960 or
 - 3) the random testing rules in a multi-family development are not being used then single family testing rules must be followed.
 - b. All inconclusive results must be confirmed with laboratory analysis, or as an alternative must be classified as positive. The ODR or UTHSCSA consultant may also wish to confirm positive XRF results with laboratory analysis. Therefore the Contractor must make a field determination of which XRF readings falls in the inconclusive or positive ranges and take paint chip samples during the XRF testing for possible laboratory analysis. If the majority of XRF readings are positive in the first few units, the inspector must consult with the ODR or UTHSCSA consultant on whether to continue taking paint chip samples.
Only the ODR or UTHSCSA consultant may determine whether to submit collected paint chip samples for laboratory analysis or to classify the element as positive.
3. Similar common areas and similar exterior sites must always be tested, but in some cases they can be sampled in much the same way that dwelling units are. Common areas and building exteriors typically have a similar painting history from one building to the next. In multifamily housing, each common area (such as building lobby, laundry room, or hallway) can be treated as a dwelling unit. If there are multiple similar common areas, they may be grouped for sampling purposes exactly the same way as regular dwelling units. However, dwelling units, common areas and exterior sites cannot be all mixed together in a single group. All testing combinations within each common area or building exteriors selected for testing must be inspected. This includes playground equipment, benches and miscellaneous

- testing combinations located throughout the development. The specific common areas and building exteriors to test should be randomly selected, in much the same way as specific units are selected using random numbers. The number of common areas to be tested should be taken from table 7.3 (HUD Guidelines). In this instance, common areas and building exteriors can be treated in the same way as housing units (although they are not to be confused with true housing units).
4. Unit and common area drawings
 - a. Mark-ups of as built drawings depicting room equivalents that are tested must be provided as part of the report.
 - b. The Contractor should test in a clockwise path starting from the door through the space and room equivalents so that the approximate location of each component tested can be easily established by referencing the room equivalent and sides.
 - c. Each space must have a reference point (side A, B, C, D or wall 1, 2, 3 or 4). The wall with the door should always be referenced as wall 1 or side A. If there is more than one door, wall 1 or side A should be used to refer to the wall with the door through which the room is first entered when moving in a clockwise fashion through the unit.
 5. XRF Instruments and testing protocols
 - a. The Contractor has the option to use any of the following instruments for the XRF testing: Scitec MAP 4 Spectrum analyzer, Princeton Gamma-Tech XK-3, Warrington MicroLead 1, Revision4, TN Technologies (TN Spectrace) PB analyzer, Radiation Monitoring Devices LPA-1, Advanced Detector-Leadstar, or the Niton XL-309 Spectrum analyzer.
 - b. Chapter 7 of the HUD guidelines 1997 Revision, assumes that the standard for classifying paint as toxic for lead is 1.0 mg/cm². The PCS of these instruments have established inconclusive ranges/thresholds by substrate type based on the 1.0 mg/cm² standard. These ranges/thresholds are interim ranges/thresholds which are subject to review by HUD; however they must be used by the Contractor unless and until the Contractor is notified otherwise in writing by the ODR or UTHSCSA consultant. Therefore the following table should be used to determine which readings falls in the inconclusive ranges/thresholds. The ODR or UTHSCSA consultant reserves the right to modify these inconclusive ranges/thresholds by notice in writing to the Contractor.
 6. Evaluation of the Inspection by the ODR or UTHSCSA consultant
 - a. The Contractor will be required to carry out retesting at no additional cost to the ODR or UTHSCSA consultant, after completion of the Inspection at each the ODR or UTHSCSA consultant development as described in the HUD Guidelines on page 7-17, section H, and page 7-28, section H, for single family housing and multi-family housing respectively. As per the HUD Guidelines, the ODR or UTHSCSA consultant shall randomly select the testing combinations to be retested and the Contractor shall perform the retesting using the same XRF instrument(s) which was/were used to take the original readings. An ODR or UTHSCSA consultant inspector shall be present to observe all retesting. The retesting shall be limited to ten (10) testing combinations, and if necessary to repeat the retest, the testing combinations randomly selected for repeating the retest shall also be limited to ten.
 - b. If the retest tolerance limit computed from the information provided in the XRF Performance Characteristics Sheet is exceeded, the retest will be repeated as described in the HUD Guidelines page 7-18, section H both for single family and multi-family housing. If the retest tolerance limit is exceeded again, the ODR or UTHSCSA consultant may require the Contractor to retest the entire development at no additional cost to the ODR or UTHSCSA consultant, or the ODR or UTHSCSA consultant may withhold all payments and terminate its agreement with the Contractor.
 7. Option to do Laboratory Testing only
 - a. The ODR or UTHSCSA consultant may, for a specific testing assignment, request in writing that the Contractor, when utilizing the multi-family housing testing rules for random sampling, or the single family housing testing rules, do all testing through laboratory analysis of paint chips rather than through XRF Spectrum Analyzer testing with laboratory confirmation as needed. Please note that under the single family

housing testing rules, only one paint chip must be taken and analyzed for each component type.

Scope Of Work: The work shall consist of furnishing all labor, material, insurance and all other incidental items required to do the following:

8. XRF Testing

- a. Random or comprehensive testing of various components in apartments in various Projects using any of the X-ray Fluorescence ("XRF") machines listed in section IIID, to determine if the lead-based paint concentration is within permissible limits.
Note: Testing may be for entire apartments or selected rooms or components within the apartment.
- b. The permissible limit shall be defined as a final reading showing a lead concentration of less than 1.0 mg/cm².
- c. Refer to the Manufacturer's manual, as well as the "XRF Performance Characteristic Sheet" when determining calibration check tolerance, and other instrument specific information. Use the adjusted "XRF Performance Characteristic Sheets" in this contract when determining the inconclusive range.
- d. In addition to the manufacturer's recommended warm up and quality control procedures, a set of three nominal XRF calibration check readings must be taken before the inspection begins and after the inspection has been completed in a particular unit, or every 4 hours, whichever occurs first. All reference material values and calibration check readings must be included in the report provided to the ODR or UTHSCSA consultant.
- e. Do not use the XRF to test highly curved or ornate surfaces, or surfaces inaccessible to the XRF, due to poor reliability of results. For such surfaces, laboratory analysis of paint chips must be done.
- f. Only one XRF reading is required per testing combination. A unique testing combination is characterized by the room equivalent, the component, the substrate and the visible color of the paint. However, testing combinations with different colors on the same component and substrate may be combined into a single component type.
- g. All inconclusive results must be treated according to the inspection rules using multi-family inspection or single family inspection rules as appropriate.
- h. XRF field data sheets shall be filled out as they appear on completed Form 7.1 and 7.5 Guidelines.
- i. Room equivalents or sections thereof that are not accessible for testing (i.e. locked bedrooms) shall be noted in the final report to the ODR or UTHSCSA consultant.

9. Laboratory testing of paint chips.

- a. Collection of paint chips from various painted components in various Projects for laboratory analysis due to XRF substrate corrected inconclusive and/or positive readings as approved by the ODR or UTHSCSA consultant.
- b. Laboratory preparation and testing by Flame Atomic Absorption Spectrometry (FAAS) or Graphite Furnace Atomic Absorption Spectrometry (GFAAS) to determine if the lead paint concentration is within permissible limits.
- c. The permissible limit shall be defined as a lead concentration less than 0.5% by weight.
- d. Collect paint chips in accordance with ASTM ES28-94.
- e. Prepare paint chips in the laboratory for testing in accordance with ASTM ES37-94.
- f. Repair and repaint areas from which paint chips have been collected, to match adjacent areas, unless notified by the ODR or UTHSCSA consultant in writing to utilize a temporary covering for the tested surfaces. The Contractor shall provide water based latex paint for this purpose. Colors shall be limited to white and off-white; and other colors if provided by the tenant.
- g. Only one paint chip is required per testing combination. A unique testing combination is characterized by the room equivalent, the component, the substrate, and the visible color of the paint. However, testing combinations with different colors on the same component and substrate may be combined into a single component type.

- h. Field data sheets and signed chain of custodies must be attached to the final report to the ODR or UTHSCSA consultant.
- 10. The Contractor shall send notices to the Project Superintendent, Residents, and the Department of Planning and Development 48 hours before the scheduled start of work. The Contractor shall make three (3) attempts to gain entry to each apartment, with proper 48 hour notification to the resident each time.
- 11. The Contractor shall begin work no later than 48 hours after receiving a work proceed order.
- 12. The Contractor shall perform work in accordance with the latest HUD Guidelines, except as such guidelines are modified by the ODR or UTHSCSA consultant in writing in this contract or any contract pursuant to this contract, and in accordance with all applicable Federal, State and Local regulations.
- 13. Workmanship required in the execution of the work herein specified shall be of good quality and subject to the approval of the ODR or UTHSCSA consultant.

XRF Testing Report Format

- 14. All XRF report must be made after a formal submittal and approval by the ODR or UTHSCSA consultant.
- 15. A faxed summary report must be provided to the ODR or UTHSCSA consultant within 48 hours after completion of testing for a work Authorization. For XRF testing requiring confirmation by laboratory analysis of paint chip samples, the faxed summary report must be provided within 48 hours after the ODR or UTHSCSA consultant gives approval for testing of the collected paint chip samples.
- 16. A detailed report must be provided to the ODR or UTHSCSA consultant within 5 business days after completion of the testing.

General Provisions

- 17. Some of the work of this contract will be in occupied apartments. The Contractor shall perform all of the work of this contract with the least inconvenience to the tenants.
- 18. The Contractor shall take all necessary precautions to protect the property of the ODR or UTHSCSA consultant, its residents and the public. The contractor must repair any damaged property, whether of the ODR or UTHSCSA consultant, its residents, or the public, and restore such property to its original condition. If the damage is beyond repair, the Contractor shall replace it with new that in the judgment of the ODR or UTHSCSA consultant, match the existing materials and are of equal quality and workmanship. All such repairs shall be at the Contractor's expense.
- 19. The Contractor shall begin work no later than 48 hours after receiving a work proceed order.
- 20. The Contractor shall perform work in accordance with the latest HUD Guidelines, except as such guidelines are modified by the ODR or UTHSCSA consultant in writing in this Contract, or any Contract pursuant to this Contract, and in accordance with all applicable Federal, State and Local regulations.
- 21. The Contractor shall include in the bid price all supplementary miscellaneous items not specified but implied or required in order to complete the work.

Applicable Regulations

- 22. All work of this contract shall be in strict accordance with the HUD Guidelines.
- 23. All work of this contract shall also be in accordance with applicable regulations of the Environmental Protection Agency (EPA), Occupational Safety & Health Agency (OSHA) and any applicable State or Local standards that may be more stringent than the Federal Standards.
- 24. OSHA Standards (without limitation), include:
 - 29 CFR 1926.20 - General safety and health provisions;
 - 29 CFR 1926.21 - Safety training and education;
 - 29 CFR 1925.25 - Housekeeping;
 - 29 CFR 1926.28 - Personal protective equipment;
 - 29 CFR 1926.51(f) - Washing facilities;
 - 29 CFR 1926.55 - Gases, vapors, fumes, dusts, and mists;
 - 29 CFR 1926.57 - Ventilations;

- 29 CFR 1926.59 - Hazardous Communication Standards;
 - 29 CFR 1926.103 - Respiratory protection; and
 - 29 CFR 1926.62 - Lead in Construction
25. The Contractor must comply with all applicable requirements of the Resource Conservation & Recovery Act (RCRA) of 1976 as amended in 1980 and 1984 by the Hazardous & Solid Waste Amendments (HSWA).

Qualification Requirements

26. Copies of the submissions listed below must be tendered with the bid:
- a. Ability to perform XRF testing and paint chip sampling by submitting evidence of the successful completion of lead inspector training by all staff to be assigned to the job including inspector technicians. Training must be provided through a State approved EPA-Model program. All staff assigned to the Contract must also demonstrate training in the use of the XRF testing machines to be dedicated to this contract. The serial number of such XRF machine shall be provided the ODR or UTHSCSA consultant.
 - 1) Contractor or Subcontractor performing the work must have at least 3 years of satisfactory experience (documented) in performing XRF testing for a City, State or Federal Agency.
 - b. Laboratory certification by the State Department of Health (or other responsible agency) and by the USEPA through the EPA's National Lead Laboratory Accreditation Program ("NLLAP"), or as an alternative having accreditation application pending before NLLAP, and having acceptable performance on five consecutive rounds of the EPA, Environmental Laboratory Proficiency Analytical Testing (ELPAT) program, including the most recent round; evidence of such accreditation must be provided. Indicate if the laboratory is an independent entity from the Contractor.
 - c. If a subcontractor will be used for any of the laboratory work of this contract, evidence of certification stated above must also be provided for the subcontractor.

Waste Disposal

27. All waste generated must be legally disposed in accordance with Federal, State and Local regulations.

END OF SECTION 02 83 19 13a

SECTION 02 83 19 13b - LEAD DUST WIPE, AIR AND TCLP SAMPLING AND ANALYSIS**DESCRIPTION OF WORK**

This specification covers the furnishing and installation of materials for lead dust wipe, air and TCLP sampling and analysis. Products shall be as follows or as approved by the ODR or UTHSCSA consultant. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

GENERAL

Definitions: Unless otherwise specified the following definitions shall apply:

1. **"Approved"**: shall mean approved by all public agencies having jurisdiction, and the ODR or UTHSCSA consultant.
2. **"The University"**: shall mean The University and its designated authorized representatives.
3. **"Contractor"**: shall mean the firm that is awarded this contract and is responsible to ensure compliance with Federal, State and City regulations as well as these Contract documents.
4. **"Development or Project"**: a group of buildings in one or more designated geographical locations, owned or operated by the ODR or UTHSCSA consultant and referred to by a common name by the ODR or UTHSCSA consultant.
5. **"Dust Cleaning Firm"**: shall mean the contractor under a separate contract or the ODR or UTHSCSA consultant responsible for cleaning of lead dust, as approved by the ODR or UTHSCSA consultant, until the clearance levels are achieved, as defined in the "Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing, June 1995" or latest edition published by the United States Department of Housing and Urban Development (HUD).
6. **"Equal or Approved Equal"**: shall mean equal in the opinion of the ODR or UTHSCSA consultant.
7. **"HUD"**: the United States Department of Housing and Urban Development.
8. **"HUD Guidelines"**: shall mean Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing issued by HUD'S Office of Lead-Based Paint Abatement and Poisoning Prevention in June 1995 except as such guidelines are later modified by HUD and/or modified by the ODR or UTHSCSA consultant in writing pursuant to this contract.
9. **"Inspector"**: an individual who has completed training from an accredited program and been licensed or certified by the appropriate State or local agency to (1) perform inspections to determine and report the presence of lead-based paint on a surface-by-surface basis through on-site testing, (2) report the findings of such an inspection, (3) collect environmental samples for laboratory analysis, (4) perform clearance testing, and (5) document successful compliance with lead-based paint hazard control requirements or standards.
10. **"Lead-Based Paint"**: any paint, varnish, shellac, or other coating that contains lead equal to or greater than 1.0 mg/cm² as measured by XRF or laboratory analysis, or 0.5 percent by weight (5,000 µg/g, 5,000 PPM, or 5,000 mg/kg) as measured by laboratory analysis.
11. **"Lead-Based Paint Hazard"**: a condition in which exposure to lead from lead-contaminated dust, lead-contaminated soil or deteriorated lead-based paint would have an adverse effect on human health (as established by the EPA Administrator under Title IV of the Toxic Substance Control Act). Lead-based paint hazards include for example, deteriorated lead-based paint, leaded dust levels above applicable standards and bare leaded soil above applicable standards.
12. **"Lead-Based Paint Hazard Control"**: activities to control or eliminate lead-based paint hazards, including interim controls and complete abatement.
13. **"Lead-Contaminated Dust"**: surface dust in residences that contain an area or mass concentration of lead in excess of the standard established by the EPA Administrator, pursuant to Title IV of the Toxic Substance Control Act. Until the EPA standards are set, the HUD recommended clearance and risk assessment standards for leaded dust are 40 µg/ft² on floors, 250 µg/ft² on interior window sills, and 800 µg/ft² on window troughs.

14. **"Monitoring"**: shall refer to inspection to ensure compliance with all Federal, State and City Standards or guidelines, and contractual specifications.
15. **"Provide"**: shall mean furnish and install.
16. **"Risk Assessor"**: a certified individual who has completed training with an accredited training program and who has been certified to (1) perform risk assessments, (2) identify acceptable abatement and interim control strategies for reducing identified lead-based paint hazards, (3) perform clearance testing and reevaluations, and (4) document the successful completion of lead-based paint hazard control activities.

Applicable Regulations/References

17. The work conducted shall comply with all applicable Federal, State and City regulations. Applicable guidelines and standards listed in the scope of work include, but are not limited to:

---	---
18. The contractor shall ensure that any programs, certifications, licenses or other documentation in accordance with the above and/or any other applicable Federal, State, and Local Regulations/Guidelines are provided.

Scope Of Work

19. The work shall consist of furnishing labor, materials, insurance and all other incidental items required to perform the following:
 - a. Dust wipe sampling and analysis
 - 1) Collect dust wipe samples from various horizontal surfaces, such as floors, window sills, window troughs, etc., as approved by the ODR or UTHSCSA consultant.
 - 2) Dust wipe samples shall be collected in accordance with ASTM ES30-94.
 - 3) Analyze dust wipe sample in the laboratory using Flame Atomic Absorption Spectrometry ("FAAS") or Graphite Furnace Atomic Absorption Spectrometry("GFAAS").
 - 4) Provide result of analysis in micrograms per square foot.

- 5) A faxed summary of results must be provided to the ODR or UTHSCSA consultant within 24 hours after the ODR or UTHSCSA consultant authorizes the Contractor to perform the laboratory analysis of the collected dust wipe sample. Contractor shall also have the ability to provide results in 4 hours for clearance, following lead-based paint abatement work, if requested by the ODR or UTHSCSA consultant. The sampling result must be provided in a form approved by the ODR or UTHSCSA consultant and must include for each dust wipe sample, the Project, the building address, the sample number, the room or room equivalent, the surface type, dimensions of sample areas, total micrograms, micrograms per square feet, and an indication of pass or fail.
 - 6) Turn-around time for results shall be counted from the time the Contractor performs collection of dust wipe samples to the time the results are actually presented to the ODR or UTHSCSA consultant. This includes travel time from the site to the laboratory of the Contractor and back to the site.
 - 7) A detailed final report covering the results of all dust wipe samples taken and analyzed must be submitted within 5 days from the time the ODR or UTHSCSA consultant authorizes the performance of the laboratory analysis. The sampling report must include for each dust wipe sample, the Project, the building address, the sample number, the room or room equivalent, the surface type, dimensions of sample areas, total micrograms, micrograms per square feet, and indicate pass or fail in a form approved by the ODR or UTHSCSA consultant. Also include in the report the method of analysis, i.e. "FAAS" or "GFAAS", and the detection limits. The laboratory test results in the final report must be signed by the Laboratory Director.
 - 8) The sampling data report must contain all required data fields as specified by the ODR or UTHSCSA consultant. The sampling data report shall be provided to the ODR or UTHSCSA consultant on 3.5 inch high density diskettes in ASCII file form. The required data fields will be provided by the ODR or UTHSCSA consultant to the Contractor.
 - 9) The laboratory used for the analysis of the dust wipe samples must be certified by the State Department of Health (or other responsible agency) and by the USEPA through the EPA's National Lead Laboratory Accreditation Program ("NLLAP"), or as an alternative having accreditation application pending before NLLAP, and having acceptable performance on five consecutive rounds of the EPA, Environmental Laboratory Proficiency Analytical Testing (ELPAT) program, including the most recent round; evidence of such accreditation must be provided. Indicate if the laboratory is an independent entity from the Contractor.
- b. Dust Spiked Samples
- 1) Provide dust spiked samples to the ODR or UTHSCSA consultant. Dust spiked samples shall be prepared in accordance with the HUD Guidelines.
NOTE: These samples are separate from the ones required by the Contractor for his own QA/QC
 - 2) Prepare dust spiked samples in a manner such that they are indistinguishable from the field samples.
 - 3) Prepare dust spiked samples using the same lot as that to be used in the field.
 - 4) Dust spiked samples shall be inserted into the sample stream, randomly, by the ODR or UTHSCSA consultant Inspector.
 - 5) Blind analysis of dust spiked samples must fall within 80%-120% of the true value. If the laboratory fails to obtain readings within these limits, two more spiked samples shall be sent immediately to the lab for analysis.
 - 6) If the two additional spiked samples fail, the sample batch shall be considered invalid, and the ODR or UTHSCSA consultant may, at its sole discretion, terminate this contract as well as withhold payment for services already rendered.
- c. Air Sampling and Analysis
- 1) Collect area air samples at various locations and various projects for personal exposure assessment as approved by the ODR or UTHSCSA consultant.
 - 2) Air samples shall be collected in accordance with ASTM E1553-93.
 - 3) Prepare air samples for analysis in accordance with ASTM E33-94

- 4) Analyze air samples using FAAS or GFAAS.
 - 5) All equipment required for personal air sampling, including pumps shall be provided by the Contractor at no extra cost to the ODR or UTHSCSA consultant.
 - 6) Provide results of air samples in micrograms per cubic meter.
 - 7) A faxed summary of result must be provided to the ODR or UTHSCSA consultant within 24 hours after the ODR or UTHSCSA consultant authorizes the Contractor to perform the laboratory analysis of the collected air sample. The sampling result must include for each air sample taken the Project, the building address, the sample number, the room or room equivalent, and the reading.
 - 8) Turn-around time shall start after collection of the air samples, and includes travel time to and from the laboratory.
 - 9) A detailed final report covering the results of all air samples taken and analyzed must be submitted within 5 days from the time the ODR or UTHSCSA consultant authorizes the performance of the laboratory analysis. The sampling report must include for each air sample, the Project, the building address, the sample number, the room or room equivalent, and the reading. The laboratory report contained in the final report must be signed by the Laboratory Director.
 - 10) The sampling data report must contain all required data fields as specified by the ODR or UTHSCSA consultant. The sampling data report shall be provided to the ODR or UTHSCSA consultant on 3.5 inch high density diskettes in ASCII file form. The required data fields will be provided by the ODR or UTHSCSA consultant to the Contractor.
 - 11) The laboratory used for the analysis of the dust wipe samples must be certified by the State Department of Health (or other responsible agency) and by the USEPA through the EPA's National Lead Laboratory Accreditation Program ("NLLAP"), or as an alternative having accreditation application pending before NLLAP, and having acceptable performance on five consecutive rounds of the EPA, Environmental Laboratory Proficiency Analytical Testing (ELPAT) program, including the most recent round; evidence of such accreditation must be provided. Indicate if the laboratory is an independent entity from the Contractor.
 - 12) Air sampling technician shall be present during the entire shift of the air sampling.
- d. TCLP Sampling and Analysis
- 1) Take core samples of construction waste as approved by the ODR or UTHSCSA consultant and analyze by TCLP testing to determine if waste is hazardous.
 - 2) Waste shall be classified as hazardous if the concentration of lead is greater than 5 parts per million by TCLP testing.
 - 3) The laboratory used for the analysis of the TCLP samples must be certified by the State Department of Health (or other responsible agency) and by the USEPA through the EPA's National Lead Laboratory Accreditation Program ("NLLAP"), or as an alternative having accreditation application pending before NLLAP, and having acceptable performance on five consecutive rounds of the EPA, Environmental Laboratory Proficiency Analytical Testing (ELPAT) program, including the most recent round; evidence of such accreditation must be provided. Indicate if the laboratory is an independent entity from the Contractor.
 - 4) A faxed summary of result must be provided to the ODR or UTHSCSA consultant within 48 hours after the ODR or UTHSCSA consultant authorizes the Contractor to perform the TCLP analysis of the waste. Provide results in parts per million (ppm).
 - 5) Final results provided to the ODR or UTHSCSA consultant by the Contractor must include written sample preparation procedure and laboratory specific written procedures for performing TCLP, including quality control procedures used for performing the TCLP, and a table listing the sample numbers, description of the construction waste, and the result of the TCLP. The laboratory report contained in the final report must be signed by the Laboratory Director.
 - 6) Final report must also specify detection limits.
 - 7) Final report must be provided within 5 days from the time the authorization to perform the TCLP is given by the ODR or UTHSCSA consultant.

General Provisions

20. Some of the work of this contract may be in occupied apartments. The Contractor shall perform all of the work of this contract with the least inconvenience to the tenants.
21. The Contractor shall take all necessary precautions to protect the property of the ODR or UTHSCSA consultant, its residents, and the public. The Contractor must repair any damaged property, whether of the ODR or UTHSCSA consultant, its residents, or the public, and restore such property to its original condition. If the damage is beyond repair, the Contractor shall replace it with new, that in the judgment of the ODR or UTHSCSA consultant, match the existing materials and/or of equal quality and workmanship. All such repairs shall be at the Contractor's expense.
22. The Contractor shall develop a work plan to be performed as requested by the Department of Planning and Development. The detailed plan shall include coordination of the monitoring and sampling work with the Contractor in a manner that will be least disruptive to the normal use of the non-work areas in the building. The plan should also include emergency procedures in case of fire.
23. The Contractor shall perform work in accordance with the latest HUD Guidelines, except as such Guidelines are modified by the ODR or UTHSCSA consultant in writing in this Contract, or any Contract pursuant to this Contract, and in accordance with all applicable Federal, State and Local regulations.
24. The Contractor shall include in the bid price all supplementary miscellaneous items not specified but implied or required in order to complete the work.

Submissions

25. Six (6) copies of the submissions listed below must be submitted to the ODR or UTHSCSA consultant by the Contractor or Subcontractor performing the Work:
 - a. Ability to perform lead dust wipe sampling by submitting evidence of the successful completion of lead inspector and/or risk assessor training by all staff to be assigned to the job including inspector technicians. As stated previously, training must be provided through an approved program.
 - b. Laboratory certification by the State Department of Health (or other responsible agency) through its ELAP program and by the USEPA through the EPA's National Lead Laboratory Accreditation Program ("NLLAP"), or as an alternative having accreditation application pending before NLLAP and having acceptable performance on five consecutive rounds of the EPA, Environmental Laboratory Proficiency Analytical Testing (ELPAT) program, including the most recent round; evidence of such accreditation must be provided.
 - c. If a subcontractor will be used for any of the laboratory work of this contract, evidence of certification stated in (2) above must also be provided for the subcontractor.

Waste Disposal

26. All waste generated must be legally disposed in accordance with the Federal, State and Local Regulations.

END OF SECTION 02 83 19 13b

THIS PAGE INTENTIONALLY LEFT BLANK

Task	Specification	Specification Description
02 83 19 13	01 22 16 00	No Specification Required
02 83 19 13	02 83 33 13	Removal And Disposal Of Lead-Containing Paint

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 83 33 13 - REMOVAL AND DISPOSAL OF LEAD-CONTAINING PAINT**1.1 GENERAL****A. Description Of Work**

1. This specification covers the removal and disposal of lead-based or lead-containing paint. Products shall be as follows or as approved by the ODR or UTHSCSA consultant. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Definitions

1. Action Level: Employee exposure, without regard to use of respirators, to an airborne concentration of lead of 30 micrograms per cubic meter of air averaged over an 8 hour period in an occupational/industrial environment.
2. Area Sampling: Sampling of lead concentrations within the lead control area and inside the physical boundaries which is representative of the airborne lead concentrations but is not collected in the breathing zone of personnel.
3. Competent Person (CP): As used in this section, refers to a person employed by the Contractor who is trained in the recognition and control of lead hazards in accordance with current federal, State, and local regulations. An industrial hygienist or safety professional certified for comprehensive practice by the American Board of Industrial Hygiene or by the Board of Certified Safety Professionals is the best choice.
4. Contaminated Room: Room for removal of contaminated personal protective equipment (PPE).
5. Decontamination Shower Facility: That facility that encompasses a clean clothing storage room, and a contaminated clothing storage and disposal rooms, with a shower facility in between.
6. Eight-Hour Time Weighted Average (TWA): Airborne concentration of lead to which an employee is exposed, averaged over an 8 hour workday as indicated in 29 CFR 1926.62.
7. High Efficiency Particulate Air (HEPA) Filter Equipment: HEPA filtered vacuuming equipment with a UL 586 filter system capable of collecting and retaining lead-contaminated paint dust. A high efficiency particulate filter means 99.97 percent efficient against 0.3 micron or larger size particles.
8. Lead: Metallic lead, inorganic lead compounds, and organic lead soaps.
9. Lead-Based Paint (LBP): Paint or other surface coating that contains lead in excess of 1.0 milligrams per centimeter squared or 0.5 percent by weight.
10. Lead-Based Paint Hazard (LBP Hazard): Any condition that causes exposure to lead from lead-contaminated dust, lead-contaminated soil, lead-based paint that is deteriorated or present in accessible surfaces, friction surfaces, or impact surfaces that would result in adverse human health effects.
11. Lead-Containing Paint (LCP): Lead-based paint or other similar surface coating containing lead or lead compound in excess of 0.06 percent by weight of the total nonvolatile content of the paint.
12. Lead Control Area: An enclosed area or structure, constructed as a temporary containment equipped with HEPA filtered local exhaust, which prevents the spread of lead dust, paint chips, or debris existing as a condition of lead-based paint removal operations. The lead control area is also isolated by physical boundaries to prevent unauthorized entry of personnel.
13. Lead Permissible Exposure Limit (PEL): Fifty micrograms per cubic meter of air as an 8 hour time weighted average as determined by 29 CFR 1926.62. If an employee is exposed for more than eight hours in a work day, the PEL shall be determined by the following formula:
$$\text{PEL (micrograms/cubic meter of air)} = 400/\text{No. hrs. worked per day.}$$
14. Personal Sampling: Sampling of airborne lead concentrations within the breathing zone of an employee to determine the 8 hour time weighted average concentration in accordance with 29 CFR 1926.62. Samples shall be representative of the employees' work tasks. Breathing zone shall be considered an area within a hemisphere, forward of the shoulders, with a radius of 6 to 9 inches (150 to 225 mm) and centered at the nose or mouth of an employee.

15. Physical Boundary: Area physically roped or partitioned off around an enclosed lead control area to limit unauthorized entry of personnel. As used in this section, "inside boundary" shall mean the same as "outside lead control area but inside boundary."

C. Submittals: Submit the following:

1. Product Data:
 - a. Vacuum filters
 - b. Respirators
2. Test Reports
 - a. Sampling results
 - b. Assessment data report
3. Certificates
 - a. Qualifications of CP
 - b. Testing laboratory</SUB> qualifications
 - c. Third party consultant qualifications
 - d. Lead-Based Paint/Lead-Containing Paint Removal Plan including CP approval (signature, date, and certification number)
 - e. Rental equipment notification
 - f. Respiratory protection program
 - g. Hazard communication program
 - h. EPA approved hazardous waste treatment or disposal facility for lead disposal
 - i. Hazardous waste management plan
 - j. Vacuum filters
4. Manufacturer's Instructions
 - a. Chemicals and equipment
 - b. Materials
 - c. Material safety data sheets for all chemicals
5. Closeout Submittals
 - a. Completed and signed hazardous waste manifest from treatment or disposal facility
 - b. Certification of medical examinations
 - c. Employee training certification

D. Qualifications Of CP

1. Submit name, address, and telephone number of the CP selected to perform responsibilities specified in paragraph entitled "Competent Person (CP) Responsibilities." Provide previous experience of the CP. Submit proper documentation that the CP is trained and licensed and certified in accordance with Federal, State, and local laws.

E. Third Party Consultant Qualifications

1. Submit the name, address, and telephone number of the third party consultant selected to perform the wipe sampling for determining concentrations of lead in dust or soil sampling. Submit proper documentation that the consultant is trained and certified as an inspector technician or inspector/risk assessor by the USEPA authorized State (or local) certification and accreditation program.

F. Testing Laboratory

1. Submit the name, address, and telephone number of the testing laboratory selected to perform the air and wipe and soil sampling, testing, and reporting of airborne concentrations of lead. Use a laboratory accredited under the EPA National Lead Laboratory Accreditation Program (NLLAP) by either the American Association for Laboratory Accreditation (A2LA) or the American Industrial Hygiene Association (AIHA) and that is successfully participating in the Environmental Lead Proficiency Analytical Testing (ELPAT) program to perform sample analysis.

G. Lead-Based Paint/Lead-Containing Paint Removal Plan (LBP/LCPRP)

1. Submit a detailed job-specific plan of the work procedures to be used in the removal of LBP/LCP. The plan shall include a sketch showing the location, size, and details of lead control areas, location and details of decontamination facilities, viewing ports, and mechanical ventilation

system. Include in the plan, eating, drinking, smoking and sanitary procedures, interface of trades, sequencing of lead related work, collected waste water and paint debris disposal plan, air sampling plan, respirators, personal protective equipment, and a detailed description of the method of containment of the operation to ensure that airborne lead concentrations of 30 micrograms per cubic meter of air and baseline lead dust/soil concentrations are not reached or exceeded outside of the lead control area. Include site preparation and cleanup procedures. Include occupational and environmental sampling, training and strategy, sampling methodology, frequency, duration of sampling, and qualifications of sampling personnel in the air sampling portion of the plan.

H. Occupational And Environmental Sampling Results

1. Submit occupational and environmental sampling results to the ODR or UTHSCSA consultant within three working days of collection, signed by the testing laboratory responsible official, the employee that performed the sampling, and the CP.
 - a. The sampling results shall represent each job classification, or if working conditions are similar to previous jobs by the same employer, provide previously collected exposure data that can be used to estimate worker exposures in accordance with 29 CFR 1926.62. The data shall represent the worker's regular daily exposure to lead.
 - b. Submit worker exposure data conducted during the task based trigger operations of 29 CFR 1926.62.
 - c. The initial monitoring shall determine the requirements for further monitoring and the need to fully implement the control and protective requirements including the compliance program (LBP/LCP) in accordance with 29 CFR 1926.62.

I. Occupational And Environmental Assessment Data Report:

1. Some LBP/LCP removal work may not require full implementation of the requirements of 29 CFR 1926.62. Based on the experience of the Contractor and/or the use of a specific process or method for performing the work, the Contractor may be able to provide historic data (previous 12 months) to demonstrate that airborne exposures are controlled below the action level. Such methods or controls shall be fully presented in the LBP/LCPRP. To reduce the full implementation of 29 CFR 1926.62, the Contractor shall provide documentation in an Assessment Data Report.
2. Submit occupational and environmental assessment report to the ODR or UTHSCSA consultant prior to start of work, signed by the testing laboratory responsible official, and the CP.
 - a. Submit a report that supports the determination regarding the reduction of the need to fully implement the requirements of 29 CFR 1926.62 and supporting the LBP/LCP. The exposure assessment shall represent each job classification, or if working conditions are similar to previous jobs by the same employer, provide previously collected exposure data that can be used to estimate worker exposures in accordance with 29 CFR 1926.62. The data shall represent the worker's regular daily exposure to lead for stated work.
 - b. Submit worker exposure data conducted during the task based trigger operations of 29 CFR 1926.62 with a complete process description in supporting a negative assessment.
 - c. The initial assessment shall determine the requirement for further monitoring and the need to fully implement the control and protective requirements including the compliance program (LBP/LCPRP) in accordance with 29 CFR 1926.62.

J. Quality Assurance

1. Medical Examinations: Initial medical surveillance as required by 29 CFR 1926.62 shall be made available to all employees exposed to lead at any time (1 day) above the action level. Full medical surveillance shall be made available to all employees on an annual basis who are or may be exposed to lead in excess of the action level for more than 30 days a year or as required by 29 CFR 1926.62. Adequate records shall show that employees meet the medical surveillance requirements of 29 CFR 1926.33, 29 CFR 1926.62, and 29 CFR 1926.103.
 - a. Medical Records: Maintain complete and accurate medical records of employees for a period of at least 30 years or for the duration of employment plus 30 years, whichever is longer.

- b. Medical Surveillance: Provide medical surveillance to all personnel exposed to lead as indicated in 29 CFR 1926.62.
- 2. Competent Person (CP) Responsibilities
 - a. Certify training as meeting all federal, State, and local requirements.
 - b. Review and approve lead-based paint/lead-containing paint removal plan for conformance to the applicable referenced standards.
 - c. Continuously inspect lead-based paint removal work for conformance with the approved plan.
 - d. Perform air and wipe sampling.
 - e. Ensure work is performed in strict accordance with specifications at all times.
 - f. Control work to prevent hazardous exposure to human beings and to the environment at all times.
 - g. Certify the conditions of the work as called for elsewhere in this specification.
- 3. Training: Train each employee performing paint removal, disposal, and air sampling operations prior to the time of initial job assignment and annually thereafter, in accordance with 29 CFR 1926.21, 29 CFR 1926.62, and State and local regulations.
 - a. Training Certification: Submit a certificate for each employee, signed and dated by the approved training source, stating that the employee has received the required lead training.
- 4. Respiratory Protection Program
 - a. Furnish each employee required to wear a negative pressure respirator or other appropriate type with a respirator fit test at the time of initial fitting and at least annually thereafter as required by 29 CFR 1926.62.
 - b. Establish and implement a respiratory protection program as required by ANSI Z88.2, 29 CFR 1926.103, 29 CFR 1926.62, and 29 CFR 1926.55.
- 5. Hazard Communication Program: Establish and implement a Hazard Communication Program as required by 29 CFR 1926.59.
- 6. Hazardous Waste Management: The Hazardous Waste Management Plan shall comply with applicable requirements of federal, State, and local hazardous waste regulations and address:
 - a. Identification and classification of hazardous wastes associated with the work.
 - b. Estimated quantities of wastes to be generated and disposed of.
 - c. Names and qualifications of each contractor that will be transporting, storing, treating, and disposing of the wastes. Include the facility location and operator and a 24-hour point of contact. Furnish two copies of EPA, or State and local hazardous waste permit applications or permits or manifests, as required, and EPA Identification numbers.
 - d. Names and qualifications (experience and training) of personnel who will be working on-site with hazardous wastes.
 - e. List of waste handling equipment to be used in performing the work, to include cleaning, volume reduction, and transport equipment.
 - f. Spill prevention, containment, and cleanup contingency measures including a health and safety plan to be implemented in accordance with 29 CFR 1926.65.
 - g. Work plan and schedule for waste containment, removal and disposal. Wastes shall be cleaned up and containerized daily.
 - h. Unit cost for hazardous waste disposal according to this plan.
- 7. Environmental, Safety and Health Compliance: In addition to the detailed requirements of this specification, comply with laws, ordinances, rules, and regulations of Federal, State, and local authorities regarding removing, handling, storing, transporting, and disposing of lead waste materials. Comply with the applicable requirements of the current issue of 29 CFR 1926.62. Submit matters regarding interpretation of standards to the ODR or UTHSCSA consultant for resolution before starting work. Where specification requirements and the referenced documents vary, the most stringent requirement shall apply.
- 8. Pre-Construction Conference: Along with the CP, meet with the ODR or UTHSCSA consultant to discuss in detail the hazardous waste management plan and the lead-based paint/lead-containing paint removal plan, including work procedures and precautions for the removal plan.

K. Equipment

1. Respirators: Furnish appropriate respirators approved by the National Institute for Occupational Safety and Health (NIOSH), Department of Health and Human Services, for use in atmospheres containing lead dust. Respirators shall comply with the requirements of 29 CFR 1926.62.
2. Special Protective Clothing: Furnish personnel who will be exposed to lead-contaminated dust with proper disposable uncontaminated, reusable protective whole body clothing, head covering, gloves, and foot coverings as required by 29 CFR 1926.62. Furnish proper disposable plastic or rubber gloves to protect hands. Reduce the level of protection only after obtaining approval from the CP.
3. Rental Equipment Notification: If rental equipment is to be used during lead-based paint handling and disposal, notify the rental agency in writing concerning the intended use of the equipment. Furnish a copy of the written notification to the ODR or UTHSCSA consultant.
4. Vacuum Filters: UL 586 labeled HEPA filters.
5. Equipment for Owner's Personnel: Furnish the ODR or UTHSCSA consultant with two complete sets of personal protective equipment (PPE) daily, as required herein, for entry into and inspection of the paint removal work within the lead controlled area. Personal protective equipment shall include disposable whole body covering, including appropriate foot, head, and hand protection. PPE shall remain the property of the Contractor. Respiratory protection for the ODR or UTHSCSA consultant will be provided by The University.

L. Removal

1. Title to Materials: Materials resulting from demolition work, except as specified otherwise, shall become the property of the Contractor and shall be disposed of in accordance with Division 02 Section(s) "Selective Structure Demolition" OR "Structure Demolition", except as specified herein.

1.2 PRODUCT

A. Chemicals

1. Submit applicable Material Safety Data Sheets for all chemicals used in paint removal work. Use the least toxic product approved by the ODR or UTHSCSA consultant.

B. Materials

1. The soluble metal content and the total metal content shall not exceed values which would cause a material to be classified as a hazardous waste.

1.3 EXECUTION

A. Protection

1. Notification: Notify the ODR or UTHSCSA consultant 20 days prior to the start of any paint removal work.
2. Lead Control Area Requirements
 - a. If LBP will be removed by means which will not likely create airborne, lead-containing dust (such as careful wet scraping or chemical stripping), establish a lead control area by situating critical barriers and physical boundaries around the area or structure where LBP/LCP removal operations will be performed.
 - b. If removal practice will create airborne, lead-containing dust (such as sanding, abrasive blasting, thermal cutting, demolition, or needle gun use), utilize full containment procedures - Contain removal operations by the use of critical barriers and HEPA filtered exhaust **OR** a negative pressure enclosure system with decontamination facilities and with HEPA filtered exhaust if required by the CP, **as directed**. For containment areas larger than 1,000 square feet (100 square meters) install a minimum of two 18 inch (450 mm) square viewing ports. Locate ports to provide a view of the required work from the exterior of the enclosed contaminated area. Glaze ports with laminated safety glass.

3. Protection of Existing Work to Remain: Perform paint removal work without damage or contamination of adjacent areas. Where existing work is damaged or contaminated, restore work to its original condition or better.
4. Boundary Requirements: Provide physical boundaries around the lead control area by roping off the area designated in the work plan or providing curtains, portable partitions or other enclosures to ensure that airborne concentrations of lead will not reach 30 micrograms per cubic meter of air outside of the lead control area.
 - a. Physical Boundary: Provide physical boundaries around the lead control area by roping off the area designated in the work plan or providing curtains, portable partitions or other enclosures to ensure that airborne concentrations of lead will not reach 30 micrograms per cubic meter of air outside of the lead control area.
 - b. Warning Signs: Provide warning signs at approaches to lead control areas. Locate signs at such a distance that personnel may read the sign and take the necessary precautions before entering the area. Signs shall comply with the requirements of 29 CFR 1926.62.
5. Furnishings:
 - a. The University will remove furniture and equipment from the building before lead-based paint removal work begins.
OR
 Furniture and equipment will remain in the building. Protect and cover furnishings or remove furnishings from the work area and store in a location approved by the ODR or UTHSCSA consultant.
OR
 Existing furniture and equipment is lead contaminated, decontaminate, dispose of as lead contaminated waste.
6. Heating, Ventilating and Air Conditioning (HVAC) Systems: Shut down, lock out, and isolate HVAC systems that supply, exhaust, or pass through the lead control areas. Seal intake and exhaust vents in the lead control area with 6 mil (0.15 mm) plastic sheet and tape. Seal seams in HVAC components that pass through the lead control area. Provide temporary HVAC system for areas in which HVAC has been shut down outside the lead control area.
7. Decontamination Shower Facility: Provide clean and contaminated change rooms and shower facilities in accordance with this specification and 29 CFR 1926.62.
8. Eye Wash Station: Where eyes may be exposed to injurious corrosive materials, suitable facilities for quick drenching or flushing of the eyes shall be provided within the work area.
9. Mechanical Ventilation System
 - a. Use adequate ventilation to control personnel exposure to lead in accordance with 29 CFR 1926.62.
 - b. To the extent feasible, use fixed local exhaust ventilation connected to HEPA filters or other collection systems, approved by the CP. Local exhaust ventilation systems shall be designed, constructed, installed, and maintained in accordance with ANSI Z9.2.
 - c. Vent local exhaust outside the building only and away from building ventilation intakes.
 - d. Use locally exhausted, power actuated, paint removal tools.
10. Personnel Protection: Personnel shall wear and use protective clothing and equipment as specified herein. Eating, smoking, or drinking or application of cosmetics is not permitted in the lead control area. No one will be permitted in the lead control area unless they have been appropriately trained and provided with protective equipment.

B.

C.

D.

- E. Work Procedures: Perform removal of lead-based paint in accordance with approved lead-based paint/lead-containing paint removal plan. Use procedures and equipment required to limit occupational and environmental exposure to lead when lead-based paint is removed in accordance with 29 CFR 1926.62, except as specified herein. Dispose of removed paint chips and associated waste in compliance with Environmental Protection Agency (EPA), federal, State, and local requirements.

1. Personnel Exiting Procedures: Whenever personnel exit the lead-controlled area, they shall perform the following procedures and shall not leave the work place wearing any clothing or equipment worn during the work day:
 - a. Vacuum themselves off.
 - b. Remove protective clothing in the contaminated change room, and place them in an approved impermeable disposal bag.
 - c. Shower **OR** Wash hands and face at the site, **as directed**, don appropriate disposable or uncontaminated reusable clothing; move to an appropriate facility; shower.
 - d. Change to clean clothes prior to leaving the physical boundary designated around the lead control area.
2. Air and Wipe Sampling
 - a. Air sample for lead in accordance with 29 CFR 1926.62 and as specified herein. Air and wipe sampling shall be directed or performed by the CP.
 - 1) The CP shall be on the job site directing the air and non-clearance wipe sampling and inspecting the lead-based paint removal work to ensure that the requirements of the contract have been satisfied during the entire lead-based paint removal operation.
 - 2) Collect personal air samples on employees who are anticipated to have the greatest risk of exposure as determined by the CP. In addition, collect air samples on at least 25 percent of the work crew or a minimum of two employees, whichever is greater, during each work shift.
 - 3) Submit results of air samples, signed by the CP, within 72 hours after the air samples are taken. Notify the ODR or UTHSCSA consultant immediately of exposure to lead at or in excess of the action level of 30 micrograms per cubic meter of air outside of the lead control area.
 - 4) For high profile, sensitive work such as present in family housing, child care facilities, administrative buildings, kitchens, barracks, etc., surface dust sampling to determine clearance (i.e., that the work has not contaminated surfaces within and adjacent to the control area) should be performed by a third party to reduce a conflict of interest. Samples must be conducted by an individual not paid or employed or otherwise compensated by the LBP/LCP removal Contractor. State or local regulations may require third party testing if the LBP/LCP removal operation is considered a lead hazard reduction activity.
 - 5) Before any work begins, collect and analyze baseline or soil wipe samples in accordance with methods defined in federal, State, and local standards inside and outside of the physical boundary to assess the degree of dust contamination in the facility prior to lead-based paint removal.
 - b. Air Sampling During Paint Removal Work: Conduct area air sampling daily, on each shift in which lead-based paint removal operations are performed, in areas immediately adjacent to the lead control area. Sufficient area monitoring shall be conducted to ensure unprotected personnel are not exposed at or above 30 micrograms per cubic meter of air. If 30 micrograms per cubic meter of air is reached or exceeded, stop work, correct the condition(s) causing the increased levels. Notify the ODR or UTHSCSA consultant immediately. Determine if condition(s) require any further change in work methods. Removal work shall resume only after approval is given by the CP and the ODR or UTHSCSA consultant. For outdoor operations, at least one sample on each shift shall be taken on the downwind side of the lead control area.
3. Lead-Based Paint Removal
 - a. Manual or power sanding of interior and exterior surfaces is not permitted. Provide methodology for removing LBP in work plan. Remove paint within the areas designated on the drawings in order to completely expose the substrate. Take whatever precautions necessary to minimize damage to the underlying substrate.
 - b. Avoid flash rusting or deterioration of the substrate. Provide surface preparations for painting in accord with Division 07.
 - c. Provide methodology for removing LBP/LCP removal processes to minimize contamination of work areas outside the control area with lead-contaminated dust or other lead-contaminated debris/waste and to ensure that unprotected personnel are not exposed to

- hazardous concentrations of lead. Describe this LBP/LCP removal process in the LBP/LCPRP.
- d. Indoor Lead Paint Removal: Perform manual **OR** mechanical **OR** thermal **OR** chemical, **as directed**, paint removal in lead control areas using enclosures, barriers, or containments and powered locally exhausted paint removal tools. Collect residue and/or debris for disposal in accordance with federal, State, and local requirements.
 - e. Outdoor Lead Paint Removal: Perform outdoor removal as indicated in federal, State, and local regulations and in the LBP/CPRP. The worksite preparation (barriers or containments) shall be job dependent and presented in the LBP/LCPRP.
 - f. Sampling After Paint Removal: After the visual inspection, conduct soil sampling if bare soil is present during external removal operations and collect air samples inside and outside the lead control area to determine the airborne levels of lead inside and outside the work area. Collect wipe samples according to the HUD protocol contained in HUD Guidelines to determine the lead content of settled dust and dirt in micrograms per square foot (square meter) of surface area and parts per million (ppm) or micrograms per gram ($\mu\text{g/g}$) for soil.
4. Cleanup and Disposal
- a. Cleanup: Maintain surfaces of the lead control area free of accumulations of paint chips and dust. Restrict the spread of dust and debris; keep waste from being distributed over the work area. Do not dry sweep or use compressed air to clean up the area. At the end of each shift and when the paint removal operation has been completed, clean the area of visible lead paint contamination by vacuuming with a HEPA filtered vacuum cleaner, wet mopping the area and wet wiping the area as indicated by the CP. Reclean areas showing dust or residual paint chips or debris. After visible dust, chips and debris is removed, wet wipe and HEPA vacuum all surfaces in the work area. If adjacent areas become contaminated at any time during the work, clean, visually inspect, and then wipe sample all contaminated areas. The CP shall then certify in writing that the area has been cleaned of lead contamination before restarting work.
 - b. Clearance Certification
 - 1) The CP shall certify in writing that the final air samples collected inside and outside the lead control area are less than 30 micrograms per cubic meter of air; the respiratory protection used for the employees was adequate; the work procedures were performed in accordance with 29 CFR 1926.62 and 40 CFR 745; and that there were no visible accumulations of material and dust containing lead left in the work site. Do not remove the lead control area or roped off boundary and warning signs prior to the ODR or UTHSCSA consultant's acknowledgement of receipt of the CP certification.
 - 2) A third party consultant shall certify surface wipe sample results collected inside and outside the work area are less than 100 micrograms per square foot (0.1 square meter) on uncarpeted floors, less than 500 micrograms per square foot (0.1 square meter) on interior window sills and less than 800 micrograms per square foot (0.1 square meter) on window troughs **OR** not significantly greater than the initial surface loading determined prior to work, **as directed**.
 - 3) For exterior paint removal work, soil samples taken at the exterior of the work site shall be used to determine if soil lead levels had increased at a statistically significant level (significant at the 95 percent confidence limit) from the soil lead levels prior to the work. If soil lead levels do show a statistically significant increase above any applicable Federal or State standard for lead in soil, the soil shall be remediated back to the pre-work level.
 - c. Testing of Lead-Based Paint Residue and Used Abrasive: Test paint residue and used abrasive in accordance with 40 CFR 261 for hazardous waste.
 - d. Disposal
 - 1) Collect lead-contaminated waste, scrap, debris, bags, containers, equipment, and lead-contaminated clothing which may produce airborne concentrations of lead particles. Label the containers in accordance with 29 CFR 1926.62 and 40 CFR 261. Dispose of lead-contaminated waste material at an EPA or State approved hazardous waste treatment, storage, or disposal facility off Owner's property.

- 2) Store waste materials in U.S. Department of Transportation (49 CFR 178) approved 55 gallon (208 liter) drums. Properly label each drum to identify the type of waste (49 CFR 172) and the date the drum was filled. The ODR or UTHSCSA consultant or an authorized representative will assign an area for interim storage of waste-containing drums. Do not store hazardous waste drums in interim storage longer than 90 calendar days from the date affixed to each drum.
- 3) Handle, store, transport, and dispose lead or lead-contaminated waste in accordance with 40 CFR 260, 40 CFR 261, 40 CFR 262, 40 CFR 263, 40 CFR 264, and 40 CFR 265. Comply with land disposal restriction notification requirements as required by 40 CFR 268.
- 4) All material, whether hazardous or non-hazardous shall be disposed in accordance with laws and provisions and Federal, State, or local regulations. Ensure waste is properly characterized. The result of each waste characterization (TCLP for RCRA materials) will dictate disposal requirements.
5. Disposal Documentation: Submit written evidence that the hazardous waste treatment, storage, or disposal facility (TSD) is approved for lead disposal by the EPA and State or local regulatory agencies. Submit one copy of the completed manifest, signed and dated by the initial transporter in accordance with 40 CFR 262.
6. Payment for Hazardous Waste: Payment for disposal of hazardous waste will not be made until a signed copy of the manifest from the treatment or disposal facility certifying the amount of lead-containing materials delivered is returned and a copy is furnished to The University.

END OF SECTION 02 83 33 13

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 84 16 00 - REMOVAL OF FLUORESCENT LIGHT BALLASTS/CAPACITORS AND FLUORESCENT LIGHT TUBES**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for removal of fluorescent light ballasts/capacitors and fluorescent light tubes. Products shall be as follows or as approved by the ODR or UTHSCSA consultant. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Before Start of Work: Submit the following to The University's Representative for review. Do not start work until these submittals are returned with Owner's Representative's approval.
 - a. Copy of State or local license for hazardous waste hauler;
 - b. Certification of at least one on-site supervisor which has satisfactorily completed the OSHA 40 Hour Health and Safety Course for Handling Hazardous Materials;
 - c. Certificates of workers which have successfully completed at least the OSHA 40-Hour Health and Safety Course for Hazardous Materials;
 - d. List of employees scheduled to perform this work;
 - e. Schedule of start and finish times and dates for this work;
 - f. Name and address of landfill where these waste materials are to be deposited (include contact person and telephone numbers);
 - g. Material Safety Data Sheets for all materials requiring removal;
 - h. If contractor introduces any chemical into the work environmental, a MSDS for that chemical is required before use;
 - i. Transporter must have notified the EPA and/or the appropriate local government agency in advance of its intentions to transport PCB's, mercury and cadmium, and receive an identification number pursuant to the Toxic Substance Control Act (TSCA); and
 - j. Contingency Plan for handling emergency spills or leaks.

1.2 PRODUCTS**A. Materials**

1. Polyethylene Sheet: A single polyethylene film in the largest sheet size possible to minimize seams, 4.0 and 6.0 mil thick, clear, frosted, or black.
2. Duct Tape: Provide duct tape in 3" widths, with an adhesive which is formulated to stick aggressively to sheet polyethylene.
3. Spray Cement: Provide spray adhesive in aerosol cans which is specifically formulated to stick tenaciously to sheet polyethylene.
4. Disposal Bays: Provide 6 mil thick leak-tight polyethylene bags.
5. Labels: As required by the EPA and OSHA for handling, transportation, and disposal of hazardous waste.
6. **Drums:** Recovery or salvage drums acceptable for disposal of hazardous waste. Prior approval of drums is required. Drums or containers must meet the required OSHA EPA (40 CFR Parts 264-265 and 300), and DOT regulations (49 CFR Parts 171-178). Use of damaged drums will not be allowed.

1.3 EXECUTION**A. General**

1. Where necessary, scaffolding shall be erected to fully access all applicable fluorescent light ballasts/capacitors and tubes. At no time will the ballasts/capacitors and tubes be allowed to drop onto the floor. Contractor must take care to protect from dropping the ballasts/capacitors and fluorescent tubes.
2. Prior to removing ballasts/capacitors and fluorescent tubes, contractor shall ensure that all electrical service to lights has been shut off, and locked out. Temporary lighting shall be erected to adequately illuminate work areas.
3. Depending on height of light fixtures, contractor shall utilize at least a 2-person per team system. The fluorescent light tubes shall be removed and passed to the appropriate number of workers required to lower the tubes to the floor without breaking them.
4. The worker on the floor shall lay the tubes in cardboard boxes large enough to hold a small quantity of tubes. Worker shall take care to not damage the tubes while they are lowered into the box. Once the box is full, it shall be wrapped with two layers of 6 mil thick polyethylene sheeting and sealed with duct tape.
5. Contractor may choose to either remove the fluorescent light ballasts/capacitors in-place or lower the lighting fixtures for easy access. The ballasts/capacitors shall be removed from the fixtures. Electrical wiring leading from the ballasts/capacitors shall be cut away. Ballasts/capacitors shall be placed in 55-gallon drums lined with at least two 6 mil thick polyethylene bags. Be careful not to overfill the drums so that they remain manageable. Once the drums have been filled to the acceptable level, seal the lid onto the top of the drum, and affix appropriate labels. Transport drums via hand dollies.

B. Worker Protection

1. As a minimum, while working with the ballasts/capacitors and light tubes, workers shall utilize impervious gloves adequate for the use with hazardous materials. If light ballasts/capacitors and/or light tubes are damaged, and/or exposure to these materials may reach the OSHA PEL or AGGIH threshold limit value (TLV), the contractor shall be required to provide impervious full body protection and respiratory protection. However, contractor is required to verify the type of protection required prior to working with these materials, and have written approval by Owner's Representative prior to beginning.
2. In addition, workers shall not smoke, drink or eat in these areas during work activities.

C. Storage Of Fluorescent Light Ballasts/Capacitors And Light Tubes

1. Once the containers holding the ballasts/capacitors and light tubes have been filled and sealed, they shall be stored in designated areas as agreed upon by The University's Representative and Contractor. They shall not be allowed to be stored on-site in transportation vehicles until the time for them to be transported to the hazardous waste incinerators or landfill facility.

END OF SECTION 02 84 16 00

SECTION 02 85 00 00 - MOLD REMEDIATION**1.1 GENERAL****A. Description Of Work**

1. This specification covers the removal and disposal of mold. Products shall be as follows or as approved by the ODR or UTHSCSA consultant. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. List of all personnel to be involved in the work with their training and certifications.
2. List of all products and procedures proposed for use in performance of the work.
3. Test reports.
4. Certificates.

C. References

1. U.S. EPA "Mold Remediation in Schools and Commercial Buildings"
2. U.S. EPA "A Brief Guide to Mold, Moisture, and Your Home"

D. Quality Assurance

1. Conform to all Federal, State, and Local regulations which govern the handling and disposal of mold materials.

1.2 PRODUCT - (Not Used)**1.3 EXECUTION**

- A. Environmental Assessment:** The presence of mold, water damage, or musty odors shall be addressed immediately. In all instances, any source(s) of water must be stopped and the extent of water damaged determined. Water damaged materials shall be dried and repaired. Mold damaged materials shall be remediated in accordance with this document.

1. **Visual Inspection:** A visual inspection is the most important initial step in identifying a possible contamination problem. The extent of any water damage and mold growth shall be visually assessed. This assessment is important in determining remedial strategies. Ventilation systems shall also be visually checked, particularly for damp filters but also for damp conditions elsewhere in the system and overall cleanliness. Ceiling tiles, gypsum wallboard (sheetrock), cardboard, paper, and other cellulosic surfaces shall be given careful attention during a visual inspection. The use of equipment such as a boroscope, to view spaces in ductwork or behind walls, or a moisture meter, to detect moisture in building materials, may be helpful in identifying hidden sources of fungal growth and the extent of water damage.

2. **Bulk/Surface Sampling**

- a. Bulk or surface sampling is not required to undertake a remediation. Remediation of visually identified fungal contamination shall proceed without further evaluation.
- b. Bulk or surface samples may need to be collected to identify specific fungal contaminants as part of a medical evaluation if occupants are experiencing symptoms which may be related to fungal exposure or to identify the presence or absence of mold if a visual inspection is equivocal (e.g., discoloration, and staining).
- c. An individual trained in appropriate sampling methodology shall perform bulk or surface sampling. Bulk samples shall be collected from visibly moldy surfaces by scraping or cutting materials with a clean tool into a clean plastic bag. Surface samples shall be collected by wiping a measured area with a sterile swab or by stripping the suspect surface

with clear tape. Surface sampling is less destructive than bulk sampling. Other sampling methods may also be available. A laboratory specializing in mycology shall be consulted for specific sampling and delivery instructions.

3. Air Monitoring

- a. Air sampling for fungi shall not be part of a routine assessment. This is because decisions about appropriate remediation strategies can usually be made on the basis of a visual inspection. In addition, air-sampling methods for some fungi are prone to false negative results and therefore cannot be used to definitively rule out contamination.
- b. Air monitoring may be necessary if an individual(s) has been diagnosed with a disease that is or may be associated with a fungal exposure (e.g., pulmonary hemorrhage/hemosiderosis, and aspergillosis).
- c. Air monitoring may be necessary if there is evidence from a visual inspection or bulk sampling that ventilation systems may be contaminated. The purpose of such air monitoring is to assess the extent of contamination throughout a building. It is preferable to conduct sampling while ventilation systems are operating.
- d. Air monitoring may be necessary if the presence of mold is suspected (e.g., musty odors) but cannot be identified by a visual inspection or bulk sampling (e.g., mold growth behind walls). The purpose of such air monitoring is to determine the location and/or extent of contamination.
- e. If air monitoring is performed, for comparative purposes, outdoor air samples shall be collected concurrently at an air intake, if possible, and at a location representative of outdoor air. For additional information on air sampling, refer to the American Conference of Governmental Industrial Hygienists' document, "Bioaerosols: Assessment and Control."
- f. Personnel conducting the sampling shall be trained in proper air sampling methods for microbial contaminants. A laboratory specializing in mycology shall be consulted for specific sampling and shipping instructions.

4. Analysis of Environmental Samples

- a. Microscopic identification of the spores/colonies requires considerable expertise. These services are not routinely available from commercial laboratories. Documented quality control in the laboratories used for analysis of the bulk/surface and air samples is necessary. The American Industrial Hygiene Association (AIHA) offers accreditation to microbial laboratories (Environmental Microbiology Laboratory Accreditation Program (EMLAP)). Accredited laboratories must participate in quarterly proficiency testing (Environmental Microbiology Proficiency Analytical Testing Program (EMPAT)).

5. Evaluation of bulk/surface and air sampling data shall be performed by an experienced health professional. The presence of few or trace amounts of fungal spores in bulk/surface sampling shall be considered background. Amounts greater than this or the presence of fungal fragments (e.g., hyphae, and conidiophores) may suggest fungal colonization, growth, and/or accumulation at or near the sampled location. Air samples shall be evaluated by means of comparison (i.e., indoors to outdoors) and by fungal type (e.g., genera, and species). In general, the levels and types of fungi found should be similar indoors (in non-problem buildings) as compared to the outdoor air. Differences in the levels or types of fungi found in air samples may indicate that moisture sources and resultant fungal growth may be problematic.

B. Remediation

1. General

- a. **In all situations, the underlying cause of water accumulation must be rectified or fungal growth will recur.** Any initial water infiltration shall be stopped and cleaned immediately. An immediate response (within 24 to 48 hours) and thorough clean up, drying, and/or removal of water damaged materials will prevent or limit mold growth. If the source of water is elevated humidity, relative humidity shall be maintained at levels below 60% to inhibit mold growth. Emphasis shall be on ensuring proper repairs of the building infrastructure, so that water damage and moisture buildup does not recur.
- b. Five different levels of abatement are described below. The size of the area impacted by fungal contamination primarily determines the type of remediation. The sizing levels below are based on professional judgment and practicality; currently there is not adequate data to relate the extent of contamination to frequency or severity of health effects. **The goal of**

remediation is to remove or clean contaminated materials in a way that prevents the emission of fungi and dust contaminated with fungi from leaving a work area and entering an occupied or non-abatement area, while protecting the health of workers performing the abatement. The listed remediation methods were designed to achieve this goal, however, due to the general nature of these methods it is the responsibility of the people conducting remediation to ensure the methods enacted are adequate. The listed remediation methods are not meant to exclude other similarly effective methods. Any changes to the remediation methods listed in these guidelines, however, shall be carefully considered prior to implementation.

- c. Non-porous (e.g., metals, glass, and hard plastics) and semi-porous (e.g., wood, and concrete) materials that are structurally sound and are visibly moldy can be cleaned and reused. Cleaning shall be done using a detergent solution. Porous materials such as ceiling tiles and insulation, and wallboards with more than a small area of contamination shall be removed and discarded. Porous materials (e.g., wallboard, and fabrics) that can be cleaned, can be reused, but should be discarded if possible. A professional restoration consultant shall be contacted when restoring porous materials with more than a small area of fungal contamination. All materials to be reused shall be dry and visibly free from mold. Routine inspections shall be conducted to confirm the effectiveness of remediation work.
 - d. The use of gaseous, vapor-phase, or aerosolized biocides for remedial purposes is **not** recommended. The use of biocides in this manner can pose health concerns for people in occupied spaces of the building and for people returning to the treated space if used improperly. Furthermore, the effectiveness of these treatments is unproven and does not address the possible health concerns from the presence of the remaining non-viable mold. For additional information on the use of biocides for remedial purposes, refer to the American Conference of Governmental Industrial Hygienists' document, "Bioaerosols: Assessment and Control."
2. **Level I: Small Isolated Areas** (10 sq. ft or less) - e.g., ceiling tiles, small areas on walls
- a. Remediation can be conducted by regular building maintenance staff. Such persons shall receive training on proper clean up methods, personal protection, and potential health hazards. This training can be performed as part of a program to comply with the requirements of the OSHA Hazard Communication Standard (29 CFR 1910.1200).
 - b. Respiratory protection (e.g., N95 disposable respirator), in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended. Gloves and eye protection shall be worn.
 - c. The work area shall be unoccupied. Vacating people from spaces adjacent to the work area is not necessary but is recommended in the presence of infants (less than 12 months old), persons recovering from recent surgery, immune suppressed people, or people with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity, pneumonitis, and severe allergies).
 - d. Containment of the work area is not necessary. Dust suppression methods, such as misting (not soaking) surfaces prior to remediation, are recommended.
 - e. Contaminated materials that cannot be cleaned shall be removed from the building in a sealed plastic bag. There are no special requirements for the disposal of moldy materials.
 - f. The work area and areas used by remedial workers for egress shall be cleaned with a damp cloth and/or mop and a detergent solution.
 - g. All areas shall be left dry and visibly free from contamination and debris.
3. **Level II: Mid-Sized Isolated Areas** (10 - 30 sq. ft.) - e.g., individual wallboard panels.
- a. Remediation can be conducted by regular building maintenance staff. Such persons shall receive training on proper clean up methods, personal protection, and potential health hazards. This training can be performed as part of a program to comply with the requirements of the OSHA Hazard Communication Standard (29 CFR 1910.1200).
 - b. Respiratory protection (e.g., N95 disposable respirator), in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended. Gloves and eye protection shall be worn.
 - c. The work area shall be unoccupied. Vacating people from spaces adjacent to the work area is not necessary but is recommended in the presence of infants (less than 12 months old), persons having undergone recent surgery, immune suppressed people, or people

- with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity, pneumonitis, and severe allergies).
- d. The work area shall be covered with a plastic sheet(s) and sealed with tape before remediation, to contain dust/debris.
 - e. Dust suppression methods, such as misting (not soaking) surfaces prior to remediation, are recommended.
 - f. Contaminated materials that cannot be cleaned shall be removed from the building in sealed plastic bags. There are no special requirements for the disposal of moldy materials.
 - g. The work area and areas used by remedial workers for egress shall be HEPA vacuumed (a vacuum equipped with a High-Efficiency Particulate Air filter) and cleaned with a damp cloth and/or mop and a detergent solution.
 - h. All areas shall be left dry and visibly free from contamination and debris.
4. **Level III: Large Isolated Areas** (30 - 100 square feet) - e.g., several wallboard panels.
- a. A health and safety professional with experience performing microbial investigations shall be consulted prior to remediation activities to provide oversight for the project.
 - b. The following procedures *at a minimum* are recommended:
 - 1) Personnel trained in the handling of hazardous materials and equipped with respiratory protection, (e.g., N95 disposable respirator), in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended. Gloves and eye protection shall be worn.
 - 2) The work area and areas directly adjacent shall be covered with a plastic sheet(s) and taped before remediation, to contain dust/debris.
 - 3) Seal ventilation ducts/grills in the work area and areas directly adjacent with plastic sheeting.
 - 4) The work area and areas directly adjacent shall be unoccupied. Further vacating of people from spaces near the work area is recommended in the presence of infants (less than 12 months old), persons having undergone recent surgery, immune suppressed people, or people with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity, pneumonitis, and severe allergies).
 - 5) Dust suppression methods, such as misting (not soaking) surfaces prior to remediation, are recommended.
 - 6) Contaminated materials that cannot be cleaned shall be removed from the building in sealed plastic bags. There are no special requirements for the disposal of moldy materials.
 - 7) The work area and surrounding areas shall be HEPA vacuumed and cleaned with a damp cloth and/or mop and a detergent solution.
 - 8) All areas shall be left dry and visibly free from contamination and debris.
 - c. If abatement procedures are expected to generate a lot of dust (e.g., abrasive cleaning of contaminated surfaces, demolition of plaster walls) or the visible concentration of the fungi is heavy (blanket coverage as opposed to patchy), then it is recommended that the remediation procedures for Level IV are followed.
5. **Level IV: Extensive Contamination** (greater than 100 contiguous square feet in an area)
- a. A health and safety professional with experience performing microbial investigations shall be consulted prior to remediation activities to provide oversight for the project. The following procedures are recommended:
 - 1) Personnel trained in the handling of hazardous materials equipped with:
 - a) Full-face respirators with high efficiency particulate air (HEPA) cartridges
 - b) Disposable protective clothing covering both head and shoes
 - c) Gloves
 - 2) Containment of the affected area:
 - a) Complete isolation of work area from occupied spaces using plastic sheeting sealed with duct tape (including ventilation ducts/grills, fixtures, and any other openings)
 - b) The use of an exhaust fan with a HEPA filter to generate negative pressurization
 - c) Airlocks and decontamination room

- 3) Vacating people from spaces adjacent to the work area is not necessary but is recommended in the presence of infants (less than 12 months old), persons having undergone recent surgery, immune suppressed people, or people with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity, pneumonitis, and severe allergies).
 - 4) Contaminated materials that cannot be cleaned shall be removed from the building in sealed plastic bags. The outside of the bags shall be cleaned with a damp cloth and a detergent solution or HEPA vacuumed in the decontamination chamber prior to their transport to uncontaminated areas of the building. There are no special requirements for the disposal of moldy materials.
 - 5) The contained area and decontamination room shall be HEPA vacuumed and cleaned with a damp cloth and/or mop with a detergent solution and be visibly clean prior to the removal of isolation barriers.
 - 6) Air monitoring shall be conducted prior to occupancy to determine if the area is fit to reoccupy.
6. **Level V: Remediation of HVAC Systems**
- a. A Small Isolated Area of Contamination (<10 square feet) in the HVAC System
 - 1) Remediation can be conducted by regular building maintenance staff. Such persons shall receive training on proper clean up methods, personal protection, and potential health hazards. This training can be performed as part of a program to comply with the requirements of the OSHA Hazard Communication Standard (29 CFR 1910.1200).
 - 2) Respiratory protection (e.g., N95 disposable respirator), in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended. Gloves and eye protection shall be worn.
 - 3) The HVAC system shall be shut down prior to any remedial activities.
 - 4) The work area shall be covered with a plastic sheet(s) and sealed with tape before remediation, to contain dust/debris.
 - 5) Dust suppression methods, such as misting (not soaking) surfaces prior to remediation, are recommended.
 - 6) Growth supporting materials that are contaminated, such as the paper on the insulation of interior lined ducts and filters, shall be removed. Other contaminated materials that cannot be cleaned shall be removed in sealed plastic bags. There are no special requirements for the disposal of moldy materials.
 - 7) The work area and areas immediately surrounding the work area shall be HEPA vacuumed and cleaned with a damp cloth and/or mop and a detergent solution.
 - 8) All areas shall be left dry and visibly free from contamination and debris.
 - 9) A variety of biocides are recommended by HVAC manufacturers for use with HVAC components, such as, cooling coils and condensation pans. HVAC manufacturers shall be consulted for the products they recommend for use in their systems.
 - b. Areas of Contamination (>10 square feet) in the HVAC System: A health and safety professional with experience performing microbial investigations shall be consulted prior to remediation activities to provide oversight for remediation projects involving more than a small isolated area in an HVAC system. The following procedures are recommended:
 - 1) Personnel trained in the handling of hazardous materials equipped with:
 - a) Respiratory protection (e.g., N95 disposable respirator), in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended.
 - b) Gloves and eye protection
 - c) Full-face respirators with HEPA cartridges and disposable protective clothing covering both head and shoes shall be worn if contamination is greater than 30 square feet.
 - 2) The HVAC system shall be shut down prior to any remedial activities.
 - 3) Containment of the affected area:
 - a) Complete isolation of work area from the other areas of the HVAC system using plastic sheeting sealed with duct tape.

- b) The use of an exhaust fan with a HEPA filter to generate negative pressurization.
 - c) Airlocks and decontamination room if contamination is greater than 30 square feet.
 - 4) Growth supporting materials that are contaminated, such as the paper on the insulation of interior lined ducts and filters, shall be removed. Other contaminated materials that cannot be cleaned should be removed in sealed plastic bags. When a decontamination chamber is present, the outside of the bags shall be cleaned with a damp cloth and a detergent solution or HEPA vacuumed prior to their transport to uncontaminated areas of the building. There are no special requirements for the disposal of moldy materials.
 - 5) The contained area and decontamination room shall be HEPA vacuumed and cleaned with a damp cloth and/or mop and a detergent solution prior to the removal of isolation barriers.
 - 6) All areas shall be left dry and visibly free from contamination and debris.
 - 7) Air monitoring shall be conducted prior to re-occupancy with the HVAC system in operation to determine if the area(s) served by the system are fit to reoccupy.
 - 8) A variety of biocides are recommended by HVAC manufacturers for use with HVAC components, such as, cooling coils and condensation pans. HVAC manufacturers shall be consulted for the products they recommend for use in their systems.
7. Hazard Communication: When fungal growth requiring large-scale remediation is found, the building owner, management, and/or employer shall notify occupants in the affected area(s) of its presence. Notification shall include a description of the remedial measures to be taken and a timetable for completion. Group meetings held before and after remediation with full disclosure of plans and results can be an effective communication mechanism. Individuals with persistent health problems that appear to be related to bioaerosol exposure should see their physicians for a referral to practitioners who are trained in occupational/environmental medicine or related specialties and are knowledgeable about these types of exposures. Individuals seeking medical attention shall be provided with a copy of all inspection results and interpretation to give to their medical practitioners.

END OF SECTION 02 85 00 00

SECTION 02 87 00 00 - BIRD AND BIRD WASTE ABATEMENT**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for bird and bird waste abatement. Products shall be as follows or as approved by the by the ODR or UTHSCSA consultant. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary Of Work

1. Work Included - Conventional Enclosure for Removal of Birds and Bird Waste
 - a. Seal off penetrations on perimeter walls into the work area (critical barriers) and establish a decontamination facility for workers.
 - b. Coordinate activities with the demolition and well capping activities.
2. Work Included - Removal and disposal of birds and bird waste.
 - a. Establish work area by installing construction barrier tape around removal area.
 - b. Remove and properly dispose of bulk contamination debris.
 - c. Mist bird waste and contaminated material with Biocide or the equivalent (i.e. Sanogene, Oxine, or Envirocon).
 - d. Remove and properly dispose of contaminated waste material from all building components.
 - e. Utilize low pressure washers or scrub brushes to clean all wall surfaces of bird waste.

C. Quality Criteria

1. Qualifications for Performance of Work
 - a. Contractor (or subcontractor engaged to perform the Work of this Section) shall:
 - 1) Be a licensed bird waste abatement contractor in accordance with the Statutes of the State in which the work is to be performed. Submit notarized documentation confirming current licensure.
 - 2) Have a record of not less than five years successful experience in bird waste removal or asbestos removal.
2. Reference Standards
 - a. Acknowledge, by the executing of the Contract, awareness and familiarity with the contents and requirements of the following regulations, codes, and standards, and assume responsibility for the performance of the Work in strict compliance therewith and for every instance of failure to comply therewith.
 - b. Where conflict among requirements or with the Contract Documents exists, the more stringent requirements shall apply.
 - 1) USEPA Regional National Emissions Standards for Hazardous Air Pollutants (NESHAPS)
 - 2) U.S. Occupational and Safety and Health Administration (OSHA)
 - 3) U.S. EPA Office of Pesticide and Toxic Substances Guidance Document
 - 4) U.S. Department of Transportation, Hazardous Substances: Final Rule (49 CFR 171 and 172), Federal Register November 21, 1986 and corrected February 17, 1987.
 - 5) Statutes of the State in which the Work is to be Performed: Licensure for Asbestos Consultants and Contractors.
 - 6) All state, county, and city codes and ordinances as applicable. Make available for review at the site one copy of EPA, OSHA, and applicable State, County, and City Regulations governing the Work.
3. Patent/Copyright Compliance: Contractor shall determine the applicability of any process patents that may be employed and shall be responsible for the payment of all fees, royalties and licenses that may be required for the use of any patented or licensed process. Contractor shall hold The University, Engineer and Testing Laboratory harmless for failure to obtain any licenses and to pay any applicable fees and royalties.

D. Product Handling

1. Deliver all materials in the original packages, containers, or bundles bearing the name of the manufacturer and the brand name.
2. Store all materials subject to damage off the ground, away from wet or damp surfaces, and under cover sufficient to prevent damage or contamination.
3. Remove from the premises all damaged or deteriorating materials. Dispose of materials that become contaminated with waste in accordance with applicable regulatory standards.

E. Worksite Conditions

1. Worker and Visitor Procedures: The Contractor is hereby advised that the birds and bird wastes have been determined to cause diseases by inhalation and Contractor shall provide workers and qualified visitors with respirators that, as a minimum, shall meet the requirements of current applicable OSHA regulations, and protective clothing during preparation of system of enclosures, prior to commencing, during actual removal, and until final clean-up is completed. Also all personnel assigned to work on this project shall attend a training/awareness class for the purpose of explaining the hazards of improperly handling these materials and proper control measures to take in order to protect themselves.

F. Personnel Protection

1. General
 - a. Provide respiratory protection in accordance with OSHA regulations 29 CFR 1910-134 and in accordance with the following paragraphs.
 - 1) Prior to commencement of work, all workers shall be instructed by the Contractor and shall be knowledgeable in the appropriate procedures of personnel protection and waste removal.
 - 2) Where respirators with disposable filters are used, provide sufficient filters for replacement as necessary by the workers, or as required by applicable regulations.
 - 3) Permit no visitors, except for governmental inspectors having jurisdiction, or as authorized by Engineer or Owner, in the work areas after commencement of waste disturbance or removal. Provide authorized visitors with suitable respirators.
 - 4) Provide workers with sufficient sets of protective disposable clothing, consisting of full-body coveralls, head covers, gloves, and foot covers, of sizes to properly fit individual workers.
 - 5) Provide authorized visitors with a set of suitable protective disposable clothing, headgear, eye protection, and/or footwear of sizes to properly fit visitors whenever they are required to enter the work area, to a maximum of six sets per day.
 - 6) Provide, in addition to respirators and protective clothing provided for authorized visitors, protective clothing and respirators for use by Testing Laboratory's representative. Furnish protective clothing in as many sets as required for full-time monitoring by Testing Laboratory.
 - 7) Provide and post the decontamination and work procedures to be followed by workers.
2. Respiratory Protection Program
 - a. Maintain a respiratory protection program that contains all the elements of the OSHA regulations. Provide a copy to the Engineer for approval.
 - b. Appoint a respiratory protection program administrator, who shall be responsible for the program, maintaining all documentation, instructing workers and providing fit tests. Respiratory protection administrator is to be qualified under OSHA requirements and to have attended and passed, as a minimum, OSHA training institute 2-week course on respiratory protection or NIOSH course "Occupational Respiratory Protection." Respiratory protection program administrator is to be on-site daily during abatement activities. All written programs and directions are to be in English and/or the language of the abatement workers if they are not fluent in English.
 - c. The Contractor is advised that the minimum respiratory requirements as called for in this section and on any drawings/sketches shall be applied unless reported measures indicate that a lower form of respiratory protection is acceptable according to the appropriate OSHA regulations and the more strict sections of the specification.
3. Respiratory Protection Requirements

- a. Workers shall be provided with respiratory protection equipment. The respirators are to be sanitized and maintained in accordance with the manufacturer's specification. Appropriate respirator selection will be dependent upon the work to be performed and the level of exposure, as given below.
- b. For the clean-up, as a minimum, the use of full-faced air-purifying respirators is required for all preparation, removal and cleaning work.
- c. This specification requires that workers shall wear suitable respiratory protection at all times whenever a potential for exposure to bird and bird waste exists.

1.2 PRODUCTS

A. Materials

1. Polyethylene/Plastic sheeting shall be of the thicknesses specified, in sizes to minimize the frequency of joints. Utilize reinforced plastic sheeting in specified thicknesses on floors.
2. Tape shall be glass fiber or other type capable of sealing joints of adjacent sheets of plastic and for attachment of plastic sheet to finished or unfinished surfaces of dissimilar materials under both dry and wet conditions.
3. Sodium Hypochlorite ("bleach")
4. Impermeable Containers shall be suitable to receive and retain contaminated materials until disposal at an approved site and shall be labeled in accordance with U.S. DOT 49 CFR 171 and 172, and containers shall be both air- and water-tight. Use a minimum of two types of impermeable containers: 1) six millimeter-thick (mil) plastic bags sized to fit within the drum; and 2) metal or fiber drums with tightly fitting lids.
5. Other Materials: Provide all other materials, such as lumber, nails, and hardware, that may be required to construct and dismantle the decontamination area and the barriers that isolate the work area(s).
6. Caulking shall be non-shrinking caulk to be used where insulated pipes continue through areas such as walls and ceilings. Contractor shall determine and submit proof that caulk proposed for use is compatible with the temperature conditions of the surfaces to which it is to be applied.
 - a. Tools And Equipment
 - 1) Water Sprayer - utilize airless or other low pressure sprayer for amended water application.
 - 2) Air Purifying Equipment (for internal recirculation in the work area) shall be HEPA Filtration Systems or Electronic Precipitators. Ensure that no internal air movement system or purification equipment exhausts contaminated air from the work area(s) outside the work area.
 - 3) Diminished Air Pressure Equipment shall comply with ANSI 29.2-7, local exhaust ventilation.
 - 4) Scaffolding shall be as required to accomplish the specified work and shall meet all applicable safety regulations.
 - 5) Transportation - as required for loading, temporary storage, transit, and unloading of contaminated waste without exposure to persons or property.

1.3 EXECUTION

A. Procedures

1. All personnel assigned to perform the work shall attend a training/awareness class for the purpose of explaining the hazards of improperly handling the waste and the proper control measures to take in order to protect themselves. These work procedures shall be discussed with each individual followed by the individual acknowledging receipt of this training by completing the pertinent information on a Hazardous Awareness Training Form
2. The majority of diseases related to bird waste is related to the inhalation of the airborne dust released by the waste. All personnel performing removal/decontamination waste shall therefore wear Powered Air Purifying Respirators (PAPR) equipped with combination Organic Vapor and High Efficiency Particulate Air (HEPA) filters while handling the waste.
3. Workers shall wear non-porous gloves and boots during all preparatory and removal operations.

4. When entering the building, the removal/decontamination personnel shall mist all surfaces having visible remnants of waste, using a diluted sodium hypochlorite ("bleach") and water solution. This solution shall be diluted at a ratio of 10 parts water to 1 part bleach for a 10 to 1 ration (10:1). The waste shall be continuously misted during occupancy in order to keep airborne dust emissions from the waste to a minimum.
5. Remove all birds from the building and seal all openings into the building. The main purpose of this is to eliminate the availability for future bird access into the building. The openings may be temporarily sealed or closed up in many ways, including boarding up windows/doors, polyethylene sheeting, or other convenient and cost effective means. It is not the intention of this task to complete seal the building airtight.
6. Designate an area of the facility for the purpose of storing the waste prior to loading for transportation to the appropriate landfill. The area designated shall have easy access to the door which will be utilized as the waste load-out.

END OF SECTION 02 87 00 00

Task	Specification	Specification Description
02 89 00 00	01 22 16 00	No Specification Required

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 03 01 30 71 - REHABILITATION OF CAST-IN-PLACE CONCRETE**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for concrete rehabilitation. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Removal of deteriorated concrete and reinforcement and subsequent replacement and patching.
 - b. Floor joint repair.
 - c. Epoxy crack injection.
 - d. Corrosion-inhibiting treatment.
 - e. Polymer overlays.
 - f. Polymer sealers.
 - g. Steel structural reinforcement.
 - h. Composite structural reinforcement.

C. Submittals

1. Product Data: For each type of product indicated. Include material descriptions, chemical composition, physical properties, test data, and mixing, preparation, and application instructions.
2. Formwork and Shoring Drawings: Prepared by or under the supervision of a qualified professional engineer detailing formwork and temporary shoring and supports. Include schedule and sequence for erection and removal relative to removal of deteriorated concrete and reinforcement and subsequent repair and reinforcement.
3. Samples: Cured Samples of overlay and patching materials.
4. Rehabilitation Program: For each phase of rehabilitation process, including protection of surrounding materials and Project site during operations. Describe in detail materials, methods, equipment, and sequence of operations to be used for each phase of the Work.
 - a. If alternative materials and methods to those indicated are proposed for any phase of rehabilitation work, submit substitution request and provide a written description of proposed materials and methods, including evidence of successful use on other comparable projects, and a testing program to demonstrate their effectiveness for this Project.

D. Delivery, Storage, And Handling

1. Deliver materials to Project site in manufacturer's original and unopened containers, labeled with type and name of products and manufacturers.
2. Comply with manufacturer's written instructions for minimum and maximum temperature requirements and other conditions for storage.
3. Store cementitious materials off the ground, under cover, and in a dry location.
4. Store aggregates, covered and in a dry location, where grading and other required characteristics can be maintained and contamination avoided.

E. Project Conditions

1. Environmental Limitations for Epoxies: Do not apply when air and substrate temperatures are outside limits permitted by manufacturer. During hot weather, cool epoxy components before mixing, store mixed products in shade, and cool unused mixed products to retard setting. Do not apply to wet substrates unless approved by manufacturer.

- a. Use only Class A epoxies when substrate temperatures are below or are expected to go below 40 deg F (5 deg C) within 8 hours.
- b. Use only Class A or B epoxies when substrate temperatures are below or are expected to go below 60 deg F (16 deg C) within 8 hours.
- c. Use only Class C epoxies when substrate temperatures are above and are expected to stay above 60 deg F (16 deg C) for 8 hours.
2. Cold-Weather Requirements for Cementitious Materials:
 - a. Do not apply unless air temperature is above 40 deg F (5 deg C) and will remain so for at least 48 hours after completion of Work.
OR
 Comply with the following procedures:
 - 1) When air temperature is below 40 deg F (5 deg C), heat patching material ingredients and existing concrete to produce temperatures between 40 and 90 deg F (5 and 32 deg C).
 - 2) When mean daily air temperature is between 25 and 40 deg F (minus 4 and plus 5 deg C), cover completed Work with weather-resistant insulating blankets for 48 hours after repair or provide enclosure and heat to maintain temperatures above 32 deg F (0 deg C) within the enclosure for 48 hours after repair.
 - 3) When mean daily air temperature is below 25 deg F (minus 4 deg C), provide enclosure and heat to maintain temperatures above 32 deg F (0 deg C) within the enclosure for 48 hours after repair.
3. Hot-Weather Requirements for Cementitious Materials: Protect repair work when temperature and humidity conditions produce excessive evaporation of water from patching materials. Provide artificial shade and wind breaks, and use cooled materials as required. Do not apply to substrates with temperatures of 90 deg F (32 deg C) and above.
4. Environmental Limitations for High-Molecular-Weight Methacrylate Sealers: Do not apply when concrete surface temperature is below 55 deg F (13 deg C) or above 75 deg F (24 deg C) **OR** 90 deg F (32 deg C), **as directed**. Apply only to dry substrates **OR** substrates that have been dry for at least 72 hours.

1.2 PRODUCTS

A. Bonding Agents

1. Epoxy-Modified, Cementitious Bonding and Anticorrosion Agent: Product that consists of water-insensitive epoxy adhesive, portland cement, and water-based solution of corrosion-inhibiting chemicals that forms a protective film on steel reinforcement.
2. Epoxy Bonding Agent: ASTM C 881/C 881M, Type II **OR** V, **as directed**.
 - a. Thin Film Open Time: Not less than two **OR** six **OR** 24, **as directed**, hours.
3. Latex Bonding Agent: ASTM C 1059, Type I **OR** II **OR** II at exterior locations and where indicated, Type I at other locations, **as directed**.
4. Mortar Scrub-Coat: 1 part portland cement complying with ASTM C 150, Type I, II, or III and 1 part fine aggregate complying with ASTM C 144, except 100 percent passing a No. 16 (1.18-mm) sieve.

B. Patching Mortar

1. Patching Mortar, General:
 - a. Overhead Patching Mortar: For overhead repairs, use patching mortar recommended by manufacturer for overhead use and as specified in this Article.
 - b. Coarse Aggregate for Adding to Patching Mortar: Washed aggregate complying with ASTM C 33, Size No. 8, Class 5S. Add only as permitted by patching mortar manufacturer.
2. Job-Mixed Patching Mortar: 1 part portland cement complying with ASTM C 150, Type I, II, or III and 2-1/2 parts fine aggregate complying with ASTM C 144, except 100 percent passing a No. 16 (1.18-mm) sieve.
3. Cementitious Patching Mortar: Packaged, dry mix complying with ASTM C 928.

4. Polymer-Modified, Cementitious Patching Mortar: Packaged, dry mix complying with ASTM C 928, that contains a non-redispersible latex additive as either a dry powder or a separate liquid that is added during mixing.
5. Polymer-Modified, Silica-Fume-Enhanced, Cementitious Patching Mortar: Packaged, dry mix complying with ASTM C 928, that contains silica fume complying with ASTM C 1240 and a non-redispersible latex additive as either a dry powder or a separate liquid that is added during mixing.

C. Concrete

1. Concrete Materials and Admixtures: Comply with Division 03 Section "Cast-in-place Concrete".
2. Steel and Fiber Reinforcement and Reinforcement Accessories: Comply with Division 03 Section "Cast-in-place Concrete".
3. Form-Facing Materials: Comply with Division 03 Section "Cast-in-place Concrete".
4. Shotcrete: Comply with Division 03 Section "Shotcrete".
5. Preplaced Aggregate: Washed aggregate complying with ASTM C 33, Class 5S, with 95 to 100 percent passing a 1-1/2-inch (37.5-mm) sieve, 40 to 80 percent passing a 1-inch (25-mm) sieve, 20 to 45 percent passing a 3/4-inch (19-mm) sieve, 0 to 10 percent passing a 1/2-inch (12.5-mm) sieve, and 0 to 2 percent passing a 3/8-inch (9.5-mm) sieve **OR** 100 percent passing a 1-1/2-inch (37.5-mm) sieve, 95 to 100 percent passing a 1-inch (25-mm) sieve, 40 to 80 percent passing a 3/4-inch (19-mm) sieve, 0 to 15 percent passing a 1/2-inch (12.5-mm) sieve, and 0 to 2 percent passing a 3/8-inch (9.5-mm) sieve, **as directed**.
6. Fine Aggregate for Grout Used with Preplaced Aggregate: Fine aggregate complying with ASTM C 33, but with 100 percent passing a No. 8 (2.36-mm) sieve, 95 to 100 percent passing a No. 16 (1.18-mm) sieve, 55 to 80 percent passing a No. 30 (0.6-mm) sieve, 30 to 55 percent passing a No. 50 (0.3-mm) sieve, 10 to 30 percent passing a No. 100 (0.15-mm) sieve, 0 to 10 percent passing a No. 200 (0.075-mm) sieve, and having a fineness modulus of 1.30 to 2.10.
7. Grout Fluidifier for Grout Used with Preplaced Aggregate: ASTM C 937.
8. Portland Cement for Grout Used with Preplaced Aggregate: ASTM C 150.
9. Pozzolans for Grout Used with Preplaced Aggregate: ASTM C 618.

D. Miscellaneous Materials

1. Epoxy Joint Filler: 2-component, semirigid, 100 percent solids, epoxy resin with a Type A Shore durometer hardness of at least 80 per ASTM D 2240.
2. Polyurea Joint Filler: 2-component, semirigid, 100 percent solids, polyurea resin with a Type A Shore durometer hardness of at least 80 per ASTM D 2240.
3. Epoxy Crack Injection Adhesive: ASTM C 881/C 881M, Type I **OR** IV, **as directed**, Grade 1, except for gel time **OR** solvent free, **as directed**.
4. Capping Adhesive: Product manufactured for use with crack injection adhesive by same manufacturer.
5. Corrosion-Inhibiting Treatment Materials: Water-based solution of alkaline corrosion-inhibiting chemicals that penetrates concrete by diffusion and forms a protective film on steel reinforcement.
6. Polymer Overlay: Epoxy adhesive complying with ASTM C 881/C 881M, Type III.
7. Aggregate for Use with Polymer Overlay: Oven-dried, washed silica sand complying with ACI 503.3.
8. Polymer Sealer: Low-viscosity epoxy or high-molecular-weight methacrylate penetrating sealer recommended by manufacturer for application to exterior concrete traffic surfaces.
9. Methylmethacrylate Sealer/Brighteners: Clear low-viscosity sealer recommended by manufacturer for sealing exterior exposed-aggregate concrete, and formulated to bring out color of aggregates and give concrete a wet look.
10. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.
 - a. After fabricating, prepare surfaces to comply with SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
 - b. For minimum protection to steel after preparation, apply one coat of lead- and chromate-free, modified-alkyd primer complying with MPI#76 and one coat of alkyd-gloss enamel complying with MPI#96.

- c. After preparation, apply two-coat high-performance coating system consisting of organic zinc-rich primer, complying with SSPC-Paint 20 or SSPC-Paint 29 and topcoat of high-build, urethane or epoxy coating recommended by manufacturer for application over specified zinc-rich primer. Comply with coating manufacturer's written directions and with requirements in SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting.
11. Bolts, Nuts, and Washers: Carbon steel; ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6), for bolts; ASTM A 563 (ASTM A 563M), Grade A, for nuts; and ASTM F 436 (ASTM F 436M) for washers; hot-dip or mechanically zinc coated.
12. Postinstalled Anchors: Chemical or expansion anchors, made from stainless-steel components complying with ASTM F 593 and ASTM F 594, Alloy Group 1 or 2 (ASTM F 738M and ASTM F 836M, Alloy Group A1 or A4) for bolts and nuts; ASTM A 666 or ASTM A 276, Type 304 or 316, for anchors, with capability to sustain, without failure, a load equal to four times the load imposed, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
13. Composite Structural Reinforcement: Manufacturer's system consisting of carbon **OR** glass, **as directed**, fiber reinforcement in the form of preimpregnated sheets or tow sheet with field-applied saturant, and epoxy primers, fillers, adhesives, saturants, and topcoats, designed for use as external structural reinforcement for concrete.

E. Mixes

1. Mix products, in clean containers, according to manufacturer's written instructions.
 - a. Add clean silica sand and coarse aggregates to products only as recommended by manufacturer.
 - b. Do not add water, thinners, or additives unless recommended by manufacturer.
 - c. When practical, use manufacturer's premeasured packages to ensure that materials are mixed in proper proportions. When premeasured packages are not used, measure ingredients using graduated measuring containers; do not estimate quantities or use shovel or trowel as unit of measure.
 - d. Do not mix more materials than can be used within recommended open time. Discard materials that have begun to set.
2. Mortar Scrub-Coat: Mix with enough water to provide consistency of thick cream.
3. Dry-Pack Mortar: Mix with just enough liquid to form damp cohesive mixture that can be squeezed by hand into a ball but is not plastic.
4. Concrete: Comply with Division 03 Section "Cast-in-place Concrete".
5. Shotcrete: Comply with Division 03 Section "Shotcrete".
6. Grout for Use with Preplaced Aggregate: Proportion according to ASTM C 938. Add grout fluidifier to mixing water followed by cementitious materials and then fine aggregate.

1.3 EXECUTION

A. Examination

1. Notify The University seven days in advance of dates when areas of deteriorated or delaminated concrete and deteriorated reinforcing bars will be located.
2. Locate areas of deteriorated or delaminated concrete using hammer or chain drag sounding and mark boundaries. Mark areas for removal by simplifying and squaring off boundaries. At columns and walls make boundaries level and plumb, unless otherwise indicated.
3. Locate at least three reinforcing bars using a pachometer, and drill test holes to determine depth of cover. Calibrate pachometer, using depth of cover measurements, and verify depth of cover in removal areas using pachometer.

B. Preparation

1. Protect people, motor vehicles, equipment, surrounding construction, Project site, plants, and surrounding buildings from injury resulting from concrete rehabilitation work.
 - a. Erect and maintain temporary protective covers over pedestrian walkways and at points of entrance and exit for people and vehicles, unless such areas are made inaccessible during

- the course of concrete rehabilitation work. Construct covers of tightly fitted, 3/4-inch (19-mm) exterior-grade plywood supported at 16 inches (405 mm) o.c. and covered with asphalt roll roofing.
- b. Protect adjacent equipment and surfaces by covering them with heavy polyethylene film and waterproof masking tape or a liquid strippable masking agent. If practical, remove items, store, and reinstall after potentially damaging operations are complete.
 - c. Neutralize and collect alkaline and acid wastes according to requirements of authorities having jurisdiction, and dispose of by legal means off Owner's property.
 - d. Dispose of runoff from wet operations by legal means and in a manner that prevents soil erosion, undermining of paving and foundations, damage to landscaping, and water penetration into building interiors.
 - e. Collect runoff from wet operations and dispose of by legal means off Owner's property.
2. Shoring: Install temporary supports before beginning concrete removal.
 3. Concrete Removal:
 - a. Saw-cut perimeter of areas indicated for removal to a depth of at least 1/2 inch (13 mm). Make cuts perpendicular to concrete surfaces and no deeper than cover on reinforcement.
 - b. Remove deteriorated and delaminated concrete by breaking up and dislodging from reinforcement.
 - c. Remove additional concrete, if necessary, to provide a depth of removal of at least 1/2 inch (13 mm) over entire removal area.
 - d. Where half or more of the perimeter of reinforcing bar is exposed, bond between reinforcing bar and surrounding concrete is broken, or reinforcing bar is corroded, remove concrete from entire perimeter of bar and to provide at least a 3/4-inch (19-mm) clearance around bar.
 - e. Test areas where concrete has been removed by tapping with hammer, and remove additional concrete until unsound and disbonded concrete is completely removed.
 - f. Provide fractured aggregate surfaces with a profile of at least 1/8 inch (3 mm) that are approximately perpendicular or parallel to original concrete surfaces. At columns and walls, make top and bottom surfaces level, unless otherwise directed.
 - g. Thoroughly clean removal areas of loose concrete, dust, and debris.
 4. Reinforcing Bar Preparation: Remove loose and flaking rust from reinforcing bars by high-pressure water cleaning **OR** abrasive blast cleaning **OR** needle scaling **OR** wire brushing, **as directed**, until only tightly bonded light rust remains.
 - a. Where section loss of reinforcing bar is more than 25 percent, or 20 percent in 2 or more adjacent bars, cut bars and remove and replace. Remove additional concrete as necessary to provide at least 3/4-inch (19-mm) clearance at existing and replacement bars. Splice replacement bars to existing bars according to ACI 318 (ACI 318M), by lapping, welding, or using mechanical couplings.
 5. Preparation of Floor Joints for Repair: Saw-cut joints full width to edges and depth of spalls, but not less than 3/4 inch (19 mm) **OR** 1 inch (25 mm) **OR** 2 inches (50 mm), **as directed**, deep. Clean out debris and loose concrete; vacuum or blow clear with compressed air.
 6. Surface Preparation for Corrosion-Inhibiting Treatment: Clean concrete by low-pressure water cleaning **OR** detergent scrubbing **OR** sand blasting, **as directed**, to remove dirt, oils, films, and other materials detrimental to treatment application. Allow surface to dry before applying corrosion-inhibiting treatment.
 7. Surface Preparation for Overlays: Remove delaminated material and deteriorated concrete surface material. Roughen surface of concrete by sand blasting **OR** shot blasting **OR** scarifying **OR** needle scaling **OR** high-pressure water jetting **OR** scabbling **OR** flame blasting **OR** milling, **as directed**, to produce a surface profile matching CSP 3 **OR** 4 **OR** 5 **OR** 6 **OR** 7 **OR** 8 **OR** 9, **as directed**, per ICRI 03732. Sweep and vacuum roughened surface to remove debris followed by low-pressure water cleaning.
 8. Surface Preparation for Sealers: Clean concrete by shot blasting **OR** low-pressure water cleaning **OR** detergent scrubbing, **as directed**, to remove dirt, oils, films, and other materials detrimental to sealer application.
 9. Surface Preparation for Sealers: Acid etch surface of concrete to produce a surface profile matching CSP 1 per ICRI 03732. Prepare surface for acid etching by detergent scrubbing to remove oils and films that may prevent acid penetration.

- a. Remove excess acid solution, reaction products, and debris by squeegeeing or vacuuming.
 - b. Scrub surface with an alkaline detergent, rinse, and squeegee or vacuum.
 - c. Check acidity of surface with pH test paper and continue rinsing until pH is acceptable.
 - d. When pH is acceptable and surface is clean, vacuum dry.
10. Surface Preparation for Composite Structural Reinforcement: Remove delaminated material and deteriorated concrete surface material. Clean concrete where reinforcement and epoxy patching mortar is to be applied by low-pressure water cleaning **OR** detergent scrubbing, **as directed**, to remove dirt, oils, films, and other materials detrimental to epoxy application. Roughen surface of concrete by sand blasting.

C. Application

1. General: Comply with manufacturer's written instructions and recommendations for application of products, including surface preparation.
2. Epoxy-Modified, Cementitious Bonding and Anticorrosion Agent: Apply to reinforcing bars and concrete by stiff brush or hopper spray according to manufacturer's written instructions. Apply to reinforcing bars in two coats, allowing first coat to dry two to three hours before applying second coat. Allow to dry before placing patching mortar or concrete.
3. Epoxy Bonding Agent: Apply to reinforcing bars and concrete by brush, roller, or spray according to manufacturer's written instructions, leaving no pinholes or other uncoated areas. Apply to reinforcing bars in at least two coats, allowing first coat to dry before applying second coat. Apply patching mortar or concrete while epoxy is still tacky. If epoxy dries, recoat before placing patching mortar or concrete.
4. Latex Bonding Agent, Type II: Mix with portland cement and scrub into concrete surface according to manufacturer's written instructions. Apply patching mortar or concrete while bonding agent is still wet. If bonding agent dries, recoat before placing patching mortar or concrete.
5. Latex Bonding Agent, Type I: Apply to concrete by brush roller or spray. Allow to dry before placing patching mortar or concrete.
6. Mortar Scrub-Coat: Dampen repair area and surrounding concrete 6 inches (150 mm) beyond repair area. Remove standing water and apply scrub-coat with a brush, scrubbing it into surface and thoroughly coating repair area. If scrub-coat dries, recoat before applying patching mortar or concrete.
7. Patching Mortar: Unless otherwise recommended by manufacturer, apply as follows:
 - a. Wet substrate thoroughly and then remove standing water. Scrub a slurry of neat patching mortar mixed with latex bonding agent into substrate, filling pores and voids.
 - b. Place patching mortar by troweling toward edges of patch to force intimate contact with edge surfaces. For large patches, fill edges first and then work toward center, always troweling toward edges of patch. At fully exposed reinforcing bars, force patching mortar to fill space behind bars by compacting with trowel from sides of bars.
 - c. For vertical patching, place material in lifts of not more than 1 inch (25 mm) **OR** 1-1/2 inches (38 mm) **OR** 2 inches (50 mm) **OR** 3 inches (75 mm), **as directed**, nor less than 1/8 inch (3 mm) **OR** 1/4 inch (6 mm), **as directed**. Do not feather edge.
 - d. For overhead patching, place material in lifts of not more than 1 inch (25 mm) **OR** 1-1/2 inches (38 mm) **OR** 2 inches (50 mm), **as directed**, nor less than 1/8 inch (3 mm) **OR** 1/4 inch (6 mm), **as directed**. Do not feather edge.
 - e. After each lift is placed, consolidate material and screed surface.
 - f. Where multiple lifts are used, score surface of lifts to provide a rough surface for application of subsequent lifts. Allow each lift to reach final set before placing subsequent lifts.
 - g. Allow surfaces of lifts that are to remain exposed to become firm and then finish to a smooth **OR** rough, **as directed**, surface with a wood or sponge float **OR** broom or burlap drag, **as directed**.
 - h. Wet-cure cementitious patching materials, including polymer-modified, cementitious patching materials, for not less than seven days by water-fog spray or water-saturated absorptive cover.
8. Dry-Pack Mortar: Use for deep cavities and where indicated. Unless otherwise recommended by manufacturer, apply as follows:
 - a. Provide forms where necessary to confine patch to required shape.

- b. Wet substrate and forms thoroughly and then remove standing water.
- c. Place dry-pack mortar into cavity by hand, and compact into place with a hardwood drive stick and mallet or hammer. Do not place more material at a time than can be properly compacted. Continue placing and compacting until patch is approximately level with surrounding surface.
- d. After cavity is filled and patch is compacted, trowel surface to match profile and finish of surrounding concrete. A thin coat of patching mortar may be troweled into the surface of patch to help obtain required finish.
- e. Wet-cure patch for not less than seven days by water-fog spray or water-saturated absorptive cover.
9. Concrete: Place according to Division 03 Section "Cast-in-place Concrete" and as follows:
 - a. Apply epoxy-modified, cementitious bonding and anticorrosion agent **OR** epoxy bonding agent, **as directed**, to reinforcement and concrete substrate.
 - b. Apply latex bonding agent **OR** Type I, latex bonding agent **OR** mortar scrub-coat, **as directed**, to concrete substrate.
 - c. Use vibrators to consolidate concrete as it is placed.
 - d. At unformed surfaces, screed concrete to produce a surface that when finished with patching mortar will match required profile and surrounding concrete.
 - e. Where indicated place concrete by form and pump method.
 - 1) Design and construct forms to resist pumping pressure in addition to weight of wet concrete. Seal joints and seams in forms and junctions of forms with existing concrete.
 - 2) Pump concrete into place, releasing air from forms as concrete is introduced. When formed space is full, close air vents and pressurize to 14 psi (96 kPa).
 - f. Wet-cure concrete for not less than seven days by leaving forms in place or keeping surfaces continuously wet by water-fog spray or water-saturated absorptive cover.
 - g. Fill placement cavities with dry-pack mortar and repair voids with patching mortar. Finish to match surrounding concrete.
10. Shotcrete: Place according to Division 03 Section "Shotcrete" and as follows:
 - a. Apply epoxy-modified, cementitious bonding and anticorrosion agent **OR** epoxy bonding agent, **as directed**, to reinforcement and concrete substrate.
 - b. Apply latex bonding agent **OR** Type I, latex bonding agent **OR** mortar scrub-coat, **as directed**, to concrete substrate.
 - c. Screed and finish shotcrete to produce a surface matching required profile and surrounding concrete.
11. Grouted Preplaced Aggregate Concrete: Use for column and wall repairs **OR** where indicated, **as directed**. Place as follows:
 - a. Design and construct forms to resist pumping pressure in addition to weight of wet grout. Seal joints and seams in forms and junctions of forms with existing concrete.
 - b. Apply epoxy-modified, cementitious bonding and anticorrosion agent **OR** epoxy bonding agent, **as directed**, to reinforcement and concrete substrate.
 - c. Place aggregate in forms, consolidating aggregate as it is placed. Pack aggregate into upper areas of forms to achieve intimate contact with concrete surfaces.
 - d. Fill forms with water to thoroughly dampen aggregate and substrates. Drain water from forms before placing grout.
 - e. Pump grout into place at bottom of preplaced aggregate, forcing grout upward. Release air from forms at top as grout is introduced. When formed space is full and grout flows from air vents, close vents and pressurize to 14 psi (96 kPa).
 - f. Wet-cure concrete for not less than seven days by leaving forms in place or keeping surfaces continuously wet by water-fog spray or water-saturated absorptive cover.
 - g. Repair voids with patching mortar and finish to match surrounding concrete.
12. Joint Filler: Install in nonmoving floor joints where indicated.
 - a. Install filler to a depth of at least 3/4 inch (19 mm) **OR** 1 inch (25 mm) **OR** 2 inches (50 mm), **as directed**. Use fine silica sand no more than 1/4 inch (6 mm) deep to close base of joint. Do not use sealant backer rods or compressible fillers below joint filler.
 - b. Install filler so that when cured, it is flush at top surface of adjacent concrete. If necessary, overfill joint and remove excess when filler has cured.

13. Epoxy Crack Injection: Comply with manufacturer's written instructions and the following:
 - a. Clean areas to receive capping adhesive of oil, dirt, and other substances that would interfere with bond, and clean cracks with oil-free compressed air or low-pressure water to remove loose particles.
 - b. Place injection ports as recommended by epoxy manufacturer, spacing no farther apart than thickness of member being injected. Seal injection ports in place with capping adhesive.
 - c. Seal cracks at exposed surfaces with a ribbon of capping adhesive at least 1/4 inch (6 mm) thick by 1 inch (25 mm) wider than crack.
 - d. Inject cracks wider than 0.003 inch (0.075 mm) to a depth of 8 inches (200 mm) or to a width of less than 0.003 inch (0.075 mm), whichever is less.
 - e. Inject epoxy adhesive, beginning at widest part of crack and working toward narrower parts. Inject adhesive into ports to refusal, capping adjacent ports when they extrude epoxy. Cap injected ports and inject through adjacent ports until crack is filled.
 - f. After epoxy adhesive has set, remove injection ports and grind surfaces smooth.
14. Corrosion-Inhibiting Treatment: Apply by brush, roller, or airless spray in two coats at manufacturer's recommended application rate. Remove film of excess treatment by high-pressure washing before patching treated concrete or applying a sealer or overlay.
15. Polymer Overlay: Apply according to ACI 503.3.
 - a. Apply to traffic-bearing surfaces, including parking areas and walks.
16. Polymer Sealer: Apply by brush, roller, or airless spray at manufacturer's recommended application rate.
 - a. Apply to traffic-bearing surfaces, including parking areas and walks.
17. Methylmethacrylate Sealer/Brighteners: Apply by brush, roller, or airless spray at manufacturer's recommended application rate.
 - a. Apply to exterior concrete surfaces that are exposed to view, excluding traffic-bearing surfaces.
18. Composite Structural Reinforcement Using Preimpregnated Fiber Sheet: Unless otherwise recommended by manufacturer, apply as follows:
 - a. Patch surface defects with epoxy mortar and allow to set before beginning reinforcement application.
 - b. Apply epoxy adhesive to a thickness of 1/16 inch (1.6 mm) to prepared concrete surfaces in areas where composite structural reinforcement will be applied.
 - c. Clean preimpregnated fiber sheet with acetone or other suitable solvent, and apply epoxy adhesive to a thickness of 1/16 inch (1.6 mm).
 - d. Apply adhesive-coated fiber sheet to adhesive-coated concrete within open time of epoxy adhesive, and roll with a hard rubber roller until fiber sheet is fully embedded in adhesive, air pockets are removed, and adhesive is forced out from beneath fiber sheet at edges.
 - e. Apply additional layers as indicated using same procedure.
19. Composite Structural Reinforcement Using Fiber Tow Sheet and Saturant: Unless otherwise recommended by manufacturer, apply as follows:
 - a. Apply epoxy primer using brush or short nap roller to prepared concrete surfaces in areas where composite structural reinforcement will be applied.
 - b. After primer has set, patch surface defects with epoxy filler and allow to set before beginning reinforcement application.
 - c. Apply epoxy saturant to fiber tow sheet or primed and patched surface with 3/8-inch- (10-mm-) nap roller. Apply fiber tow sheet to primed and patched surface while saturant is still wet, using pressure roller to remove air pockets. Remove paper backing from fiber tow sheet and apply additional epoxy as needed to fully saturate tow sheet.
 - d. Apply additional layers as indicated, fully saturating each with epoxy.
 - e. After saturant has cured, apply protective topcoat by brush, roller or spray.

D. Field Quality Control

1. Testing Agency: Engage a qualified testing agency to sample materials and perform tests as follows:
 - a. Patching Mortar, Packaged Mixes: <Insert number> randomly selected samples tested according to ASTM C 928.

- b. Patching Mortar, Field Mixed: <Insert number> randomly selected samples tested for compressive strength according to ASTM C 109/C 109M.
- c. Concrete: As specified in Division 03 Section "Cast-in-place Concrete".
- d. Shotcrete: As specified in Division 03 Section "Shotcrete".
- e. Grouted Preplaced Aggregate: Tested for compressive strength of grout according to ASTM C 942.
 - 1) Testing Frequency: One sample for each 25 cu. yd. (19 cu. m) of grout or fraction thereof, but not less than one sample for each day's work.
- f. Joint Filler: Core drilled samples to verify proper installation.
 - 1) Testing Frequency: One sample for each 100 feet (30 m) of joint filled.
 - 2) Where samples are taken, fill holes with joint filler.
- g. Epoxy Crack Injection: Core drilled samples to verify proper installation.
 - 1) Testing Frequency: 3 samples from mockup and 1 sample for each 100 feet (30 m) of crack injected.
 - 2) Where samples are taken, fill holes with epoxy mortar.

SECTION 03 30 00 00 - CAST-IN-PLACE CONCRETE**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for cast-in-place concrete. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section specifies cast-in place concrete, including formwork, reinforcement, concrete materials, mixture design, placement procedures, and finishes, for the following:
 - a. Footings.
 - b. Foundation walls.
 - c. Slabs-on-grade.
 - d. Suspended slabs.
 - e. Concrete toppings.
 - f. Building frame members.
 - g. Building walls.

C. Definitions

1. Cementitious Materials: Portland cement alone or in combination with one or more of the following: blended hydraulic cement, fly ash and other pozzolans, ground granulated blast-furnace slag, and silica fume; subject to compliance with requirements.

D. Submittals

1. Product Data: For each type of product indicated.
2. Design Mixtures: For each concrete mixture.
3. Shop Drawings: For steel reinforcement and formwork. Material test reports **OR** certificates, **as directed**.

E. Quality Assurance

1. Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94/C 94M requirements for production facilities and equipment.
 - a. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities."
2. Testing Agency Qualifications: An independent agency, acceptable to authorities having jurisdiction, **as directed**, qualified according to ASTM C 1077 and ASTM E 329 for testing indicated, as documented according to ASTM E 548.
3. ACI Publications: Comply with the following unless modified by requirements in the Contract Documents:
 - a. ACI 301, "Specification for Structural Concrete," Sections 1 through 5 **OR** Sections 1 through 5 and Section 7, "Lightweight Concrete", **as directed**.
 - b. ACI 117, "Specifications for Tolerances for Concrete Construction and Materials."
4. Concrete Testing Service: Engage a qualified independent testing agency to perform material evaluation tests and to design concrete mixtures.
5. Preinstallation Conference: Conduct conference at Project site.

F. Delivery, Storage, And Handling

1. Steel Reinforcement: Deliver, store, and handle steel reinforcement to prevent bending and damage. Avoid damaging coatings on steel reinforcement, **as directed**.
2. Waterstops: Store waterstops under cover to protect from moisture, sunlight, dirt, oil, and other contaminants.

1.2 PRODUCTS

A. Form-Facing Materials

1. Smooth-Formed Finished Concrete: Form-facing panels that will provide continuous, true, and smooth concrete surfaces. Furnish in largest practicable sizes to minimize number of joints.
2. Rough-Formed Finished Concrete: Plywood, lumber, metal, or another approved material. Provide lumber dressed on at least two edges and one side for tight fit.
3. Forms for Cylindrical Columns, Pedestals, and Supports: Metal, glass-fiber-reinforced plastic, paper, or fiber tubes that will produce surfaces with gradual or abrupt irregularities not exceeding specified formwork surface class. Provide units with sufficient wall thickness to resist plastic concrete loads without detrimental deformation.
4. Pan-Type Forms: Glass-fiber-reinforced plastic or formed steel, stiffened to resist plastic concrete loads without detrimental deformation.
5. Void Forms: Biodegradable paper surface, treated for moisture resistance, structurally sufficient to support weight of plastic concrete and other superimposed loads.
6. Chamfer Strips: Wood, metal, PVC, or rubber strips, 3/4 by 3/4 inch (19 by 19 mm), minimum.
7. Rustication Strips: Wood, metal, PVC, or rubber strips, kerfed for ease of form removal.
8. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent treatments of concrete surfaces.
 - a. Formulate form-release agent with rust inhibitor for steel form-facing materials.
9. Form Ties: Factory-fabricated, removable or snap-off metal or glass-fiber-reinforced plastic form ties designed to resist lateral pressure of fresh concrete on forms and to prevent spalling of concrete on removal.
 - a. Furnish units that will leave no corrodible metal closer than 1 inch (25 mm) to the plane of exposed concrete surface.
 - b. Furnish ties that, when removed, will leave holes no larger than 1 inch (25 mm) in diameter in concrete surface.
 - c. Furnish ties with integral water-barrier plates to walls indicated to receive dampproofing or waterproofing.

B. Steel Reinforcement

1. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 **OR** 60, **as directed**, percent.
2. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), deformed.
3. Low-Alloy-Steel Reinforcing Bars: ASTM A 706/A 706M, deformed.
4. Galvanized Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (Grade 420) **OR** ASTM A 706/A 706M, **as directed**, deformed bars, ASTM A 767/A 767M, Class I **OR** II, **as directed**, zinc coated after fabrication and bending.
5. Epoxy-Coated Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (Grade 420) **OR** ASTM A 706/A 706M, **as directed**, deformed bars, ASTM A 775/A 775M **OR** ASTM A 934/A 934M, **as directed**, epoxy coated, with less than 2 percent damaged coating in each 12-inch (300-mm) bar length.
6. Stainless-Steel Reinforcing Bars: ASTM A 955/A 955M, Grade 60 (Grade 420), Type 304 **OR** 316L, **as directed**, deformed.
7. Steel Bar Mats: ASTM A 184/A 184M, fabricated from ASTM A 615/A 615M, Grade 60 (Grade 420) **OR** ASTM A 706/A 706M, **as directed**, deformed bars, assembled with clips.
8. Plain-Steel Wire: ASTM A 82, as drawn **OR** galvanized, **as directed**.
9. Deformed-Steel Wire: ASTM A 496.
10. Epoxy-Coated Wire: ASTM A 884/A 884M, Class A, Type 1 coated, as-drawn, plain-steel-wire **OR** deformed-steel wire, **as directed**, with less than 2 percent damaged coating in each 12-inch (300-mm) wire length.
11. Plain-Steel Welded Wire Reinforcement: ASTM A 185, plain, fabricated from as-drawn steel wire into flat sheets.
12. Deformed-Steel Welded Wire Reinforcement: ASTM A 497, flat sheet.

13. Galvanized-Steel Welded Wire Reinforcement: ASTM A 185, plain, fabricated from galvanized steel wire into flat sheets.
 14. Epoxy-Coated Welded Wire Reinforcement: ASTM A 884/A 884M, Class A coated, Type 1, plain **OR** deformed, **as directed**, steel.
- C. Reinforcement Accessories
1. Joint Dowel Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), plain-steel bars, cut bars true to length with ends square and free of burrs.
 2. Epoxy-Coated Joint Dowel Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), plain-steel bars, ASTM A 775/A 775M epoxy coated.
 3. Epoxy Repair Coating: Liquid, two-part, epoxy repair coating; compatible with epoxy coating on reinforcement and complying with ASTM A 775/A 775M.
 4. Zinc Repair Material: ASTM A 780, zinc-based solder, paint containing zinc dust, or sprayed zinc.
 5. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire reinforcement in place. Manufacture bar supports from steel wire, plastic, or precast concrete according to CRSI's "Manual of Standard Practice," of greater compressive strength than concrete and as follows:
 - a. For concrete surfaces exposed to view where legs of wire bar supports contact forms, use CRSI Class 1 plastic-protected steel wire or CRSI Class 2 stainless-steel bar supports.
 - b. For epoxy-coated reinforcement, use epoxy-coated or other dielectric-polymer-coated wire bar supports.
 - c. For zinc-coated reinforcement, use galvanized wire or dielectric-polymer-coated wire bar supports.
- D. Concrete Materials
1. Cementitious Material: Use the following cementitious materials, of the same type, brand, and source, throughout Project:
 - a. Portland Cement: ASTM C 150, Type I **OR** II **OR** I/II **OR** III **OR** V, **as directed**, gray **OR** white, **as directed**. Supplement with the following:
 - 1) Fly Ash: ASTM C 618, Class C **OR** F, **as directed**.
 - 2) Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.
 - b. Blended Hydraulic Cement: ASTM C 595, Type IS, portland blast-furnace slag **OR** IP, portland-pozzolan **OR** I (PM), pozzolan-modified portland **OR** I (SM), slag-modified Portland, **as directed**, cement.
 2. Silica Fume: ASTM C 1240, amorphous silica.
 3. Normal-Weight Aggregates: ASTM C 33, graded, 1-1/2-inch (38-mm) **OR** 1-inch (25-mm) **OR** 3/4-inch (19-mm), **as directed**, nominal maximum coarse-aggregate size.
 - a. Fine Aggregate: Free of materials with deleterious reactivity to alkali in cement.
 4. Lightweight Aggregate: ASTM C 330, 1-inch (25-mm) **OR** 3/4-inch (19-mm) **OR** 1/2-inch (13-mm) **OR** 3/8-inch (10-mm), **as directed**, nominal maximum aggregate size.
 5. Water: ASTM C 94/C 94M and potable, **as directed**.
- E. Admixtures
1. Air-Entraining Admixture: ASTM C 260.
 2. Chemical Admixtures: Provide admixtures certified by manufacturer to be compatible with other admixtures and that will not contribute water-soluble chloride ions exceeding those permitted in hardened concrete. Do not use calcium chloride or admixtures containing calcium chloride.
 - a. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
 - b. Retarding Admixture: ASTM C 494/C 494M, Type B.
 - c. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
 - d. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
 - e. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
 - f. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M, Type II.
 3. Set-Accelerating Corrosion-Inhibiting Admixture: Commercially formulated, anodic inhibitor or mixed cathodic and anodic inhibitor; capable of forming a protective barrier and minimizing

chloride reactions with steel reinforcement in concrete and complying with ASTM C 494/C 494M, Type C.

4. Non-Set-Accelerating Corrosion-Inhibiting Admixture: Commercially formulated, non-set-accelerating, anodic inhibitor or mixed cathodic and anodic inhibitor; capable of forming a protective barrier and minimizing chloride reactions with steel reinforcement in concrete.
5. Color Pigment: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures; color stable, free of carbon black, **as directed**, nonfading, and resistant to lime and other alkalis.
 - a. Color: As indicated by manufacturer's designation **OR** Match UTHSCSA's sample **OR** As selected by UTHSCSA from manufacturer's full range, **as directed**.

F. Fiber Reinforcement

1. Carbon-Steel Fiber: ASTM A 820, deformed, minimum of 1.5 inches (38 mm) **OR** 2 inches (50 mm) **OR** 2.4 inches (60 mm), **as directed**, long, and aspect ratio of 35 to 40 **OR** 45 to 50 **OR** 60 to 65, **as directed**.
 - a. Fiber: Type 1, cold-drawn wire **OR** 2, cut sheet, **as directed**.
2. Synthetic Fiber: Monofilament or fibrillated polypropylene fibers engineered and designed for use in concrete pavement, complying with ASTM C 1116, Type III, 1/2 to 1-1/2 inches (13 to 38 mm) long.

G. Waterstops

1. Flexible Rubber Waterstops: CE CRD-C 513, with factory-installed metal eyelets, **as directed**, for embedding in concrete to prevent passage of fluids through joints. Factory fabricate corners, intersections, and directional changes.
 - a. Profile: Flat, dumbbell with center bulb **OR** Flat, dumbbell without center bulb **OR** Ribbed with center bulb **OR** Ribbed without center bulb **OR** As indicated, **as directed**.
 - b. Dimensions: 4 inches by 3/16 inch thick (100 mm by 4.75 mm thick) **OR** 6 inches by 3/8 inch thick (150 mm by 10 mm thick) **OR** 9 inches by 3/8 inch thick (225 mm by 10 mm thick), **as directed**; nontapered.
2. Chemically Resistant Flexible Waterstops: Thermoplastic elastomer rubber waterstops with factory-installed metal eyelets, **as directed**, for embedding in concrete to prevent passage of fluids through joints; resistant to oils, solvents, and chemicals. Factory fabricate corners, intersections, and directional changes.
 - a. Profile: Flat, dumbbell with center bulb **OR** Flat, dumbbell without center bulb **OR** Ribbed with center bulb **OR** Ribbed without center bulb **OR** As indicated, **as directed**.
 - b. Dimensions: 4 inches by 3/16 inch thick (100 mm by 4.75 mm thick) **OR** 6 inches by 3/16 inch thick (150 mm by 4.75 mm thick) **OR** 6 inches by 3/8 inch thick (150 mm by 10 mm thick) **OR** 9 inches by 3/16 inch thick (225 mm by 4.75 mm thick) **OR** 9 inches by 3/8 inch thick (225 mm by 10 mm thick), **as directed**; nontapered.
3. Flexible PVC Waterstops: CE CRD-C 572, with factory-installed metal eyelets, **as directed**, for embedding in concrete to prevent passage of fluids through joints. Factory fabricate corners, intersections, and directional changes.
 - a. Profile: Flat, dumbbell with center bulb **OR** Flat, dumbbell without center bulb **OR** Ribbed with center bulb **OR** Ribbed without center bulb **OR** As indicated, **as directed**.
 - b. Dimensions: 4 inches by 3/16 inch thick (100 mm by 4.75 mm thick) **OR** 6 inches by 3/8 inch thick (150 mm by 10 mm thick) **OR** 9 inches by 3/8 inch thick (225 mm by 10 mm thick), **as directed**; nontapered.
4. Self-Expanding Butyl Strip Waterstops: Manufactured rectangular or trapezoidal strip, butyl rubber with sodium bentonite or other hydrophilic polymers, for adhesive bonding to concrete, 3/4 by 1 inch (19 by 25 mm).
5. Self-Expanding Rubber Strip Waterstops: Manufactured rectangular or trapezoidal strip, bentonite-free hydrophilic polymer modified chloroprene rubber, for adhesive bonding to concrete, 3/8 by 3/4 inch (10 by 19 mm).

H. Vapor Retarders

1. Plastic Vapor Retarder:

- a. ASTM E 1745, Class A. Include manufacturer's recommended adhesive or pressure-sensitive tape.
 - b. ASTM E 1745, Class B. Include manufacturer's recommended adhesive or pressure-sensitive tape.
 - c. ASTM E 1745, Class C, or polyethylene sheet, ASTM D 4397, not less than 10 mils (0.25 mm) thick, **as directed**. Include manufacturer's recommended adhesive or pressure-sensitive joint tape.
 2. Bituminous Vapor Retarder: 110-mil- (2.8-mm-) thick, semiflexible, 7-ply sheet membrane consisting of reinforced core and carrier sheet with fortified asphalt layers, protective weathercoating, and removable plastic release liner. Furnish manufacturer's accessories including bonding asphalt, pointing mastics, and self-adhering joint tape.
 - a. Water-Vapor Permeance: 0.00 grains/h x sq. ft. x inches Hg (0.00 ng/Pa x s x sq. m); ASTM E 154.
 - b. Tensile Strength: 140 lbf/in. (24.5 kN/m); ASTM E 154.
 - c. Puncture Resistance: 90 lbf (400N); ASTM E 154.
 3. Granular Fill: Clean mixture of crushed stone or crushed or uncrushed gravel; ASTM D 448, Size 57, with 100 percent passing a 1-1/2-inch (37.5-mm) sieve and 0 to 5 percent passing a No. 8 (2.36-mm) sieve.
 4. Fine-Graded Granular Material: Clean mixture of crushed stone, crushed gravel, and manufactured or natural sand; ASTM D 448, Size 10, with 100 percent passing a 3/8-inch (9.5-mm) sieve, 10 to 30 percent passing a No. 100 (0.15-mm) sieve, and at least 5 percent passing No. 200 (0.075-mm) sieve; complying with deleterious substance limits of ASTM C 33 for fine aggregates.
- I. Floor And Slab Treatments
1. Slip-Resistive Emery Aggregate Finish: Factory-graded, packaged, rustproof, nonglazing, abrasive, crushed emery aggregate containing not less than 50 percent aluminum oxide and not less than 20 percent ferric oxide; unaffected by freezing, moisture, and cleaning materials with 100 percent passing 3/8-inch (9.5-mm) **OR** No. 4 (4.75-mm) **OR** No. 8 (2.36-mm), **as directed**, sieve.
 2. Slip-Resistive Aluminum Granule Finish: Factory-graded, packaged, rustproof, nonglazing, abrasive aggregate of not less than 95 percent fused aluminum-oxide granules.
 3. Emery Dry-Shake Floor Hardener: Pigmented **OR** Unpigmented, **as directed**, factory-packaged, dry combination of portland cement, graded emery aggregate, and plasticizing admixture; with emery aggregate consisting of no less than 60 percent of total aggregate content.
 - a. Color: As indicated by manufacturer's designation **OR** Match UTHSCSA's sample **OR** As selected by UTHSCSA from manufacturer's full range, **as directed**.
 4. Metallic Dry-Shake Floor Hardener: Pigmented **OR** Unpigmented, **as directed**, factory-packaged, dry combination of portland cement, graded metallic aggregate, rust inhibitors, and plasticizing admixture; with metallic aggregate consisting of no less than 65 percent of total aggregate content.
 - a. Color: As indicated by manufacturer's designation **OR** Match UTHSCSA's sample **OR** As selected by UTHSCSA from manufacturer's full range, **as directed**.
 5. Unpigmented Mineral Dry-Shake Floor Hardener: Factory-packaged dry combination of portland cement, graded quartz aggregate, and plasticizing admixture.
 6. Pigmented Mineral Dry-Shake Floor Hardener: Factory-packaged, dry combination of portland cement, graded quartz aggregate, color pigments, and plasticizing admixture. Use color pigments that are finely ground, nonfading mineral oxides interground with cement.
 - a. Color: As indicated by manufacturer's designation **OR** Match UTHSCSA's sample **OR** As selected by UTHSCSA from manufacturer's full range, **as directed**.
 7. Penetrating Liquid Floor Treatment: Clear, chemically reactive, waterborne solution of inorganic silicate or silicate materials and proprietary components; odorless; colorless; that penetrates, hardens, and densifies concrete surfaces.
- J. Curing Materials
1. Evaporation Retarder: Waterborne, monomolecular film forming, manufactured for application to fresh concrete.

2. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, weighing approximately 9 oz./sq. yd. (305 g/sq. m) when dry.
3. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.
4. Water: Potable.
5. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, dissipating.
6. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, nondissipating, certified by curing compound manufacturer to not interfere with bonding of floor covering, **as directed**.
7. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, 18 to 25 percent solids, nondissipating, certified by curing compound manufacturer to not interfere with bonding of floor covering, **as directed**.
8. Clear, Solvent-Borne, Membrane-Forming Curing and Sealing Compound: ASTM C 1315, Type 1, Class A.
9. Clear, Waterborne, Membrane-Forming Curing and Sealing Compound: ASTM C 1315, Type 1, Class A.

K. Related Materials

1. Expansion- and Isolation-Joint-Filler Strips: ASTM D 1751, asphalt-saturated cellulosic fiber **OR** ASTM D 1752, cork or self-expanding cork, **as directed**.
2. Semirigid Joint Filler: Two-component, semirigid, 100 percent solids, epoxy resin with a Type A shore durometer hardness of 80 **OR** aromatic polyurea with a Type A shore durometer hardness range of 90 to 95, **as directed**, per ASTM D 2240.
3. Bonding Agent: ASTM C 1059, Type II, non-redispersible, acrylic emulsion or styrene butadiene.
4. Epoxy Bonding Adhesive: ASTM C 881, two-component epoxy resin, capable of humid curing and bonding to damp surfaces, of class suitable for application temperature and of grade to suit requirements, and as follows:
 - a. Types I and II, non-load bearing **OR** IV and V, load bearing, **as directed**, for bonding hardened or freshly mixed concrete to hardened concrete.
5. Reglets: Fabricate reglets of not less than 0.0217-inch- (0.55-mm-) thick, galvanized steel sheet. Temporarily fill or cover face opening of reglet to prevent intrusion of concrete or debris.
6. Dovetail Anchor Slots: Hot-dip galvanized steel sheet, not less than 0.0336 inch (0.85 mm) thick, with bent tab anchors. Temporarily fill or cover face opening of slots to prevent intrusion of concrete or debris.

L. Repair Materials

1. Repair Underlayment: Cement-based, polymer-modified, self-leveling product that can be applied in thicknesses from 1/8 inch (3.2 mm) and that can be feathered at edges to match adjacent floor elevations.
 - a. Cement Binder: ASTM C 150, portland cement or hydraulic or blended hydraulic cement as defined in ASTM C 219.
 - b. Primer: Product of underlayment manufacturer recommended for substrate, conditions, and application.
 - c. Aggregate: Well-graded, washed gravel, 1/8 to 1/4 inch (3.2 to 6 mm) or coarse sand as recommended by underlayment manufacturer.
 - d. Compressive Strength: Not less than 4100 psi (29 MPa) at 28 days when tested according to ASTM C 109/C 109M.
2. Repair Overlayment: Cement-based, polymer-modified, self-leveling product that can be applied in thicknesses from 1/8 inch (3.2 mm) and that can be feathered at edges to match adjacent floor elevations.
 - a. Cement Binder: ASTM C 150, portland cement or hydraulic or blended hydraulic cement as defined in ASTM C 219.
 - b. Primer: Product of topping manufacturer recommended for substrate, conditions, and application.
 - c. Aggregate: Well-graded, washed gravel, 1/8 to 1/4 inch (3.2 to 6 mm) or coarse sand as recommended by topping manufacturer.

- d. Compressive Strength: Not less than 5000 psi (34.5 MPa) at 28 days when tested according to ASTM C 109/C 109M.

M. Concrete Mixtures, General

1. Prepare design mixtures for each type and strength of concrete, proportioned on the basis of laboratory trial mixture or field test data, or both, according to ACI 301.
 - a. Use a qualified independent testing agency for preparing and reporting proposed mixture designs based on laboratory trial mixtures.
2. Cementitious Materials: Use fly ash, pozzolan, ground granulated blast-furnace slag, and silica fume as needed to reduce the total amount of portland cement, which would otherwise be used, by not less than 40 percent **OR** Limit percentage, by weight, of cementitious materials other than portland cement in concrete as follows, **as directed**
 - a. Fly Ash: 25 percent.
 - b. Combined Fly Ash and Pozzolan: 25 percent.
 - c. Ground Granulated Blast-Furnace Slag: 50 percent.
 - d. Combined Fly Ash or Pozzolan and Ground Granulated Blast-Furnace Slag: 50 percent portland cement minimum, with fly ash or pozzolan not exceeding 25 percent.
 - e. Silica Fume: 10 percent.
 - f. Combined Fly Ash, Pozzolans, and Silica Fume: 35 percent with fly ash or pozzolans not exceeding 25 percent and silica fume not exceeding 10 percent.
 - g. Combined Fly Ash or Pozzolans, Ground Granulated Blast-Furnace Slag, and Silica Fume: 50 percent with fly ash or pozzolans not exceeding 25 percent and silica fume not exceeding 10 percent.
3. Limit water-soluble, chloride-ion content in hardened concrete to 0.06 **OR** 0.15 **OR** 0.30 **OR** 1.00, **as directed**, percent by weight of cement.
4. Admixtures: Use admixtures according to manufacturer's written instructions.
 - a. Use water-reducing **OR** high-range water-reducing **OR** plasticizing, **as directed**, admixture in concrete, as required, for placement and workability.
 - b. Use water-reducing and retarding admixture when required by high temperatures, low humidity, or other adverse placement conditions.
 - c. Use water-reducing admixture in pumped concrete, concrete for heavy-use industrial slabs and parking structure slabs, concrete required to be watertight, and concrete with a water-cementitious materials ratio below 0.50.
 - d. Use corrosion-inhibiting admixture in concrete mixtures where indicated.
5. Color Pigment: Add color pigment to concrete mixture according to manufacturer's written instructions and to result in hardened concrete color consistent with approved mockup.

N. Concrete Mixtures For Building Elements

1. Footings: Proportion normal-weight concrete mixture as follows:
 - a. Minimum Compressive Strength: 5000 psi (34.5 MPa) **OR** 4500 psi (31 MPa) **OR** 4000 psi (27.6 MPa) **OR** 3500 psi (24.1 MPa) **OR** 3000 psi (20.7 MPa), **as directed**, at 28 days.
 - b. Maximum Water-Cementitious Materials Ratio: 0.50 **OR** 0.45 **OR** 0.40, **as directed**.
 - c. Slump Limit: 4 inches (100 mm) **OR** 5 inches (125 mm) **OR** 8 inches (200 mm) for concrete with verified slump of 2 to 4 inches (50 to 100 mm) before adding high-range water-reducing admixture or plasticizing admixture, **as directed**, plus or minus 1 inch (25 mm).
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) **OR** 3/4-inch (19-mm), **as directed**, nominal maximum aggregate size.
2. Foundation Walls: Proportion normal-weight concrete mixture as follows:
 - a. Minimum Compressive Strength: 5000 psi (34.5 MPa) **OR** 4500 psi (31 MPa) **OR** 4000 psi (27.6 MPa) **OR** 3500 psi (24.1 MPa) **OR** 3000 psi (20.7 MPa), **as directed**, at 28 days.
 - b. Maximum Water-Cementitious Materials Ratio: 0.50 **OR** 0.45 **OR** 0.40, **as directed**.
 - c. Slump Limit: 4 inches (100 mm) **OR** 5 inches (125 mm) **OR** 8 inches (200 mm) for concrete with verified slump of 2 to 4 inches (50 to 100 mm) before adding high-range

- water-reducing admixture or plasticizing admixture, **as directed**, plus or minus 1 inch (25 mm).
- d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) **OR** 3/4-inch (19-mm), **as directed**, nominal maximum aggregate size.
 3. Slabs-on-Grade: Proportion normal-weight concrete mixture as follows:
 - a. Minimum Compressive Strength: 5000 psi (34.5 MPa) **OR** 4500 psi (31 MPa) **OR** 4000 psi (27.6 MPa) **OR** 3500 psi (24.1 MPa) **OR** 3000 psi (20.7 MPa), **as directed**, at 28 days.
 - b. Minimum Cementitious Materials Content: 470 lb/cu. yd. (279 kg/cu. m) **OR** 520 lb/cu. yd. (309 kg/cu. m) **OR** 540 lb/cu. yd. (320 kg/cu. m), **as directed**.
 - c. Slump Limit: 4 inches (100 mm) **OR** 5 inches (125 mm), **as directed**, plus or minus 1 inch (25 mm).
 - d. Air Content
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) **OR** 3/4-inch (19-mm), **as directed**, nominal maximum aggregate size.
 - 3) Do not allow air content of troweled finished floors to exceed 3 percent.
 - e. Steel-Fiber Reinforcement: Add to concrete mixture, according to manufacturer's written instructions, at a rate of 50 lb/cu. yd. (29.7 kg/cu. m).
 - f. Synthetic Fiber: Uniformly disperse in concrete mixture at manufacturer's recommended rate, but not less than 1.0 lb/cu. yd. (0.60 kg/cu. m) **OR** 1.5 lb/cu. yd. (0.90 kg/cu. m), **as directed**.
 4. Suspended Slabs: Proportion normal-weight concrete mixture as follows:
 - a. Minimum Compressive Strength: 5000 psi (34.5 MPa) **OR** 4500 psi (31 MPa) **OR** 4000 psi (27.6 MPa) **OR** 3500 psi (24.1 MPa) **OR** 3000 psi (20.7 MPa), **as directed**, at 28 days.
 - b. Minimum Cementitious Materials Content: 470 lb/cu. yd. (279 kg/cu. m) **OR** 520 lb/cu. yd. (309 kg/cu. m) **OR** 540 lb/cu. yd. (320 kg/cu. m), **as directed**.
 - c. Slump Limit: 4 inches (100 mm) **OR** 5 inches (125 mm), **as directed**, plus or minus 1 inch (25 mm).
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) **OR** 3/4-inch (19-mm), **as directed**, nominal maximum aggregate size.
 - 3) Do not allow air content of troweled finished floors to exceed 3 percent.
 - e. Steel-Fiber Reinforcement: Add to concrete mixture, according to manufacturer's written instructions, at a rate of 50 lb/cu. yd. (29.7 kg/cu. m).
 - f. Synthetic Fiber: Uniformly disperse in concrete mixture at manufacturer's recommended rate, but not less than 1.0 lb/cu. yd. (0.60 kg/cu. m) **OR** 1.5 lb/cu. yd. (0.90 kg/cu. m), **as directed**.
 5. Suspended Slabs: Proportion structural lightweight concrete mixture as follows:
 - a. Minimum Compressive Strength: 5000 psi (34.5 MPa) **OR** 4500 psi (31 MPa) **OR** 4000 psi (27.6 MPa) **OR** 3500 psi (24.1 MPa) **OR** 3000 psi (20.7 MPa), **as directed**, at 28 days.
 - b. Calculated Equilibrium Unit Weight: 115 lb/cu. ft. (1842 kg/cu. m) **OR** 110 lb/cu. ft. (1762 kg/cu. m) **OR** 105 lb/cu. ft. (1682 kg/cu. m), **as directed**, plus or minus 3 lb/cu. ft. (48.1 kg/cu. m) as determined by ASTM C 567.
 - c. Slump Limit: 4 inches (100 mm) **OR** 5 inches (125 mm), **as directed**, plus or minus 1 inch (25 mm).
 - d. Air Content:
 - 1) 6 percent, plus or minus 2 percent at point of delivery for nominal maximum aggregate size greater than 3/8 inch (10 mm).
 - 2) 7 percent, plus or minus 2 percent at point of delivery for nominal maximum aggregate size 3/8 inch (10 mm) or less.
 - 3) Do not allow air content of troweled finished floors to exceed 3 percent.

- e. Steel-Fiber Reinforcement: Add to concrete mixture, according to manufacturer's written instructions, at a rate of 50 lb/cu. yd. (29.7 kg/cu. m).
 - f. Synthetic Fiber: Uniformly disperse in concrete mixture at manufacturer's recommended rate, but not less than 1.0 lb/cu. yd. (0.60 kg/cu. m) **OR** 1.5 lb/cu. yd. (0.90 kg/cu. m), **as directed**.
6. Concrete Toppings: Proportion normal-weight concrete mixture as follows:
- a. Minimum Compressive Strength: 5000 psi (34.5 MPa) **OR** 4500 psi (31 MPa) **OR** 4000 psi (27.6 MPa) **OR** 3500 psi (24.1 MPa) **OR** 3000 psi (20.7 MPa), **as directed**, at 28 days.
 - b. Minimum Cementitious Materials Content: 470 lb/cu. yd. (279 kg/cu. m) **OR** 520 lb/cu. yd. (309 kg/cu. m) **OR** 540 lb/cu. yd. (320 kg/cu. m), **as directed**.
 - c. Slump Limit: 4 inches (100 mm) **OR** 5 inches (125 mm), **as directed**, plus or minus 1 inch (25 mm).
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) **OR** 3/4-inch (19-mm), **as directed**, nominal maximum aggregate size.
 - 3) Do not allow air content of troweled finished toppings to exceed 3 percent.
 - e. Steel-Fiber Reinforcement: Add to concrete mixture, according to manufacturer's written instructions, at a rate of 50 lb/cu. yd. (29.7 kg/cu. m).
 - f. Synthetic Fiber: Uniformly disperse in concrete mixture at manufacturer's recommended rate, but not less than 1.0 lb/cu. yd. (0.60 kg/cu. m) **OR** 1.5 lb/cu. yd. (0.90 kg/cu. m), **as directed**.
7. Building Frame Members: Proportion normal-weight concrete mixture as follows:
- a. Minimum Compressive Strength: 5000 psi (34.5 MPa) **OR** 4500 psi (31 MPa) **OR** 4000 psi (27.6 MPa) **OR** 3500 psi (24.1 MPa) **OR** 3000 psi (20.7 MPa), **as directed**, at 28 days.
 - b. Maximum Water-Cementitious Materials Ratio: 0.50 **OR** 0.45 **OR** 0.40, **as directed**.
 - c. Slump Limit: 4 inches (100 mm) **OR** 5 inches (125 mm) **OR** 8 inches (200 mm) for concrete with verified slump of 2 to 4 inches (50 to 100 mm) before adding high-range water-reducing admixture or plasticizing admixture, **as directed**, plus or minus 1 inch (25 mm).
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) **OR** 3/4-inch (19-mm), **as directed**, nominal maximum aggregate size.
8. Building Walls: Proportion normal-weight concrete mixture as follows:
- a. Minimum Compressive Strength: 5000 psi (34.5 MPa) **OR** 4500 psi (31 MPa) **OR** 4000 psi (27.6 MPa) **OR** 3500 psi (24.1 MPa) **OR** 3000 psi (20.7 MPa), **as directed**, at 28 days.
 - b. Maximum Water-Cementitious Materials Ratio: 0.50 **OR** 0.45 **OR** 0.40, **as directed**.
 - c. Slump Limit: 4 inches (100 mm) **OR** 5 inches (125 mm) **OR** 8 inches (200 mm) for concrete with verified slump of 2 to 4 inches (50 to 100 mm) before adding high-range water-reducing admixture or plasticizing admixture, **as directed**, plus or minus 1 inch (25 mm).
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) **OR** 3/4-inch (19-mm), **as directed**, nominal maximum aggregate size.
- O. Fabricating Reinforcement
1. Fabricate steel reinforcement according to CRSI's "Manual of Standard Practice."
- P. Concrete Mixing
1. Ready-Mixed Concrete: Measure, batch, mix, and deliver concrete according to ASTM C 94/C 94M and ASTM C 1116, **as directed**, and furnish batch ticket information.

- a. When air temperature is between 85 and 90 deg F (30 and 32 deg C), reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F (32 deg C), reduce mixing and delivery time to 60 minutes.
2. Project-Site Mixing: Measure, batch, and mix concrete materials and concrete according to ASTM C 94/C 94M. Mix concrete materials in appropriate drum-type batch machine mixer.
 - a. For mixer capacity of 1 cu. yd. (0.76 cu. m) or smaller, continue mixing at least 1-1/2 minutes, but not more than 5 minutes after ingredients are in mixer, before any part of batch is released.
 - b. For mixer capacity larger than 1 cu. yd. (0.76 cu. m), increase mixing time by 15 seconds for each additional 1 cu. yd. (0.76 cu. m).
 - c. Provide batch ticket for each batch discharged and used in the Work, indicating Project identification name and number, date, mixture type, mixture time, quantity, and amount of water added. Record approximate location of final deposit in structure.

1.3 EXECUTION

A. Formwork

1. Design, erect, shore, brace, and maintain formwork, according to ACI 301, to support vertical, lateral, static, and dynamic loads, and construction loads that might be applied, until structure can support such loads.
2. Construct formwork so concrete members and structures are of size, shape, alignment, elevation, and position indicated, within tolerance limits of ACI 117.
3. Limit concrete surface irregularities, designated by ACI 347R as abrupt or gradual, as follows:
 - a. Class A, 1/8 inch (3.2 mm) for smooth-formed finished surfaces.
 - b. Class B, 1/4 inch (6 mm) **OR** Class C, 1/2 inch (13 mm) **OR** Class D, 1 inch (25 mm), **as directed**, for rough-formed finished surfaces.
4. Construct forms tight enough to prevent loss of concrete mortar.
5. Fabricate forms for easy removal without hammering or prying against concrete surfaces. Provide crush or wrecking plates where stripping may damage cast concrete surfaces. Provide top forms for inclined surfaces steeper than 1.5 horizontal to 1 vertical.
 - a. Install keyways, reglets, recesses, and the like, for easy removal.
 - b. Do not use rust-stained steel form-facing material.
6. Set edge forms, bulkheads, and intermediate screed strips for slabs to achieve required elevations and slopes in finished concrete surfaces. Provide and secure units to support screed strips; use strike-off templates or compacting-type screeds.
7. Provide temporary openings for cleanouts and inspection ports where interior area of formwork is inaccessible. Close openings with panels tightly fitted to forms and securely braced to prevent loss of concrete mortar. Locate temporary openings in forms at inconspicuous locations.
8. Chamfer **OR** Do not chamfer, **as directed**, exterior corners and edges of permanently exposed concrete.
9. Form openings, chases, offsets, sinkages, keyways, reglets, blocking, screeds, and bulkheads required in the Work. Determine sizes and locations from trades providing such items.
10. Clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, and other debris just before placing concrete.
11. Retighten forms and bracing before placing concrete, as required, to prevent mortar leaks and maintain proper alignment.
12. Coat contact surfaces of forms with form-release agent, according to manufacturer's written instructions, before placing reinforcement.

B. Embedded Items

1. Place and secure anchorage devices and other embedded items required for adjoining work that is attached to or supported by cast-in-place concrete. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - a. Install anchor rods, accurately located, to elevations required and complying with tolerances in Section 7.5 of AISC's "Code of Standard Practice for Steel Buildings and Bridges."

- b. Install reglets to receive waterproofing and to receive through-wall flashings in outer face of concrete frame at exterior walls, where flashing is shown at lintels, shelf angles, and other conditions.
 - c. Install dovetail anchor slots in concrete structures as indicated.
- C. Removing And Reusing Forms
 - 1. General: Formwork for sides of beams, walls, columns, and similar parts of the Work that does not support weight of concrete may be removed after cumulatively curing at not less than 50 deg F (10 deg C) for 24 hours after placing concrete, if concrete is hard enough to not be damaged by form-removal operations and curing and protection operations are maintained.
 - a. Leave formwork for beam soffits, joists, slabs, and other structural elements that supports weight of concrete in place until concrete has achieved at least 70 percent of, **as directed**, its 28-day design compressive strength.
 - b. Remove forms only if shores have been arranged to permit removal of forms without loosening or disturbing shores.
 - 2. Clean and repair surfaces of forms to be reused in the Work. Split, frayed, delaminated, or otherwise damaged form-facing material will not be acceptable for exposed surfaces. Apply new form-release agent.
 - 3. When forms are reused, clean surfaces, remove fins and laitance, and tighten to close joints. Align and secure joints to avoid offsets. Do not use patched forms for exposed concrete surfaces unless approved by UTHSCSA.
- D. Shores And Reshores
 - 1. Comply with ACI 318 (ACI 318M) and ACI 301 for design, installation, and removal of shoring and reshoring.
 - a. Do not remove shoring or reshoring until measurement of slab tolerances is complete.
 - 2. In multistory construction, extend shoring or reshoring over a sufficient number of stories to distribute loads in such a manner that no floor or member will be excessively loaded or will induce tensile stress in concrete members without sufficient steel reinforcement.
 - 3. Plan sequence of removal of shores and reshore to avoid damage to concrete. Locate and provide adequate reshoring to support construction without excessive stress or deflection.
- E. Vapor Retarders
 - 1. Plastic Vapor Retarders: Place, protect, and repair vapor retarders according to ASTM E 1643 and manufacturer's written instructions.
 - a. Lap joints 6 inches (150 mm) and seal with manufacturer's recommended tape.
 - 2. Bituminous Vapor Retarders: Place, protect, and repair vapor retarders according to manufacturer's written instructions.
 - 3. Granular Course: Cover vapor retarder with granular fill **OR** fine-graded granular material, **as directed**, moisten, and compact with mechanical equipment to elevation tolerances of plus 0 inch (0 mm) or minus 3/4 inch (19 mm).
 - a. Place and compact a 1/2-inch- (13-mm-) thick layer of fine-graded granular material over granular fill.
- F. Steel Reinforcement
 - 1. General: Comply with CRSI's "Manual of Standard Practice" for placing reinforcement.
 - a. Do not cut or puncture vapor retarder. Repair damage and reseal vapor retarder before placing concrete.
 - 2. Clean reinforcement of loose rust and mill scale, earth, ice, and other foreign materials that would reduce bond to concrete.
 - 3. Accurately position, support, and secure reinforcement against displacement. Locate and support reinforcement with bar supports to maintain minimum concrete cover. Do not tack weld crossing reinforcing bars.
 - a. Weld reinforcing bars according to AWS D1.4, where indicated.
 - 4. Set wire ties with ends directed into concrete, not toward exposed concrete surfaces.

5. Install welded wire reinforcement in longest practicable lengths on bar supports spaced to minimize sagging. Lap edges and ends of adjoining sheets at least one mesh spacing. Offset laps of adjoining sheet widths to prevent continuous laps in either direction. Lace overlaps with wire.
6. Epoxy-Coated Reinforcement: Repair cut and damaged epoxy coatings with epoxy repair coating according to ASTM D 3963/D 3963M. Use epoxy-coated steel wire ties to fasten epoxy-coated steel reinforcement.
7. Zinc-Coated Reinforcement: Repair cut and damaged zinc coatings with zinc repair material according to ASTM A 780. Use galvanized steel wire ties to fasten zinc-coated steel reinforcement.

G. Joints

1. General: Construct joints true to line with faces perpendicular to surface plane of concrete.
2. Construction Joints: Install so strength and appearance of concrete are not impaired, at locations indicated or as approved by UTHSCSA.
 - a. Place joints perpendicular to main reinforcement. Continue reinforcement across construction joints, unless otherwise indicated. Do not continue reinforcement through sides of strip placements of floors and slabs.
 - b. Form keyed joints as indicated. Embed keys at least 1-1/2 inches (38 mm) into concrete.
 - c. Locate joints for beams, slabs, joists, and girders in the middle third of spans. Offset joints in girders a minimum distance of twice the beam width from a beam-girder intersection.
 - d. Locate horizontal joints in walls and columns at underside of floors, slabs, beams, and girders and at the top of footings or floor slabs.
 - e. Space vertical joints in walls, **as directed**. Locate joints beside piers integral with walls, near corners, and in concealed locations where possible.
 - f. Use a bonding agent at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
 - g. Use epoxy-bonding adhesive at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
3. Contraction Joints in Slabs-on-Grade: Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-fourth of concrete thickness as follows:
 - a. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint to a radius of 1/8 inch (3.2 mm). Repeat grooving of contraction joints after applying surface finishes. Eliminate groover tool marks on concrete surfaces.
 - b. Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch- (3.2-mm-) wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before concrete develops random contraction cracks.
4. Isolation Joints in Slabs-on-Grade: After removing formwork, install joint-filler strips at slab junctions with vertical surfaces, such as column pedestals, foundation walls, grade beams, and other locations, as indicated.
 - a. Extend joint-filler strips full width and depth of joint, terminating flush with finished concrete surface, unless otherwise indicated.
 - b. Terminate full-width joint-filler strips not less than 1/2 inch (13 mm) or more than 1 inch (25 mm) below finished concrete surface where joint sealants, specified in Division 07 Section "Joint Sealants", are indicated.
 - c. Install joint-filler strips in lengths as long as practicable. Where more than one length is required, lace or clip sections together.
5. Doweled Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or asphalt coat one-half of dowel length to prevent concrete bonding to one side of joint.

H. Waterstops

1. Flexible Waterstops: Install in construction joints and at other joints indicated to form a continuous diaphragm. Install in longest lengths practicable. Support and protect exposed waterstops during progress of the Work. Field fabricate joints in waterstops according to manufacturer's written instructions.

2. Self-Expanding Strip Waterstops: Install in construction joints and at other locations indicated, according to manufacturer's written instructions, adhesive bonding, mechanically fastening, and firmly pressing into place. Install in longest lengths practicable.

I. Concrete Placement

1. Before placing concrete, verify that installation of formwork, reinforcement, and embedded items is complete and that required inspections have been performed.
2. Do not add water to concrete during delivery, at Project site, or during placement unless approved by UTHSCSA.
3. Before test sampling and placing concrete, water may be added at Project site, subject to limitations of ACI 301.
 - a. Do not add water to concrete after adding high-range water-reducing admixtures to mixture.
4. Deposit concrete continuously in one layer or in horizontal layers of such thickness that no new concrete will be placed on concrete that has hardened enough to cause seams or planes of weakness. If a section cannot be placed continuously, provide construction joints as indicated. Deposit concrete to avoid segregation.
 - a. Deposit concrete in horizontal layers of depth to not exceed formwork design pressures and in a manner to avoid inclined construction joints.
 - b. Consolidate placed concrete with mechanical vibrating equipment according to ACI 301.
 - c. Do not use vibrators to transport concrete inside forms. Insert and withdraw vibrators vertically at uniformly spaced locations to rapidly penetrate placed layer and at least 6 inches (150 mm) into preceding layer. Do not insert vibrators into lower layers of concrete that have begun to lose plasticity. At each insertion, limit duration of vibration to time necessary to consolidate concrete and complete embedment of reinforcement and other embedded items without causing mixture constituents to segregate.
5. Deposit and consolidate concrete for floors and slabs in a continuous operation, within limits of construction joints, until placement of a panel or section is complete.
 - a. Consolidate concrete during placement operations so concrete is thoroughly worked around reinforcement and other embedded items and into corners.
 - b. Maintain reinforcement in position on chairs during concrete placement.
 - c. Screed slab surfaces with a straightedge and strike off to correct elevations.
 - d. Slope surfaces uniformly to drains where required.
 - e. Begin initial floating using bull floats or darbies to form a uniform and open-textured surface plane, before excess bleedwater appears on the surface. Do not further disturb slab surfaces before starting finishing operations.
6. Cold-Weather Placement: Comply with ACI 306.1 and as follows. Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing actions, or low temperatures.
 - a. When average high and low temperature is expected to fall below 40 deg F (4.4 deg C) for three successive days, maintain delivered concrete mixture temperature within the temperature range required by ACI 301.
 - b. Do not use frozen materials or materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials.
 - c. Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators unless otherwise specified and approved in mixture designs.
7. Hot-Weather Placement: Comply with ACI 301 and as follows:
 - a. Maintain concrete temperature below 90 deg F (32 deg C) at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated to total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
 - b. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade uniformly moist without standing water, soft spots, or dry areas.

J. Finishing Formed Surfaces

1. Rough-Formed Finish: As-cast concrete texture imparted by form-facing material with tie holes and defects repaired and patched. Remove fins and other projections that exceed specified limits on formed-surface irregularities.
 - a. Apply to concrete surfaces not exposed to public view.
2. Smooth-Formed Finish: As-cast concrete texture imparted by form-facing material, arranged in an orderly and symmetrical manner with a minimum of seams. Repair and patch tie holes and defects. Remove fins and other projections that exceed specified limits on formed-surface irregularities.
 - a. Apply to concrete surfaces exposed to public view, **OR** to receive a rubbed finish, **OR** to be covered with a coating or covering material applied directly to concrete, **as directed**.
3. Rubbed Finish: Apply the following to smooth-formed finished as-cast concrete where indicated:
 - a. Smooth-Rubbed Finish: Not later than one day after form removal, moisten concrete surfaces and rub with carborundum brick or another abrasive until producing a uniform color and texture. Do not apply cement grout other than that created by the rubbing process.
 - b. Grout-Cleaned Finish: Wet concrete surfaces and apply grout of a consistency of thick paint to coat surfaces and fill small holes. Mix one part portland cement to one and one-half parts fine sand with a 1:1 mixture of bonding admixture and water. Add white portland cement in amounts determined by trial patches so color of dry grout will match adjacent surfaces. Scrub grout into voids and remove excess grout. When grout whitens, rub surface with clean burlap and keep surface damp by fog spray for at least 36 hours.
 - c. Cork-Floated Finish: Wet concrete surfaces and apply a stiff grout. Mix one part portland cement and one part fine sand with a 1:1 mixture of bonding agent and water. Add white portland cement in amounts determined by trial patches so color of dry grout will match adjacent surfaces. Compress grout into voids by grinding surface. In a swirling motion, finish surface with a cork float.
4. Related Unformed Surfaces: At tops of walls, horizontal offsets, and similar unformed surfaces adjacent to formed surfaces, strike off smooth and finish with a texture matching adjacent formed surfaces. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces, unless otherwise indicated.

K. Finishing Floors And Slabs

1. General: Comply with ACI 302.1R recommendations for screeding, restraighening, and finishing operations for concrete surfaces. Do not wet concrete surfaces.
2. Scratch Finish: While still plastic, texture concrete surface that has been screeded and bull-floated or darbied. Use stiff brushes, brooms, or rakes to produce a profile amplitude of 1/4 inch (6 mm) in 1 direction.
 - a. Apply scratch finish to surfaces indicated and to receive concrete floor toppings **OR** to receive mortar setting beds for bonded cementitious floor finishes, **as directed**.
3. Float Finish: Consolidate surface with power-driven floats or by hand floating if area is small or inaccessible to power driven floats. Restraighten, cut down high spots, and fill low spots. Repeat float passes and restraighening until surface is left with a uniform, smooth, granular texture.
 - a. Apply float finish to surfaces indicated **OR** to receive trowel finish **OR** to be covered with fluid-applied or sheet waterproofing, built-up or membrane roofing, or sand-bed terrazzo, **as directed**.
4. Trowel Finish: After applying float finish, apply first troweling and consolidate concrete by hand or power-driven trowel. Continue troweling passes and restraighten until surface is free of trowel marks and uniform in texture and appearance. Grind smooth any surface defects that would telegraph through applied coatings or floor coverings.
 - a. Apply a trowel finish to surfaces indicated **OR** exposed to view **OR** to be covered with resilient flooring, carpet, ceramic or quarry tile set over a cleavage membrane, paint, or another thin-film-finish coating system, **as directed**.
 - b. Finish surfaces to the following tolerances, according to ASTM E 1155 (ASTM E 1155M), for a randomly trafficked floor surface:
 - 1) Specified overall values of flatness, F(F) 25; and of levelness, F(L) 20; with minimum local values of flatness, F(F) 17; and of levelness, F(L) 15.

- 2) Specified overall values of flatness, F(F) 35; and of levelness, F(L) 25; with minimum local values of flatness, F(F) 24; and of levelness, F(L) 17; for slabs-on-grade.
- 3) Specified overall values of flatness, F(F) 30; and of levelness, F(L) 20; with minimum local values of flatness, F(F) 24; and of levelness, F(L) 15; for suspended slabs.
- 4) Specified overall values of flatness, F(F) 45; and of levelness, F(L) 35; with minimum local values of flatness, F(F) 30; and of levelness, F(L) 24.
- c. Finish and measure surface so gap at any point between concrete surface and an unleveled, freestanding, 10-foot- (3.05-m-) long straightedge resting on 2 high spots and placed anywhere on the surface does not exceed 1/4 inch (6 mm) **OR** 3/16 inch (4.8 mm) **OR** 1/8 inch (3.2 mm), **as directed**.
5. Trowel and Fine-Broom Finish: Apply a first trowel finish to surfaces indicated **OR** where ceramic or quarry tile is to be installed by either thickset or thin-set method, **as directed**. While concrete is still plastic, slightly scarify surface with a fine broom.
 - a. Comply with flatness and levelness tolerances for trowel finished floor surfaces.
6. Broom Finish: Apply a broom finish to exterior concrete platforms, steps, and ramps, and elsewhere as indicated.
 - a. Immediately after float finishing, slightly roughen trafficked surface by brooming with fiber-bristle broom perpendicular to main traffic route. Coordinate required final finish with UTHSCSA before application.
7. Slip-Resistive Finish: Before final floating, apply slip-resistive aggregate **OR** aluminum granule, **as directed**, finish where indicated and to concrete stair treads, platforms, and ramps. Apply according to manufacturer's written instructions and as follows:
 - a. Uniformly spread 25 lb/100 sq. ft. (12 kg/10 sq. m) of dampened slip-resistive aggregate **OR** aluminum granules, **as directed**, over surface in 1 or 2 applications. Tamp aggregate flush with surface, but do not force below surface.
 - b. After broadcasting and tamping, apply float finish.
 - c. After curing, lightly work surface with a steel wire brush or an abrasive stone and water to expose slip-resistive aggregate **OR** aluminum granules, **as directed**.
8. Dry-Shake Floor Hardener Finish: After initial floating, apply dry-shake floor hardener to surfaces according to manufacturer's written instructions and as follows:
 - a. Uniformly apply dry-shake floor hardener at a rate of 100 lb/100 sq. ft. (49 kg/10 sq. m), **as directed**, unless greater amount is recommended by manufacturer.
 - b. Uniformly distribute approximately two-thirds of dry-shake floor hardener over surface by hand or with mechanical spreader, and embed by power floating. Follow power floating with a second dry-shake floor hardener application, uniformly distributing remainder of material, and embed by power floating.
 - c. After final floating, apply a trowel finish. Cure concrete with curing compound recommended by dry-shake floor hardener manufacturer and apply immediately after final finishing.
- L. Miscellaneous Concrete Items
 1. Filling In: Fill in holes and openings left in concrete structures, unless otherwise indicated, after work of other trades is in place. Mix, place, and cure concrete, as specified, to blend with in-place construction. Provide other miscellaneous concrete filling indicated or required to complete the Work.
 2. Curbs: Provide monolithic finish to interior curbs by stripping forms while concrete is still green and by steel-troweling surfaces to a hard, dense finish with corners, intersections, and terminations slightly rounded.
 3. Equipment Bases and Foundations: Provide machine and equipment bases and foundations as shown on Drawings. Set anchor bolts for machines and equipment at correct elevations, complying with diagrams or templates from manufacturer furnishing machines and equipment.
 4. Steel Pan Stairs: Provide concrete fill for steel pan stair treads, landings, and associated items. Cast-in inserts and accessories as shown on Drawings. Screed, tamp, and trowel-finish concrete surfaces.

M. Concrete Protecting And Curing

1. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with ACI 306.1 for cold-weather protection and ACI 301 for hot-weather protection during curing.
2. Evaporation Retarder: Apply evaporation retarder to unformed concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching 0.2 lb/sq. ft. x h (1 kg/sq. m x h) before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying concrete, but before float finishing.
3. Formed Surfaces: Cure formed concrete surfaces, including underside of beams, supported slabs, and other similar surfaces. If forms remain during curing period, moist cure after loosening forms. If removing forms before end of curing period, continue curing for the remainder of the curing period.
4. Unformed Surfaces: Begin curing immediately after finishing concrete. Cure unformed surfaces, including floors and slabs, concrete floor toppings, and other surfaces.
5. Cure concrete according to ACI 308.1, by one or a combination of the following methods:
 - a. Moisture Curing: Keep surfaces continuously moist for not less than seven days with the following materials:
 - 1) Water.
 - 2) Continuous water-fog spray.
 - 3) Absorptive cover, water saturated, and kept continuously wet. Cover concrete surfaces and edges with 12-inch (300-mm) lap over adjacent absorptive covers.
 - b. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least 12 inches (300 mm), and sealed by waterproof tape or adhesive. Cure for not less than seven days. Immediately repair any holes or tears during curing period using cover material and waterproof tape.
 - 1) Moisture cure or use moisture-retaining covers to cure concrete surfaces to receive floor coverings.
 - 2) Moisture cure or use moisture-retaining covers to cure concrete surfaces to receive penetrating liquid floor treatments.
 - 3) Cure concrete surfaces to receive floor coverings with either a moisture-retaining cover or a curing compound that the manufacturer certifies will not interfere with bonding of floor covering used on Project.
 - c. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating and repair damage during curing period.
 - 1) After curing period has elapsed, remove curing compound without damaging concrete surfaces by method recommended by curing compound manufacturer unless manufacturer certifies curing compound will not interfere with bonding of floor covering used on Project.
 - d. Curing and Sealing Compound: Apply uniformly to floors and slabs indicated in a continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Repeat process 24 hours later and apply a second coat. Maintain continuity of coating and repair damage during curing period.

N. Liquid Floor Treatments

1. Penetrating Liquid Floor Treatment: Prepare, apply, and finish penetrating liquid floor treatment according to manufacturer's written instructions.
 - a. Remove curing compounds, sealers, oil, dirt, laitance, and other contaminants and complete surface repairs.
 - b. Do not apply to concrete that is less than three **OR** seven **OR** 14 **OR** 28, **as directed**, days' old.
 - c. Apply liquid until surface is saturated, scrubbing into surface until a gel forms; rewet; and repeat brooming or scrubbing. Rinse with water; remove excess material until surface is dry. Apply a second coat in a similar manner if surface is rough or porous.

2. Sealing Coat: Uniformly apply a continuous sealing coat of curing and sealing compound to hardened concrete by power spray or roller according to manufacturer's written instructions.
- O. Joint Filling
1. Prepare, clean, and install joint filler according to manufacturer's written instructions.
 - a. Defer joint filling until concrete has aged at least one **OR** six, **as directed**, month(s). Do not fill joints until construction traffic has permanently ceased.
 2. Remove dirt, debris, saw cuttings, curing compounds, and sealers from joints; leave contact faces of joint clean and dry.
 3. Install semirigid joint filler full depth in saw-cut joints and at least 2 inches (50 mm) deep in formed joints. Overfill joint and trim joint filler flush with top of joint after hardening.
- P. Concrete Surface Repairs
1. Defective Concrete: Repair and patch defective areas when approved by UTHSCSA. Remove and replace concrete that cannot be repaired and patched to UTHSCSA's approval.
 2. Patching Mortar: Mix dry-pack patching mortar, consisting of one part portland cement to two and one-half parts fine aggregate passing a No. 16 (1.18-mm) sieve, using only enough water for handling and placing.
 3. Repairing Formed Surfaces: Surface defects include color and texture irregularities, cracks, spalls, air bubbles, honeycombs, rock pockets, fins and other projections on the surface, and stains and other discolorations that cannot be removed by cleaning.
 - a. Immediately after form removal, cut out honeycombs, rock pockets, and voids more than 1/2 inch (13 mm) in any dimension in solid concrete, but not less than 1 inch (25 mm) in depth. Make edges of cuts perpendicular to concrete surface. Clean, dampen with water, and brush-coat holes and voids with bonding agent. Fill and compact with patching mortar before bonding agent has dried. Fill form-tie voids with patching mortar or cone plugs secured in place with bonding agent.
 - b. Repair defects on surfaces exposed to view by blending white portland cement and standard portland cement so that, when dry, patching mortar will match surrounding color. Patch a test area at inconspicuous locations to verify mixture and color match before proceeding with patching. Compact mortar in place and strike off slightly higher than surrounding surface.
 - c. Repair defects on concealed formed surfaces that affect concrete's durability and structural performance as determined by UTHSCSA.
 4. Repairing Unformed Surfaces: Test unformed surfaces, such as floors and slabs, for finish and verify surface tolerances specified for each surface. Correct low and high areas. Test surfaces sloped to drain for trueness of slope and smoothness; use a sloped template.
 - a. Repair finished surfaces containing defects. Surface defects include spalls, popouts, honeycombs, rock pockets, crazing and cracks in excess of 0.01 inch (0.25 mm) wide or that penetrate to reinforcement or completely through unreinforced sections regardless of width, and other objectionable conditions.
 - b. After concrete has cured at least 14 days, correct high areas by grinding.
 - c. Correct localized low areas during or immediately after completing surface finishing operations by cutting out low areas and replacing with patching mortar. Finish repaired areas to blend into adjacent concrete.
 - d. Correct other low areas scheduled to receive floor coverings with a repair underlayment. Prepare, mix, and apply repair underlayment and primer according to manufacturer's written instructions to produce a smooth, uniform, plane, and level surface. Feather edges to match adjacent floor elevations.
 - e. Correct other low areas scheduled to remain exposed with a repair topping. Cut out low areas to ensure a minimum repair topping depth of 1/4 inch (6 mm) to match adjacent floor elevations. Prepare, mix, and apply repair topping and primer according to manufacturer's written instructions to produce a smooth, uniform, plane, and level surface.
 - f. Repair defective areas, except random cracks and single holes 1 inch (25 mm) or less in diameter, by cutting out and replacing with fresh concrete. Remove defective areas with clean, square cuts and expose steel reinforcement with at least a 3/4-inch (19-mm) clearance all around. Dampen concrete surfaces in contact with patching concrete and

apply bonding agent. Mix patching concrete of same materials and mixture as original concrete except without coarse aggregate. Place, compact, and finish to blend with adjacent finished concrete. Cure in same manner as adjacent concrete.

- g. Repair random cracks and single holes 1 inch (25 mm) or less in diameter with patching mortar. Groove top of cracks and cut out holes to sound concrete and clean off dust, dirt, and loose particles. Dampen cleaned concrete surfaces and apply bonding agent. Place patching mortar before bonding agent has dried. Compact patching mortar and finish to match adjacent concrete. Keep patched area continuously moist for at least 72 hours.
5. Perform structural repairs of concrete, subject to UTHSCSA's approval, using epoxy adhesive and patching mortar.
6. Repair materials and installation not specified above may be used, subject to UTHSCSA's approval.

Q. Field Quality Control

1. Testing and Inspecting: Engage a qualified testing and inspecting agency to perform tests and inspections and to submit reports.
2. Inspections:
 - a. Steel reinforcement placement.
 - b. Steel reinforcement welding.
 - c. Headed bolts and studs.
 - d. Verification of use of required design mixture.
 - e. Concrete placement, including conveying and depositing.
 - f. Curing procedures and maintenance of curing temperature.
 - g. Verification of concrete strength before removal of shores and forms from beams and slabs.
3. Concrete Tests: Testing of composite samples of fresh concrete obtained according to ASTM C 172 shall be performed according to the following requirements:
 - a. Testing Frequency: Obtain at least one composite sample for each 100 cu. yd. (76 cu. m) or fraction thereof of each concrete mixture placed each day.
 - 1) When frequency of testing will provide fewer than five compressive-strength tests for each concrete mixture, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.
 - b. Slump: ASTM C 143/C 143M; one test at point of placement for each composite sample, but not less than one test for each day's pour of each concrete mixture. Perform additional tests when concrete consistency appears to change.
 - c. Air Content: ASTM C 231, pressure method, for normal-weight concrete; ASTM C 173/C 173M, volumetric method, for structural lightweight concrete, **as directed**; one test for each composite sample, but not less than one test for each day's pour of each concrete mixture.
 - d. Concrete Temperature: ASTM C 1064/C 1064M; one test hourly when air temperature is 40 deg F (4.4 deg C) and below and when 80 deg F (27 deg C) and above, and one test for each composite sample.
 - e. Unit Weight: ASTM C 567, fresh unit weight of structural lightweight concrete; one test for each composite sample, but not less than one test for each day's pour of each concrete mixture.
 - f. Compression Test Specimens: ASTM C 31/C 31M.
 - 1) Cast and laboratory cure two sets of two standard cylinder specimens for each composite sample.
 - 2) Cast and field cure two sets of two standard cylinder specimens for each composite sample.
 - g. Compressive-Strength Tests: ASTM C 39/C 39M; test one set of two laboratory-cured specimens at 7 days and one set of two specimens at 28 days.
 - 1) Test one set of two field-cured specimens at 7 days and one set of two specimens at 28 days.
 - 2) A compressive-strength test shall be the average compressive strength from a set of two specimens obtained from same composite sample and tested at age indicated.

- h. When strength of field-cured cylinders is less than 85 percent of companion laboratory-cured cylinders, Contractor shall evaluate operations and provide corrective procedures for protecting and curing in-place concrete.
 - i. Strength of each concrete mixture will be satisfactory if every average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than 500 psi (3.4 MPa).
 - j. Test results shall be reported in writing to UTHSCSA, concrete manufacturer, and Contractor within 48 hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.
 - k. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by UTHSCSA but will not be used as sole basis for approval or rejection of concrete.
 - l. Additional Tests: Testing and inspecting agency shall make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as approved by UTHSCSA. Testing and inspecting agency may conduct tests to determine adequacy of concrete by cored cylinders complying with ASTM C 42/C 42M or by other methods as approved by UTHSCSA.
 - m. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
 - n. Correct deficiencies in the Work that test reports and inspections indicate does not comply with the Contract Documents.
4. Measure floor and slab flatness and levelness according to ASTM E 1155 (ASTM E 1155M) within 24 **OR** 48, **as directed**, hours of finishing.

SECTION 03 53 00 00 - CONCRETE FLOOR TOPPING**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for concrete floor topping. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Emery-aggregate concrete floor topping.
 - b. Iron-aggregate concrete floor topping.

C. Submittals

1. Product Data: For each type of product indicated.
2. Product Test Reports.
3. Field quality-control test reports.

D. Quality Assurance

1. Testing Agency Qualifications: An independent agency qualified according to ASTM C 1077 and ASTM E 329 for testing indicated.
2. Preinstallation Conference: Conduct conference at Project site.

E. Delivery, Storage, And Handling

1. Deliver materials in original packages and containers, with seals unbroken, bearing manufacturer's labels indicating brand name and directions for storage, mixing with other components, and application.
2. Store materials to comply with manufacturer's written instructions to prevent deterioration from moisture or other detrimental effects.

F. Project Conditions

1. Environmental Limitations: Comply with manufacturer's written instructions for substrate temperature and moisture content, ambient temperature and humidity, ventilation, and other conditions affecting concrete floor topping performance.
 - a. Place concrete floor topping only when ambient temperature and temperature of base slabs are between 50 and 86 deg F (10 and 30 deg C).
2. Close areas to traffic during topping application and, after application, for time period recommended in writing by manufacturer.

1.2 PRODUCTS**A. Concrete Floor Toppings**

1. Emery-Aggregate Concrete Floor Topping: Factory-prepared and dry-packaged mixture of graded, crushed emery aggregate containing not less than 50 percent aluminum oxide, not less than 24 percent ferric oxide, and not more than 8 percent silica; portland cement or blended hydraulic cement; plasticizers; and other admixtures to which only water needs to be added at Project site.
 - a. Compressive Strength (28 Days): 10,000 psi (69 MPa); ASTM C 109/C 109M.
2. Iron-Aggregate Concrete Floor Topping: Factory-prepared and dry-packaged mixture of graded iron aggregate, portland cement, plasticizers, and other admixtures to which only water needs to be added at Project site.

- a. Compressive Strength (28 Days): 12,000 psi (83 MPa); ASTM C 109/C 109M.

B. Curing Materials

1. Evaporation Retarder: Waterborne, monomolecular film forming; manufactured for application to fresh concrete.
2. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, weighing approximately 9 oz./sq. yd. (305 g/sq. m) when dry.
3. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.
4. Water: Potable.
5. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, 25 percent solids content, minimum.

C. Related Materials

1. Semirigid Joint Filler: Two-component, semirigid, 100 percent solids, epoxy resin with a Type A Shore durometer hardness of 80 **OR** aromatic polyurea with a Type A Shore durometer hardness range of 90 to 95, **as directed**, per ASTM D 2240.
2. Joint-Filler Strips: ASTM D 1751, asphalt-saturated cellulosic fiber or ASTM D 1752, cork or self-expanding cork.
3. Portland Cement: ASTM C 150, Type I or II.
4. Sand: ASTM C 404, fine aggregate passing No. 16 (1.18-mm) sieve.
5. Water: Potable.
6. Acrylic-Bonding Agent: ASTM C 1059, Type II, non-redispersible, acrylic emulsion or styrene butadiene.
7. Epoxy Adhesive: ASTM C 881/C 881M, Type V, two-component epoxy resin, capable of humid curing and bonding to damp surfaces, of class and grade to suit requirements.

D. Mixing

1. Bonding Slurry: Mix portland cement with water to a thick paint consistency.
OR
Bonding Slurry: Mix 1 part portland cement and 1-1/2 **OR** 2 **OR** 2-1/2, **as directed**, parts sand with water and an acrylic-bonding agent according to manufacturer's written instructions, **as directed**, to a thick paint consistency.
2. Floor Topping: Mix concrete floor topping materials and water in appropriate drum-type batch machine mixer or truck mixer according to manufacturer's written instructions.

1.3 EXECUTION

A. Examination

1. Examine substrates, with Installer present, for conditions affecting performance of concrete floor topping.
2. Verify that base concrete slabs comply with scratch finish requirements specified in Division 03 Section "Cast-in-place Concrete".
3. Verify that base slabs are visibly dry and free of moisture. Test for capillary moisture by the plastic sheet method according to ASTM D 4263.
4. Proceed with application only after unsatisfactory conditions have been corrected.

B. Preparation

1. Existing Concrete: Remove existing surface treatments and deteriorated and unsound concrete. Mechanically abrade base slabs to produce a heavily scarified surface profile with an amplitude of 1/4 inch (6 mm.).
 - a. Prepare and clean existing base slabs according to concrete floor topping manufacturer's written instructions. Fill voids, cracks, and cavities in base slabs.
 - b. Mechanically remove contaminants from existing concrete that might impair bond of floor topping.

- c. Saw cut contraction and construction joints in existing concrete to a depth of 1/2 inch (13 mm) and fill with semirigid joint filler.
 - d. To both sides of joint edges and at perimeter of existing base slab mechanically remove a 4-inch- (100-mm-) wide and 0- to 1-inch (0- to 25-mm-) deep, tapered wedge of concrete and retexture surface **OR** install concrete nails in manufacturer's recommended staggered pattern, **as directed**.
 2. Install joint-filler strips where topping abuts vertical surfaces, such as column pedestals, foundation walls, grade beams, and other locations, as indicated.
 - a. Extend joint-filler strips full width and depth of joint, terminating flush with topping surface, unless otherwise indicated.
 - b. Terminate full-width, joint-filler strips 1/2 inch (13 mm) below topping surface where joint sealants, specified in Division 07 Section "Joint Sealants", are indicated.
 - c. Install joint-filler strips in lengths as long as practicable. Where more than one length is required, lace or clip sections together.
- C. Floor Topping Application
1. Start floor topping application in presence of manufacturer's technical representative.
 2. Monolithic Floor Topping: After textured-float finish is applied to fresh concrete of base slabs specified in Division 03 Section "Cast-in-place Concrete", place concrete floor topping while concrete is still plastic.
 3. Deferred Floor Topping: Within 72 hours of placing base slabs, mix and scrub bonding slurry into dampened concrete to a thickness of 1/16 to 1/8 inch (1.6 to 3 mm), without puddling. Place floor topping while slurry is still tacky.
 4. Existing Concrete: Apply epoxy-bonding adhesive, mixed according to manufacturer's written instructions, and scrub into dry base slabs to a thickness of 1/16 to 1/8 inch (1.6 to 3 mm), without puddling. Place floor topping while adhesive is still tacky.
 5. Place concrete floor topping continuously in a single layer, tamping and consolidating to achieve tight contact with bonding surface. Do not permit cold joints or seams to develop within pour strip.
 - a. Screed surface with a straightedge and strike off to correct elevations.
 - b. Slope surfaces uniformly where indicated.
 - c. Begin initial floating using bull floats to form a uniform and open-textured surface plane free of humps or hollows.
 6. Finishing: Consolidate surface with power-driven floats as soon as concrete floor topping can support equipment and operator. Restraighten, cut down high spots, and fill low spots. Repeat float passes and restraightening until concrete floor topping surface has a uniform, smooth, granular texture.
 - 1) Hard Trowel Finish: After floating surface, apply first trowel finish and consolidate concrete floor topping by power-driven trowel without allowing blisters to develop. Continue troweling passes and restraighten until surface is smooth and uniform in texture.
 - 2) Finish surfaces to specified overall values of flatness, F(F) 25; and levelness, F(L) 20; with minimum local values of flatness, F(F) 17; and levelness, F(L) 15, and measure **OR** notify independent testing agency to permit measurement, **as directed**, within 24 hours according to ASTM E 1155 (ASTM E 1155M) for a randomly trafficked floor surface.
 - 3) Finish and measure surface so gap at any point between surface and an unlevelled freestanding 10-foot- (3-m-) long straightedge, resting on 2 high spots and placed anywhere on the surface, does not exceed 1/4 inch (6 mm).
 7. Construction Joints: Construct joints true to line with faces perpendicular to surface plane of concrete floor topping, at locations indicated or as approved by The University.
 - a. Coat face of construction joint with epoxy adhesive at locations where concrete floor topping is placed against hardened or partially hardened concrete floor topping.
 8. Contraction Joints: Form weakened-plane contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch- (3-mm-) wide joints into concrete floor topping when cutting action will not tear, abrade, or otherwise damage surface and before random contraction cracks develop.

- a. Form joints in concrete floor topping over contraction joints in base slabs, unless otherwise indicated.
 - b. Construct contraction joints for a combined depth equal to topping thickness and not less than one-fourth of base-slab thickness.
 - c. Construct contraction joints for a depth equal to one-half of concrete floor topping thickness, but not less than 1/2 inch (13 mm) deep.
- D. Protecting And Curing
1. General: Protect freshly placed concrete floor topping from premature drying and excessive cold or hot temperatures.
 2. Evaporation Retarder: Apply evaporation retarder to concrete floor topping surfaces in hot, dry, or windy conditions before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying floor topping, but before float finishing.
 3. Begin curing immediately after finishing concrete floor topping. Cure by one or a combination of the following methods, according to concrete floor topping manufacturer's written instructions:
 - a. Moisture Curing: Keep surfaces continuously moist for not less than 7 days with water **OR** continuous water-fog spray **OR** absorptive cover, water saturated and kept continuously wet. Cover topping surfaces and edges with 12-inch (300-mm) lap over adjacent absorptive covers, **as directed**.
 - b. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least 12 inches (300 mm), and sealed by waterproof tape or adhesive. Cure for not less than seven days. Immediately repair any holes or tears during curing period using cover material and waterproof tape.
 - c. Curing Compound: Apply uniformly in two coats in continuous operations by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating and repair damage during curing period.
- E. Joint Filling
1. Prepare and clean contraction joints and install semirigid joint filler, according to manufacturer's written instructions, once topping has fully cured.
 2. Remove dirt, debris, saw cuttings, curing compounds, and sealers from joints; leave contact faces of joint clean and dry.
 3. Install semirigid joint filler full depth of contraction joints. Overfill joint and trim semirigid joint filler flush with top of joint after hardening.
- F. Repairs
1. Defective Topping: Repair and patch defective concrete floor topping areas, including areas that have not bonded to concrete substrate.
- G. Field Quality Control
1. Testing Agency: Engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.
 2. Testing Services: Testing and inspecting of completed applications of concrete floor toppings shall take place in successive stages, in areas of extent and using methods as follows:
 - a. Sample Sets: At point of placement, a set of 3 molded-cube samples shall be taken from the topping mix for the first 1000 sq. ft. (93 sq. m), plus 1 set of samples for each subsequent 5000 sq. ft. (464 sq. m) of topping, or fraction thereof, but not less than 6 samples for each day's placement. Samples shall be tested according to ASTM C 109/C 109M for compliance with compressive-strength requirements.
 - b. Concrete floor topping shall be tested for delamination by dragging a steel chain over the surface.
 - c. Concrete floor topping shall be tested for compliance with surface flatness and levelness tolerances.

3. Remove and replace applications of concrete floor topping where test results indicate that it does not comply with specified requirements.
4. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 03 54 16 00 - HYDRAULIC CEMENT UNDERLAYMENT

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Concrete Supplier: Regularly engaged in production of concrete floor underlayments.
- B. Concrete Applicator: Regularly engaged and properly equipped for application of concrete floor underlayments, and as acceptable by aggregate manufacturer.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Product data in the form of manufacturer's technical data, specifications, and installation instructions.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials in manufacturer's original undamaged packages or acceptable bulk containers.
- B. Store packaged materials to protect them from elements or physical damage.
- C. Do not use cement which shows indications of moisture damage, caking, or other signs of deterioration.

1.06 PROJECT CONDITIONS

- A. Do not place concrete when ambient temperature is below freezing (32 degrees F, 0 degrees C).

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MATERIALS

- A. Underlayment Compound: Free-flowing, self-leveling, pumpable, cement-based compound for applications from 1 inch thick to feathered edges.
 - 1. Ardex, Inc. "K-15"
- B. Primer: Provide manufacturer's recommended primer for each applicable substrate.

2.03 MIXING

- A. Provide batch type mechanical mixer for mixing topping material at the Project Site. Equip batch mixer with a suitable charging hopper, water storage tank, and a water-measuring device. Use only mixers which are capable of mixing aggregates, cement, and water into a uniform mix within specified time, and of discharging mix without segregation.

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Place underlayment in accordance with manufacturer's instructions, using equipment and procedures to avoid segregation of mix and loss of air content. Deposit and screed in a continuous operation until an entire panel or section of floor area is completed. Do not vibrate or work mix except for screeding or floating.

3.02 PLACING

- A. Spread topping mixture evenly over prepared base to the required elevation and strikeoff. Use highway straightedge, bull float, or darby to level surface. After the topping has stiffened sufficiently to permit the operation, and water sheen has disappeared, float the surface at least twice to a uniform sandy texture. Restraighten where necessary with highway straightedge. The surface shall achieve an FF20/FL17 tolerance when tested in accordance with ASTM E 1155. Uniformly slope surface to drains.
 - 1. Where joints are required, construct to match and coincide with joints in base slab. Provide other joints as shown.
- B. After floating, begin first trowel finish operation using power driven trowels. Continue troweling until surface is ready to receive final troweling. Begin final troweling when a ringing sound is produced as trowel is moved over surface.
- C. Continue final trowel operation to produce finished surface free of trowel marks, uniform in texture and appearance, achieving an F_F25/F_L20 when tested in accordance with ASTM E 1155.

3.03 CURING AND PROTECTION

- A. Cure and protect topping applications and finishes as specified by the topping manufacturer.

3.04 PERFORMANCES

- A. Failure of concrete topping to bond to substrate (as evidenced by a hollow sound when tapped), or disintegration or other failure of topping to perform as a floor finish, will be considered failure of materials and workmanship. Repair or replace toppings in areas of such failures, as directed.

END OF SECTION 03 54 16 00

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 04 01 20 52 - MASONRY RESTORATION AND CLEANING**PART 1: GENERAL****1.01 SCOPE OF STANDARD**

- A. This standard provides general guidance concerning the specific preferences of the University of Texas at Austin for materials, equipment, and services for the cleaning and restoration of masonry.
- B. UT recognizes that project conditions and requirements vary, thus precluding the absolute adherence to the items identified herein in all cases. However, unless there is adequate written justification, it is expected that these guidelines will govern the design and specifications for UT projects.

1.02 REFERENCE STANDARDS

- A. Expansion joints in masonry: Section 07940, JOINTING OF EXTERIOR VERTICAL SURFACES.
- B. Finishes: Section 09950, COATINGS AND PAINT SYSTEMS.
- C. The Secretary of the U.S. Department of the Interior's Standards for Rehabilitation.
- D. Conservation of Building and Decorative Stone, 2 vols., John Ashurst.
- E. Clear Water Repellent Treatments for Concrete Masonry, Masonry Institute of America.
- F. Practical Building Conservation, 4 vols., John Asbury.

1.03 QUALITY CONTROL

- A. Masonry resurfacing: As the UT-Austin campus is a historic district, in no instance shall it be acceptable to paint masonry surfaces.

1.04 GENERAL REQUIREMENTS

- A. Masonry cleaning: Cleaning shall be limited to the gentlest means possible. Test areas in inconspicuous locations. Tests must be approved by University project representative. Low pressure wash no greater than 400 psi unless authorized by University project representative. In no instance shall sandblasting be acceptable. Compliance with the Office of Environmental Health and Safety is required. See 3.01A below.
- B. Masonry restoration: Historic buildings' grout re-pointing shall comply with the UT-Austin campus historic restoration recommendations. Extreme care shall be taken during the repointing process. Use of hand tools is required.

PART 2 - PRODUCTS**2.01 SEALANTS****A. General**

- 1. Sealant: If use of a water repellant sealer is proposed, the sealant shall be a "breathable" type, and shall be approved by UT project representative and the Texas Historical Commission. Use Water based materials when possible.

PART 3 - EXECUTION

3.01 DISCHARGES

- A. Discharges from pressure washing shall not be allowed to enter a storm sewer or waterway. Vacuum the water for disposal off-site or berm the process water and allow it to evaporate. If the rinsate only contains water and dirt or sediment, it may be spread on the ground only with written prior permission from the University of Texas at Austin Office of Environmental Environmental Health and Safety.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 04 20 00 00 - UNIT MASONRY**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Single Source Responsibility for Masonry Units: Obtain exposed masonry units of uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, from one manufacturer for each different product required for each continuous surface or visually related surfaces.
- B. Single Source Responsibility for Mortar Materials: Obtain mortar ingredients of uniform quality, including color for exposed masonry, from one manufacturer for each cementitious component and from one source and producer for each aggregate.
- C. Field Constructed Mock Ups: Prior to installation of unit masonry, erect sample wall panels to further verify selections made under sample submittals and to demonstrate aesthetic effects as well as qualities of materials and execution. Build mock ups to comply with the following requirements, using materials indicated for final unit of Work:
 - 1. Locate mock ups on Site in locations indicated or, if not indicated, as approved by Architect.
 - 2. Build mock ups for the following types of masonry in sizes of approximately 4 feet long by 4 feet high by full thickness, including face and backup wythes as well as accessories.
 - a. Each type of exposed unit masonry construction.
 - b. Typical exterior face brick wall.
 - c. Typical exterior face brick wall with framed window opening.
 - d. Typical interior unit masonry wall.
 - 3. Where masonry is to match existing, erect panels parallel to existing surface.
 - 4. Notify Architect one week in advance of the dates and times when mock ups will be erected.
 - 5. Protect mock ups from the elements with weather resistant membrane.

6. Retain and maintain mock ups during construction in undisturbed condition as standard for judging completed unit masonry construction.

- a. When directed, demolish and remove mock ups from the Project Site.
- b. Accepted mock ups in undisturbed condition at time of Substantial Completion may become part of completed unit of Work.

- D. Preinstallation Conference: Conduct conference at the Project Site to comply with requirements of Division 01.

1.04 SUBMITTALS

A. Product Data:

1. Material certificates for the following signed by manufacturer and Contractor certifying that each material complies with requirements.
 - a. Each different cement product required for mortar and grout including name of manufacturer, brand, type, and weight slips at time of delivery.
 - b. Each material and grade indicated for reinforcing bars.
 - c. Each type and size of joint reinforcement.
 - 1) Each type and size of anchors, ties, and metal accessories.

B. Samples:

1. Samples for initial selection purposes of the following:
 - a. Unit masonry samples in small scale form showing full extent of colors and textures available for each different exposed masonry unit required.
 - b. Colored masonry mortar samples showing full extent of colors available.
2. Samples for verification purposes of the following:
 - a. Full size units for each different exposed masonry unit required showing full range of exposed color, texture, and dimensions to be expected in completed construction.
 - 1) Include size variation data verifying that actual range of sizes for brick falls within ASTM C 216 dimension tolerances for brick where modular dimensioning is indicated.
 - b. Colored masonry mortar samples for each color required showing the full range of colors expected in the finished construction. Label samples to indicate type and amount of colorant used.
 - c. Weep holes/vents in color to match mortar color.
 - d. Accessories embedded in the masonry.

C. Record Documents:

1. Shop drawings for reinforcing detailing fabrication, bending, and placement of unit masonry reinforcing bars. Comply with ACI 315 "Details and Detailing of Concrete Reinforcing" showing bar schedules, stirrup spacing, diagrams of bent bars, and arrangement of masonry reinforcement.

2. Cold weather construction procedures evidencing compliance with requirements specified in referenced unit masonry standard.
3. Hot weather construction procedures evidencing compliance with requirements specified in referenced unit masonry standard.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver masonry materials to Project in undamaged condition.
- B. Store and handle masonry units off the ground, under cover, and in a dry location to prevent their deterioration or damage due to moisture, temperature changes, contaminants, corrosion, and other causes. If units become wet, do not place until units are in an air dried condition.
- C. Store cementitious materials off the ground, under cover, and in dry location.
- D. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.
- E. Store masonry accessories including metal items to prevent corrosion and accumulation of dirt and oil.

1.06 PROJECT CONDITIONS

- A. During erection, cover tops of walls, projections, and sills with waterproof sheeting at end of each day's work. Cover partially completed masonry when construction is not in progress.
 1. Extend cover a minimum of 24 inches down both sides and hold cover securely in place.
 2. Where one wythe of multiwythe masonry walls is completed in advance of other wythes, secure cover a minimum of 24 inches down face next to unconstructed wythe and hold cover in place.
- B. Do not apply uniform floor or roof loads for at least 12 hours and concentrated loads for at least 3 days after building masonry walls or columns.
- C. Stain Prevention: Prevent grout, mortar, and soil from staining the face of masonry to be left exposed or painted. Remove immediately any grout, mortar, and soil that comes in contact with such masonry.
 1. Protect base of walls from rain splashed mud and mortar splatter by means of coverings spread on ground and over wall surface.
 2. Protect sills, ledges, and projections from mortar droppings.
 3. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes from mortar droppings.
- D. Cold Weather Construction: Comply with referenced unit masonry standard for cold weather construction and the following:
 1. Do not lay masonry units that are wet or frozen.
 2. Remove masonry damaged by freezing conditions.
- E. Hot Weather Construction: Comply with referenced unit masonry standard.

1.07 ALLOWANCES

- A. Furnish face brick, excluding special molded shapes.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Comply with referenced unit masonry standard and other requirements specified in this Section applicable to each material indicated.

2.02 BRICK UNITS

- A. Comply with the following requirements applicable to each form of brick required:
 - 1. Provide special molded shapes where indicated and as follows:
 - a. For applications requiring brick of form, color, texture, and size on exposed surfaces that cannot be produced by sawing standard brick sizes.
 - b. For applications where stretcher units cannot accommodate special conditions including those at corners, movement joints, bond beams, sashes, and lintels.
 - 2. Provide units without cores or frogs and with all exposed surfaces finished for ends of sills, caps, and similar applications that expose brick surfaces that otherwise would be concealed from view.
- B. Face Brick Standard: ASTM C 216 and as follows:
 - 1. Grade and Unit Compressive Strength: Provide units of grade SW and minimum average net area compressive strength not less than the unit compressive strengths required to produce clay masonry construction of compressive strength indicated.
 - 2. Type FBS (for general use in exposed masonry requiring wider variations in size and color ranges than Type FBX).
 - 3. Type FBX (for general use in exposed masonry requiring minimum variations in size and color ranges).
 - 4. Type FBA (for special architectural effects resulting from non-uniformity in size, color, and texture of individual units).
 - 5. Provide bricks manufactured to the dimensions within the tolerances specified in ASTM C 216 for Standard Modular Brick; 3-5/8 inches thick by 2-1/4 inches high by 7-5/8 inches long.
 - 6. Application: Use where brick is exposed, unless otherwise indicated.
 - 7. Wherever shown to "match existing," provide face brick of matching color, texture, and size as existing adjacent brickwork.
 - 8. Color and Texture: Match Architect's sample.

2.03 CONCRETE MASONRY UNITS

- A. Comply with requirements indicated below applicable to each form of concrete masonry unit required.
 - 1. Provide special shapes where indicated and as follows:
 - a. For lintels, corners, jambs, sash, control joints, headers, bonding, and other special conditions.

- b. Bullnose units for outside corners unless otherwise indicated.
 - c. Square edged units for outside corners, except where indicated as bullnose.
- 2. Size: Provide concrete masonry units complying with requirements indicated below for size that are manufactured to specified face dimensions within tolerances specified in the applicable referenced ASTM specification for concrete masonry units.
 - a. Concrete Masonry Units: Manufactured to specified dimensions of 3/8 inch less than nominal widths by nominal heights by nominal lengths indicated on drawings.
 - b. Prefaced Concrete Masonry Units: Manufactured to specified dimensions of 3/8 inch less than nominal widths by nominal heights by nominal lengths indicated on drawings, with prefaced surfaces having 1/16 inch thick returns of facing to create 1/4 inch wide mortar joints with modular coursing.
- 3. Provide Type I, moisture controlled units.
- 4. Exposed Faces: Manufacturer's standard color and texture, unless otherwise indicated.
 - a. Where special finishes are indicated, provide units with exposed faces of the following general description matching color and texture of Architect's sample.
 - 1) Standard aggregate, ground finish
 - 2) Special aggregate, ground finish
 - 3) Standard aggregate, split face finish
 - 4) Special aggregate, split face finish
 - 5) Standard aggregate, split ribbed finish
 - 6) Special aggregate, split ribbed finish
 - b. Where special patterns are indicated, provide units with exposed faces matching color, texture and pattern of Architect's sample.
- B. Hollow Load Bearing Concrete Masonry Units: ASTM C 90, and as follows:
 - 1. Unit Compressive Strength: Provide units with minimum average net area compressive strength not less than the unit compressive strengths required to produce concrete unit masonry construction of compressive strength indicated.
 - 2. Weight Classification: Lightweight unless otherwise indicated or required by Project conditions.
- C. Solid Load Bearing Concrete Masonry Units: ASTM C 90, and as follows:
 - 1. Unit Compressive Strength: Provide units with minimum average net area compressive strength not less than the unit compressive strengths required to produce concrete unit masonry construction of compressive strength indicated.
 - 2. Weight Classification: Lightweight unless otherwise indicated or required by Project conditions.
- D. Prefaced Concrete Block: Lightweight concrete units indicated below with manufacturer's standard smooth resinous tile facing complying with ASTM C 744:
 - 1. For units on which prefaced surfaces are molded, comply with the following:
 - a. Hollow Load Bearing Concrete Block: ASTM C 90

- b. Unit Compressive Strength: Provide units with minimum average net area compressive strength not less than the unit compressive strengths required to produce concrete unit masonry construction of compressive strength indicated.
- 2. Color and Pattern: Match Architect's sample
- 3. Color and Pattern: Provide color and pattern selected by Architect from manufacturer's full range of standard colors and patterns.
- 4. Available Products: Subject to compliance with requirements, prefaced concrete masonry units that may be incorporated in the Work include, but are not limited to, the following:
 - a. "Astra Glaze," Trenwyth Industries, Inc.
 - b. "Spectra Glaze II," The Burns & Russell Co.

2.04 MORTAR AND GROUT MATERIALS

- A. Portland Cement: ASTM C 150, Type I or II, except Type III may be used for cold weather construction. Provide natural color or white cement as required to produce required mortar color.
- B. Mortar Cement: U.B.C. Standard No. 21-14
 - 1. For pigmented mortars, use premixed, colored mortar cements of formulation required to produce color indicated, or if not indicated, as selected from manufacturer's standard formulations. Pigments shall not exceed 5 percent of mortar cement by weight for mineral oxides nor 1 percent for carbon black.
- C. Ready Mixed Mortar: Cementitious materials, water, and aggregate complying with requirements specified in this article, combined with set controlling admixtures to produce a ready mixed mortar complying with ASTM C 1142.
- D. Hydrated Lime: ASTM C 207, Type S
- E. Aggregate for Mortar: ASTM C 144, except for joints less than 1/4 inch use aggregate graded with 100 percent passing the No. 16 sieve.
 - 1. White Mortar Aggregates: Natural white sand or ground white stone
 - 2. Colored Mortar Aggregates: Ground marble, granite, or other sound stone, as required to match Architect's sample.
- F. Aggregate for Grout: ASTM C 404
- G. Colored Mortar Pigments: Natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes. Use only pigments with record of satisfactory performance in masonry mortars.
- H. Water: Clean and potable

2.05 REINFORCING STEEL

- A. Provide reinforcing steel complying with requirements of referenced unit masonry standard and this article.
- B. Steel Reinforcing Bars: Material and grade as follows:
 - 1. Billet steel complying with ASTM A 615
 - 2. Epoxy coated billet steel complying with ASTM A 615 and ASTM A 775

3. Grade 60

- C. Deformed Reinforcing Wire: ASTM A 496
- D. Plain Welded Wire Fabric: ASTM A 185
- E. Deformed Welded Wire Fabric: ASTM A 497

2.06 JOINT REINFORCEMENT

- A. Provide joint reinforcement complying with requirements of referenced unit masonry standard and this article, formed from galvanized carbon steel wire, coating class as required by referenced unit masonry standard for application indicated.
- B. Description: Welded wire units prefabricated with deformed continuous side rods and plain cross rods into straight lengths of not less than 10 feet, with prefabricated corner and tee units, and complying with requirements indicated below:
 - 1. Wire Diameter for Side Rods: 0.1483 inch (9 gage)
 - 2. Wire Diameter for Cross Rods: 0.1483 inch (9 gage)
 - 3. For single wythe masonry provide type as follows with single pair of side rods:
 - a. Ladder design with perpendicular cross rods spaced not more than 16 inches on center.
 - b. Truss design with continuous diagonal cross rods spaced not more than 16 inches on center.
 - 4. For multiwythe masonry provide type as follows:
 - a. Tab design with single pair of side rods and rectangular box type cross ties spaced not more than 16 inches on center; with side rods spaced for embedment within each face shell of backup wythe and ties extended to engage the outer wythe by at least 1½ inches.
 - b. Acceptable products include Masonry Reinforcing Corp. "Series 800", Dur O wal "Ladur-Eye", or Hohman & Barnard "Hookit with 2Z Ties".

2.07 TIES AND ANCHORS, GENERAL

- A. Provide ties and anchors specified in subsequent articles that comply with requirements for metal and size of referenced unit masonry standard and of this article.
- B. Galvanized Carbon Steel Wire: ASTM A 82, coating class as required by referenced unit masonry standard for application indicated.
- C. Galvanized Steel Sheet: ASTM A 366 (commercial quality) cold rolled carbon steel sheet, hot dip galvanized after fabrication to comply with ASTM A 525, Class B2 (for unit lengths over 15 inches) and Class B3 (for unit lengths under 15 inches), for sheet metal ties and anchors.

2.08 ADJUSTABLE ANCHORS FOR CONNECTING MASONRY TO STRUCTURAL FRAMEWORK

- A. Two piece assemblies as described below allowing vertical or horizontal differential movement between wall and framework parallel to plane of wall, but resisting tension and compression forces perpendicular to it.
- B. For anchorage to concrete framework, provide manufacturer's standard with dovetail anchor section formed from sheet metal and triangular shaped wire tie section sized to extend within 1 inch of masonry face and as follows:
 - 1. Furnish dovetail slots to concrete trade for installation.

2. Acceptable products include Masonry Reinforcing Corp. "1304/2102", Dur O waL "D/A100/D/A720 723", or Heckman "100/103".
- C. For anchorage to steel framework provide manufacturer's standard anchors with crimped 1/4 inch diameter wire anchor section for welding to steel and triangular shaped wire tie section sized to extend within 1 inch of masonry face and as follows:
 1. Acceptable products include Masonry Reinforcing Corp. "1000, Type 1/1100", Dur O waL "D/A100/D/A720 723", or Heckman "100/103".

2.09 RIGID ANCHORS

- A. Provide straps of form and length indicated, fabricated from metal strips of following width and thickness.
 1. 1½ inches wide by ¼ inch thick.
 2. As indicated.

2.10 ADJUSTABLE MASONRY VENEER ANCHORS

- A. Provide two piece assemblies allowing vertical or horizontal differential movement between wall and framework parallel to plane of wall, but resisting tension and compression forces perpendicular to it; for attachment over sheathing to metal studs; and with the following structural performance characteristics:
 1. Structural Performance Characteristics: Capable of withstanding a 100 pound/foot load in either tension or compression without deforming over, or developing play in excess of, 0.05 inch.
- B. Provide anchors and ties as specified below with all components hot-dipped galvanized after fabrication. Size ties to extend to within ¾ inch of outside face of brick veneer.
 1. Brick Veneer Anchors at Metal Stud Back Up Construction: Flexible two piece anchors consisting of 3/16 inch diameter trapezoidal shaped wire ties and 16 gage minimum steel strap designed for screw attachment into metal stud framing.
 - a. Acceptable products include Hohman & Barnard "DW 10/VWT", Masonry Reinforcing Corp. "1004/1100", or Dur O WaL "D/A213-.5/D/A701 708".
 2. Brick Veneer Anchors at Solid Back Up Construction: Flexible two piece anchors consisting of 3/16 inch diameter trapezoidal shaped wire ties with 16 gage channel locking tab and 16 gage minimum steel "channel slot" designed for surface attachment to concrete or CMU back up.
 - a. Acceptable products include Masonry Reinforcing Corp. "1302/2103", Dur O WaL "D/A901/918 921", or Heckman "132/129".
- C. Steel Drill Screws for Steel Studs: ASTM C 954 except manufactured with hex washer head and neoprene washer, #10 diameter by length required to penetrate steel stud flange by not less than 3 exposed threads, and with the following corrosion protective coating:
 1. Organic polymer coating with salt spray resistance to red rust of more than 800 hours per ASTM B 117.
 2. Organic Polymer Coated Steel Drill Screws:
 - a. "Traxx," ITW Buildex
 - b. "Dril Flex," Elco Industries, Inc.

2.11 MISCELLANEOUS ANCHORS

- A. Unit Type Masonry Inserts in Concrete: Cast iron or malleable iron inserts of type and size indicated.
- B. Dovetail Slots: Furnish dovetail slots, with filler strips, of slot size indicated, fabricated from 0.0336 inch (22 gage) sheet metal.
- C. Anchor Bolts: Steel bolts complying with A 307, Grade A; with ASTM A 563 hex nuts and, where indicated, flat washers; hot dip galvanized to comply with ASTM A 153, Class C; of diameter and length indicated and in the following configurations:
 - 1. Headed bolts.
 - 2. Nonheaded bolts, straight.
 - 3. Nonheaded bolts, bent in manner indicated.

2.12 POSTINSTALLED ANCHORS

- A. Anchors as described below, with capability to sustain, without failure, load imposed within factors of safety indicated, as determined by testing per ASTM E 488, conducted by a qualified independent testing laboratory.
 - 1. Type: Chemical anchors.
 - 2. Type: Expansion anchors.
 - 3. Type: Undercut anchors.
 - 4. Corrosion Protection: Carbon steel components zinc plated to comply with ASTM B 633, Class Fe/Zn 5 (5 microns) for Class SC 1 service condition (mild).
 - 5. Corrosion Protection: Stainless steel components complying with ASTM F 593 and ASTM F 594, Group 1 alloy 304 or 316 for bolts and nuts; alloy 304 or 316 for anchor.
 - 6. For cast in place and postinstalled anchors in concrete: Capability to sustain, without failure, a load equal to 4 times loads imposed by masonry.
 - 7. For postinstalled anchors in grouted concrete masonry units: Capability to sustain, without failure, a load equal to 6 times loads imposed by masonry.

2.13 EMBEDDED THROUGH-WALL FLASHING MATERIALS

- A. Copper Fabric Laminate: 5 ounce copper sheet bonded with asphalt between 2 layers of glass fiber cloth.
 - 1. "Copper Fabric," Afco Products Inc.
 - 2. "Type FCC Fabric Covered Copper," Phoenix Building Products
 - 3. "Copper Fabric Flashing," Sandell Manufacturing Co., Inc.
 - 4. "York Copper Fabric Flashing," York Manufacturing, Inc.
- B. Adhesive for Flashings: Of type recommended by manufacturer of flashing material for use indicated.

2.14 MISCELLANEOUS MASONRY ACCESSORIES

- A. Expansion and Control Joint Fillers:

1. Premolded Expansion Joint Filler: Closed cell polyethylene foam material with a density of ± 2 psf, and compatible with most sealants. Acceptable products include Sonneborn "Sonoflex F" and Williams Products Inc. "Expand O Foam 1380 Series".
 2. Construction Joint Filler: Closed cell expanded neoprene foam material with a density of 15 to 35 psf, flame resistant, and compatible with most sealants. Acceptable products include Williams Products Inc. "Neoprene Type NN1" and Rubatex Corp. "R 1800 FS".
 3. Premolded Control Joint Strip: Solid rubber strips with a Shore A durometer hardness of 60 to 80, designed to fit standard sash blocks and maintain lateral stability of masonry wall. Provide strips in width approximately 2" less than thickness of masonry wythe. Acceptable products include Dur O wal "Rapid Control Joint" and Hohman & Barnard "QS Series".
- B. Bond Breaker Strips: Asphalt saturated organic roofing felt complying with ASTM D 226, Type I (No. 15 asphalt felt).
- C. Weep Holes: Provide one of the following at Contractor's option:
1. Aluminum Weep Hole/Vent: One piece L shaped units made to fit in a vertical mortar joint from sheet aluminum and consisting of a vertical channel with louvers stamped in web and a flat horizontal; prepainted prior to installation, in color to match that of masonry or mortar as selected by Architect.
 - a. "Louvered Weephole", Masonry Reinforcing Corp.
 2. Plastic Weep Hole/Vent: One piece flexible extrusion manufactured from ultraviolet resistant polypropylene co polymer, designed to weep moisture in masonry cavity to exterior, sized to fill head joints with outside face held back 1/8 inch from exterior face of masonry, in custom color to match that of masonry or mortar as selected by Architect.
 - a. "Cell Vent," Dur O Wal, Inc.
- D. Cavity Drainage Material: To prevent mortar from blocking cavity weep holes, provide one of the following:
1. 1-inch-(25-mm-) thick, reticulated, nonabsorbent mesh, made from polyethylene strands and shaped to maintain drainage at weep holes without being clogged by mortar droppings. Product: "Mortar Net".

2.15 INSULATION

- A. Loose Granular Perlite Insulation: ASTM C 549, Type II (surface treated for water repellency and limited moisture absorption) or IV (surface treated for water repellency and to limit dust generation).
- B. Loose Granular Vermiculite Insulation: ASTM C 516, Type II (surface treated for water repellency and limited moisture absorption), Grade 3 (Fine), complying with 29 CFR 1926 by containing less than 0.10 percent by weight of asbestos and that demonstration shows will not release asbestos fibers in excess of 0.1 fibers per cubic centimeter under reasonably foreseeable Site conditions.
- C. Extruded Polystyrene Board Insulation: Rigid cellular polystyrene thermal insulation with closed cells and integral high density skin, formed by the expansion of polystyrene base resin in an extrusion process to comply with ASTM C 578, Type IV; in manufacturer's standard lengths and widths; thicknesses as indicated.
- D. Molded Polystyrene Board Insulation: Rigid, cellular thermal insulation formed by the expansion of polystyrene resin beads or granules in a closed mold to comply with ASTM C 578, Type I; in manufacturer's standard lengths and widths; thicknesses as indicated.

1. Provide specially shaped units designed for installation in cores of concrete blocks.
 - E. Adhesive: Type recommended by insulation board manufacturer for application indicated.
- 2.16 MORTAR AND GROUT MIXES
- A. Do not add admixtures including coloring pigments, air entraining agents, accelerators, retarders, water repellent agents, antifreeze compounds, or other admixtures, unless otherwise indicated.
 1. Do not use calcium chloride in mortar or grout.
 - B. Mortar for Unit Masonry: Comply with ASTM C 270, Proportion Specification, for types of mortar indicated below:
 - C. Proportions listed are in the following order, by volume of cementitious materials: (Portland Cement):(Hydrated Lime or Lime Putty):(Aggregate). Aggregate volume is based on the sum of the separate volumes of other cementitious materials.
 1. Limit cementitious materials in mortar to portland cement lime.
 2. Use Type M mortar for masonry below grade and in contact with earth, and where indicated: (1):(1/4):(2 1/4 to 3).
 3. Use Type S mortar for reinforced masonry: (1):(1/4 to 1/2):(2 1/4 to 3).
 4. Use Type N mortar for all other exterior and interior walls: (1):(1/2 to 1 1/4):(2 1/4 to 3).
 5. Colored Pigmented Mortar: Select and proportion pigments with other ingredients to produce color required. Do not exceed pigment to-cement ratio of 1:10, by weight. Match Architect's sample.
 - D. Provide grout complying with ASTM C 476, of consistency indicated or, if not otherwise indicated, of consistency (fine or coarse) at time of placement which will completely fill all spaces intended to receive grout.
 1. Provide grout in the following proportions, by volume: (1 part portland cement):(0 to 1/10 part hydrated lime or lime putty):(aggregate, 2½ to 3 times the sum of the volumes of other cementitious materials). Add coarse aggregate in the proportion of 1 to 2 times the sum of the volumes of other cementitious materials for "coarse" grout.
 2. Use fine grout in grout spaces less than 2 inches in horizontal direction, unless otherwise indicated.
 3. Use coarse grout in grout spaces 2 inches or more in least horizontal dimension, unless otherwise indicated.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other specific conditions, and other conditions affecting performance of unit masonry.
 1. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of unit masonry.
- B. Examine rough in and built in construction to verify actual locations of piping connections prior to installation.

- C. Do not proceed until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Comply with referenced unit masonry standard and other requirements indicated applicable to each type of installation included in Project.
- D. Thickness: Build cavity and composite walls and other masonry construction to the full thickness shown. Build single wythe walls to the actual thickness of the masonry units, using units of nominal thickness indicated.
- E. Build chases and recesses as shown or required to accommodate items specified in this and other Sections of the Specifications. Provide not less than 8 inches of masonry between chase or recess and jamb of openings and between adjacent chases and recesses.
- F. Leave openings for equipment to be installed before completion of masonry. After installation of equipment, complete masonry to match construction immediately adjacent to the opening.
- G. Cut masonry units with motor driven saws to provide clean, sharp, unchipped edges. Cut units as required to provide continuous pattern and to fit adjoining construction. Use full size units without cutting where possible.
- H. Matching Existing Masonry: Match coursing, bonding, color, and texture of new masonry with existing masonry.

3.03 CONSTRUCTION TOLERANCES

- A. Comply with construction tolerances of referenced unit masonry standard.

3.04 LAYING MASONRY WALLS

- A. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint widths and for accurate locating of openings, movement type joints, returns, and offsets. Avoid the use of less than half size units at corners, jambs, and where possible at other locations.
- B. Lay up walls to comply with specified construction tolerances, with courses accurately spaced and coordinated with other construction.
- C. Bond Pattern for Exposed Masonry: Lay exposed masonry in the following bond pattern; do not use units with less than nominal 4 inch horizontal face dimensions at corners or jambs.
 - 1. One half running bond with vertical joint in each course centered on units in courses above and below.
 - 2. Stack bond
 - 3. One third running bond
 - 4. As indicated on drawings
- D. Lay concealed masonry with all units in a wythe in running bond or bonded by lapping not less than 2 inches. Bond and interlock each course of each wythe at corners. Do not use units with less than nominal 4 inch horizontal face dimensions at corners or jambs.

- E. Stopping and Resuming Work: In each course, rack back 1/2 unit length for one half running bond or 1/3 unit length for one third running bond; do not tooth. Clean exposed surfaces of set masonry, wet clay masonry units lightly (if required), and remove loose masonry units and mortar prior to laying fresh masonry.
- F. Built In Work: As construction progresses, build in items specified under this and other Sections of the Specifications. Fill in solidly with masonry around built in items.
 - 1. Fill space between hollow metal frames and masonry solidly with mortar, unless otherwise indicated.
 - a. At exterior frames insert extruded polystyrene board insulation around perimeter of frame in thickness indicated but not less than 3/4 inch to act as a thermal break between frame and masonry.
 - 2. Where built in items are to be embedded in cores of hollow masonry units, place a layer of metal lath in the joint below and rod mortar or grout into core.
 - 3. Fill cores in hollow concrete masonry units with grout 3 courses (24 inches) under bearing plates, beams, lintels, posts, and similar items, unless otherwise indicated.

3.05 MORTAR BEDDING AND JOINTING

- A. Lay brick units with full mortar coverage on bed and head joints. Furrowing of joints will not be permitted.
- B. Lay hollow concrete masonry units as follows:
 - 1. With full mortar coverage on horizontal and vertical face shells.
 - 2. Bed webs in mortar in starting course on footings and in all courses of piers, columns, and pilasters, and where adjacent to cells or cavities to be filled with grout.
 - 3. For starting course on footings where cells are not grouted, spread out full mortar bed including areas under cells.
- C. Cut joints flush for masonry walls to be concealed or to be covered by other materials, unless otherwise indicated.

3.06 STRUCTURAL BONDING OF MULTI-WYTHE MASONRY

- A. Use individual metal ties installed in horizontal joints to bond wythes together.
- B. Use continuous horizontal joint reinforcement installed in horizontal mortar joints for bond tie between wythes.
- C. Use either of the structural bonding systems specified above.
- D. Use structural bonding system indicated on Drawings.
- E. Corners: Provide interlocking masonry unit bond in each course at corners, unless otherwise shown.
 - 1. Provide continuity with horizontal joint reinforcement at corners using prefabricated "L" units, in addition to masonry bonding.
- F. Intersecting and Abutting Walls: Unless vertical expansion or control joints are shown at juncture, provide same type of bonding specified for structural bonding between wythes and space as follows:
 - 1. Provide individual metal ties.

2. Provide continuity with horizontal joint reinforcement using prefabricated "T" units.

G. Nonbearing Interior Partitions: Build full height of story to underside of solid floor or roof structure above and as follows:

1. Install pressure relieving joint filler in joint between top of partition and underside of structure above.

3.07 CAVITIES/AIR SPACES

A. Keep cavities/air spaces clean of mortar droppings and other materials during construction. Strike joints facing cavities/air spaces flush.

B. Tie exterior wythe to backup with individual metal ties. Stagger alternate courses.

C. Tie exterior wythe to backup with continuous horizontal joint reinforcing.

D. Install vents in vertical head joints at the top of each continuous cavity/air space. Space vents and close off cavities/air spaces vertically and horizontally with blocking in manner indicated.

3.08 CAVITY WALL AND MASONRY CELL INSULATION

A. On units of plastic insulation, install small pads of adhesive spaced approximately 1' 0" on center both ways on inside face or attach to inside face with plastic fasteners designed for this purpose. Fit courses of insulation between wall ties and other confining obstructions in cavity, with edges butted tightly both ways. Press units firmly against inside wythe of masonry or other construction as shown.

1. Fill all cracks and open gaps in insulation with crack sealer compatible with insulation and masonry.

B. Pour granular insulation into cavities as shown to fill void spaces completely. Maintain inspection ports to show presence of insulation at extremities of each pour area. Close ports after complete coverage has been confirmed. Limit fall of insulation to one story in height, but not to exceed 20 feet.

3.09 HORIZONTAL JOINT REINFORCEMENT

A. Provide continuous horizontal joint reinforcement as indicated. Install longitudinal side rods in mortar for their entire length with a minimum cover of 5/8 inch on exterior side of walls, 1/2 inch elsewhere. Lap reinforcing a minimum of 6 inches.

B. Cut or interrupt joint reinforcement at control and expansion joints, unless otherwise indicated.

C. Provide continuity at corners and wall intersections by use of prefabricated "L" and "T" sections. Cut and bend reinforcement units as approved by manufacturer for continuity at returns, offsets, column fireproofing, pipe enclosures, and other special conditions.

3.10 ANCHORING MASONRY TO STRUCTURAL MEMBERS

A. Anchor masonry to structural members where masonry abuts or faces structural members to comply with the following:

1. Provide an open space not less than 1 inch in width between masonry and structural member, unless otherwise indicated. Keep open space free of mortar or other rigid materials.

2. Anchor masonry to structural members with flexible anchors embedded in masonry joints and attached to structure.

3. Space anchors as indicated, but not more than 24 inches on center vertically and 36 inches on center horizontally.

3.11 ANCHORING SINGLE WYTHE MASONRY VENEER

- A. Anchor single wythe masonry veneer to metal studs with masonry veneer anchors to comply with the following requirements:
 1. Fasten each anchor section through sheathing to metal studs with 2 metal fasteners of type indicated.
 2. Embed tie section in masonry joints. Provide not less than 2 inch air space between back of masonry veneer wythe and face of sheathing.
 3. Locate anchor section relative to course in which tie section is embedded to allow maximum vertical differential movement of tie up and down.
 4. Space anchors as indicated but not more than 16 inches on center vertically and 18 inches on center horizontally with not less than one anchor for each 3 square feet of wall area. Install additional anchors within 12 inches of openings and at intervals around perimeter not exceeding 8 inches.
- B. Install vents at the top of each continuous air space in masonry veneer walls.

3.12 MOVEMENT (CONTROL AND EXPANSION) JOINTS

- A. Install control and expansion joints in unit masonry where indicated. Build in related items as the masonry progresses. Do not form a continuous span through movement joints unless provisions are made to prevent in plane restraint of wall or partition movement.
- B. Joint Spacing: If location of control joints and expansion joints is not shown, place vertical joints spaced not to exceed 35 feet on center and horizontal joints not to exceed story height.
 1. Locate control joints in face brick at all points of discontinuity of back up construction, vertical and horizontal.
- C. Form control joints in concrete masonry as follows:
 1. Fit bond breaker strips into hollow contour in ends of block units on one side of control joint. Fill the resultant core with grout and rake joints in exposed faces.
 2. Install preformed control joint gaskets designed to fit standard sash block.
 3. Install special shapes designed for control joints. Install bond breaker strips at joint. Keep head joints free and clear of mortar or rake joint.
- D. Form expansion joints in brick made from clay or shale as follows:
 1. Build flanges of metal expansion strips into masonry. Lap each joint 4 inches in direction of water flow. Seal joints below grade and at junctures with horizontal expansion joints, if any.
 2. Build flanges of factory fabricated expansion joint units into masonry.
 3. Build in joint fillers where indicated.
 4. Form open joint of width indicated but not less than 3/8 inch for installation of sealant and backer rod. Maintain joint free and clear of mortar.

- E. Build in horizontal pressure relieving joints where indicated; construct joints by either leaving an air space or inserting nonmetallic 50 percent compressible joint filler of width required to permit installation of sealant and backer rod.

- 1. Locate horizontal pressure relieving joints beneath shelf angles supporting masonry veneer and attached to structure behind masonry veneer.

3.13 LINTELS

- A. Install steel lintels where indicated.
- B. Provide masonry lintels where shown and wherever openings of more than 12 inches for brick size units and 24 inches for block size units are shown without structural steel or other supporting lintels. Provide precast or formed in place masonry lintels. Cure precast lintels before handling and installation. Temporarily support formed in place lintels.
 - 1. For hollow concrete masonry unit walls, use specially formed bond beam units with reinforcement bars placed as indicated and filled with coarse grout.
- C. Provide minimum bearing of 8 inches at each jamb, unless otherwise indicated.

3.14 THROUGH-WALL FLASHING/WEEP HOLES

- A. Install embedded flashing and weep holes in masonry at shelf angles, lintels, ledges, other obstructions to the downward flow of water in the wall, and where indicated.
- B. Prepare masonry surfaces so that they are smooth and free from projections that could puncture flashing. Place through wall flashing on sloping bed of mortar and cover with mortar. Seal penetrations in flashing with adhesive/sealant/tape as recommended by flashing manufacturer before covering with mortar.
- C. Install flashings as follows:
 - 1. At masonry backup construction, extend flashing from exterior face of outer wythe of masonry, through the outer wythe, turned up a minimum of 8 inches, and through the inner wythe to within $\frac{1}{2}$ inch of the interior face of the wall in exposed masonry. Where interior surface of inner wythe is concealed by furring, carry flashing completely through the inner wythe and turn up approximately 2 inches, unless otherwise indicated.
 - 2. At sheathing backup construction, extend flashing from exterior face of outer wythe of masonry, through the outer wythe to the face of the sheathing, and turn up a minimum of 8 inches onto the sheathing.
 - a. Fully adhere flashing to substrate with adhesive; using a roller or other device to ensure full and complete adhesion.
 - b. At joints, lap flashing sheets a minimum of 4 inches onto adjacent sheet and seal with adhesive.
 - 3. At lintels and shelf angles, extend flashing a minimum of 4 inches into masonry at each end.
 - 4. At heads and sills, extend flashing as specified above unless otherwise indicated but turn up ends not less than 2 inches to form a pan.
 - 5. Turn down sheet metal flashings at exterior face of masonry to form drip.
 - 6. Strip in top edge of flashing installed against inner face of cavity with mastic and reinforcing fabric.

- D. Install weep holes in the head joints in exterior wythes of the first course of masonry immediately above embedded flashings and as follows:
 - 1. Form weep holes by using open head-joints in brick veneer.
 - 2. Form weep holes with product specified in Part 2 of this Section.
 - 3. Space weep holes 24 inches on center.
 - 4. In uninsulated cavities/air spaces place cavity drainage material immediately above flashing embedded in the wall, as masonry construction progresses, to splatter mortar droppings and to maintain drainage.
- E. Install reglets and nailers for flashing and other related construction where shown to be built into masonry.

3.15 INSTALLATION OF REINFORCED UNIT MASONRY

- A. Install reinforced unit masonry to comply with requirements of referenced unit masonry standard.
 - 1. Provide continuous vertical reinforcing as indicated on the Drawings or otherwise required, including additional reinforcing bars at corners, around openings, at attachments of other work, and similar work.
 - 2. Install bars to provide proper embedment and laps where indicated as "continuous reinforcing".
 - 3. Fill cores containing vertical reinforcing with grout to full height of wall.
- B. Temporary Formwork: Construct formwork and shores to support reinforced masonry elements during construction.
 - 1. Construct formwork to conform to shape, line, and dimensions shown. Make sufficiently tight to prevent leakage of mortar and grout. Brace, tie, and support forms to maintain position and shape during construction and curing of reinforced masonry.
- C. Do not place grout until entire height of masonry to be grouted has attained sufficient strength to resist grout pressure.
- D. Do not remove forms and shores until reinforced masonry members have hardened sufficiently to carry their own weight and other temporary loads that may be placed on them during construction.

3.16 REPAIRING, POINTING, AND CLEANING

- A. Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or if units do not match adjoining units. Install new units to match adjoining units and in fresh mortar or grout, pointed to eliminate evidence of replacement.
- B. Pointing: During the tooling of joints, enlarge any voids or holes, except weep holes, and completely fill with mortar. Point up all joints including corners, openings, and adjacent construction to provide a neat, uniform appearance, prepared for application of sealants.
- C. Final Cleaning: After mortar is thoroughly set and cured, clean exposed masonry as follows:
 - 1. Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.
 - 2. Test cleaning methods on sample wall panel; leave ½ panel uncleaned for comparison purposes. Obtain Architect's approval of sample cleaning before proceeding with cleaning of masonry.

3. Protect adjacent stone and nonmasonry surfaces from contact with cleaner by covering them with liquid strippable masking agent, polyethylene film, or waterproof masking tape.
 4. Wet wall surfaces with water prior to application of cleaners; remove cleaners promptly by rinsing thoroughly with clear water.
 5. Clean brick by means of bucket and brush hand cleaning method described in BIA "Technical Note No. 20 Revised".
 6. Clean concrete masonry by means of cleaning method indicated in NCMA TEK 45 applicable to type of stain present on exposed surfaces.
- D. Provide final protection and maintain conditions, in a manner acceptable to Installer, that ensure unit masonry is without damage and deterioration at time of Substantial Completion.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 04 23 13 00 - GLASS UNIT MASONRY VERTICAL ASSEMBLIES**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for glass unit masonry assemblies. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes
 - a. Glass block set in mortar.
 - b. Glass block set in silicone sealant.
 - c. Glass block set in glass-block grid systems.

C. Performance Requirements

1. Structural Performance: Provide glass-block grid systems capable of withstanding the effects of gravity loads and the loads and stresses within limits and under conditions indicated.

D. Action Submittals

1. Product Data: For each type of product indicated.
2. LEED Submittals:
 - a. Product Data for Credit IEQ 4.1: For sealants used inside the weatherproofing system, documentation including printed statement of VOC content.
 - b. Laboratory Test Reports for Credit IEQ 4: For sealants used inside the weatherproofing system, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
3. Shop Drawings: Show fabrication and installation details for glass unit masonry, including vertical and horizontal coursing, anchors, reinforcement, and expansion strips and glass-block grid systems.
4. Provide Samples for each form, pattern, and color of glass block and color of joint material and glass-block grid material indicated or selected by The University.
5. Delegated-Design Submittal: For installed products indicated to comply with performance requirements and design criteria, documentation including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

E. Informational Submittals

1. Qualification Data: For qualified professional engineer.

F. Quality Assurance

1. Fire-Rated Glass Unit Masonry Assemblies: Assemblies listed by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire-protection ratings indicated, based on testing according to NFPA 257 **OR** UBC Standard 7-4, **as directed**.
 - a. Test Pressure: Test at atmospheric pressure **OR** After 10 minutes into the test, neutral pressure level in furnace shall be located so that at least two-thirds of test specimen is above the neutral pressure plane, **as directed**.

G. Delivery, Storage, And Handling

1. Store glass block in unopened cartons on elevated platforms, under cover, and in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied.

2. Store glass-block grid materials in unopened cartons in an enclosed, dry location.
3. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.
4. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.
5. Store accessories, including metal items, to prevent corrosion and accumulation of dirt and oil.

H. Project Conditions

1. Environmental Limitations for Sealants: Do not install sealants when ambient and substrate temperatures are outside limits permitted by sealant manufacturer or below 40 deg F (5 deg C) or when joint substrates are wet.
2. Weather Limitations: Proceed with installation of glass unit masonry assemblies only when ambient and material temperatures are 40 deg F (5 deg C) or higher.
 - a. Maintain temperature in installation areas at 40 deg F (5 deg C) or above for 48 hours after installing.

I. Sequencing And Scheduling

1. Sequence and coordinate completion of glass unit masonry assemblies so sealants can be installed immediately after mortar has attained final set.

1.2 PRODUCTS

A. Glass Block

1. Hollow Glass Block: Hollow units made from transparent glass, with manufacturer's standard edge coating.
 - a. Glass Color: As selected from manufacturer's full range.
 - b. Pattern:
 - 1) Smooth, undistorted inner and outer faces.
 - 2) Wavy, light-diffusive design on inner faces, and smooth outer faces.
 - 3) Fluted, light-diffusive design, horizontal on one inner face, vertical on other; and smooth outer faces.
 - 4) Linear prismatic design, horizontal on one inner face, vertical on other; and smooth outer faces.
 - 5) Prismatic pyramid, light-diffusive design on inner faces, and smooth outer faces.
 - 6) As indicated by manufacturer's designation.
 - 7) Manufacturer's standard decorative pattern to match sample.
 - 8) As selected from manufacturer's full range.
 - 9) Custom decorative pattern to match design.
 - c. Edge-Coating Color: As selected from manufacturer's full range.
 - d. Sizes: Manufacturer's standard sizes corresponding to nominal sizes indicated on Drawings.
 - e. Thick-Faced Units: Units with faces at least 3/4 inch (19 mm) thick.
2. Solid Glass Block: Colorless, transparent, solid glass blocks with smooth **OR** stippled, **as directed**, faces and manufacturer's standard edge coating.
 - a. Square-Block Size: 5-3/4 inches (146 mm) **OR** 7-3/4 inches (197 mm) **OR** 11-3/4 inches (299 mm) **as directed**, square by 1-1/2 inches (38 mm) **OR** 3 inches (76 mm) thick, actual size, **as directed**.
 - b. Rectangular-Block Size: 3 by 7-3/4 inches (76 by 197 mm) **OR** 5-3/4 by 7-3/4 inches (146 by 197 mm), **as approved by** 1-1/2 inches (38 mm) **OR** 3 inches (76 mm) thick, actual size, **as directed**.
3. Glass Paver Block: Transparent, colorless, pressed glass units, with a smooth top surface and a decorative, light-diffusing, patterned bottom surface; **6 inches (152 mm) square by 1 inch (25 mm) OR 4-3/4 inches (120 mm) square by 1-9/16 inches (40 mm) OR 6-5/16 inches (160 mm) square by 1-3/16 inches (30 mm) OR 7-1/2 inches (190 mm) square by 1-1-15/16 inches (50 mm) OR 7-1/2 inches (190 mm) square by 2-3/4 inches (70 mm) OR 7-7/8 inches (200 mm) square by 7/8 inch (22 mm) OR 7-7/8 inches (200 mm) square by 1-15/16 inches**

(50 mm) OR 4-5/8 inches (117 mm) in diameter by 2-3/8 inches (60 mm) thick, actual size, as directed.

a.

B. Glass-Block Grid Systems

1. General: Aluminum extrusions complying with ASTM B 221 (ASTM B 221M), Alloy 6063-T6 or Alloy 6463-T6, forming a grid system and frame designed for application indicated.
2. Window and Wall System: Aluminum T-bar grid with tubular frame and vinyl glass-block boots.
 - a. Finish: As selected from manufacturer's full range.
 - b. Glass-Block Size: 7-3/4 inches (197 mm) square by 3-1/8 inches (79 mm) thick.
 - c. Provide self-flashing, **as directed**, aluminum exterior frame covers with vinyl thermal break.
 - d. Provide extruded-aluminum frame receivers (corner starters) at heads, jambs, and sills.
 - e. Provide extruded-aluminum mullions where indicated.
 - f. Provide aluminum trim and closures as indicated.
3. Skylight System: Aluminum T-bar grid with tubular frame; vinyl thermal break; extruded-aluminum, curb-mounting frame and counterflashing; and vinyl glass-block boots.
 - a. Finish: As selected from manufacturer's full range.
 - b. Glass-Block Size: 7-3/4 inches (197 mm) square by 3-1/8 inches (79 mm) thick.
4. Floor System: Aluminum tubular grid and frame with glass-block boots made from UV- and oil-resistant EPDM.
 - a. Finish: Class II, clear-anodized finish; complying with AAMA 611.
 - b. Glass-Paver-Block Size: 6 inches (152 mm) square by 1 inch (25 mm) thick.
5. Sealant: Product recommended by glass-block grid system manufacturer.
 - a. Provide sealants for use inside the weatherproofing system that have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. Mortar Materials

1. Portland Cement: ASTM C 150, Type I or Type II, natural color or white cement as required to produce mortar color indicated.
 - a. Where joints are indicated to be raked out and pointed, gray cement may be used for setting mortar.
2. Hydrated Lime: ASTM C 207, Type S.
3. Portland Cement-Lime Mix: Packaged blend of portland cement complying with ASTM C 150, Type I or Type III, and hydrated lime complying with ASTM C 207, Type S.
4. Masonry Cement: ASTM C 91.
5. Mortar Pigments: Natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes. Use only pigments with a record of satisfactory performance in masonry mortar.
6. Colored Cement Product: Packaged blend made from portland cement and lime **OR** masonry cement, **as directed**, and mortar pigments, all complying with specified requirements, and containing no other ingredients.
 - a. Formulate blend as required to produce color indicated or, if not indicated, as selected from manufacturer's standard colors.
 - b. Pigments shall not exceed 10 percent of portland cement **OR** 5 percent of masonry cement, **as directed**, by weight.
7. Aggregate: ASTM C 144, with 100 percent passing No. 8 (2.36-mm) sieve.
 - a. For pointing mortar and joints narrower than 1/4 inch (6 mm), use aggregate graded with 100 percent passing No. 16 (1.18-mm) sieve.
 - b. White Aggregates: Natural white sand or crushed white stone.
 - c. Colored Aggregates: Natural sand or crushed stone of color necessary to produce required mortar color.
8. Water-Repellent Admixture: Manufacturer's standard dry mixture of stearates, water-reducing agents, and fine aggregates intended to reduce capillarity in mortar.
9. Water-Repellent Admixture: Liquid polymeric water-repellent mortar admixture that does not reduce flexural bond strength of mortar.
10. Water: Potable.

D. Glass Unit Masonry Accessories

1. Panel Reinforcement: Ladder-type units, butt welded, not lapped and welded; complying with ASTM A 951 in straight lengths of not less than 10 feet (3 m), and as follows:
 - a. Interior Walls: Hot-dip galvanized, carbon-steel wire.
 - b. Exterior Walls: Hot-dip galvanized, carbon-steel **OR** Stainless-steel, **as directed**, wire.
 - c. Wire Size: W1.7 or 0.148-inch (3.8-mm) diameter.
 - d. Width: 2 inches (50 mm) **OR** 1-5/8 inches (40 mm), **as directed**.
 - e. Spacing of Cross Rods: Not more than 16 inches (407 mm) apart.
2. Panel Anchors: Glass-block manufacturer's standard perforated steel strips, 0.0359 inch (0.9 mm) by 1-3/4 inches (44 mm) wide by 24 inches (600 mm) long, hot-dip galvanized after fabrication to comply with ASTM A 153/A 153M.
3. Mortarless Installation System: System of aluminum or plastic perimeter framing, anchors, and spacers designed for installing glass block with sealant-filled joints.
4. Fasteners, General: Unless otherwise indicated, provide Type 304 or Type 316 stainless-steel fasteners at exterior walls and zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 5, at interior walls. Select fasteners for type, grade, and class required.
5. Carbon-Steel Bolts: ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6) with hex nuts, ASTM A 563 (ASTM A 563M), if applicable.
6. Stainless-Steel Bolts: ASTM F 593 (ASTM F 738M), Alloy Group 1 or 2 (A1 or A4) with hex nuts, ASTM F 594 (ASTM F 836M), if applicable.
7. Postinstalled Anchors: Provide powder-actuated fasteners **OR** metal expansion sleeve anchors **OR** metal impact expansion anchors, **as directed**, of type and size necessary for installation indicated, as recommended by manufacturer, unless otherwise indicated.
8. Asphalt Emulsion: Cold-applied asphalt emulsion complying with ASTM D 1187 or ASTM D 1227.
9. Mineral-Fiber Expansion Strips: Mineral-fiber strips, complying with requirements of fire-rated assembly listing and glass-block manufacturer.
 - a. Use for fire-rated assemblies.
10. Plastic-Foam Expansion Strips: Polyethylene foam complying with requirements of glass-block manufacturer; 3/8 inch (9 mm) thick by 4 inches (100 mm) **OR** 3-1/2 inches (89 mm) **OR** 2-1/2 inches (63 mm) wide, **as directed**.
 - a. Use plastic-foam expansion strips for non-fire-rated assemblies **OR** fire-rated and non-fire-rated assemblies, **as directed**.
11. Sealants: Manufacturer's standard chemically curing, elastomeric sealants of base polymer and characteristics indicated below that comply with applicable requirements in Division 07 Section "Joint Sealants".
 - a. Single-component, neutral-curing **OR** acid-curing, **as directed**, silicone sealant.
 - b. Single-component, nonsag urethane sealant.
 - c. Multicomponent, nonsag polysulfide sealant.
 - d. Provide sealants for use inside the weatherproofing system that have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - e. Sealant Accessories: Provide sealant accessories, including primers, bond-breaker tape, and cylindrical sealant backing, that comply with applicable requirements in Division 07 Section "Joint Sealants".

E. Mortar Mixes

1. General: Do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, or antifreeze compounds, unless otherwise indicated.
 - a. Do not use calcium chloride in mortar.
 - b. For mortar in exterior panels, use water-repellent admixture according to admixture manufacturer's written instructions.
 - c. For pointing mortar in exterior panels, use water-repellent admixture according to admixture manufacturer's written instructions.
 - d. Limit cementitious materials in mortar to portland cement and lime.
2. Mortar for Glass Unit Masonry Assemblies: Provide mortar, mixed according to glass-block manufacturer's listing with testing and inspecting agency, for fire-resistance rating indicated.
OR

Mortar for Glass Unit Masonry Assemblies: Comply with ASTM C 270, Proportion Specification for Type S mortar.

- a. Combine and thoroughly mix cementitious materials, water, and aggregates in a mechanical batch mixer, unless otherwise indicated. Mix mortar to produce a stiff but workable consistency that is drier than mortar for brick or concrete masonry. Discard mortar when it has reached initial set.
3. Pigmented Mortar: Use colored cement product **OR** Select and proportion pigments with other ingredients to produce color required. Do not add pigments to colored cement products, **as directed**.
 - a. Pigments shall not exceed 10 percent of portland cement by weight.
 - b. Pigments shall not exceed 5 percent of masonry cement by weight.
 - c. Mix to match sample.
4. Colored-Aggregate Mortar: Produce required mortar color by using colored aggregates and natural color or white cement as necessary to produce required mortar color.
 - a. Mix to match sample.

1.3 EXECUTION

A. Examination

1. Examine sills, jambs, and heads surrounding glass unit masonry assemblies for compliance with requirements for installation tolerances and other conditions affecting performance.
 - a. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Installing Glass Block With Mortar

1. Apply a heavy coat of asphalt emulsion to sill and adhere expansion strips to jambs and heads with asphalt emulsion. Allow asphalt emulsion to dry before placing mortar. Trim expansion strips to width required to fit glass block and to full lengths of heads and jambs.
2. Set glass block with completely filled bed and head joints, with no furrowing, accurately spaced and coordinated with other construction. Maintain 1/4-inch (6-mm) **OR** 3/8-inch (10-mm), **as directed**, exposed joint widths, unless otherwise indicated.
3. Install panel reinforcement in horizontal joints at spacing indicated and continuously from end to end of panels; comply with the following requirements:
 - a. Vertical Spacing of Panel Reinforcement for Exterior Panels: Every other course but not more than 16 inches (407 mm) o.c., starting with first course above sill **OR** As indicated on Drawings, **as directed**.
 - b. Vertical Spacing of Panel Reinforcement for Interior Panels: Not more than 16 inches (407 mm) o.c. **OR** As indicated on Drawings, **as directed**.
 - c. Do not bridge expansion joints with panel reinforcement.
 - d. Place panel reinforcement in joints immediately above and below all openings within glass unit masonry assemblies.
 - e. Lap panel reinforcement not less than 6 inches (150 mm) if more than 1 length is necessary.
 - f. Embed panel reinforcement in mortar bed by placing lower half of mortar bed first, pressing panel reinforcement into place and covering with upper half of mortar bed.
4. Install panel anchors at locations indicated and in same horizontal joints where panel reinforcement occurs. Extend panel anchors at least 12 inches (300 mm) into joints, and bend within expansion joints at edges of panels and across the head. Attach panel anchors as follows:
 - a. For in-place unit masonry assemblies and concrete, attach panel anchors with 1/4-inch- (6-mm-) diameter bolt-size, postinstalled anchors, 2 per panel anchor.
 - b. For new unit masonry assemblies, embed other ends of panel anchors, after bending portions crossing expansion joint, in horizontal mortar joints closest in elevation to joints in glass unit masonry assemblies containing panel anchors.
 - c. For steel members, attach panel anchors with 1/4-inch- (6-mm-) diameter through bolts and nuts or bolts in tapped holes in steel members.

5. Use rubber mallet to tap units into position. Do not use steel tools, and do not allow units to come into contact with metal accessories and frames.
6. Use plastic spacers **OR** temporary wedges, **as directed**, in mortar joints to produce uniform joint widths and to prevent mortar from being squeezed out of joints.
 - a. If temporary wedges are used, remove them after mortar has set and fill voids with mortar.
7. Keep expansion joints free of mortar.
8. Rake out joints indicated to be pointed to a uniform depth sufficient to accommodate pointing material, but not less than joint width.
 - a. If temporary wedges are used, remove them before raking out and pointing joints.
 - b. Point joints at exterior face **OR** both faces, **as directed**, of exterior panels with mortar.
 - c. Point joints at exterior face **OR** both faces, **as directed**, of exterior panels with sealant.
 - d. Point joints at both faces of exterior and interior panels with sealant.
9. Point joints with mortar by filling raked joints and voids. Place and compact pointing mortar in layers not more than 3/8 inch (10 mm) thick. Compact each layer thoroughly and allow to become thumbprint hard before applying next layer.
 - a. Tool exposed joints slightly concave when pointing mortar is thumbprint hard. Use a smooth plastic jointer larger than joint width.
10. Point joints by filling with sealant to comply with requirements in Division 07 Section "Joint Sealants".
11. Clean glass unit masonry assemblies as work progresses. Remove mortar fins and smears immediately, using a clean, wet sponge or a scrub brush with stiff fiber bristles. Do not use harsh cleaners, acids, abrasives, steel wool, or wire brushes when removing mortar or cleaning glass unit masonry assemblies.
12. Install sealant at jambs, heads, mullions and other locations indicated. Prepare joints, including installation of primer and bond-breaker tape or cylindrical sealant backing, and apply elastomeric sealants to comply with requirements in Division 07 Section "Joint Sealants".
13. Construction Tolerances: Set glass block to comply with the following tolerances:
 - a. Variation from Plumb: For lines and surfaces of vertical elements and arris, do not exceed 1/4 inch in 10 feet (6 mm in 3 m), 3/8 inch in 20 feet (9 mm in 6 m), or 1/2 inch in 40 feet (12 mm in 12 m) or more.
 - b. Variation from Level: For bed joints, and other conspicuous lines, do not exceed 1/8 inch in 10 feet (3 mm in 3 m), 1/4 inch in 20 feet (6 mm in 6 m) or 1/2 inch in 40 feet (12 mm in 12 m) or more.
 - c. Variation of Location in Plan: For location of elements in plan do not vary from that indicated by more than plus or minus 1/4 inch (6 mm).
 - d. Variation in Mortar-Joint Thickness: Do not vary from joint thickness indicated by more than plus or minus 1/16 inch (1.5 mm).
 - e. For faces of adjacent exposed units, do not vary from flush alignment by more than 1/16 inch (1.5 mm).

C. Installing Glass Block With Sealant

1. General: Install mortarless glass-block systems according to manufacturer's written instructions.
 - a. Fasten frames and anchors or clips securely to surrounding construction.
 - b. Shim starting track as needed to make it level.
 - c. Adhere glass block to starting track and spacers with silicone sealant.
2. After glass blocks are installed, apply sealant to completely fill channel around each glass block, and tool flush with exterior surface. Remove excess sealant and smears.

D. Glass-Block Grid System Installation

1. General: Install glass-block grid systems according to manufacturer's written instructions.
2. Window and Wall System Installation: Assemble grid system, apply continuous sealant bead to back of window Z-bar, place in position, adjust as needed to make grid level and plumb, and fasten to substrate.
 - a. Insert glass blocks into vinyl glass-block boots and carefully insert into grid from exterior side. Install blocks firmly against T-bars without deforming boots.
 - b. Apply sealant to completely fill channel around each glass block, and tool flush with exterior surface. Remove excess sealant and smears.

3. Skylight System Installation: Assemble grid system, apply continuous sealant bead to top of supporting curb, place in position, adjust as needed to bring grid true to line, and fasten to substrate.
 - a. Insert glass blocks into vinyl glass-block boots and carefully insert into grid from exterior side. Install blocks firmly against T-bars without deforming boots.
 - b. Apply sealant to completely fill channel around each glass block, and tool flush with exterior surface. Remove excess sealant and smears.
 4. Floor System Installation: Assemble grid system in position, adjusting supports as needed to level grid as system is assembled, and fasten to substrate.
 - a. Insert glass blocks into glass-block boots and install in grid. Install blocks flush with adjoining floor surfaces and aluminum grid.
 - b. Apply sealant to completely fill channel around each glass block and joints of aluminum grid. Tool sealant flush with exterior surface and remove excess sealant and smears.
- E. Cleaning
1. On surfaces adjacent to glass unit masonry assemblies, remove mortar, sealants, and other residue resulting from glass-block installation, in a manner approved by manufacturers of materials involved.
 2. Remove excess sealants with commercial solvents of type recommended by sealant manufacturer. Exercise care not to damage sealant in joints.
 3. Perform final cleaning of glass unit masonry assemblies when surface is not exposed to direct sunlight. Start at top of panel using generous amounts of clean water. Remove water with clean, dry, soft cloths; change cloths frequently to eliminate dried mortar particles and aggregate.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 05 12 00 00 - STRUCTURAL STEEL FRAMING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Comply with applicable provisions of the following specifications and documents.
 - 1. AISC's "Specification for Structural Steel Buildings - Allowable Stress Design and Plastic Design."
 - 2. AISC's "Load and Resistance Factor Design (LFRD) Specification for Structural Steel Buildings."
 - 3. AISC's "Specification for Allowable Stress Design of Single-Angle Members."
 - 4. AISC's "Specification for Load and Resistance Factor Design of Single-Angle Members."
 - 5. AISC's "Seismic Provisions for Structural Steel Building."
 - 6. ASTM A 6 (ASTM A 6M) "Specification for General Requirements for Rolled Steel Plates, Shapes, Sheet Piling, and Bars for Structural Use."
 - 7. Research Council on Structural Connections' (RCSC) "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."
 - 8. Research Council on Structural Connections' (RCSC) "Load and Resistance Factor Design Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."
- B. Qualifications for Welding Work: Qualify welding procedures and welding operators in accordance with AWS "Qualification" requirements.
 - 1. Provide certification that welders to be employed in work have satisfactorily passed AWS qualification tests.
 - 2. If recertification of welders is required, retesting will be Contractor's responsibility.

1.04 SUBMITTALS

- A. Product Data:

1. Product data or manufacturer's specifications and installation instructions for following products. Include laboratory test reports and other data to show compliance with specifications (including specified standards).
 - a. Structural steel (each type), including certified copies of mill reports covering chemical and physical properties.
 - b. High strength bolts (each type), including nuts and washers.
 - 1) Include Direct Tension Indicators if used.
 - c. Structural steel primer paint.
 - d. Shrinkage resistant grout.

B. Record Documents:

1. Shop drawings prepared under supervision of a licensed Structural Engineer, including complete details and schedules for fabrication and assembly of structural steel members, procedures, and diagrams.
 - a. Include details of cuts, connections, camber, holes, and other pertinent data. Indicate welds by standard AWS symbols and show size, length, and type of each weld.
 - b. Provide setting drawings, templates, and directions for installation of anchor bolts and other anchorages to be installed as work of other sections.
2. Test reports conducted on shop and field bolted and welded connections. Include data on type(s) of tests conducted and test results.
3. Certified copies of each survey conducted by a licensed Land Surveyor, showing elevations and locations of base plates and anchor bolts to receive structural steel and final elevations and locations for major members. Indicate discrepancies between actual installation and contract documents.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to the Project Site at such intervals to ensure uninterrupted progress of work.
- B. Deliver anchor bolts and anchorage devices, which are to be embedded in cast in place concrete or masonry, in ample time to not to delay work.
- C. Store materials to permit easy access for inspection and identification. Keep steel members off ground by using pallets, platforms, or other supports. Protect steel members and packaged materials from erosion and deterioration. If bolts and nuts become dry or rusty, clean and re-lubricate before use.
 1. Do not store materials on structure in a manner that might cause distortion or damage to members or supporting structures. Repair or replace damaged materials or structures as directed.

1.06 PERFORMANCE REQUIREMENTS

- A. Engineer structural steel connections required by the Contract Documents to be selected or completed by the fabricator to withstand design loadings indicated.
- B. Engage a fabricator who utilizes a qualified professional engineer to prepare calculations, Shop Drawings, and other structural data for structural steel connections.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MATERIALS

- A. Metal Surfaces, General: For fabrication of work that will be exposed to view, use only materials that are smooth and free of surface blemishes including pitting, rust and scale seam marks, roller marks, rolled trade names, and roughness. Remove such blemishes by grinding, or by welding and grinding, prior to cleaning, treating, and applying surface finishes.
- B. Structural Steel Shapes, Plates, and Bars: ASTM A 36 (ASTM A 36M).
- C. Cold Formed Steel Tubing: ASTM A 500, Grade B.
- D. Hot Formed Steel Tubing: ASTM A 501.
- E. Headed Stud Type Shear Connectors: ASTM A 108, Grade 1015 or 1020, cold finished carbon steel with dimensions complying with AISC Specifications.
- F. Anchor Rods, Bolts, Nuts, and Washers: As follows:
 - 1. Unheaded Rods: ASTM A 36 (ASTM A 36M)
 - 2. Unheaded Rods: ASTM A 572, Grade 50 (ASTM A 572M, Grade 345)
 - 3. Unheaded Bolts: ASTM A 687, high strength
 - 4. Headed Bolts: ASTM A 307, Grade A (ASTM F 568, Property Class 4.6); carbon-steel, hex-head bolts; and carbon-steel nuts.
 - 5. Headed Bolts: ASTM A325 (ASTM A 325M), Type 1, heavy hex steel structural bolts and heavy hex carbon-steel nuts.
 - 6. Headed Bolts: ASTM A 490 (ASTM A 490M), Type 1, heavy hex steel structural bolts and heavy hex carbon-steel nuts.
 - 7. Washers: ASTM A 36 (ASTM A 36M)
- G. Nonhigh-Strength Bolts, Nuts, and Washers: ASTM A 307, Grade A (ASTM F 58, Property Class 4.6); carbon-steel, hex-head bolts; carbon-steel nuts; and flat, unhardened steel washers.
 - 1. Finish: Plain, uncoated
 - 2. Finish: Hot-dip zinc-coating, ASTM A 153, Class C
 - 3. Finish: Mechanically deposited zinc-coating, ASTM B 695, Class 50
- H. High-Strength Bolts, Nuts, and Washers: ASTM A 325 (ASTM A 325M), Type 1, heavy hex steel structural bolts, heavy hex carbon-steel nuts, and hardened carbon-steel washers.
 - 1. Finish: Plain, uncoated
 - 2. Finish: Hot-dip zinc-coating, ASTM A 153, Class C
 - 3. Finish: Mechanically deposited zinc-coating, ASTM B 695, Class 50, epoxy coated

4. Direct-Tension Indicators: ASTM F 959, Type 325

- a. Finish: Plain, uncoated
- b. Finish: Mechanically deposited zinc-coating, ASTM B 695, Class 50
- c. Finish: Mechanically deposited zinc-coating, ASTM B 695, Class 50, epoxy coated

I. High-Strength Bolts, Nuts, and Washers: ASTM A 490 (ASTM A 490M), Type 1, heavy hex steel structural bolts, heavy hex carbon-steel nuts, and hardened carbon-steel washers, uncoated.

1. Direct-Tension Indicators: ASTM F 959, Type 490 uncoated

J. Welding Electrodes: Comply with AWS requirements.

2.03 PRIMER

- A. Primer: Fast-curing, lead- and chromate-free, universal modified-alkyd primer with good resistance to normal atmospheric corrosion, complying with performance requirements of FS TT-P-664.
- B. Primer: SSPC-Paint 23, latex primer.
- C. Galvanizing Repair Paint: High-zinc-dust-content paint for regalvanizing welds and repair painting galvanized steel, with dry film containing not less than 93 percent zinc dust by weight, and complying with DOD-P-21035A or SSPC-Paint 20.

2.04 GROUT

- A. Cement Grout: Portland cement (ASTM C 150, Type I or Type III) and clean, uniformly graded, natural sand (ASTM C 404, Size No. 2). Mix at a ratio of 1.0 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.
- B. Nonmetallic Shrinkage Resistant Grout: Premixed, nonmetallic, noncorrosive, nonstaining product containing selected silica sands, Portland cement, shrinkage compensating agents, plasticizing and water reducing agents, complying with ASTM C 1107 of consistency suitable for application, and a 30 minute working time.

2.05 FABRICATION

- A. Shop Fabrication and Assembly: Fabricate and assemble structural assemblies in shop to greatest extent possible. Fabricate items of structural steel in accordance with AISC Specifications and as indicated on final shop drawings. Provide camber in structural members where indicated.
 - 1. Properly mark and match mark materials for field assembly. Fabricate for delivery sequence that will expedite erection and minimize field handling of materials.
 - 2. Where finishing is required, complete assembly, including welding of units, before start of finishing operations. Provide finish surfaces of members exposed in final structure free of markings, burrs, and other defects.
- B. Connections: Weld or bolt shop connections, as indicated.
- C. Bolt field connections, except where welded connections or other connections are indicated.
 - 1. Provide high strength threaded fasteners for principal bolted connections, except where unfinished bolts are indicated.

2. Provide unfinished threaded fasteners for only bolted connections of secondary framing members to primary members (including purlins, girts, and other framing members taking only nominal stresses) and for temporary bracing to facilitate erection.
- D. High Strength Bolted Construction: Install high strength threaded fasteners in accordance with AISC "Specifications for Structural Joints using ASTM A 325 or A 490 Bolts."
- E. Welded Construction: Comply with AWS Code for procedures, appearance and quality of welds, and methods used in correcting welding work.
- F. Assemble and weld built up sections by methods that will produce true alignment of axes without warp.
- G. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Weld shear connectors in field, spaced as shown, to beams and girders in composite construction. Use automatic end welding of headed stud shear connectors in accordance with manufacturer's printed instructions.
- H. Steel Wall Framing: Select members that are true and straight for fabrication of steel wall framing. Straighten as required to provide uniform, square, and true members in completed wall framing.
- I. Build up welded door frames attached to structural steel framing. Weld exposed joints continuously and grind smooth. Plug weld steel bar stops to frames, except where shown removable. Secure removable stops to frames with countersunk, cross recessed head machine screws, uniformly spaced not more than 10 inches on center, unless otherwise indicated.
- J. Holes for Other Work: Provide holes required for securing other work to structural steel framing and for passage of other work through steel framing members, as shown on final shop drawings.
- K. Provide threaded nuts welded to framing and other specialty items as indicated to receive other work.
- L. Cut, drill, or punch holes perpendicular to metal surfaces. Do not flame cut holes or enlarge holes by burning. Drill holes in bearing plates.
- M. Expansion Joints: Provide expansion joints in steel shelf angles when part of structural steel frame; locate at vertical brick expansion joints as indicated on drawings.

2.06 SHOP PAINTING

- A. Shop paint structural steel, except those members or portions of members to be embedded in concrete or mortar. Paint embedded steel that is partially exposed on exposed portions and initial 2 inches of embedded areas only.
 1. Do not paint surfaces to be welded or high strength bolted with friction type connections.
 2. Do not paint surfaces scheduled to receive sprayed on fireproofing.
 3. Apply 2 coats of paint to surfaces that are inaccessible after assembly or erection. Change color of second coat to distinguish it from first.
- B. Surface Preparation: After inspection and before shipping, clean steelwork to be painted. Remove loose rust, loose mill scale, and spatter, slag, or flux deposits. Clean steel in accordance with Steel Structures Painting Council (SSPC) as follows:
 1. SP 2 "Hand Tool Cleaning"
 2. SP 3 "Power Tool Cleaning"
 3. SP 6 "Commercial Blast Cleaning"

4. SP 7 "Brush Off Blast Cleaning"

5. SP 10 "Near White Blast Cleaning"

- C. Painting: Immediately after surface preparation, apply structural steel primer paint in accordance with manufacturer's instructions and at a rate to provide dry film thickness of not less than 1.5 mils. Use painting methods that result in full coverage of joints, corners, edges, and exposed surfaces.

2.07 GALVANIZING

- A. Hot-Dip Galvanized Finish: Apply zinc coating by the hot-dip process to structural steel indicated for galvanizing according to ASTM A 123.

2.08 SOURCE QUALITY CONTROL

- A. Materials and fabrication procedures are subject to inspection and tests in mill, shop, and field, conducted by a qualified inspection agency. Such inspections and tests will not relieve Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.

1. Promptly remove and replace materials or fabricated components that do not comply.

- B. Design of Members and Connections: Details shown are typical; similar details apply to similar conditions, unless otherwise indicated. Verify dimensions at the Project Site whenever possible without causing delay in the work.

1. Promptly notify Owner whenever design of members and connections for any portion of structure are not clearly indicated.

PART 3 - EXECUTION

3.01 ERECTION

- A. Surveys: Employ a licensed land surveyor for accurate erection of structural steel. Check elevations of concrete and masonry bearing surfaces, and locations of anchor bolts and similar devices, before erection work proceeds, and report discrepancies to Owner. Do not proceed with erection until corrections have been made or until compensating adjustments to structural steel work have been agreed upon with Owner.

- B. Temporary Shoring and Bracing: Provide temporary shoring and bracing members with connections of sufficient strength to bear imposed loads. Remove temporary members and connections when permanent members are in place and final connections are made. Provide temporary guy lines to achieve proper alignment of structures as erection proceeds.

- C. Setting Bases and Bearing Plates: Clean concrete and masonry bearing surfaces of bond reducing materials and roughen to improve bond to surfaces. Clean bottom surface of base and bearing plates.

1. Set loose and attached base plates and bearing plates for structural members on wedges or other adjusting devices.

2. Tighten anchor bolts after supported members have been positioned and plumbed. Do not remove wedges or shims, but if protruding, cut off flush with edge of base or bearing plate prior to packing with grout.

3. Pack grout solidly between bearing surfaces and bases or plates to ensure that no voids remain. Finish exposed surfaces, protect installed materials, and allow to cure.

4. For proprietary grout materials, comply with manufacturer's instructions.
- D. Field Assembly: Set structural frames accurately to lines and elevations indicated. Align and adjust various members forming part of complete frame or structure before permanently fastening. Clean bearing surfaces and other surfaces that will be in permanent contact before assembly. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
- E. Level and plumb individual members of structure within specified AISC tolerances.
- F. Establish required leveling and plumbing measurements on mean operating temperature of structure. Make allowances for difference between temperature at time of erection and mean temperature at which structure will be when completed and in service.
- G. Splice members only where indicated and accepted on shop drawings.
- H. Erection Bolts: On exposed welded construction, remove erection bolts, fill holes with plug welds, and grind smooth at exposed surfaces.
 1. Comply with AISC Specifications for bearing, adequacy of temporary connections, alignment, and removal of paint on surfaces adjacent to field welds.
 2. Do not enlarge unfair holes in members by burning or by using drift pins, except in secondary bracing members. Ream holes that must be enlarged to admit bolts.
- I. Gas Cutting: Do not use gas cutting torches in field for correcting fabrication errors in primary structural framing. Cutting will be permitted only on secondary members that are not under stress, as acceptable to Owner. Finish gas cut sections equal to a sheared appearance when permitted.
- J. Touch Up Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint. Apply paint to exposed areas using same material as used for shop painting.
 1. Apply by brush or spray to provide minimum dry film thickness of 1.5 mils.

3.02 QUALITY CONTROL

- A. Owner will engage an independent testing and inspection agency to inspect high-strength bolted connections and welded connections and to perform tests and prepare test reports. Testing agency shall conduct and interpret tests and state in each report whether test specimens comply with requirements, and specifically state any deviations there from. Provide access for testing agency to places where structural steel work is being fabricated or produced so that required inspection and testing can be accomplished.
 1. Testing agency shall comply with all the regulations of the Department of Public Works of the City of Houston and shall certify in writing, upon completion of the Work, that all Work was performed in accordance with the construction documents and all applicable city ordinances.
- B. Testing agency shall conduct and interpret tests, state in each report whether test specimens comply with requirements, and specifically state any deviations there from.
- C. Provide access for testing agency to places where structural steel work is being fabricated or produced so that required inspection and testing can be accomplished.
- D. Testing agency may inspect structural steel at plant before shipment; however, Owner reserves right, at any time before final acceptance, to reject material not complying with specified requirements.
- E. Correct deficiencies in structural steel work that inspections and laboratory test reports have indicated to be not in compliance with requirements. Perform additional tests, at Contractor's expense, as necessary to reconfirm any noncompliance of original work and to show compliance of corrected work.

- F. Field-bolted connections will be tested and inspected according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."
- G. Field-bolted connections will be tested and inspected according to RCSC's "Load and Resistance Factor Design Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."
 - 1. Direct-tension indicator gaps will be verified to comply with ASTM F 959, Table 2
- H. In addition to visual inspection, field-welded connections will be inspected and tested according to AWS D1.1 and the inspection procedures listed below, at testing agency's options.
 - 1. Liquid Penetrant Inspection: ASTM E 165
 - 2. Magnetic Particle Inspection: ASTM E 709; performed on roof pass and on finished weld. Cracks or zones of incomplete fusion or penetration will not be accepted.
 - 3. Radiographic Inspection: ASTM E 94 and ASTM E 142; minimum quality level "2-2T"
 - 4. Ultrasonic Inspection: ASTM E 164
- I. In addition to visual inspection, field-welded shear connectors will be inspected and tested according to requirements of AWS D1.1 for stud welding and as follows:
 - 1. Bend tests will be performed when visual inspections reveal either less than a continuous 360 degree flash or welding repairs to any shear connector.
 - 2. Tests will be conducted on additional shear connectors when weld fracture occurs on shear connectors already tested, according to requirements of AWS D1.1.

3.03 CLEANING

- A. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint. Apply paint to exposed areas using same material as used for shop painting.
 - 1. Apply by brush or spray to provide a minimum dry film thickness of 1.5 mils (0.038 mm).
- B. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and apply galvanizing repair paint according to ASTM A 780.

END OF SECTION 05 12 00 00

SECTION 05 12 23 00 - STRUCTURAL STEEL FOR BUILDINGS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for structural steel. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Structural steel.
 - b. Prefabricated building columns.
 - c. Grout.

C. Definitions

1. Structural Steel: Elements of structural-steel frame, as classified by AISC 303, "Code of Standard Practice for Steel Buildings and Bridges."
2. Seismic-Load-Resisting System: Elements of structural-steel frame designated as "SLRS" or along grid lines designated as "SLRS" on Drawings, including columns, beams, and braces and their connections.
3. Heavy Sections: Rolled and built-up sections as follows:
 - a. Shapes included in ASTM A 6/A 6M with flanges thicker than 1-1/2 inches (38 mm).
 - b. Welded built-up members with plates thicker than 2 inches (50 mm).
 - c. Column base plates thicker than 2 inches (50 mm).
4. Protected Zone: Structural members or portions of structural members indicated as "Protected Zone" on Drawings. Connections of structural and nonstructural elements to protected zones are limited.
5. Demand Critical Welds: Those welds, the failure of which would result in significant degradation of the strength and stiffness of the Seismic-Load-Resisting System and which are indicated as "Demand Critical" or "Seismic Critical" on Drawings.

D. Performance Requirements

1. Connections: Provide details of connections **OR** simple shear connections, **as directed**, required by the Contract Documents to be selected or completed by structural-steel fabricator, including comprehensive engineering design by a qualified professional engineer, **as directed**, to withstand loads indicated and comply with other information and restrictions indicated.
 - a. Select and complete connections using schematic details indicated and AISC 360.
 - b. Use LRFD; data are given at factored-load level **OR** ASD; data are given at service-load level, **as directed**.
2. Moment Connections: Type PR, partially **OR** FR, fully, **as directed**, restrained.
3. Construction: Moment frame **OR** Braced frame **OR** Shear wall system **OR** Combined system of moment frame and braced frame **OR** Combined system of moment frame and shear walls **OR** Combined system of braced frame and shear walls **OR** Combined system of moment frame, braced frame, and shear walls, **as directed**.

E. Submittals

1. Product Data: For each type of product indicated.
2. LEED Submittal:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2, **as directed**: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating costs for each product having recycled content.

3. Shop Drawings: Show fabrication of structural-steel components.
 - a. Include details of cuts, connections, splices, camber, holes, and other pertinent data.
 - b. Include embedment drawings.
 - c. Indicate welds by standard AWS symbols, distinguishing between shop and field welds, and show size, length, and type of each weld. Show backing bars that are to be removed and supplemental fillet welds where backing bars are to remain.
 - d. Indicate type, size, and length of bolts, distinguishing between shop and field bolts. Identify pretensioned and slip-critical high-strength bolted connections.
 - e. Identify members and connections of the seismic-load-resisting system.
 - f. Indicate locations and dimensions of protected zones.
 - g. Identify demand critical welds.
 - h. For structural-steel connections indicated to comply with design loads, include structural design data signed and sealed by the qualified professional engineer responsible for their preparation, **as directed**.
4. Welding Procedure Specifications (WPSs) and Procedure Qualification Records (PQRs): Provide according to AWS D1.1/D1.1M, "Structural Welding Code - Steel," for each welded joint whether prequalified or qualified by testing **OR** qualified by testing, **as directed**, including the following:
 - a. Power source (constant current or constant voltage).
 - b. Electrode manufacturer and trade name, for demand critical welds.
5. Qualification Data: For qualified Installer **OR** fabricator **OR** professional engineer **OR** testing agency, **as directed**.
6. Welding certificates.
7. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers, certifying that shop primers are compatible with topcoats.
8. Mill test reports for structural steel, including chemical and physical properties.
9. Product Test Reports: For the following:
 - a. Bolts, nuts, and washers including mechanical properties and chemical analysis.
 - b. Direct-tension indicators.
 - c. Tension-control, high-strength bolt-nut-washer assemblies.
 - d. Shear stud connectors.
 - e. Shop primers.
 - f. Nonshrink grout.
10. Source quality-control reports.

F. Quality Assurance

1. Fabricator Qualifications: A qualified fabricator that participates in the AISC Quality Certification Program and is designated an AISC-Certified Plant, Category STD.
2. Installer Qualifications: A qualified installer who participates in the AISC Quality Certification Program and is designated an AISC-Certified Erector, Category ACSE **OR** CSE, **as directed**.
3. Shop-Painting Applicators: Qualified according to AISC's Sophisticated Paint Endorsement P1 **OR** P2 **OR** P3, **as directed**, or SSPC-QP 3, "Standard Procedure for Evaluating Qualifications of Shop Painting Applicators."
4. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
 - a. Welders and welding operators performing work on bottom-flange, demand-critical welds shall pass the supplemental welder qualification testing, as required by AWS D1.8. FCAW-S and FCAW-G shall be considered separate processes for welding personnel qualification.
5. Comply with applicable provisions of the following specifications and documents:
 - a. AISC 303.
 - b. AISC 341 and AISC 341s1.
 - c. AISC 360.
 - d. RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."
6. Preinstallation Conference: Conduct conference at Project site.

G. Delivery, Storage, And Handling

1. Store materials to permit easy access for inspection and identification. Keep steel members off ground and spaced by using pallets, dunnage, or other supports and spacers. Protect steel members and packaged materials from corrosion and deterioration.
 - a. Do not store materials on structure in a manner that might cause distortion, damage, or overload to members or supporting structures. Repair or replace damaged materials or structures as directed.
2. Store fasteners in a protected place in sealed containers with manufacturer's labels intact.
 - a. Fasteners may be repackaged provided Owner's testing and inspecting agency observes repackaging and seals containers.
 - b. Clean and relubricate bolts and nuts that become dry or rusty before use.
 - c. Comply with manufacturers' written recommendations for cleaning and lubricating ASTM F 1852 fasteners and for retesting fasteners after lubrication.

H. Coordination

1. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' recommendations to ensure that shop primers and topcoats are compatible with one another.
2. Coordinate installation of anchorage items to be embedded in or attached to other construction without delaying the Work. Provide setting diagrams, sheet metal templates, instructions, and directions for installation.

1.2 PRODUCTS

A. Structural-Steel Materials

1. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 **OR** 50, **as directed**, percent.
OR
Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than the following:
 - a. W-Shapes: 60 percent.
 - b. Channels, Angles, M **OR** S, **as directed**, -Shapes: 60 percent.
 - c. Plate and Bar: 25 percent.
 - d. Cold-Formed Hollow Structural Sections: 25 percent.
 - e. Steel Pipe: 25 percent.
 - f. All Other Steel Materials: 25 percent.
2. W-Shapes: ASTM A 992/A 992M **OR** ASTM A 572/A 572M, Grade 50 (345) **OR** ASTM A 529/A 529M, Grade 50 (345) **OR** ASTM A 913/A 913M, Grade 50 (345), **as directed**.
3. Channels, Angles, M **OR** S, **as directed**, -Shapes: ASTM A 36/A 36M **OR** ASTM A 572/A 572M, Grade 50 (345) **OR** ASTM A 529/A 529M, Grade 50 (345) **OR** ASTM A 913/A 913M, Grade 50 (345), **as directed**.
4. Plate and Bar: ASTM A 36/A 36M **OR** ASTM A 572/A 572M, Grade 50 (345) **OR** ASTM A 529/A 529M, Grade 50 (345), **as directed**.
5. Corrosion-Resisting Structural-Steel Shapes, Plates, and Bars: ASTM A 588/A 588M, Grade 50 (345).
6. Cold-Formed Hollow Structural Sections: ASTM A 500, Grade B **OR** C, **as directed**, structural tubing.
7. Corrosion-Resisting Cold-Formed Hollow Structural Sections: ASTM A 847/A 847M, structural tubing.
8. Steel Pipe: ASTM A 53/A 53M, Type E or S, Grade B.
 - a. Weight Class: Standard **OR** Extra strong **OR** Double-extra strong, **as directed**.
 - b. Finish: Black **OR** Galvanized **OR** Black except where indicated to be galvanized, **as directed**.
9. Steel Castings: ASTM A 216/A 216M, Grade WCB with supplementary requirement S11.

10. Steel Forgings: ASTM A 668/A 668M.
11. Welding Electrodes: Comply with AWS requirements.

B. Bolts, Connectors, And Anchors

1. High-Strength Bolts, Nuts, and Washers: ASTM A 325 (ASTM A 325M), Type 1, heavy-hex steel structural bolts; ASTM A 563, Grade C, (ASTM A 563M, Class 8S) heavy-hex carbon-steel nuts; and ASTM F 436 (ASTM F 436M), Type 1, hardened carbon-steel washers; all with plain finish.
 - a. Direct-Tension Indicators: ASTM F 959, Type 325 (ASTM F 959M, Type 8.8), compressible-washer type with plain finish.
2. High-Strength Bolts, Nuts, and Washers: ASTM A 490 (ASTM A 490M), Type 1, heavy-hex steel structural bolts or tension-control, bolt-nut-washer assemblies with splined ends, **as directed**; ASTM A 563, Grade DH, (ASTM A 563M, Class 10S) heavy-hex carbon-steel nuts; and ASTM F 436 (ASTM F 436M), Type 1, hardened carbon-steel washers with plain finish.
 - a. Direct-Tension Indicators: ASTM F 959, Type 490 (ASTM F 959M, Type 10.9), compressible-washer type with plain finish.
3. Zinc-Coated High-Strength Bolts, Nuts, and Washers: ASTM A 325 (ASTM A 325M), Type 1, heavy-hex steel structural bolts; ASTM A 563, Grade DH (ASTM A 563M, Class 10S) heavy-hex carbon-steel nuts; and ASTM F 436 (ASTM F 436M), Type 1, hardened carbon-steel washers.
 - a. Finish: Hot-dip zinc coating **OR** Mechanically deposited zinc coating, **as directed**.
 - b. Direct-Tension Indicators: ASTM F 959, Type 325 (ASTM F 959M, Type 8.8), compressible-washer type with mechanically deposited zinc coating **OR** mechanically deposited zinc coating, baked epoxy-coated, **as directed**, finish.
4. Tension-Control, High-Strength Bolt-Nut-Washer Assemblies: ASTM F 1852, Type 1, heavy-hex **OR** round, **as directed**, head assemblies consisting of steel structural bolts with splined ends, heavy-hex carbon-steel nuts, and hardened carbon-steel washers.
 - a. Finish: Plain **OR** Mechanically deposited zinc coating, **as directed**.
5. Shear Connectors: ASTM A 108, Grades 1015 through 1020, headed-stud type, cold-finished carbon steel; AWS D1.1/D1.1M, Type B.
6. Unheaded Anchor Rods: ASTM F 1554, Grade 36 **OR** ASTM F 1554, Grade 55, weldable **OR** ASTM A 354 **OR** ASTM A 449 **OR** ASTM A 572/A 572M, Grade 50 (345) **OR** ASTM A 36/A 36M, **as directed**.
 - a. Configuration: Straight **OR** Hooked, **as directed**.
 - b. Nuts: ASTM A 563 (ASTM A 563M) hex **OR** heavy-hex, **as directed**, carbon steel.
 - c. Plate Washers: ASTM A 36/A 36M carbon steel.
 - d. Washers: ASTM F 436 (ASTM F 436M), Type 1, hardened carbon steel.
 - e. Finish: Plain **OR** Hot-dip zinc coating, ASTM A 153/A 153M, Class C **OR** Mechanically deposited zinc coating, ASTM B 695, Class 50, **as directed**.
7. Headed Anchor Rods: ASTM F 1554, Grade 36 **OR** ASTM F 1554, Grade 55, weldable **OR** ASTM A 354 **OR** ASTM A 449, **as directed**, straight.
 - a. Nuts: ASTM A 563 (ASTM A 563M) hex **OR** heavy-hex, **as directed**, carbon steel.
 - b. Plate Washers: ASTM A 36/A 36M carbon steel.
 - c. Washers: ASTM F 436 (ASTM F 436M), Type 1, hardened carbon steel.
 - d. Finish: Plain **OR** Hot-dip zinc coating, ASTM A 153/A 153M, Class C **OR** Mechanically deposited zinc coating, ASTM B 695, Class 50, **as directed**.
8. Threaded Rods: ASTM A 36/A 36M **OR** ASTM A 193/A 193M, Grade B7 **OR** ASTM A 354, Grade BD **OR** ASTM A 449 **OR** ASTM A 572/A 572M, Grade 50 (345), **as directed**.
 - a. Nuts: ASTM A 563 (ASTM A 563M) hex **OR** heavy-hex, **as directed**, carbon steel.
 - b. Washers: ASTM F 436 (ASTM F 436M), Type 1, hardened **OR** ASTM A 36/A 36M, **as directed**, carbon steel.
 - c. Finish: Plain **OR** Hot-dip zinc coating, ASTM A 153/A 153M, Class C **OR** Mechanically deposited zinc coating, ASTM B 695, Class 50, **as directed**.
9. Clevises and Turnbuckles: Made from cold-finished carbon steel bars, ASTM A 108, Grade 1035.
10. Eye Bolts and Nuts: Made from cold-finished carbon steel bars, ASTM A 108, Grade 1030.
11. Sleeve Nuts: Made from cold-finished carbon steel bars, ASTM A 108, Grade 1018.

12. Structural Slide Bearings: Low-friction assemblies, of configuration indicated, that provide vertical transfer of loads and allow horizontal movement perpendicular to plane of expansion joint while resisting movement within plane of expansion joint.
 - a. Mating Surfaces: PTFE and PTFE **OR** PTFE and mirror-finished stainless steel, **as directed**.
 - b. Coefficient of Friction: Not more than 0.03 **OR** 0.04 **OR** 0.05 **OR** 0.06 **OR** 0.10 **OR** 0.12, **as directed**.
 - c. Design Load: Not less than 2,000 psi (13.7 MPa) **OR** 5,000 psi (34 MPa) **OR** 6,000 psi (41 MPa), **as directed**.
 - d. Total Movement Capability: 2 inches (50 mm).

- C. Primer
 1. Primer: Comply with Division 07 **OR** Division 09 Section(s) "High-performance Coatings" **OR** Division 07 **AND** Division 09 Section(s) "High-performance Coatings", **as directed**.
OR
 Primer: SSPC-Paint 25, Type I **OR** Type II, **as directed**, zinc oxide, alkyd, linseed oil primer.
OR
 Primer: SSPC-Paint 25 BCS, Type I **OR** Type II, **as directed**, zinc oxide, alkyd, linseed oil primer.
OR
 Primer: SSPC-Paint 23, latex primer.
OR
 Primer: Fabricator's standard lead- and chromate-free, nonasphaltic, rust-inhibiting primer complying with MPI#79 and compatible with topcoat, **as directed**.
 2. Galvanizing Repair Paint: MPI#18, MPI#19, or SSPC-Paint 20 **OR** ASTM A 780, **as directed**.

- D. Grout
 1. Metallic, Shrinkage-Resistant Grout: ASTM C 1107, factory-packaged, metallic aggregate grout, mixed with water to consistency suitable for application and a 30-minute working time.
 2. Nonmetallic, Shrinkage-Resistant Grout: ASTM C 1107, factory-packaged, nonmetallic aggregate grout, noncorrosive and nonstaining, mixed with water to consistency suitable for application and a 30-minute working time.

- E. Fabrication
 1. Structural Steel: Fabricate and assemble in shop to greatest extent possible. Fabricate according to AISC's "Code of Standard Practice for Steel Buildings and Bridges" and AISC 360.
 - a. Camber structural-steel members where indicated.
 - b. Fabricate beams with rolling camber up.
 - c. Identify high-strength structural steel according to ASTM A 6/A 6M and maintain markings until structural steel has been erected.
 - d. Mark and match-mark materials for field assembly.
 - e. If shop priming is required, complete structural-steel assemblies, including welding of units, before starting shop-priming operations.
 2. Thermal Cutting: Perform thermal cutting by machine to greatest extent possible.
 - a. Plane thermally cut edges to be welded to comply with requirements in AWS D1.1/D1.1M.
 3. Bolt Holes: Cut, drill, mechanically thermal cut, **as directed**, or punch standard bolt holes perpendicular to metal surfaces.
 4. Finishing: Accurately finish ends of columns and other members transmitting bearing loads.
 5. Cleaning: Clean and prepare steel surfaces that are to remain unpainted according to SSPC-SP 1, "Solvent Cleaning" **OR** SSPC-SP 2, "Hand Tool Cleaning" **OR** SSPC-SP 3, "Power Tool Cleaning", **as directed**.
 6. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1/D1.1M and manufacturer's written instructions.
 7. Steel Wall-Opening Framing: Select true and straight members for fabricating steel wall-opening framing to be attached to structural steel. Straighten as required to provide uniform, square, and true members in completed wall framing.

8. Welded Door Frames: Build up welded door frames attached to structural steel. Weld exposed joints continuously and grind smooth. Plug-weld fixed steel bar stops to frames. Secure removable stops to frames with countersunk machine screws, uniformly spaced not more than 10 inches (250 mm) o.c. unless otherwise indicated.
 9. Holes: Provide holes required for securing other work to structural steel and for other work to pass through steel framing members.
 - a. Cut, drill, or punch holes perpendicular to steel surfaces. Do not thermally cut bolt holes or enlarge holes by burning, **unless directed otherwise**.
 - b. Baseplate Holes: Cut, drill, mechanically thermal cut, or punch holes perpendicular to steel surfaces.
 - c. Weld threaded nuts to framing and other specialty items indicated to receive other work.
- F. Shop Connections
1. High-Strength Bolts: Shop install high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts" for type of bolt and type of joint specified.
 - a. Joint Type: Snug tightened **OR** Pretensioned **OR** Slip critical, **as directed**.
 2. Weld Connections: Comply with AWS D1.1/D1.1M and AWS D1.8/D1.8M, **as directed**, for tolerances, appearances, welding procedure specifications, weld quality, and methods used in correcting welding work.
 - a. Assemble and weld built-up sections by methods that will maintain true alignment of axes without exceeding tolerances in AISC 303 for mill material.
- G. Prefabricated Building Columns
1. Prefabricated building columns consisting of load-bearing structural-steel members protected by concrete fireproofing encased in an outer non-load-bearing steel shell.
 2. Fire-Resistance Ratings: Provide prefabricated building column listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction for ratings indicated, based on testing according to ASTM E 119.
 - a. Fire-Resistance Rating: 4 hours **OR** 3 hours **OR** 2 hours **OR** As indicated, **as directed**.
- H. Shop Priming
1. If shop priming is required, shop prime steel surfaces except the following:
 - a. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches (50 mm).
 - b. Surfaces to be field welded.
 - c. Surfaces to be high-strength bolted with slip-critical connections.
 - d. Surfaces to receive sprayed fire-resistive materials (applied fireproofing).
 - e. Galvanized surfaces.
 2. Surface Preparation: Clean surfaces to be painted. Remove loose rust and mill scale and spatter, slag, or flux deposits. Prepare surfaces according to the following specifications and standards:
 - a. SSPC-SP 2, "Hand Tool Cleaning."
 - b. SSPC-SP 3, "Power Tool Cleaning."
 - c. SSPC-SP 7/NACE No. 4, "Brush-Off Blast Cleaning."
 - d. SSPC-SP 11, "Power Tool Cleaning to Bare Metal."
 - e. SSPC-SP 14/NACE No. 8, "Industrial Blast Cleaning."
 - f. SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
 - g. SSPC-SP 10/NACE No. 2, "Near-White Blast Cleaning."
 - h. SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning."
 - i. SSPC-SP 8, "Pickling."
 3. Priming: Immediately after surface preparation, apply primer according to manufacturer's written instructions and at rate recommended by SSPC to provide a minimum dry film thickness of 1.5 mils (0.038 mm). Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.
 - a. Stripe paint corners, crevices, bolts, welds, and sharp edges.
 - b. Apply two coats of shop paint to surfaces that are inaccessible after assembly or erection. Change color of second coat to distinguish it from first.

4. Painting: Prepare steel and apply a one-coat, nonasphaltic primer complying with SSPC-PS Guide 7.00, "Painting System Guide 7.00: Guide for Selecting One-Coat Shop Painting Systems," to provide a dry film thickness of not less than 1.5 mils (0.038 mm).
- I. Galvanizing
 1. Hot-Dip Galvanized Finish: Apply zinc coating by the hot-dip process to structural steel according to ASTM A 123/A 123M.
 - a. Fill vent and drain holes that will be exposed in the finished Work unless they will function as weep holes, by plugging with zinc solder and filing off smooth.
 - b. Galvanize lintels, shelf angles, and welded door frames attached to structural-steel frame and located in exterior walls.
 - J. Source Quality Control
 1. Testing Agency: Owner will engage an independent testing and inspecting agency to perform shop tests and inspections and prepare test reports.
 - a. Provide testing agency with access to places where structural-steel work is being fabricated or produced to perform tests and inspections.
 2. Correct deficiencies in Work that test reports and inspections indicate does not comply with the Contract Documents.
 3. Bolted Connections: Shop-bolted connections will be inspected **OR** tested and inspected, **as directed**, according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."
 4. Welded Connections: In addition to visual inspection, shop-welded connections will be tested and inspected according to AWS D1.1/D1.1M and the following inspection procedures, at testing agency's option:
 - a. Liquid Penetrant Inspection: ASTM E 165.
 - b. Magnetic Particle Inspection: ASTM E 709; performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration will not be accepted.
 - c. Ultrasonic Inspection: ASTM E 164.
 - d. Radiographic Inspection: ASTM E 94.
 5. In addition to visual inspection, shop-welded shear connectors will be tested and inspected according to requirements in AWS D1.1/D1.1M for stud welding and as follows:
 - a. Bend tests will be performed if visual inspections reveal either a less-than-continuous 360-degree flash or welding repairs to any shear connector.
 - b. Tests will be conducted on additional shear connectors if weld fracture occurs on shear connectors already tested, according to requirements in AWS D1.1/D1.1M.

1.3 EXECUTION

- A. Examination
 1. Verify, with steel Erector present, elevations of concrete- and masonry-bearing surfaces and locations of anchor rods, bearing plates, and other embedments for compliance with requirements.
 - a. Prepare a certified survey of bearing surfaces, anchor rods, bearing plates, and other embedments showing dimensions, locations, angles, and elevations.
 2. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Preparation
 1. Provide temporary shores, guys, braces, and other supports during erection to keep structural steel secure, plumb, and in alignment against temporary construction loads and loads equal in intensity to design loads. Remove temporary supports when permanent structural steel, connections, and bracing are in place unless otherwise indicated.
 - a. Do not remove temporary shoring supporting composite deck construction until cast-in-place concrete has attained its design compressive strength.

C. Erection

1. Set structural steel accurately in locations and to elevations indicated and according to AISC 303 and AISC 360.
2. Base Bearing and Leveling Plates: Clean concrete- and masonry-bearing surfaces of bond-reducing materials, and roughen surfaces prior to setting plates. Clean bottom surface of plates.
 - a. Set plates for structural members on wedges, shims, or setting nuts as required.
 - b. Weld plate washers to top of baseplate.
 - c. Snug-tighten **OR** Pretension, **as directed**, anchor rods after supported members have been positioned and plumbed. Do not remove wedges or shims but, if protruding, cut off flush with edge of plate before packing with grout.
 - d. Promptly pack grout solidly between bearing surfaces and plates so no voids remain. Neatly finish exposed surfaces; protect grout and allow to cure. Comply with manufacturer's written installation instructions for shrinkage-resistant grouts, **as directed**.
3. Maintain erection tolerances of structural steel within AISC's "Code of Standard Practice for Steel Buildings and Bridges."
4. Align and adjust various members that form part of complete frame or structure before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that will be in permanent contact with members. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
 - a. Level and plumb individual members of structure.
 - b. Make allowances for difference between temperature at time of erection and mean temperature when structure is completed and in service.
5. Splice members only where indicated.
6. Do not use thermal cutting during erection unless approved by The University. Finish thermally cut sections within smoothness limits in AWS D1.1/D1.1M.
7. Do not enlarge unfair holes in members by burning or using drift pins. Ream holes that must be enlarged to admit bolts.
8. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1/D1.1M and manufacturer's written instructions.

D. Field Connections

1. High-Strength Bolts: Install high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts" for type of bolt and type of joint specified.
 - a. Joint Type: Snug tightened **OR** Pretensioned **OR** Slip critical, **as directed**.
2. Weld Connections: Comply with AWS D1.1/D1.1M and AWS D1.8/D1.8M, **as directed**, for tolerances, appearances, welding procedure specifications, weld quality, and methods used in correcting welding work.
 - a. Comply with AISC 303 and AISC 360 for bearing, alignment, adequacy of temporary connections, and removal of paint on surfaces adjacent to field welds.
 - b. Remove backing bars or runoff tabs where indicated, back gouge, and grind steel smooth.
 - c. Assemble and weld built-up sections by methods that will maintain true alignment of axes without exceeding tolerances in AISC's "Code of Standard Practice for Steel Buildings and Bridges" for mill material.

E. Prefabricated Building Columns

1. Install prefabricated building columns to comply with AISC 360, manufacturer's written recommendations, and requirements of testing and inspecting agency that apply to the fire-resistance rating indicated.

F. Field Quality Control

1. Testing Agency: Engage a qualified independent testing and inspecting agency to inspect field welds and high-strength bolted connections.
2. Bolted Connections: Bolted connections will be inspected **OR** tested and inspected, **as directed**, according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."
3. Welded Connections: Field welds will be visually inspected according to AWS D1.1/D1.1M.

- a. In addition to visual inspection, field welds will be tested and inspected according to AWS D1.1/D1.1M and the following inspection procedures, at testing agency's option:
 - 1) Liquid Penetrant Inspection: ASTM E 165.
 - 2) Magnetic Particle Inspection: ASTM E 709; performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration will not be accepted.
 - 3) Ultrasonic Inspection: ASTM E 164.
 - 4) Radiographic Inspection: ASTM E 94.
 4. In addition to visual inspection, test and inspect field-welded shear connectors according to requirements in AWS D1.1/D1.1M for stud welding and as follows:
 - a. Perform bend tests if visual inspections reveal either a less-than-continuous 360-degree flash or welding repairs to any shear connector.
 - b. Conduct tests on additional shear connectors if weld fracture occurs on shear connectors already tested, according to requirements in AWS D1.1/D1.1M.
 5. Correct deficiencies in Work that test reports and inspections indicate does not comply with the Contract Documents.
- G. Repairs And Protection
1. Galvanized Surfaces: Clean areas where galvanizing is damaged or missing and repair galvanizing to comply with ASTM A 780.
 2. Touchup Painting: Immediately after erection, clean exposed areas where primer is damaged or missing and paint with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
 - a. Clean and prepare surfaces by SSPC-SP 2 hand-tool cleaning or SSPC-SP 3 power-tool cleaning.
- OR**
- Touchup Painting: Cleaning and touchup painting are specified in Division 07.

05 15 16 00	05 50 00 00	Metal Fabrications

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 05 21 00 00 - STEEL JOISTS FRAMING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Engage a firm experienced in manufacturing joists similar to those indicated for this Project and that have a record of successful in-service performance.
 - 1. Manufacturer must be certified by SJI to manufacture joists conforming to SJI standard specifications and load tables.
- B. SJI Design Standard: Comply with recommendations of SJI's "Standard Specifications Load Tables and Weight Tables for Steel Joists and Joist Griders," applicable to types of joists indicated.
- C. Welding Standards: Comply with applicable provisions of AWS D1.1 "Structural Welding Code - Steel" and AWS D13 "Structural Welding Code - Sheet Steel."
 - 1. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.
- D. Professional Engineer Qualifications: A professional engineer who is legally authorized to practice in the jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of joists that are similar to those indicated for this Project in material, design, and extent.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Product data and installation instructions for each type of joist and accessories.
 - a. Include manufacturer's certification that joists comply with SJI "Specifications."
- B. Record Documents:
 - 1. Submit the following in accordance with Conditions of Contract and Division 01 Specification Sections.

2. Shop drawings showing layout of joist members, special connections, joining and accessories. Include mark, number, type, location and spacing of joists and bridging.
 - a. Provide templates or location drawings for installation of anchor bolts and metal bearing plates.
3. VOC compliance certificate signed by manufacturers certifying compliance of their products with regulations of authorities having jurisdiction over volatile organic compounds (VOCs).

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store and handle steel joists as recommended in SJI "Specifications." Handle and store joists in a manner to avoid deforming members and to avoid excessive stresses.

1.06 PERFORMANCE REQUIREMENTS

- A. Structural Performance: Engineer, fabricate, and erect joists and connections to withstand design loads within limits and under conditions required.
 1. Design Loads: As indicated.
 2. Design Joist to withstand design loads without deflections greater than the following:
 - a. Floor Joists: Vertical deflection of 1/360 of the span
 - b. Roof Joists: Vertical deflection of 1/240 of the span
 - c. Roof Joists: Vertical deflection of 1/360 of the span
- B. Engineering Responsibility: Engage a joist manufacturer who utilizes a qualified professional engineer to prepare design calculations, shop drawings, and other structural data for steel joists.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MATERIALS

- A. Steel: Comply with SJI "Specifications" for chord and web sections.
- B. Steel Bearing Plates: ASTM A 36
- C. Carbon-Steel Bolts and Threaded Fasteners: ASTM A 307, Grade A (ASTM F 568, Property Class 4.6), carbon-steel, hex-head bolts and threaded fasteners; carbon-steel nuts; and flat, unhardened steel washers.
 1. Finish: Plain, noncoated
 2. Finish: Hot-dip zinc coating, ASTM A 153, Class C
 3. Finish: Mechanically deposited zinc coating, ASTM B 695, Class 50
- D. High-Strength Bolts and Nuts: ASTM A 325 (ASTM A 325M), Type 1, heavy hex steel structural bolts, heavy hex carbon-steel nuts, and hardened carbon-steel washers.

1. Finish: Plain, noncoated
 2. Finish: Hot-dip zinc coating, ASTM A 153, Class C
 3. Finish Mechanically deposited zinc coating, ASTM B 695, Class 50
- E. Welding Electrodes: Comply with AWS standards.
- F. Galvanizing Repair Paint: SSPC-Paint 20 or DOD-P-21035, with dry film containing a minimum of 94 percent zinc dust by weight.

2.03 PRIMERS

- A. Primer: SSPC-Paint 15, Type I, red oxide; Federal Specification TT-P-636, red oxide; or manufacturer's standard shop primer meeting the performance requirements of either of these red-oxide primers.
- B. Primer: Fast-curing, lead- and chromate-free, VOC-compliant, universal modified-alkyd primer with good resistance to normal atmospheric corrosion, complying with performance requirements of FS TT-P-664.

2.04 FABRICATION

- A. Fabricate steel joists in accordance with SJI "Specification."
- B. Holes in Chord Members: Provide holes in chord members where shown for securing other work to steel joists; however, deduct area of holes from the area of chord when calculating strength of member.
- C. Extended End: Provide extended ends on joists where indicated, complying with SJI "Specifications" and load tables.
- D. Ceiling Extension: Provide ceiling extensions in areas having ceilings attached directly to joist bottom chord. Provide either an extended bottom chord element or a separate unit, to suit manufacturer's standards, of sufficient strength to support ceiling construction. Extend ends to within 1/2 inch of finished wall surface, unless otherwise indicated.
- E. Top Chord Extension: Provide top chord extensions ("S" type) on joists where indicated, complying with SJI "Specifications" and load tables.
- F. Bridging: Provide horizontal or diagonal type bridging for joists complying with SJI "Specifications."
1. Provide bridging anchors for ends of bridging lines terminating at walls or beams.
- G. End Anchorage: Provide end anchorages, including steel bearing plates, to secure joists to adjacent construction, complying with SJI "Specifications."
- H. Header Units: Provide header units to support tail joists at openings in floor or roof system not framed with steel shapes.

2.05 SHOP PAINTING

- A. Do not shop paint joists to receive fireproofing.
- B. Clean and remove loose scale, heavy rust, and other foreign materials from fabricated joists and accessories to be primed as follows: Surface Preparation; Power tool cleaning, SSPC-SP 3.
- C. Apply one shop coat of primer to joists and joist accessories to be primed to provide a continuous, dry paint film thickness of not less than 1 mil (0.025 mm).

PART 3 - EXECUTION**3.01 ERECTION**

- A. Place and secure steel joists in accordance with SJI "Specifications," final shop drawings, and as herein specified.
- B. Anchors: Furnish anchor bolts, steel bearing plates, and other devices to be built into concrete and masonry construction.
 - 1. Provide unfinished threaded fasteners for anchor bolts, unless high strength bolts indicated.
- C. Placing Joists: Do not start placement of steel joists until supporting work is in place and secured. Place joists on supporting work, adjust and align in accurate locations and spacing before permanently fastening.
- D. Provide temporary bridging, connections, and anchors to ensure lateral stability during construction.
 - 1. Where "open web" joist lengths are 40 feet and longer, install a center row of bolted bridging to provide lateral stability before slackening of hoisting lines.
- E. Bridging: Install bridging simultaneously with joist erection, before construction loads are applied. Anchor ends of bridging lines at top and bottom chords where terminating at walls or beams.
- F. Fastening Joists: Comply with the following:
 - 1. Field weld joists to supporting steel framework and steel bearing plates where indicated in accordance with SJI "Specifications" for type of joists used. Coordinate welding sequence and procedure with placing of joists.
 - 2. Bolt joists to supporting steel framework in accordance with SJI "Specifications" for type of joists used.
 - a. Use unfinished threaded fasteners for bolted connections, unless otherwise indicated.

3.02 FIELD QUALITY CONTROL

- A. Testing Agency: A qualified independent testing agency employed and paid by Owner will perform field quality-control testing.
- B. Testing agency will report test results promptly and in writing to Contractor and Owner.
- C. Testing and verification procedures will be required of high-strength bolted connections and field welds.
 - 1. Bolted connections will be visually inspected
 - 2. High-strength, field-bolted connections will be tested and verified according to procedures in RCSC's "Specification for Structural Joints Using ASTM A 325 or ASTM A 490 Bolts."
 - 3. Field-bolted connections will be tested and verified according to procedures in RCSC's "Load and Resistance Factor Design Specification for Structural Joints Using ASTM A 325 or ASTM A 490 Bolts."
 - 4. Field welds will be visually inspected
 - 5. In addition to visual inspection, field welds will be inspected and tested according to AWS D1.1 and the following procedures:

- a. Radiographic Testing: ASTM E 94 and ASTM E 142
 - b. Magnetic Particle Inspection: ASTM E 709
 - c. Ultrasonic Testing: ASTM E 164
 - d. Liquid Penetrant Inspection: ASTM E 165
- D. Correct deficiencies in Work that inspections and test reports have indicated are not in compliance with specified requirements.
- E. Additional testing will be performed to determine compliance of corrected Work with specified requirements.

3.03 REPAIRS AND PROTECTION

- A. Repair damaged galvanized coatings on exposed surfaces with galvanized repair paint according to ASTM A 780 and the manufacturer's instructions.
- B. Touch Up Painting: Following installation, promptly clean, prepare, and prime or re-prime field connections, rust spots and abraded surfaces of prime-painted joists, accessories, bearing plates, and abutting structural steel.
 - 1. Clean and prepare surface by hand tool cleaning, SSPC-SP 2, or power tool cleaning, SSPC SP 3.
 - 2. Apply and compatible primer of the same type as the shop primer used on adjacent surface.

3.04 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

END OF SECTION 05 21 00 00

THIS PAGE INTENTIONALLY LEFT BLANK

Task	Specification	Specification Description
05 21 19 00	05 21 00 00	Steel Joists Framing

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 05 31 00 00 - STEEL DECKING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. American Iron and Steel Institute (AISI), "Specification for the Design of Cold Formed Steel Structural Members."
 - 2. American Welding Society (AWS), D1.3 "Structural Welding Code Sheet Steel."
 - 3. Steel Deck Institute (SDI), "Design Manual for Composite Decks, Form Decks and Roof Decks."

1.03 QUALITY ASSURANCE

- A. Qualification of Field Welding: Use qualified welding processes and welding operators in accordance with "Welder Qualification" procedures of AWS.
 - 1. Welded decking in place is subject to inspection and testing. Owner will bear expense of removing and replacing portions of decking for testing purposes if welds are found to be satisfactory. Remove work found to be defective and replace with new acceptable work.
- B. Underwriters' Label: Provide metal floor deck units listed in Underwriters' Laboratories "Fire Resistance Directory", with each deck unit bearing the UL label and marking for specific system detailed.
 - 1. Provide cellular floor deck units listed in UL "Electrical Construction Materials Directory" with each cellular metal floor deck unit bearing UL labels and marking. Provide units that will permit use of standard header ducts and outlets for electrical distribution systems.
- C. FM Listing: Provide steel roof deck units that have been evaluated by Factory Mutual System and are listed in "Factory Mutual Approval Guide" for "Class I" fire rated construction.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Product data including manufacturer's specifications and installation instructions for each type of decking and accessories.

- a. Provide test data for mechanical fasteners used in lieu of welding for fastening deck to supporting structures.

B. Shop Drawings:

1. Showing layout and types of deck units, anchorage details, and conditions requiring closure strips, supplementary framing, sump pans, cant strips, cut openings, special jointing, and other accessories.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated in the work include:
 1. American Building Co.
 2. ASC Pacific, Inc.
 3. Bowman Metal Deck Div., Cyclops Corp.
 4. Consolidated Systems, Inc.
 5. Epic Metals Corp.
 6. Marlyn Steel Products, Inc.
 7. H. H. Robertson Co.
 8. Roof Deck, Inc.
 9. United Steel Deck, Inc.
 10. Verco Manufacturing Co.
 11. Vulcraft Div., Nucor Corp.
 12. Walker.
 13. Wheeling Corrugating Co.

2.03 ROOF DECK

- A. Steel Roof Deck: Fabricate panels without top-flange stiffening grooves conforming to SDI Publication No. 28" Specifications and Commentary for Steel Roof Deck" and the following:
 1. Galvanized-Steel Sheet: ASTM A 446 Grade A, G 60 (ASTM A 446M, Grade A, Z 180) zinc coated according to ASTM A 525 (ASTM A 525M).
 2. Galvanized-Steel Sheet: ASTM A 446 Grade A, G 90 (ASTM A 446M, Grade A, Z 275) zinc coated according to ASTM A 425 (ASTM A 525M).

B. Acoustical Steel Roof Deck: Fabricate panels without top-flange stiffening grooves conforming to SDI Publication No. 28 "Specifications and Commentary for Steel Roof Deck" and the following:

1. Galvanized-Steel Sheet: ASTM A 446, Grade A, G 60 (ASTM A 446M, Grade A, Z 180) zinc coated according to ASTM A 525 (ASTM A 525M).
2. Galvanized-Steel Sheet: ASTM A 446, Grade A, G 90 (ASTM A 446M, Grade A, Z 275) zinc coated according to ASTM A 525 (ASTM A 525M).
3. Acoustical Perforations and Sound Insulation: Deck panels with manufacturer's standard perforated vertical webs.
4. Acoustical Perforations and Sound Insulation: Cellular deck panels with manufacturer's standard perforated flat-bottom plate welded to ribbed deck.

2.04 FLOOR DECK

A. Composite Steel Floor Deck: Fabricate panels with integrally embossed or raised pattern ribs and interlocking side laps, conforming to SDI Publication No. 28 "Specifications and Commentary for Composite Steel Floor Deck," the minimum section properties indicated, and the following:

1. Galvanized-Steel Sheet: ASTM A 446, Grade A, G 60 (ASTM A 446M, Grade A, Z 180) zinc coated according to ASTM A 525 (ASTM A 525M).
2. Galvanized-Steel Sheet: ASTM A 446, Grade A, G 90 (ASTM A 446M, Grade A, Z 275) zinc coated according to ASTM A 525 (ASTM A 525M).

B. Cellular Metal Floor Deck for Electrical Distribution:

1. Fabricate steel sheet cellular floor deck panels composed of a ribbed top section welded to a lower flat-bottom sheet with interlocking side laps conforming to SDI Publication No. 28 "Specifications and Commentary for Cellular Metal Floor Deck with Electrical Distribution."
2. Fabricate deck to the minimum section properties, width of panel, number and area of cells per panel indicated, and the following:
 - a. Deck Type: Composite
 - b. Deck Type: Noncomposite
3. Galvanized-Steel Sheet: ASTM A 446, Grade A, G 60 (ASTM A 446M, Grade A, Z 180) zinc coated according to ASTM A 525 (ASTM A 525M)
4. Galvanized-Steel Sheet: ASTM A 446, Grade A, G 90 (ASTM A 446M, Grade A, Z 275) zinc coated according to ASTM A 525 (ASTM A 525M)
5. Galvanized and Shop-Primed Steel Sheet: ASTM A 446, Grade A, G 60 (ASTM A 446M, Grade A, Z 180) zinc coated according to ASTM A 525 (ASTM A 525M); cleaned, pretreated, and primed with manufacturer's baked-on, lead- and chromate-free rust-inhibitive primer.
6. Shop punch holes of size and arrangement recommended by deck manufacturer, into each cell of the deck at preset inserts and header duct locations.
7. Shop punch holes, of size and arrangement indicated, into each cell of the deck at preset inserts and header duct locations.

2.05 FORM DECK

- A. Noncomposite Steel Form Deck: Fabricate ribbed-steel sheet noncomposite form deck panels conforming to SDI Publication No. 28 "Specifications and Commentary for Noncomposite steel form Deck", the minimum section properties indicated, and the following:
1. Galvanized-Steel Sheet: ASTM A 446, Grade E, G 60 (ASTM A 446M, Grade E, Z 180) zinc coated according to ASTM A 525 (ASTM A 525M)
 2. Galvanized-Steel Sheet: ASTM A 446, Grade E, G 90 (ASTM A 446M, Grade E, Z 275) zinc coated according to ASTM A 525 (ASTM A 525M)
- B. Vented Noncomposite Steel Form Deck: Fabricate ribbed- and vented-steel sheet noncomposite form deck panels conforming to SDI Publication No. 28 "Specifications and Commentary for Noncomposite Steel Form Deck," and the following:
1. Galvanized-Steel Sheet: ASTM A 446, Grade E, G 60 (ASTM A 446M, Grade E, Z 180) zinc coated according to ASTM A 525 (ASTM A 525M)
 2. Galvanized-Steel Sheet: ASTM A 446, Grade E, G 90 (ASTM A 446M, Grade E, Z 275) zinc coated according to ASTM A 525 (ASTM A 525M)
 3. Vent Slot Area: Manufacturer's standard vent slots providing 1.5 percent minimum open area.

2.06 ACCESSORIES

- A. Provide accessory materials for steel deck that comply with requirements indicated and recommendations of the steel deck manufacturer.
- B. Mechanical Fasteners: Manufacturer's standard, corrosion-resistant, low-velocity, powder-actuated or pneumatically driven carbon steel fasteners; or self-drilling, self-threading screws.
- C. Side Lap Fasteners: Manufacturer's standard, corrosion-resistant, hexagonal washer head; self-drilling, carbon steel screws, No. 10 (4.8 mm) minimum diameter.
- D. Rib Closure Strip: Manufacturer's standard vulcanized, closed-cell, synthetic rubber.
- E. Sound-Absorbing Insulation: Manufacturer's standard premolded roll or strip glass fiber or mineral fiber.
- F. Miscellaneous Roof Deck Accessories: Steel sheet, 0.0359-inch- (0.91-mm) thick minimum ridge and valley plates, finish strips, and reinforcing channels, of same material as roof deck.
- G. Pour Stops and Girder Fillers: Steel sheet, of same material as deck panels, and of thickness and profile indicated.
- H. Column Closures, End Closures, Z-Closures, and Cover Plates: Steel sheet, of same material and thickness as deck panels, unless otherwise indicated.
- I. Hanger Tabs: Manufacturer's standard piercing steel sheet hanger attachment devices for floor deck panels.
- J. Weld Washers: Manufacturer's standard uncoated-steel sheet weld washers, shaped to fit deck rib, 0.0598 inch (1.5 mm) thick with 3/8-inch (9.5-mm) minimum diameter prepunched hole.
- K. Recessed Sump pans: Manufacturer's standard size, single piece steel sheet 0.071-inch- (1.8mm-) thick minimum, of same material as deck panels, with 1-1/2-inch- (38-mm-) minimum deep level recessed pans and 3-inch- (76-mm-) wide flanges. Cut holes for drains in the field.

- L. Flat Receiver Pan: Manufacturer's standard size, single-piece steel sheet, 0.071-inch- (1.8-mm-) thick minimum units, of same material as deck panels. Cut holes for drains in the field.
- M. Shear Connectors: ASTM A 108, Grade 1010 through 1020 headed stud type, cold-finished carbon steel, AWS D1.1, Type b.
- N. Steel Sheet Accessories: ASTM A 446, G 60 (ASTM A 446M, Z 180) coating class, galvanized according to ASTM A 525 (ASTM A 525M).
- O. Galvanizing Repair Paint: SSPC-Paint 20 or DOD-P-21035, with dry film containing a minimum of 94 percent zinc dust by weight.
- P. Preset Inserts: Manufacturer's standard, UL-labeled single-piece preset inserts, fabricated from either still sheet galvanized according to ASTM A 525, G 60 (ASTM A 525M, Z 180) coating class, or zinc sheet, with removable covers.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install deck units and accessories in accordance with manufacturer's recommendations, shop drawings, and as specified herein.
- D. Place deck units on supporting steel framework and adjust to final position with ends accurately aligned and bearing on supporting members before being permanently fastened. Do not stretch or contract side lap interlocks.
- E. Align deck units for entire length of run of cells and with close alignment between cells at ends of abutting units.
- F. Place deck units flat and square, secured to adjacent framing without warp or deflection.
- G. Do not place deck units on concrete supporting structure until concrete has cured and is dry.
- H. Coordinate and cooperate with structural steel erector in locating decking bundles to prevent overloading of structural members.
- I. Do not use deck units for storage or working platforms until permanently secured.

3.02 ROOF DECK INSTALLATION

- A. Fasten roof deck panels to steel supporting members by arc spot (puddle) welds of the surface diameter indicated or arc seam welds with an equal perimeter, but not less than 1-1/2 inches (38 mm) long, and as follows:
 - 1. Weld Diameter: 5/8 inch (16 mm), nominal
 - 2. Weld Diameter: 3/4 inch (19 mm), nominal
 - 3. Weld Spacing: Weld edge ribs of panels at each support. Space welds an average of 12 inches (305 mm) apart, with a minimum of two welds per unit at each support.
 - 4. Weld Spacing: Space and locate welds as indicated

5. Weld Washers: Where deck thickness is less than 0.028 inches, install weld washers at each weld location.
- B. Side Lap and Perimeter Edge Fastening: Fasten side laps and perimeter edges of panels between supports, at intervals not exceeding 36 inches (910 mm), using one of the following methods:
 1. Mechanically fasten with self-drilling No. 10 - (4.8-mm-) diameter or larger carbon steel screws.
 2. Mechanically clinch or bottom punch
 3. Fasten with 1-1/2-inch- (38-mm-) long minimum welds.
- C. End Bearing: Install deck ends over supporting framing with a minimum end bearing of 1-1/2 inches (38 mm), with end joints as follows:
 1. End Joints: Lapped 2 inches (51 mm) minimum
 2. End Joints: Butted
 3. End Joints: Lapped 2 inches (51 mm) minimum or butted at Contractor's option
- D. Roof Sump Pans and Sump Plates: Install over openings provide in roof decking, and weld flanges to top of deck. Space welds not more than 12 inches (305 mm) apart with at least one weld at each corner.
- E. Miscellaneous Roof Deck Accessories: Install ridge and valley plates, finish strips, cover plates, end closures, and reinforcing channels according to deck manufacturer's recommendations. Weld to substrate to provide a complete deck installation.
- F. Flexible Closure Strips: Install flexible closure strips over partitions, walls, and where indicated. Install with adhesive according to manufacturer's instructions to ensure complete closure.
- G. Sound-Absorbing Insulation: Install premolded, roll or strip sound-absorbing insulation according to deck manufacturer's instructions.

3.03 FLOOR DECK INSTALLATION

- A. Fasten floor deck panels to steel supporting members by arc spot (puddle) welds of the surface diameter indicated and as follows:
 1. Weld Diameter 5/8 inch (16 mm), nominal
 2. Weld Diameter: 3/4 inch (19 mm), nominal
 3. Weld Spacing: Weld edge ribs of panels at each support. Space additional welds an average of 12 inch (305 mm) apart, but not more than 18 inches (457 mm) apart.
 4. Weld Spacing: Space and locate welds as indicated.
 5. Weld Washers: Where deck thickness is less than 0.028 inches, install weld washers at each weld location.
- B. Side Lap and Perimeter Edge Fastening: Fasten side laps and perimeter edges of panels between supports or at intervals not exceeding 36 inches (910 mm), using one of the following methods:
 1. Mechanically fasten with self-drilling No. 10- (4.8-mm-) diameter or large carbon steel screws.
 2. Mechanically clinch or bottom punch

3. Fasten with 1-1/2-inch- (38-mm-) long minimum welds.
- C. End Bearing: Install deck ends over supporting framing with a minimum end bearing of 1-1/2 inches (38 mm), with end joints as follows:
 1. End Joints: Lapped
 2. End Joints: Butted
 3. End Joints: Lapped or butted at Contractor's options
- D. Shear Connectors: Weld shear connectors through deck to support framing according to AWS D1.1 and manufacturer's instructions. Butt end joints of dec panels; do not overlap.
- E. Pour Stops and Girder Fillers: Weld steel sheet pour stops and girder fillers to supporting structure according to SDI recommendations, unless otherwise indicated.
- F. Floor Deck Closures: Weld steel column closures, cell closures, and Z-closures to deck according to SDI recommendations to provide tight-fitting closures at open ends of ribs and sides of decking. Weld cover plates at changes in direction of floor deck panels, unless otherwise indicated.
- G. Maintain smooth cellular raceway interiors free of welds or mechanical fasteners.
- H. Install piercing hanger tabs not more than 14 inches (355 mm) apart in both directions, within 9 inches (228 mm) of wall at ends, and not more than 12 inches (305 mm) from walls at sides, unless otherwise indicated.

3.04 FIELD QUALITY CONTROL

- A. Testing Agency: A qualified independent testing agency employed and paid by Owner will perform field quality-control testing.
- B. Field welds will be subject to inspection.
- C. Shear connector welds will be inspected and tested according to the requirements of AWS D1.1 for stud welding and as follows:
 1. Shear connector welds will be visually inspected.
 2. Blend tests will be performed when visual inspection reveal either less than a continuous 360 degree flash or welding repairs to any shear connector.
 3. Test will be conducted on additional shear connectors when weld fracture occurs on shear connectors already tested, according to the requirements of AWS D1.1.
- D. Testing agency will report test results promptly and in writing to Contractor and Owner.
- E. Remove and replace Work that does not comply with specified requirements.
- F. Additional testing will be performed to determine compliance of corrected work with specified requirements.

3.05 REPAIRS AND PROTECTION

- A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on both surfaces with galvanized repair paint according to ASTM A 780 and the manufacturer's instructions.
- B. Provide final protection and maintain conditions to ensure steel decking is without damage or deterioration at time of Substantial Completions.

Task	Specification	Specification Description
05 36 00 00	05 31 00 00	Steel Decking

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 05 40 00 00 - COLD-FORMED METAL FRAMING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Component Design: Calculate structural properties of studs and joists in accordance with American Iron and Steel Institute (AISI) "Specification for Design of Cold Formed Steel Structural Members."
- B. Welding: Use qualified welders and comply with American Welding Society (AWS) D1.3, "Structural Welding Code Sheet Steel."
- C. Fire Rated Assemblies: Where framing units are components of assemblies indicated for a fire resistance rating, including those required for compliance with governing regulations, provide units that have been approved by governing authorities that have jurisdiction.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Product data and installation instructions for each item of cold formed metal framing and accessories
- B. Record Documents:
 - 1. Shop drawings for special components and installations not fully dimensioned or detailed in manufacturer's product data.
 - a. Include placing drawings for framing members showing size and gage designations, number, type, location, and spacing. Indicate supplemental strapping, bracing, splices, bridging, accessories, and details required for proper installation.

1.05 PERFORMANCE REQUIREMENTS

- A. AISI "Specification": Calculate structural characteristics of cold-formed metal framing according to AISI's "Specification for the Design of Cold-Formed Steel Structural Members" and the following:

- B. AISI "Specification": Calculate structural characteristics of cold-formed metal framing according to AISI's "Load and Resistance Factor Design Specification for Cold-Formed Steel Structural Members" and the following:
 - 1. Center for Cold-Formed Steel Structures (CCFSS) Technical Bulletin, Vol. 2, No. 1, February 1993 "AISI Specification Provisions for Screw Connections."
- C. Structural Performance: Engineer, fabricate and erect cold-formed metal framing with the following minimum physical and structural properties:
 - 1. Physical and Structural Properties: As indicated.
- D. Structural Performance: Engineer, fabricate, and erect cold-formed metal framing to withstand design loads within limits and under conditions required.
 - 1. Design framing systems to withstand design loads without deflections greater than the following:
 - a. Exterior Load-Bearing Walls: Lateral deflection of $1/360$ of the wall height, unless otherwise indicated.
 - b. Interior Load-Bearing Walls: Lateral deflection of $1/360$ of the wall height.
 - c. Exterior Nonload-Bearing Curtainwall: Lateral deflection of $1/240$ of the wall height.
 - d. Exterior Nonload-Bearing Curtainwall: Lateral deflection of $1/360$ of the wall height.
 - e. Exterior Nonload-Bearing Curtainwall: Lateral deflection of $1/600$ of the wall height.
 - f. Exterior Nonload-Bearing Curtainwall: Lateral deflection of $1/720$ of the wall height.
 - g. Floor Joists: Vertical deflection of $1/240$ of the span.
 - h. Floor Joists: Vertical deflection of $1/360$ of the span.
 - i. Roof Trusses: Vertical deflection of $1/240$ of the span.
 - j. Roof Trusses: Vertical deflection of $1/360$ of the span.
 - 2. Design framing systems to provide for movement of framing members without damage or overstressing, sheathing failure, connection failure, undue strain on fasteners and anchors, or other detrimental effects with subject to a maximum ambient temperature change (range) of 120 degrees F (67 degrees C).
 - 3. Design framing system to accommodate deflection of primary building structure and construction tolerances, and to maintain clearances at openings.
- E. Design exterior nonload-bearing curtainwall framing to accommodate lateral deflection without regard to contribution of sheathing materials.
- F. Engineering Responsibility: Engage a fabricator who assumes undivided responsibility for engineering cold formed metal framing by employing a qualified professional engineer to prepare design calculations, shop drawings, and other structural data.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 ACCEPTABLE MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated in the work include:
1. Alabama Metal Industries Corp.
 2. American Studco, Inc.
 3. Dale/Incor, Industries of Florida
 4. Dale Industries, Inc.
 5. Dietrich Industries, Inc.
 6. Incor Plant Dale Industries
 7. Marino/Ware; Div. of Ware Industries, Inc.
 8. Super Stud Building Products, Inc.
 9. Unimast, Inc.
 10. United Construction Supply
 11. United States Steel

2.03 METAL FRAMING

- A. System Components: Manufacturers' standard load bearing steel studs and joists of type, size, shape, and gage as indicated. With each type of metal framing required, provide manufacturer's standard, steel runners (tracks), blocking, lintels, clip angles, shoes, reinforcements, fasteners, and accessories for applications indicated, as needed to provide a complete metal framing system.
- B. Materials and Finishes:
1. For 16 gage and heavier units, fabricate metal framing components of structural quality steel sheet with a minimum yield point of 40,000 psi; ASTM A 446, A 570, or A 611.
 2. For 18 gage and lighter units, fabricate metal framing components of commercial quality steel sheet with a minimum yield point of 33,000 psi; ASTM A 446, A 570, or A 611.
 3. Provide galvanized finish to metal framing components complying with ASTM A 525 for minimum G 60 coating.
 - a. Where metal framing provides back-up support for brick veneer, provide G90 (Z275) coating.
 4. Prime-Painted Steel Sheet: ASTM A 570 (ASTM A 570M) or ASTM A 611, cleaned, pretreated, and primed with manufacturer's baked-on, lead- and chromate-free, rust-inhibitive prime conforming to the performance requirements of FS TT-P-664.
 - a. Finish of installation accessories to match that of main framing components, unless otherwise indicated.

5. Fasteners: Provide nuts, bolts, washers, screws, and other fasteners with corrosion resistant plated finish.
6. Electrodes for Welding: Comply with AWS Code and as recommended by stud manufacturer.
7. Galvanizing Repair: Where galvanized surfaces are damaged, prepare surfaces and repair in accordance with procedures specified in ASTM A 780.

2.04 FRAMING ACCESSORIES

- A. Fabricate steel-framing accessories of the same material and finish used for framing members, with minimum yield strength of 33,000 psi (230 MPa).
- B. Provide accessories of manufacturer's standard thickness and configuration, unless otherwise indicated, including:
 1. Supplementary framing
 2. Bracing, bridging, and solid blocking
 3. Web stiffeners
 4. Gusset plates
 5. Deflection track and vertical slide clips
 6. Reinforcement plates

2.05 ANCHORS, CLIPS, AND FASTENERS

- A. Steel Shapes and Clips: ASTM A 36 (ASTM A 36M), zinc coated by the hot-dip process according to ASTM A 123.
- B. Cast-in-Place Anchor Bolts and Studs: ASTM A 307, Grade A (ASTM F 568, Property Class 4.6); carbon-steel hex-head bolts and studs; carbon-steel nuts; and flat, unhardened-steel washers. Zinc coated by hot-dip process according to ASTM A 153.
- C. Welding Electrodes: Comply with AWS standards.

2.06 MISCELLANEOUS MATERIALS

- A. Galvanizing Repair Paint: SSPC-Paint 20 or DOD-P-21035, with dry film containing a minimum of 94 percent zinc dust by weight.
- B. Cement Grout: Portland cement, ASTM C 150, Type I; and clean, natural sand, ASTM C 404. Mix at ratio of 1 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.
- C. Nonmetallic, Nonshrink Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, portland cement, shrinkage-compensating agents, plasticizing and water-reducing agents, complying with ASTM C 1107, with fluid consistency and a 30-minute working time.

2.07 FABRICATION

- A. Framing components may be prefabricated into assemblies before erection. Fabricate panels plumb, square, true to line, and braced against racking with joints welded. Perform lifting of prefabricated units to prevent damage or distortion.

- B. Fabricate units in jig templates to hold members in proper alignment and position and to assure consistent component placement.
- C. Fastenings: Attach similar components by welding. Attach dissimilar components by welding, bolting, or screw fasteners, as standard with manufacturer.
- D. Wire tying of framing components is not permitted.
- E. Fabrication Tolerances: Fabricate units to a maximum allowable tolerance variation from plumb, level, and true to line of 1/8 inch in 10 feet.
 - 1. Spacing: Space individual framing members no more than plus or minus 1/8 inch (3 mm) from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.
 - 2. Squareness: Fabricate each cold-formed metal framing assembly to a maximum out-of-square tolerance of 1/8 inch (3 mm).

PART 3 - EXECUTION

3.01 PREPARATION

- A. Pre-Installation Conference:
 - 1. Prior to start of installation of metal framing systems, meet at Project Site with installers of other work including door and window frames and mechanical and electrical work.
 - 2. Review areas of potential interference and conflicts, and coordinate layout and support provisions for interfacing work.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install metal framing systems in accordance with manufacturer's printed or written instructions and recommendations.
- D. Runner Tracks: Install continuous tracks sized to match studs. Align tracks accurately to layout at base and tops of studs. Secure tracks as recommended by stud manufacturer for type of construction involved, except do not exceed 24 inches on center spacing for nail or powder driven fasteners or 16 inches on center for other types of attachment. Provide fasteners at corners and ends of tracks.
- E. Installation of Wall Studs: Secure studs to top and bottom runner tracks by either welding or screw fastening at both inside and outside flanges.
- F. Set studs plumb, except as needed for diagonal bracing or required for nonplumb walls or warped surfaces and similar requirements.
- G. Where stud system abuts structural columns or walls, including masonry walls, anchor ends of stiffeners to supporting structure.

- H. Install supplementary framing, blocking, and bracing in metal framing system wherever walls or partitions are indicated to support fixtures, equipment, services, casework, heavy trim and furnishings, and similar work requiring attachment to the wall or partition. Where type of supplementary support is not otherwise indicated, comply with stud manufacturer's recommendations and industry standards in each case, considering weight or loading resulting from item supported.
- I. Frame wall openings larger than two feet square with double stud at each jamb of frame except where more than two are either shown or indicated in manufacturer's instructions. Install runner tracks and jack studs above and below wall openings. Anchor tracks to jamb studs with stud shoes or by welding, and space jack studs same as full height studs of wall. Secure stud system wall opening frame in manner indicated.
- J. Frame both sides of expansion and control joints with separate studs; do not bridge the joint with components of stud system.
- K. Install horizontal stiffeners in stud system, spaced (vertical distance) at not more than 54 inches on center. Weld at each intersection.
- L. Erection Tolerances: Bolt or weld wall panels (at both horizontal and vertical junctures) to produce flush, even, true to line joints.
 - 1. Maximum variation in plane and true position between prefabricated assemblies should not exceed 1/16 inch.
- M. Installation of Joists: Install level, straight, and plumb, complete with bracing and reinforcing as indicated on drawings. Provide not less than 1-1/2 inch end bearing.
- N. Reinforce ends with end clips, steel hangers, steel angle clips, steel stud section, or as otherwise recommended by joist manufacturer.
- O. Where required, reinforce joists at interior supports with single short length of joist section located directly over interior support, snap on shoe, 30 percent side piece lapped reinforcement, or other method recommended by joist manufacturer.
- P. Secure joists to interior support systems to prevent lateral movement of bottom flange.
- Q. Field Painting: Touch up damaged shop applied protective coatings. Use compatible primer for prime coated surfaces; use galvanizing repair system for galvanized surfaces.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 05 50 00 00 - METAL FABRICATIONS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Fabricator Qualifications: Firm experienced in successfully producing metal fabrications similar to that indicated for this Project, with sufficient production capacity to produce required units without causing delay in the Work.
- B. Installer Qualifications: Arrange for installation of metal fabrications specified in this section by same firm that fabricated them.
- C. Qualify welding processes and welding operators in accordance with AWS D1.1 "Structural Welding Code Steel," D1.3 "Structural Welding Code Sheet Steel", and D1.2 "Structural Welding Code Aluminum."
 - 1. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Product data and installation instructions for each prefabricated item of miscellaneous metal fabrications and accessories.
 - 2. Samples representative of materials and finished products as may be requested by Owner.
- B. Record Documents:
 - 1. Shop drawings detailing fabrication and erection of each metal fabrication indicated. Include plans, elevations, sections, and details of metal fabrications and their connections. Show anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other sections.

- a. Where installed metal fabrications are indicated to comply with certain design loadings, include structural computations, material properties, and other information needed for structural analysis that has been signed and sealed by the qualified professional engineer who was responsible for their preparation.

1.05 PROJECT CONDITIONS

- A. Field Measurements: Check actual locations of walls and other construction to which metal fabrications must fit, by accurate field measurements before fabrication; show recorded measurements on final shop drawings. Coordinate fabrication schedule with construction progress to avoid delay of Work.
 1. Where field measurements cannot be made without delaying the Work, guarantee dimensions and proceed with fabrication of products without field measurements. Coordinate construction to ensure that actual opening dimensions correspond to guaranteed dimensions. Allow for trimming and fitting.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 FERROUS METALS

- A. For metal fabrications exposed to view upon completion of the Work, provide materials selected for their surface flatness, smoothness, and freedom from surface blemishes. Do not use materials whose exposed surfaces exhibit pitting, seam marks, roller marks, rolled trade names, roughness, and, for steel sheet, variations in flatness exceeding those permitted by reference standards for stretcher leveled sheet.
- B. Steel Plates, Shapes, and Bars: ASTM A 36.
- C. Rolled Steel Floor Plates: ASTM A 786.
- D. Steel Bars for Gratings: ASTM A 569 or ASTM A 36.
- E. Wire Rod for Grating Cross Bars: ASTM A 510.
- F. Steel Tubing: Product type (manufacturing method) and as follows:
 1. Cold Formed Steel Tubing: ASTM A 500, grade as indicated below:
 - a. Grade A, unless otherwise indicated or required for design loading.
 - b. For exterior installations and where indicated, provide tubing with hot dip galvanized coating per ASTM A 53.
- G. Uncoated Steel Sheet: Commercial quality, product type (method of manufacture) as follows:
 1. Cold Rolled Steel Sheet: ASTM A 366
- H. Galvanized Steel Sheet: Commercial Quality; ASTM A 526, G90 coating designation unless otherwise indicated.
- I. Steel Pipe: ASTM A 53; finish and type as follows:

1. Black finish, unless otherwise indicated.
 2. Galvanized finish for exterior installations and where indicated.
- J. Gray Iron Castings: ASTM A 48, Class 30.
- K. Malleable Iron Castings: ASTM A 47, grade 32510.
- L. Brackets, Flanges and Anchors: Cast or formed metal of the same type material and finish as supported rails, unless otherwise indicated.
- M. Concrete Inserts: Threaded or wedge type; galvanized ferrous castings, either malleable iron, ASTM A 47, or cast steel, ASTM A 27. Provide bolts, washers, and shims as required, hot dip galvanized per ASTM A 153.
- N. Welding Rods and Bare Electrodes: Select in accordance with AWS specifications for the metal alloy to be welded.

2.03 STAINLESS STEEL

- A. Bar Stock: ASTM A 276, Type 302 or 304.
- B. Plate: ASTM A 167, Type 302 or 304.

2.04 ALUMINUM

- A. Extruded Bars and Shapes: ASTM B 221, alloys 6063-T6:
- B. Aluminum Alloy Rolled Tread Plate: ASTM B 632, alloys 6061-T6:
- C. Aluminum Sheet for Expanded Aluminum Grating: ASTM B 209, alloy 5052 H32.

2.05 GROUT AND ANCHORING CEMENT

- A. Nonshrink Nonmetallic Grout: Premixed, factory packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications of type specified in this section.
1. "B-6 Construction Grout"; W. R. Bonsal Co.
 2. "Diamond Crete Grout"; Concrete Service Materials Co.
 3. "Euco N S Grout"; Euclid Chemical Co.
 4. "Masterflow 928 and 713"; Master Builders.
 5. "Sealtight 588 Grout"; W. R. Meadows, Inc.
 6. "Sonogrout 14"; Sonneborn Building Products.
 7. "Stoncrete NM1"; Stonhard, Inc.
 8. "Five Star Grout"; U. S. Grout Corp.
 9. "Vibropruf #11"; Lambert Corp.
- B. Interior Anchoring Cement: Factory prepackaged, nonshrink, nonstaining, hydraulic controlled expansion cement formulation for mixing with water at Project Site to create pourable anchoring, patching, and grouting compound. Use for interior applications only.

1. "Bonsal Anchor Cement"; W. R. Bonsal Co.
 2. "Por Rok"; Minwax Construction Products Division.
- C. Nonshrink Metallic Grout: Premixed, factory packaged, ferrous aggregate grout complying with ASTM C 1107 2, specifically recommended by manufacturer for heavy duty loading applications of type specified in this section.
1. "Metox RM"; Chem Masters Corp.
 2. "Hi Mod Grout"; Euclid Chemical Co.
 3. "Embeco 885 and 636"; Master Builders.
 4. "Ferrolith G Redi Mix and G NC"; Sonneborn Building Products Div., Rexnord Chemical Products, Inc.

2.06 FASTENERS

- A. Provide zinc coated fasteners for exterior use or where built into exterior walls. Select fasteners for the type, grade, and class required.
- B. Bolts and Nuts: Regular hexagon head type, ASTM A 307, Grade A.
- C. Lag Bolts: Square head type, FS FF B 561.
- D. Machine Screws: Cadmium plated steel, FS FF S 92.
- E. Wood Screws: Flat head carbon steel, FS FF S 111.
- F. Plain Washers: Round, carbon steel, FS FF W 92.
- G. Drilled In Expansion Anchors: Expansion anchors complying with FS FF S 325, Group VIII (anchors, expansion, [nondrilling]), Type I (internally threaded tubular expansion anchor); and machine bolts complying with FS FF B 575, Grade 5.
- H. Toggle Bolts: Tumble wing type, FS FF B 588, type, class, and style as required.
- I. Lock Washers: Helical spring type carbon steel, FS FF W 84.

2.07 PAINT

- A. Shop Primer for Ferrous Metal: Manufacturer's or fabricator's standard, fast curing, lead free, universal modified alkyd primer selected for good resistance to normal atmospheric corrosion, for compatibility with finish paint systems indicated, and for capability to provide a sound foundation for field applied topcoats despite prolonged exposure complying with performance requirements of FS TT P 645.
- B. Galvanizing Repair Paint: High zinc dust content paint for regalvanizing welds in galvanized steel, with dry film containing not less than 94 percent zinc dust by weight, and complying with DOD P 21035 or SSPC Paint 20.
- C. Bituminous Paint: Cold applied asphalt mastic complying with SSPC Paint 12 except containing no asbestos fibers.

2.08 FABRICATION, GENERAL

- A. Form metal fabrications from materials of size, thickness, and shapes indicated but not less than that needed to comply with performance requirements indicated. Work to dimensions indicated or accepted on shop drawings, using proven details of fabrication and support. Use type of materials indicated or specified for various components of each metal fabrication.
- B. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges.
- C. Allow for thermal movement resulting from 100 degrees F (55.5 degrees C) maximum change (range) in ambient temperature in the design, fabrication, and installation of installed metal assemblies to prevent buckling, opening up of joints, and overstressing of welds and fasteners. Base design calculations on actual surface temperatures of metals due to both solar heat gain and nighttime sky heat loss.
- D. Shear and punch metals cleanly and accurately. Remove burrs.
- E. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- F. Remove sharp or rough areas on exposed traffic surfaces.
- G. Weld corners and seams continuously to comply with AWS recommendations and the following:
 - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 - 2. Obtain fusion without undercut or overlap.
 - 3. Remove welding flux immediately.
 - 4. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing and contour of welded surface matches those adjacent.
- H. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners wherever possible. Use exposed fasteners of type indicated or, if not indicated, Phillips flat head (countersunk) screws or bolts. Locate joints where least conspicuous.
- I. Provide for anchorage of type indicated; coordinate with supporting structure. Fabricate and space anchoring devices to provide adequate support for intended use.
- J. Preassemble items in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.
- K. Cut, reinforce, drill and tap miscellaneous metal work as indicated to receive finish hardware, screws, and similar items.
- L. Fabricate joints that will be exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.

2.09 ROUGH HARDWARE

- A. Furnish bent or otherwise custom fabricated bolts, plates, anchors, hangers, dowels, and other miscellaneous steel and iron shapes as required for framing and supporting woodwork, and for anchoring or securing woodwork to concrete or other structures. Straight bolts and other stock rough hardware items are specified in Division 06 sections.

- B. Fabricate items to sizes, shapes, and dimensions required. Furnish malleable iron washers for heads and nuts which bear on wood structural connections; elsewhere, furnish steel washers.

2.10 STEEL LADDERS

- A. Fabricate ladders for the locations shown, with dimensions, spacing, and anchorages as indicated. Unless otherwise indicated, fabricate ladders with component parts specified herein. Comply with requirements of ANSI A14.3.
- B. Siderails: Continuous steel flat bars, 1/2 inch x 2 1/2 inches, with eased edges, spaced 18 inches apart.
- C. Bar Rungs: Round steel bars, 3/4 inch diameter, spaced 12 inches on center.
- D. Bar Rungs: Square steel bars, 3/4 inch, spaced 12 inches on center.
- E. Fit rungs in centerline of side rails, plug weld and grind smooth on outer rail faces.
- F. Support each ladder at top and bottom and at intermediate points spaced not more than 5' 0" on center by means of welded or bolted steel brackets.
 - 1. Size brackets to support design dead and live loads indicated and to hold centerline of ladder rungs clear of the wall surface by not less than 7 inches.
 - 2. Extend side rails 42 inches above top rung, and return rails to wall or structure unless other secure handholds are provided. If the adjacent structure does not extend above the top rung, goose neck the extended rails back to the structure to provide secure ladder access.
- G. Provide non slip surface on top of each rung, either by coating the rung with aluminum oxide granules set in epoxy resin adhesive, or by using a type of manufactured rung which is filled with aluminum oxide grout.

2.11 SHIP'S LADDERS

- A. Provide ship's ladders where indicated. Fabricate of open type construction with structural steel channel or steel plate stringers, pipe handrails, and open steel grating treads, unless otherwise indicated. Provide all necessary brackets and fittings for installation.
- B. Galvanize all ladders, including, brackets and fasteners.

2.12 ABRASIVE NOSINGS

- A. Provide abrasive nosings on stair treads where indicated fabricated with an aluminum base and an aluminum oxide or silicone carbide abrasive filler.
 - 1. Provide configuration of nosings as indicated and appropriate to the stair construction.
 - 2. Size nosings to extend full width of concrete-filled steel pan treads and approximately 3 inches short of each end of concrete stair treads.
 - 3. Provide color of filler as selected by Owner from manufacturer's standards; 8 choices minimum.
- B. Product: Subject to compliance with requirements, provide "Supergrit Safety Nosings" by Wooster Products Inc., or equal product of one of the following:
 - 1. Amstep Products
 - 2. American Safety Tread Co.

3. Armstrong Products Inc.

4. Safe-T-Metal Co. Inc.

2.13 LOOSE BEARING AND LEVELING PLATES

A. Provide loose bearing and leveling plates for steel items bearing on masonry or concrete construction, made flat, free from warps or twists, and of required thickness and bearing area. Drill plates to receive anchor bolts and for grouting as required. Galvanize after fabrication.

2.14 MISCELLANEOUS FRAMING AND SUPPORTS

A. Provide steel framing and supports for applications indicated or which are not parts of structural steel framework, as required to complete work.

B. Fabricate units to sizes, shapes, and profiles indicated and required to receive adjacent other construction retained by framing and supports. Fabricate from structural steel shapes, plates, and steel bars of welded construction using mitered joints for field connection. Cut, drill, and tap units to receive hardware, hangers, and similar items.

1. Equip units with integrally welded anchors for casting into concrete or building into masonry. Furnish inserts if units must be installed after concrete is placed.

a. Except as otherwise indicated, space anchors 24 inches on center and provide minimum anchor units in the form of steel straps 1-1/4 inches wide x 1/4 inch x 8 inches long.

2.15 METAL BAR GRATINGS

A. Produce metal bar gratings of description indicated per NAAMM marking system that comply with the following:

1. Metal Bar Grating Standard "Standard Specifications for Metal Bar Grating and Metal Bar Grating Treads" published in ANSI/NAAMM A202.1 "Metal Bar Grating Manual."

2. Heavy Duty Metal Bar Grating Standard: "Guide Specifications for Heavy Duty Metal Bar Grating" published in NAAMM "Heavy Duty Metal Bar Grating Manual."

B. To establish standards of manufacturer, specification is based upon products of Reliance Steel Products, Inc. Subject to compliance with requirements, other manufacturers offering metal bar gratings that may be incorporated in the Work include, but are not limited to, the following:

1. Alabama Metal Industries Corp.

2. Barnett/Bates Corp.

3. Blaw Knox Grating Div., Blaw Knox Corp.

4. IKG Industries

5. Klemp Corp.

6. Ohio Gratings, Inc.

7. Seidelhuber Metal Products, Inc.

8. Trueweld, Inc.

- C. Galvanized Steel Bar Grating: Provide Reliance Steel Products Company hot dipped galvanized steel "Type 3/4R4 Electro Pressure Welded" grating with 1-1/2 inch x 1/4 inch bearing bars spaced at 1 inch centers and 1/2 inch x 3/16 inch rectangular cross bars spaced at 4 inch centers. Slot bearing bars for rectangular cross bars prior to electropressure welding. Provide banding bars of same size as bearing bars.
- D. Prime Painted Steel Bar Grating: Provide Reliance Steel Products Company "Type 1R4 Electro Pressure Welded" grating with 1-1/2 inch x 1/4 inch bearing bars spaced 1-1/4 inch centers and 1/2 inch x 3/16 inch rectangular cross bars spaced at 4 inch centers. Provide one shop coat Tnemec 10 99G (green) modified alkyd rust inhibitive primer as specified after fabrication.

2.16 STEEL PIPE RAILINGS AND HANDRAILS

- A. Fabricate pipe railings and handrails to comply with requirements indicated for design, dimensions, details, finish, and member sizes, including wall thickness of pipe, post spacings, and anchorage, but not less than that required to support structural loads.
- B. Interconnect railing and handrail members by butt welding or welding with internal connectors, at fabricator's option, unless otherwise indicated.
 - 1. At tee and cross intersections, notch ends of intersecting members to fit contour of pipe to which end is joined and weld all around.
- C. Form changes in direction of railing members as follows:
 - 1. By insertion of prefabricated elbow fittings.
 - 2. By radius bends of radius indicated.
 - 3. By mitering at elbow bends.
 - 4. By bending.
 - 5. By any method indicated above, applicable to change of direction involved.
- D. Form simple and compound curves by bending pipe in jigs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross section of pipe throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of pipe.
- E. Provide wall returns at ends of wall mounted handrails, unless otherwise indicated.
- F. Close exposed ends of pipe by welding 3/16 inch thick steel plate in place or by use of prefabricated fittings, except where clearance of end of pipe and adjoining wall surface is 1/4 inch or less.
- G. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, end closures, flanges, miscellaneous fittings, and anchors for interconnections of pipe and attachment of railings and handrails to other work. Furnish inserts and other anchorage devices for connecting railings and handrails to concrete or masonry work.
- H. For exterior steel railings and handrails formed from steel pipe with galvanized finish, galvanize fittings, brackets, fasteners, sleeves, and other ferrous components.
- I. For interior steel railings and handrails formed from steel pipe with galvanized finish, galvanize fittings, brackets, fasteners, sleeves, and other ferrous components.
- J. For interior steel railings formed from steel pipe with black finish, provide nongalvanized ferrous metal fittings, brackets, fasteners, and sleeves, except galvanize anchors embedded in exterior masonry and concrete construction.

2.17 STEEL AND IRON FINISHES

- A. Galvanizing: For those items indicated for galvanizing, apply zinc coating by the hot dip process compliance with the following requirements:
 - 1. ASTM A 153 for galvanizing iron and steel hardware.
 - 2. ASTM A 123 for galvanizing both fabricated and unfabricated iron and steel products made of uncoated rolled, pressed, and forged shapes, plates, bars, and strip 0.0299 inch thick and heavier.
- B. Preparation for Shop Priming: Prepare uncoated ferrous metal surfaces to comply with minimum requirements indicated below for SSPC surface preparation specifications and environmental exposure conditions of installed metal fabrications:
 - 1. Exteriors (SSPC Zone 1B): SSPC SP6 "Commercial Blast Cleaning."
 - 2. Interiors (SSPC Zone 1A): SSPC SP3 "Power Tool Cleaning:"
- C. Apply shop primer to uncoated surfaces of metal fabrications, except those with galvanized finish or to be embedded in concrete, sprayed on fireproofing, or masonry, unless otherwise indicated. Comply with requirements of SSPC PA1 "Paint Application Specification No. 1" for shop painting.
 - 1. Stripe paint all edges, corners, crevices, bolts, welds, and sharp edges.

PART 3 - EXECUTION**3.01 PREPARATION**

- A. Coordinate and furnish anchorages, setting drawings, diagrams, templates, instructions, and directions for installation of anchorages, including concrete inserts, sleeves, anchor bolts, and miscellaneous items having integral anchors that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to the Project Site.
- B. Center nosings on tread widths with noses flush with riser faces and tread surfaces.
- C. Set sleeves in concrete with tops flush with finish surface elevations; protect sleeves from water and concrete entry.
- D. Sequencing and Scheduling:
 - 1. Sequence and coordinate installation of wall handrails as follows:
 - a. Mount handrails only on completed walls. Do not support handrails temporarily by any means not satisfying structural performance requirements.
 - b. Mount handrails only on gypsum board assemblies reinforced to receive anchors, and where the location of concealed anchor plates has been clearly marked for benefit of Installer.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

- C. Fastening to In Place Construction: Provide anchorage devices and fasteners where necessary for securing miscellaneous metal fabrications to in place construction; include threaded fasteners for concrete and masonry inserts, toggle bolts, through bolts, lag bolts, wood screws, and other connectors as required.
- D. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installation of miscellaneous metal fabrications. Set metal fabrication accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.
- E. Provide temporary bracing or anchors in formwork for items that are to be built into concrete masonry or similar construction.
- F. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints, but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade the surfaces of exterior units which have been hot dip galvanized after fabrication, and are intended for bolted or screwed field connections.
- G. Field Welding: Comply with AWS Code for procedures of manual shielded metal arc welding, appearance and quality of welds made, methods used in correcting welding work, and the following:
 - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 - 2. Obtain fusion without undercut or overlap.
 - 3. Remove welding flux immediately.
 - 4. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing and contour of welded surface matches those adjacent.
- H. Corrosion Protection: Coat concealed surfaces of aluminum that will come into contact with grout, concrete, masonry, wood, or dissimilar metals with a heavy coat of bituminous paint or zinc chromate primer.

3.03 FABRICATION

- A. Provide miscellaneous metal work fabricated by processes and techniques which will result in the appropriate workmanship class as scheduled.
 - 1. Class 1 Workmanship: Sandblast exposed surfaces smooth with pits, mill marks, nicks, and scratches filled and ground smooth so that no defects are visible from a distance of 6' after painting.
 - a. Conceal welds where possible. Where exposed, grind welds to small radius with uniform size cove. Welds shall be undetectable after painting.
 - b. Use only flat head countersunk bolts in exposed locations.
 - c. Fit all joints to hairline finish.
 - d. Distortions visible to the eye will be cause for rejection.
 - 2. Items required to have Class 1 Workmanship include:
 - a. Stair railings, handrails, and guardrails in public and "high finish level" areas, interior and exterior.

- b. Steel framed stairs in public and "high finish level" areas, interior and exterior.
- 3. Class 2 Workmanship: Grind exposed surfaces to remove surface irregularities. Moderate imperfections not visible at 20 feet may remain. Mill marks may remain.
 - a. Grind welds to small radius with uniform sized core and smooth transition between joined pieces.
 - b. Use only flat or oval head, countersunk bolts where exposed to view.
 - c. Straightness: Minor distortions will be permitted.
 - d. Joints: Provide maximum gap of 1/16 inches.
- 4. Items required to have Class 2 Workmanship include:
 - a. Stair railings, handrails, and guardrails in "back of house" areas, interior and exterior.
 - b. Steel ladders.
 - c. Steel framed stairs in "back of house" areas, interior and exterior.
 - d. Steel bollards.
 - e. Exposed door supports, guides, and bracing.
 - f. Lavatory countertop supports.
 - g. Garage overhead clearance bars.
- 5. Class 3 Workmanship: No improvement from mill finish required except preparation for priming and galvanizing.
- 6. Items required to have Class 3 Workmanship include all concealed items and those items exposed to view only in "service" areas such as mechanical equipment rooms, and other areas accessible only to building maintenance staff.

3.04 SETTING LOOSE PLATES

- A. Clean concrete and masonry bearing surfaces of any bond reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of bearing plates.
- B. Set loose leveling and bearing plates on wedges, or other adjustable devices. After the bearing members have been positioned and plumbed, tighten the anchor bolts. Do not remove wedges or shims, but if protruding, cut off flush with the edge of the bearing plate before packing with grout.
 - 1. Use metallic nonshrink grout in concealed locations where not exposed to moisture; use nonmetallic nonshrink grout in exposed locations, unless otherwise indicated.
 - 2. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

3.05 INSTALLATION OF STEEL PIPE RAILINGS AND HANDRAILS

- A. Adjust railings prior to anchoring to ensure matching alignment at abutting joints. Space posts at spacing indicated, or if not indicated, as required by design loadings. Plumb posts in each direction.
- B. Secure handrails to wall with wall brackets and end fittings. Provide bracket with not less than 1-1/2 inch clearance from inside face of handrail and finished wall surface. Locate brackets as indicated, or if not indicated, at spacing required to support structural loads. Secure wall brackets and wall return fittings to building construction as follows:

1. Use type of bracket with flange tapped for concealed anchorage to threaded hanger bolt.
2. Use type of bracket with pre drilled hole for exposed bolt anchorage.
3. For concrete and solid masonry anchorage, use drilled in expansion shield and either concealed hanger bolt or exposed lag bolt, as applicable.
4. For hollow masonry anchorage, use toggle bolts having square heads.
5. For wood stud partitions, use lag bolts set into wood backing between studs. Coordinate with stud installations for accurate location of backing members.
6. For steel framed gypsum board assemblies, fasten brackets directly to steel framing or concealed anchors using self tapping screws of size and type required to support structural loads.

3.06 ADJUSTING AND CLEANING

- A. Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material as used for shop painting to comply with SSPC PA 1 requirements for touch up of field painted surfaces.
 1. Apply by brush or spray to provide a minimum dry film thickness of 2.0 mils.
- B. For galvanized surfaces clean welds, bolted connections and abraded areas and apply galvanizing repair paint to comply with ASTM A 780.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 05 52 13 00 - PIPE AND TUBE RAILINGS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for pipe and tube railings. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Steel pipe and tube railings.
 - b. Aluminum pipe and tube railings.
 - c. Stainless-steel pipe and tube railings.

C. Performance Requirements

1. Delegated Design: Design railings, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
2. General: In engineering railings to withstand structural loads indicated, determine allowable design working stresses of railing materials based on the following:
 - a. Steel: 72 percent of minimum yield strength.
 - b. Aluminum: The lesser of minimum yield strength divided by 1.65 or minimum ultimate tensile strength divided by 1.95.
 - c. Stainless Steel: 60 percent of minimum yield strength.
3. Structural Performance: Railings shall withstand the effects of gravity loads and loads and stresses within limits and under conditions indicated. Following loads are examples only and are based on the 2006 International Building Code (IBC).
 - a. Handrails and Top Rails of Guards:
 - 1) Uniform load of 50 lbf/ ft. (0.73 kN/m) applied in any direction.
 - 2) Concentrated load of 200 lbf (0.89 kN) applied in any direction.
 - 3) Uniform and concentrated loads need not be assumed to act concurrently.
 - b. Infill of Guards:
 - 1) Concentrated load of 50 lbf (0.22 kN) applied horizontally on an area of 1 sq. ft. (0.093 sq. m).
 - 2) Infill load and other loads need not be assumed to act concurrently.
4. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes acting on exterior metal fabrications by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects.
 - a. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.
5. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

D. Submittals

1. Product Data: For the following:
 - a. Manufacturer's product lines of mechanically connected railings.
 - b. Railing brackets.
 - c. Grout, anchoring cement, and paint products.
2. LEED Submittals:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2, **as directed**: Indicating percentages by weight of postconsumer and preconsumer recycled content for products having recycled content. Include statement indicating costs for each product having recycled content.
3. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

4. Samples: For each type of exposed finish required.
 - a. Sections of each distinctly different linear railing member, including handrails, top rails, posts, and balusters.
 - b. Fittings and brackets.
 - c. Assembled Sample of railing system, made from full-size components, including top rail, post, handrail, and infill. Sample need not be full height.
 - 1) Show method of finishing **OR** connecting, **as directed**, members at intersections.
5. Delegated-Design Submittal: For installed products indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
6. Qualification Data: For qualified professional engineer **OR** testing agency, .
7. Mill Certificates: Signed by manufacturers of stainless-steel products certifying that products furnished comply with requirements.
8. Welding certificates.
9. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers certifying that shop primers are compatible with topcoats.
10. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, according to ASTM E 894 and ASTM E 935.

E. Quality Assurance

1. Source Limitations: Obtain each type of railing from single source from single manufacturer.
2. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
3. Welding Qualifications: Qualify procedures and personnel according to the following:
 - a. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
 - b. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."
 - c. AWS D1.6, "Structural Welding Code - Stainless Steel."

F. Project Conditions

1. Field Measurements: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication.

G. Coordination And Scheduling

1. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' written recommendations to ensure that shop primers and topcoats are compatible with one another.
2. Coordinate installation of anchorages for railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
3. Schedule installation so wall attachments are made only to completed walls. Do not support railings temporarily by any means that do not satisfy structural performance requirements.

1.2 PRODUCTS

A. Metals, General

1. Metal Surfaces, General: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.
2. Brackets, Flanges, and Anchors: Cast or formed metal of same type of material and finish as supported rails unless otherwise indicated.

B. Steel And Iron

1. Recycled Content of Steel Products: Provide products with average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 percent.

2. Tubing: ASTM A 500 (cold formed) or ASTM A 513.
3. Pipe: ASTM A 53/A 53M, Type F or Type S, Grade A, Standard Weight (Schedule 40), unless another grade and weight are required by structural loads.
 - a. Provide galvanized finish for exterior installations and where indicated.
4. Plates, Shapes, and Bars: ASTM A 36/A 36M.
5. Cast Iron: Either gray iron, ASTM A 48/A 48M, or malleable iron, ASTM A 47/A 47M, unless otherwise indicated.
6. Expanded Metal: ASTM F 1267, Type I (expanded) **OR** Type II (expanded and flattened), **as directed**, Class 1 (uncoated).
 - a. Style Designation: 3/4 number 13 **OR** 1-1/2 number 10, **as directed**.
7. Perforated Metal: Cold-rolled steel sheet, ASTM A 1008/A 1008M, or hot-rolled steel sheet, ASTM A 1011/A 1011M, commercial steel Type B, 0.060 inch (1.52 mm) thick, with 1/4-inch (6.4-mm) holes 3/8 inch (9.5 mm) o.c. in staggered rows.
8. Perforated Metal: Galvanized-steel sheet, ASTM A 653/A 653M, G90 (Z275) coating, commercial steel Type B, 0.064 inch (1.63 mm) thick, with 1/4-inch (6.4-mm) holes 3/8 inch (9.5 mm) o.c. in staggered rows **OR** with 1/8-by-1-inch (3.2-by-25.4-mm) round end slotted holes in staggered rows, **as directed**.
9. Woven-Wire Mesh: Intermediate-crimp, diamond **OR** square, **as directed**, pattern, 2-inch (50-mm) woven-wire mesh, made from 0.135-inch (3.5-mm) nominal diameter wire complying with ASTM A 510 (ASTM A 510M).

C. Aluminum

1. Aluminum, General: Provide alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with not less than the strength and durability properties of alloy and temper designated below for each aluminum form required.
2. Extruded Bars and Tubing: ASTM B 221 (ASTM B 221M), Alloy 6063-T5/T52.
3. Extruded Structural Pipe and Round Tubing: ASTM B 429/B 429M, Alloy 6063-T6.
 - a. Provide Standard Weight (Schedule 40) pipe, unless otherwise indicated.
4. Drawn Seamless Tubing: ASTM B 210 (ASTM B 210M), Alloy 6063-T832.
5. Plate and Sheet: ASTM B 209 (ASTM B 209M), Alloy 6061-T6.
6. Die and Hand Forgings: ASTM B 247 (ASTM B 247M), Alloy 6061-T6.
7. Castings: ASTM B 26/B 26M, Alloy A356.0-T6.
8. Perforated Metal: Aluminum sheet, ASTM B 209 (ASTM B 209M), Alloy 6061-T6, 0.063 inch (1.60 mm) thick, with 1/4-inch (6.4-mm) holes 3/8 inch (9.5 mm) o.c. in staggered rows.
9. Woven-Wire Mesh: Intermediate-crimp, diamond **OR** square, **as directed**, pattern, 2-inch (50-mm) woven-wire mesh, made from 0.162-inch (4.1-mm) nominal diameter wire complying with ASTM B 211 (ASTM B 211M), Alloy 6061-T94.

D. Stainless Steel

1. Tubing: ASTM A 554, Grade MT 304 **OR** Grade MT 316L, **as directed**.
2. Pipe: ASTM A 312/A 312M, Grade TP 304 **OR** Grade TP 316L, **as directed**.
3. Castings: ASTM A 743/A 743M, Grade CF 8 or CF 20 **OR** Grade CF 8M or CF 3M, **as directed**.
4. Plate and Sheet: ASTM A 240/A 240M or ASTM A 666, Type 304 **OR** Type 316L, **as directed**.
5. Expanded Metal: ASTM F 1267, Type I (expanded) **OR** Type II (expanded and flattened), **as directed**, Class 3 (corrosion-resistant steel), made from stainless-steel sheet, ASTM A 240/A 240M or ASTM A 666, Type 304 **OR** Type 316, **as directed**.
 - a. Style Designation: 3/4 number 13 **OR** 1-1/2 number 10, **as directed**.
6. Perforated Metal: Stainless-steel sheet, ASTM A 240/A 240M or ASTM A 666, Type 304 **OR** Type 316L, **as directed**, 0.062 inch (1.59 mm) thick, with 1/4-inch (6.4-mm) holes 3/8 inch (9.5 mm) o.c. in staggered rows.
7. Woven-Wire Mesh: Intermediate-crimp, diamond **OR** square, **as directed**, pattern, 2-inch (50-mm) woven-wire mesh, made from 0.135-inch (3.5-mm) nominal diameter wire complying with ASTM A 580/A 580M, Type 304 **OR** Type 316, **as directed**.

E. Fasteners

1. General: Provide the following:

- a. Ungalvanized-Steel Railings: Plated steel fasteners complying with ASTM B 633 or ASTM F 1941 (ASTM F 1941M), Class Fe/Zn 5 for zinc coating.
- b. Hot-Dip Galvanized Railings: Type 304 stainless-steel or hot-dip zinc-coated steel fasteners complying with ASTM A 153/A 153M or ASTM F 2329 for zinc coating.
- c. Aluminum Railings: Type 304 **OR** Type 316, **as directed**, stainless-steel fasteners.
- d. Stainless-Steel Railings: Type 304 **OR** Type 316, **as directed**, stainless-steel fasteners.
2. Fasteners for Anchoring Railings to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings to other types of construction indicated and capable of withstanding design loads, **as directed**.
3. Fasteners for Interconnecting Railing Components:
 - a. Provide concealed fasteners for interconnecting railing components and for attaching them to other work, unless otherwise indicated.
OR
Provide concealed fasteners for interconnecting railing components and for attaching them to other work, unless exposed fasteners are unavoidable or are the standard fastening method for railings indicated.
 - b. Provide Phillips **OR** tamper-resistant **OR** square or hex socket, **as directed**, flat-head machine screws for exposed fasteners unless otherwise indicated.
4. Post-Installed Anchors: Torque-controlled expansion anchors or chemical anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.
 - a. Material for Interior Locations: Carbon-steel components zinc-plated to comply with ASTM B 633 or ASTM F 1941 (ASTM F 1941M), Class Fe/Zn 5, unless otherwise indicated.
 - b. Material for Exterior Locations and Where Stainless Steel is Indicated: Alloy Group 1 (A1) **OR** Group 2 (A4), **as directed**, stainless-steel bolts, ASTM F 593 (ASTM F 738M), and nuts, ASTM F 594 (ASTM F 836M).

F. Miscellaneous Materials

1. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
 - a. For aluminum and stainless-steel railings, provide type and alloy as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items.
2. Etching Cleaner for Galvanized Metal: Complying with MPI#25.
3. Galvanizing Repair Paint: High-zinc-dust-content paint complying with SSPC-Paint 20 and compatible with paints specified to be used over it.
4. Shop Primers: Provide primers that comply with Division 07 **OR** Division 09 Section(s) "High-performance Coatings" **OR** Division 07 AND Division 09 Section(s) "High-performance Coatings", **as directed**.
5. Universal Shop Primer: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with MPI#79 and compatible with topcoat.
 - a. Use primer containing pigments that make it easily distinguishable from zinc-rich primer.
6. Epoxy Zinc-Rich Primer: Complying with MPI#20 and compatible with topcoat.
7. Shop Primer for Galvanized Steel: Cementitious galvanized metal primer complying with MPI#26 **OR** Vinyl wash primer complying with MPI#80 **OR** Water based galvanized metal primer complying with MPI#134, **as directed**.
8. Intermediate Coats and Topcoats: Provide products that comply with Division 07 **OR** Division 09 Section(s) "High-performance Coatings" **OR** Division 07 AND Division 09 Section(s) "High-performance Coatings", **as directed**.
9. Epoxy Intermediate Coat: Complying with MPI #77 and compatible with primer and topcoat.
10. Polyurethane Topcoat: Complying with MPI #72 and compatible with undercoat.
11. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.
12. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

13. Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound.
 - a. Water-Resistant Product: At exterior locations and where indicated provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended by manufacturer for exterior use.

G. Fabrication

1. General: Fabricate railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.
2. Assemble railings in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
3. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
4. Form work true to line and level with accurate angles and surfaces.
5. Fabricate connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.
6. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.
7. Connections: Fabricate railings with welded **OR** nonwelded, **as directed**, connections unless otherwise indicated.
8. Welded Connections: Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.
 - a. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 - b. Obtain fusion without undercut or overlap.
 - c. Remove flux immediately.
 - d. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.
9. Welded Connections for Aluminum Pipe: Fabricate railings to interconnect members with concealed internal welds that eliminate surface grinding, using manufacturer's standard system of sleeve and socket fittings.
10. Nonwelded Connections: Connect members with concealed mechanical fasteners and fittings. Fabricate members and fittings to produce flush, smooth, rigid, hairline joints.
 - a. Fabricate splice joints for field connection using an epoxy structural adhesive if this is manufacturer's standard splicing method.
11. Form changes in direction as follows:
 - a. As detailed.
OR
By bending or by inserting prefabricated elbow fittings.
OR
By flush bends or by inserting prefabricated flush-elbow fittings.
OR
By radius bends of radius indicated or by inserting prefabricated elbow fittings of radius indicated.
12. Bend members in jigs to produce uniform curvature for each configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.
13. Close exposed ends of railing members with prefabricated end fittings.
14. Provide wall returns at ends of wall-mounted handrails unless otherwise indicated. Close ends of returns unless clearance between end of rail and wall is 1/4 inch (6 mm) or less.
15. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect railing members to other work unless otherwise indicated.

- a. At brackets and fittings fastened to plaster or gypsum board partitions, provide crush-resistant fillers, or other means to transfer loads through wall finishes to structural supports and prevent bracket or fitting rotation and crushing of substrate.
16. Provide inserts and other anchorage devices for connecting railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by railings. Coordinate anchorage devices with supporting structure.
17. For railing posts set in concrete, provide steel **OR** stainless-steel, **as directed**, sleeves not less than 6 inches (150 mm) long with inside dimensions not less than 1/2 inch (13 mm) greater than outside dimensions of post, with metal plate forming bottom closure.
18. For removable railing posts, fabricate slip-fit sockets from steel **OR** stainless-steel, **as directed**, tube or pipe whose ID is sized for a close fit with posts; limit movement of post without lateral load, measured at top, to not more than one-fortieth of post height. Provide socket covers designed and fabricated to resist being dislodged.
 - a. Provide chain with eye, snap hook, and staple across gaps formed by removable railing sections at locations indicated. Fabricate from same metal as railings.
19. Expanded-Metal Infill Panels: Fabricate infill panels from expanded metal made from same metal as railings in which they are installed.
 - a. Edge panels with U-shaped channels made from metal sheet, of same metal as expanded metal and not less than 0.043 inch (1.1 mm) thick.
 - b. Orient expanded metal with long dimension of diamonds parallel to top rail **OR** perpendicular to top rail **OR** horizontal **OR** vertical, **as directed**.
20. Perforated-Metal Infill Panels: Fabricate infill panels from perforated metal made from steel **OR** galvanized steel **OR** aluminum **OR** stainless steel **OR** same metal as railings in which they are installed, **as directed**.
 - a. Edge panels with U-shaped channels made from metal sheet, of same metal as perforated metal and not less than 0.043 inch (1.1 mm) thick.
 - b. Orient perforated metal with pattern parallel to top rail **OR** perpendicular to top rail **OR** horizontal **OR** vertical **OR** as indicated on Drawings, **as directed**.
21. Woven-Wire Mesh Infill Panels: Fabricate infill panels from woven-wire mesh crimped into 1-by-1/2-by-1/8-inch (25-by-13-by-3-mm) metal channel frames. Make wire mesh and frames from same metal as railings in which they are installed.
 - a. Orient wire mesh with diamonds vertical **OR** wires perpendicular and parallel to top rail **OR** wires horizontal and vertical, **as directed**.
22. Toe Boards: Where indicated, provide toe boards at railings around openings and at edge of open-sided floors and platforms. Fabricate to dimensions and details indicated.

H. Finishes, General

1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
2. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
3. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.
4. Provide exposed fasteners with finish matching appearance, including color and texture, of railings.

I. Steel And Iron Finishes

1. Galvanized Railings:
 - a. Hot-dip galvanize steel **OR** exterior steel, **as directed**, and iron railings, including hardware, after fabrication.
OR
Hot-dip galvanize indicated steel and iron railings, including hardware, after fabrication.
 - b. Comply with ASTM A 123/A 123M for hot-dip galvanized railings.
 - c. Comply with ASTM A 153/A 153M for hot-dip galvanized hardware.

- d. Do not quench or apply post galvanizing treatments that might interfere with paint adhesion.
 - e. Fill vent and drain holes that will be exposed in the finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.
 2. For galvanized railings, provide hot-dip galvanized fittings, brackets, fasteners, sleeves, and other ferrous components.
 3. Preparing Galvanized Railings for Shop Priming: After galvanizing, thoroughly clean railings of grease, dirt, oil, flux, and other foreign matter, and treat with etching cleaner.
 4. For nongalvanized steel railings, provide nongalvanized ferrous-metal fittings, brackets, fasteners, and sleeves, except galvanize anchors to be embedded in exterior concrete or masonry.
 5. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning" **OR** SSPC-SP 3, "Power Tool Cleaning" **OR** requirements indicated below, **as directed**:
 - a. Exterior Railings: SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
 - b. Railings Indicated to Receive Zinc-Rich Primer: SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
 - c. Railings Indicated to Receive Primers Specified in Division 9 Section "High-Performance Coatings": SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
 - d. Other Railings: SSPC-SP 3, "Power Tool Cleaning."
 6. Primer Application: Apply shop primer to prepared surfaces of railings unless otherwise indicated. Comply with requirements in SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting. Primer need not be applied to surfaces to be embedded in concrete or masonry.
 - a. Shop prime uncoated railings with universal shop primer **OR** primers specified in Division 07, **as directed**, unless zinc-rich primer is **OR** primers specified in Division 09 Section "High-performance Coatings" are, **as directed**, indicated.
 - b. Do not apply primer to galvanized surfaces.
 7. Shop-Painted Finish: Comply with Division 09 Section(s) "Exterior Painting" **OR** "High-performance Coatings", **as directed**.
 - a. Color: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
 8. High-Performance Coating: Apply epoxy intermediate and polyurethane topcoats to prime-coated surfaces. Comply with coating manufacturer's written instructions and with requirements in SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting. Apply at spreading rates recommended by coating manufacturer.
 - a. Color: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
- J. Aluminum Finishes
1. Mechanical Finish: AA-M12 (Mechanical Finish: nonspecular as fabricated).
 2. Clear Anodic Finish: AAMA 611, AA-M12C22A41, Class I, 0.018 mm **OR** AA-M12C22A31, Class II, 0.010 mm, **as directed**, or thicker.
 3. Color Anodic Finish: AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm **OR** AA-M12C22A32/A34, Class II, 0.010 mm, **as directed**, or thicker.
 - a. Color: Light bronze **OR** Medium bronze **OR** Dark bronze **OR** Black **OR** As selected from full range of industry colors and color densities, **as directed**.
 4. Baked-Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of 1.5 mils (0.04 mm). Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.
 - a. Color and Gloss: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
 5. High-Performance Organic Finish: Two-coat fluoropolymer finish complying with AAMA 2604 **OR** AAMA 2605, **as directed**, and containing not less than 50 **OR** 70, **as directed**, percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

- a. Color and Gloss: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.

OR

High-Performance Organic Finish: Three **OR** Four, **as directed**, -coat fluoropolymer finish complying with AAMA 2605 and containing not less than 50 **OR** 70, **as directed**, percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

- b. Color and Gloss: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.

K. Stainless-Steel Finishes

1. Remove tool and die marks and stretch lines, or blend into finish.
2. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
3. 180-Grit Polished Finish: Oil-ground, uniform, directionally textured finish.
4. 320-Grit Polished Finish: Oil-ground, uniform, fine, directionally textured finish.
5. Polished and Buffed Finish: Oil-ground, 180-grit finish followed by buffing.
6. Directional Satin Finish: No. 4.
7. Dull Satin Finish: No. 6.
8. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

1.3 EXECUTION

A. Examination

1. Examine plaster and gypsum board assemblies, where reinforced to receive anchors, to verify that locations of concealed reinforcements have been clearly marked for Installer. Locate reinforcements and mark locations if not already done.

B. Installation, General

1. Fit exposed connections together to form tight, hairline joints.
2. Perform cutting, drilling, and fitting required for installing railings. Set railings accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.
 - a. Do not weld, cut, or abrade surfaces of railing components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
 - b. Set posts plumb within a tolerance of 1/16 inch in 3 feet (2 mm in 1 m).
 - c. Align rails so variations from level for horizontal members and variations from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet (5 mm in 3 m).
3. Corrosion Protection: Coat concealed surfaces of aluminum that will be in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.
4. Adjust railings before anchoring to ensure matching alignment at abutting joints.
5. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing railings and for properly transferring loads to in-place construction.

C. Railing Connections

1. Nonwelded Connections: Use mechanical or adhesive joints for permanently connecting railing components. Seal recessed holes of exposed locking screws using plastic cement filler colored to match finish of railings.
2. Welded Connections: Use fully welded joints for permanently connecting railing components. Comply with requirements for welded connections in "Fabrication" Article whether welding is performed in the shop or in the field.
3. Expansion Joints: Install expansion joints at locations indicated but not farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve extending 2

inches (50 mm) beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6 inches (150 mm) of post.

D. Anchoring Posts

1. Use metal sleeves preset and anchored into concrete for installing posts. After posts have been inserted into sleeves, fill annular space between post and sleeve with nonshrink, nonmetallic grout or anchoring cement, mixed and placed to comply with anchoring material manufacturer's written instructions.
2. Form or core-drill holes not less than 5 inches (125 mm) deep and 3/4 inch (20 mm) larger than OD of post for installing posts in concrete. Clean holes of loose material, insert posts, and fill annular space between post and concrete with nonshrink, nonmetallic grout or anchoring cement, mixed and placed to comply with anchoring material manufacturer's written instructions.
3. Cover anchorage joint with flange of same metal as post, welded to post after placing anchoring material **OR** attached to post with set screws, **as directed**.
OR
Leave anchorage joint exposed with 1/8-inch (3-mm) buildup, sloped away from post **OR** anchoring material flush with adjacent surface, **as directed**.
4. Anchor posts to metal surfaces with oval flanges, angle type, or floor type as required by conditions, connected to posts and to metal supporting members as follows:
 - a. For aluminum pipe railings, attach posts using fittings designed and engineered for this purpose.
 - b. For stainless-steel pipe railings, weld flanges to post and bolt to supporting surfaces.
 - c. For steel pipe railings, weld flanges to post and bolt to metal supporting surfaces.
5. Install removable railing sections, where indicated, in slip-fit metal sockets cast in concrete.

E. Attaching Railings

1. Anchor railing ends at walls with round flanges anchored to wall construction and welded to railing ends or connected to railing ends using nonwelded connections.
2. Anchor railing ends to metal surfaces with flanges bolted to metal surfaces and welded to railing ends or connected to railing ends using nonwelded connections.
3. Attach railings to wall with wall brackets, except where end flanges are used. Provide brackets with 1-1/2-inch (38-mm) clearance from inside face of handrail and finished wall surface. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads.
 - a. Use type of bracket with flange tapped for concealed anchorage to threaded hanger bolt **OR** predrilled hole for exposed bolt anchorage, **as directed**.
 - b. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads.
4. Secure wall brackets and railing end flanges to building construction as follows:
 - a. For concrete and solid masonry anchorage, use drilled-in expansion shields and hanger or lag bolts.
 - b. For hollow masonry anchorage, use toggle bolts.
 - c. For wood stud partitions, use hanger or lag bolts set into studs or wood backing between studs. Coordinate with carpentry work to locate backing members.
 - d. For steel-framed partitions, use hanger or lag bolts set into fire-retardant-treated, **as directed**, wood backing between studs. Coordinate with stud installation to locate backing members.
OR
For steel-framed partitions, use self-tapping screws fastened to steel framing or to concealed steel reinforcements.
OR
For steel-framed partitions, use toggle bolts installed through flanges of steel framing or through concealed steel reinforcements.

F. Adjusting And Cleaning

1. Clean aluminum and stainless steel by washing thoroughly with clean water and soap and rinsing with clean water.

2. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
 - a. Apply by brush or spray to provide a minimum 2.0-mil (0.05-mm) dry film thickness.
3. Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint are specified in Division 07 OR Division 09 Section(s) "High-performance Coatings" **OR** Division 07 AND Division 09 Section(s) "High-performance Coatings", **as directed**.
4. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.

G. Protection

1. Protect finishes of railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at time of Substantial Completion.

END OF SECTION 05 52 13 00

Task	Specification	Specification Description
05 52 13 00	05 50 00 00	Metal Fabrications

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 05 53 00 00 - METAL GRATINGS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for gratings. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Metal bar gratings.
 - b. Expanded-metal gratings.
 - c. Formed-metal plank gratings.
 - d. Extruded-aluminum plank gratings.
 - e. Glass-fiber-reinforced plastic gratings.
 - f. Metal frames and supports for gratings.

C. Performance Requirements

1. Delegated Design: Design gratings, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
2. Structural Performance: Gratings shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated.
 - a. Loads in subparagraphs below are examples based on the 2006 International Building Code and ASCE/SEI 7. Adjust to local Project requirements.
 - 1) Floors (light manufacturing): Uniform load of 125 lbf/sq. ft. (6.00 kN/sq. m) or concentrated load of 2000 lbf (8.90 kN), whichever produces the greater stress.
 - 2) Floors (heavy manufacturing): Uniform load of 250 lbf/sq. ft. (11.97 kN/sq. m) or concentrated load of 3000 lbf (13.40 kN), whichever produces the greater stress.
 - 3) Walkways and Elevated Platforms Other Than Exits: Uniform load of 60 lbf/sq. ft. (2.87 kN/sq. m).
 - 4) Walkways and Elevated Platforms Used as Exits: Uniform load of 100 lbf/sq. ft. (4.79 kN/sq. m).
 - 5) Sidewalks and Vehicular Driveways, Subject to Trucking: Uniform load of 250 lbf/sq. ft. (11.97 kN/sq. m) or concentrated load of 8000 lbf (35.60 kN), whichever produces the greater stress.
 - 6) Limit deflection to L/240 **OR** L/360, **as directed**, or 1/4 inch (6.4 mm), whichever is less.
3. Seismic Performance: Provide gratings capable of withstanding the effects of earthquake motions determined according to ASCE/SEI 7.

D. Submittals

1. Product Data: For the following:
 - a. Formed-metal plank gratings.
 - b. Extruded-aluminum plank gratings.
 - c. Glass-fiber-reinforced plastic gratings.
 - d. Clips and anchorage devices for gratings.
 - e. Paint products.
2. LEED Submittals:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2, **as directed**: Indicating percentages by weight of postconsumer and preconsumer recycled content for products having recycled content. Include statement indicating costs for each product having recycled content.
3. Shop Drawings: Include plans, sections, details, and attachments to other work.

4. Delegated-Design Submittal: For installed products indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
5. Qualification Data: For qualified professional engineer.
6. Mill Certificates: Signed by manufacturers of stainless-steel sheet certifying that products furnished comply with requirements.
7. Welding certificates.
8. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers certifying that shop primers are compatible with topcoats.

E. Quality Assurance

1. Metal Bar Grating Standards: Comply with NAAMM MBG 531, "Metal Bar Grating Manual" and NAAMM MBG 532, "Heavy-Duty Metal Bar Grating Manual."
2. Welding Qualifications: Qualify procedures and personnel according to the following:
 - a. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
 - b. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."
 - c. AWS D1.3, "Structural Welding Code - Sheet Steel."
 - d. AWS D1.6, "Structural Welding Code - Stainless Steel."

F. Project Conditions

1. Field Measurements: Verify actual locations of walls and other construction contiguous with gratings by field measurements before fabrication.

G. Coordination

1. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' written recommendations to ensure that shop primers and topcoats are compatible with one another.
2. Coordinate installation of anchorages for gratings, grating frames, and supports. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

1.2 PRODUCTS

A. Ferrous Metals

1. Recycled Content of Steel Products: Provide products with average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 percent.
2. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.
3. Steel Bars for Bar Gratings: ASTM A 36/A 36M or steel strip, ASTM A 1011/A 1011M or ASTM A 1018/A 1018M.
4. Wire Rod for Bar Grating Crossbars: ASTM A 510 (ASTM A 510M).
5. Uncoated Steel Sheet: ASTM A 1011/A 1011M, structural steel, Grade 30 (Grade 205).
6. Galvanized-Steel Sheet: ASTM A 653/A 653M, structural quality, Grade 33 (Grade 230), with G90 (Z275) coating.
7. Expanded-Metal Carbon Steel: ASTM F 1267, Class 1.
8. Expanded-Metal Galvanized Steel: ASTM F 1267, Class 2, Grade A.
9. Stainless-Steel Sheet, Strip, Plate, and Flat Bars: ASTM A 666, Type 304 **OR** Type 316, **as directed**.
10. Stainless-Steel Bars and Shapes: ASTM A 276, Type 304 **OR** Type 316, **as directed**.
11. Expanded-Metal Stainless Steel: ASTM F 1267, Class 3, made from stainless-steel sheet, ASTM A 666, Type 304 **OR** Type 316, **as directed**.

B. Aluminum

1. Aluminum, General: Provide alloy and temper recommended by aluminum producer for type of use indicated, and with not less than the strength and durability properties of alloy and temper designated below for each aluminum form required.
2. Extruded Bars and Shapes: ASTM B 221 (ASTM B 221M), alloys as follows:
 - a. 6061-T6 or 6063-T6, for bearing bars of gratings and shapes.
 - b. 6061-T1, for grating crossbars.
3. Aluminum Sheet: ASTM B 209 (ASTM B 209M), Alloy 5052-H32.

C. Fasteners

1. General: Unless otherwise indicated, provide Type 304 **OR** Type 316, **as directed**, stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B 633 or ASTM F 1941 (ASTM F 1941M), Class Fe/Zn 5, at exterior walls. Select fasteners for type, grade, and class required.
 - a. Provide stainless-steel fasteners for fastening aluminum.
 - b. Provide stainless steel fasteners for fastening stainless steel.
2. Steel Bolts and Nuts: Regular hexagon-head bolts, ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6); with hex nuts, ASTM A 563 (ASTM A 563M); and, where indicated, flat washers.
3. Stainless-Steel Bolts and Nuts: Regular hexagon-head annealed stainless-steel bolts, nuts, and, where indicated, flat washers; ASTM F 593 (ASTM F 738M) for bolts and ASTM F 594 (ASTM F 836M) for nuts, Alloy Group 1 (A1) **OR** Group 2 (A4), **as directed**.
4. Anchor Bolts: ASTM F 1554, Grade 36, of dimensions indicated; with nuts, ASTM A 563 (ASTM A 563M); and, where indicated, flat washers.
 - a. Hot-dip galvanize or provide mechanically deposited, zinc coating where item being fastened is indicated to be galvanized.
5. Plain Washers: Round, ASME B18.22.1 (ASME B18.22M).
6. Lock Washers: Helical, spring type, ASME B18.21.1 (ASME B18.21.2M).
7. Post-Installed Anchors: Torque-controlled expansion anchors or chemical anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.
 - a. Material for Interior Locations: Carbon-steel components zinc plated to comply with ASTM B 633 or ASTM F 1941 (ASTM F 1941M), Class Fe/Zn 5, unless otherwise indicated.
 - b. Material for Exterior Locations and Where Stainless Steel is Indicated: Alloy Group 1 (A1) **OR** Group 2 (A4), **as directed**, stainless-steel bolts, ASTM F 593 (ASTM F 738M), and nuts, ASTM F 594 (ASTM F 836M).

D. Miscellaneous Materials

1. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy that is welded.
2. Shop Primers: Provide primers that comply with Division 07 **OR** Division 09 Section(s) "High-performance Coatings" **OR** Division 07 **AND** Division 09 Section(s) "High-performance Coatings", **as directed**.
3. Universal Shop Primer: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with MPI#79 and compatible with topcoat.
 - a. Use primer containing pigments that make it easily distinguishable from zinc-rich primer.
4. Epoxy Zinc-Rich Primer: Complying with MPI#20 and compatible with topcoat.
5. Galvanizing Repair Paint: High-zinc-dust-content paint complying with SSPC-Paint 20 and compatible with paints specified to be used over it.
6. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

E. Fabrication

1. Shop Assembly: Fabricate grating sections in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

2. Cut, drill, and punch material cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
3. Form from materials of size, thickness, and shapes indicated, but not less than that needed to support indicated loads.
4. Fit exposed connections accurately together to form hairline joints.
5. Welding: Comply with AWS recommendations and the following:
 - a. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 - b. Obtain fusion without undercut or overlap.
 - c. Remove welding flux immediately.
6. Provide for anchorage of type indicated; coordinate with supporting structure. Fabricate and space the anchoring devices to secure gratings, frames, and supports rigidly in place and to support indicated loads.
 - a. Fabricate toeplates to fit grating units and weld to units in shop unless otherwise indicated.
OR
Fabricate toeplates for attaching in the field.
 - b. Toeplate Height: 4 inches (100 mm) unless otherwise indicated.

F. Metal Bar Gratings

1. Welded Steel Grating:
 - a. Bearing Bar Spacing: 7/16 or 1/2 inch (11 or 13 mm) **OR** 11/16 inch (17 mm) **OR** 15/16 inch (24 mm) **OR** 1-3/16 inches (30 mm) **OR** 1-3/8 inches (35 mm) **OR** 1-7/8 inches (48 mm) **OR** 2-3/8 inches (60 mm), **as directed**, o.c.
 - b. Bearing Bar Depth: 3/4 inch (19 mm) **OR** 1 inch (25 mm) **OR** 1-1/4 inches (32 mm) **OR** 1-1/2 inches (38 mm) **OR** 1-3/4 inches (44 mm) **OR** 2 inches (51 mm) **OR** 2-1/4 inches (57 mm) **OR** 2-1/2 inches (64 mm) **OR** 3 inches (76 mm) **OR** 3-1/2 inches (89 mm) **OR** 4 inches (102 mm) **OR** 4-1/2 inches (114 mm) **OR** 5 inches (127 mm) **OR** As required to comply with structural performance requirements, **as directed**.
 - c. Bearing Bar Thickness: 1/8 inch (3.2 mm) **OR** 3/16 inch (4.8 mm) **OR** 1/4 inch (6.4 mm) **OR** 3/8 inch (9.5 mm) **OR** As required to comply with structural performance requirements, **as directed**.
 - d. Crossbar Spacing: 2 inches (51 mm) **OR** 4 inches (102 mm), **as directed**, o.c.
 - e. Grating Mark W-11-4 (1 x 3/16) STEEL: 1-by-3/16-inch (25-by-4.8-mm) bearing bars at 11/16 inch (18 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - f. Grating Mark W-15-4 (1 x 1/8) STEEL: 1-by-1/8-inch (25-by-3.2-mm) bearing bars at 15/16 inch (24 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - g. Grating Mark W-19-4 (1-1/4 x 3/16) STEEL: 1-1/4-by-3/16-inch (32-by-4.8-mm) bearing bars at 1-3/16 inches (30 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - h. Grating Mark W-19-4 (1-1/2 x 3/16) STEEL: 1-1/2-by-3/16-inch (38-by-4.8-mm) bearing bars at 1-3/16 inches (30 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - i. Grating Mark W-19-4 (2 x 1/4) STEEL: 2-by-1/4-inch (51-by-6.4-mm) bearing bars at 1-3/16 inches (30 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - j. Grating Mark W-30-4 (5 x 3/8) STEEL: 5-by-3/8-inch (127-by-9.5-mm) bearing bars at 1-7/8 inches (60 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - k. Grating Mark: As indicated.
 - l. Traffic Surface: Plain **OR** Serrated **OR** Knurled **OR** Applied abrasive finish consisting of aluminum-oxide aggregate in an epoxy-resin adhesive **OR** As indicated, **as directed**.
 - m. Steel Finish: Shop primed **OR** Hot-dip galvanized with a coating weight of not less than 1.8 oz./sq. ft. (550 g/sq. m) of coated surface, **as directed**.
2. Pressure-Locked Steel Grating: Fabricated by pressing rectangular flush-top crossbars into slotted bearing bars or swaging crossbars between bearing bars.
 - a. Bearing Bar Spacing: 7/16 or 1/2 inch (11 or 13 mm) **OR** 11/16 inch (17 mm) **OR** 15/16 inch (24 mm) **OR** 1-3/16 inches (30 mm), **as directed**, o.c.
 - b. Bearing Bar Depth: 3/4 inch (19 mm) **OR** 1 inch (25 mm) **OR** 1-1/4 inches (32 mm) **OR** 1-1/2 inches (38 mm) **OR** 1-3/4 inches (44 mm) **OR** 2 inches (51 mm) **OR** 2-1/4 inches (57

- mm) **OR** 2-1/2 inches (64 mm) **OR** As required to comply with structural performance requirements, **as directed**.
- c. Bearing Bar Thickness: 1/8 inch (3.2 mm) **OR** 3/16 inch (4.8 mm) **OR** As required to comply with structural performance requirements, **as directed**.
 - d. Crossbar Spacing: 2 inches (51 mm) **OR** 4 inches (102 mm), **as directed**, o.c.
 - e. Grating Mark P-11-4 (1 x 3/16) STEEL: 1-by-3/16-inch (25-by-4.8-mm) bearing bars at 11/16 inch (18 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - f. Grating Mark P-15-4 (1-1/4 x 1/8) STEEL: 1-1/4-by-1/8-inch (32-by-3.2-mm) bearing bars at 15/16 inch (24 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - g. Grating Mark P-19-4 (1-1/2 x 3/16) STEEL: 1-1/2-by-3/16-inch (38-by-4.8-mm) bearing bars at 1-3/16 inches (30 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - h. Grating Mark: As indicated.
 - i. Traffic Surface: Plain **OR** Serrated **OR** Knurled **OR** Applied abrasive finish consisting of aluminum-oxide aggregate in an epoxy-resin adhesive **OR** As indicated, **as directed**.
 - j. Steel Finish: Shop primed **OR** Hot-dip galvanized with a coating weight of not less than 1.8 oz./sq. ft. (550 g/sq. m) of coated surface, **as directed**.
3. Riveted Steel Grating:
- a. Bearing Bar Spacing: 3/4 inch (19 mm) **OR** 1-1/8 inches (29 mm) **OR** 2-5/16 inches (59 mm), **as directed**, clear.
 - b. Bearing Bar Depth: 3/4 inch (19 mm) **OR** 1 inch (25 mm) **OR** 1-1/4 inches (32 mm) **OR** 1-1/2 inches (38 mm) **OR** 1-3/4 inches (44 mm) **OR** 2 inches (51 mm) **OR** 2-1/4 inches (57 mm) **OR** 2-1/2 inches (64 mm) **OR** 3 inches (76 mm) **OR** 3-1/2 inches (89 mm) **OR** 4 inches (102 mm) **OR** 4-1/2 inches (114 mm) **OR** 5 inches (127 mm) **OR** As required to comply with structural performance requirements, **as directed**.
 - c. Bearing Bar Thickness: 1/8 inch (3.2 mm) **OR** 3/16 inch (4.8 mm) **OR** 1/4 inch (6.4 mm) **OR** 3/8 inch (9.5 mm) **OR** As required to comply with structural performance requirements, **as directed**.
 - d. Rivet Spacing: 3-1/2 inches (89 mm) **OR** 5 inches (127 mm) **OR** 7 inches (178 mm), **as directed**, o.c. along bearing bar.
 - e. Grating Mark R-12-3-1/2 (1 x 1/8) STEEL: 1-by-1/8-inch (25-by-3.2-mm) bearing bars with 3/4-inch (19-mm) clear space between bearing bars, and rivets at 3-1/2 inches (89 mm) o.c. along bearing bar.
 - f. Grating Mark R-18-7 (1-1/2 x 3/16) STEEL: 1-1/2-by-3/16-inch (38-by-4.8-mm) bearing bars with 1-1/8-inch (29-mm) clear space between bearing bars, and rivets at 7 inches (178 mm) o.c. along bearing bar.
 - g. Grating Mark R-37-5 (4 x 1/4) STEEL: 4-by-1/4-inch (102-by-6.4-mm) bearing bars with 2-5/16-inch (59-mm) clear space between bearing bars, and rivets at 5 inches (127 mm) o.c. along bearing bar.
 - h. Grating Mark R-37-5 (5 x 3/8) STEEL: 5-by-3/8-inch (127-by-9.5-mm) bearing bars with 2-5/16-inch (59-mm) clear space between bearing bars, and rivets at 5 inches (127 mm) o.c. along bearing bar.
 - i. Grating Mark: As indicated.
 - j. Traffic Surface: Plain **OR** Serrated **OR** Knurled **OR** Applied abrasive finish consisting of aluminum-oxide aggregate in an epoxy-resin adhesive **OR** As indicated, **as directed**.
 - k. Steel Finish: Shop primed **OR** Hot-dip galvanized with a coating weight of not less than 1.8 oz./sq. ft. (550 g/sq. m) of coated surface, **as directed**.
4. Pressure-Locked, Stainless-Steel Grating: Fabricated by pressing rectangular flush-top crossbars into slotted bearing bars or swaging crossbars between bearing bars, **as directed**.
- a. Bearing Bar Spacing: 7/16 or 1/2 inch (11 or 13 mm) **OR** 11/16 inch (17 mm) **OR** 15/16 inch (24 mm) **OR** 1-3/16 inches (30 mm) **OR** 1-3/8 inches (35 mm) **OR** 1-7/8 inches (48 mm) **OR** 2-3/8 inches (60 mm), **as directed**, o.c.
 - b. Bearing Bar Depth: 3/4 inch (19 mm) **OR** 1 inch (25 mm) **OR** 1-1/4 inches (32 mm) **OR** 1-1/2 inches (38 mm) **OR** 1-3/4 inches (44 mm) **OR** 2 inches (51 mm) **OR** 2-1/4 inches (57 mm) **OR** 2-1/2 inches (64 mm) **OR** 3 inches (76 mm) **OR** 3-1/2 inches (89 mm) **OR** 4 inches (102 mm) **OR** 4-1/2 inches (114 mm) **OR** 5 inches (127 mm) **OR** As required to comply with structural performance requirements, **as directed**.

- c. Bearing Bar Thickness: 1/8 inch (3.2 mm) **OR** 3/16 inch (4.8 mm) **OR** 1/4 inch (6.4 mm) **OR** 3/8 inch (9.5 mm) **OR** As required to comply with structural performance requirements, **as directed**.
- d. Crossbar Spacing: 2 inches (51 mm) **OR** 4 inches (102 mm), **as directed**, o.c.
- e. Grating Mark P-11-4 (1 x 3/16) STAINLESS STEEL: 1-by-3/16-inch (25-by-4.8-mm) bearing bars at 11/16 inch (18 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
- f. Grating Mark P-15-2 (1 x 1/8) STAINLESS STEEL: 1-by-1/8-inch (25-by-3.2-mm) bearing bars at 15/16 inch (24 mm) o.c., and crossbars at 2 inches (51 mm) o.c.
- g. Grating Mark P-19-4 (1-1/2 x 3/16) STAINLESS STEEL: 1-1/2-by-3/16-inch (38-by-4.8-mm) bearing bars at 1-3/16 inches (30 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
- h. Grating Mark P-30-4 (3 x 3/8) STAINLESS STEEL: 3-by-3/8-inch (76-by-9.5-mm) bearing bars at 1-7/8 inches (48 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
- i. Grating Mark: As indicated.
- j. Traffic Surface: Plain **OR** Serrated **OR** Knurled **OR** Applied abrasive finish consisting of aluminum-oxide aggregate in an epoxy-resin adhesive **OR** As indicated, **as directed**.
- k. Finish: Mill finish **OR** Abrasive blasted **OR** Electropolished, **as directed**.
- 5. Pressure-Locked, Rectangular Bar Aluminum Grating: Fabricated by pressing rectangular flush-top crossbars into slotted bearing bars or swaging crossbars between bearing bars.
 - a. Bearing Bar Spacing: 7/16 or 1/2 inch (11 or 13 mm) **OR** 11/16 inch (17.5 mm) **OR** 15/16 inch (24 mm) **OR** 1-3/16 inches (30 mm), **as directed**, o.c.
 - b. Bearing Bar Depth: 1 inch (25 mm) **OR** 1-1/4 inches (32 mm) **OR** 1-1/2 inches (38 mm) **OR** 1-3/4 inches (44 mm) **OR** 2 inches (51 mm) **OR** 2-1/4 inches (57 mm) **OR** 2-1/2 inches (64 mm) **OR** As required to comply with structural performance requirements, **as directed**.
 - c. Bearing Bar Thickness: 1/8 inch (3.2 mm) **OR** 3/16 inch (4.8 mm) **OR** 1/4 inch (6.4 mm) **OR** As required to comply with structural performance requirements, **as directed**.
 - d. Crossbar Spacing: 2 inches (51 mm) **OR** 4 inches (102 mm), **as directed**, o.c.
 - e. Grating Mark P-7-4 (1 x 1/8) ALUMINUM: 1-by-1/8-inch (25-by-3.2-mm) bearing bars at 7/16 inch (11 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - f. Grating Mark P-11-4 (1 x 3/16) ALUMINUM: 1-by-3/16-inch (25-by-4.8-mm) bearing bars at 11/16 inch (18 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - g. Grating Mark P-15-4 (1-1/2 x 3/16) ALUMINUM: 1-1/2-by-3/16-inch (38-by-4.8-mm) bearing bars at 15/16 inch (24 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - h. Grating Mark P-19-4 (2 x 3/16) ALUMINUM: 2-by-3/16-inch (51-by-4.8-mm) bearing bars at 1-3/16 inches (30 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - i. Grating Mark: As indicated.
 - j. Traffic Surface: Plain **OR** Applied abrasive finish consisting of aluminum-oxide aggregate in an epoxy-resin adhesive **OR** As indicated, **as directed**.
 - k. Aluminum Finish: Mill finish **OR** Class I, clear, anodized finish, **as directed**.
- 6. Pressure-Locked, Aluminum I-Bar Grating: Fabricated by swaging crossbars between bearing bars.
 - a. Bearing Bar Spacing: 7/16 or 1/2 inch (11 or 13 mm) **OR** 11/16 inch (17 mm) **OR** 15/16 inch (24 mm) **OR** 1-3/16 inches (30 mm), **as directed**, o.c.
 - b. Bearing Bar Depth: 1 inch (25 mm) **OR** 1-1/4 inches (32 mm) **OR** 1-1/2 inches (38 mm) **OR** 1-3/4 inches (44 mm) **OR** 2 inches (51 mm) **OR** 2-1/4 inches (57 mm) **OR** 2-1/2 inches (64 mm) **OR** As required to comply with structural performance requirements, **as directed**.
 - c. Bearing Bar Flange Width: 1/4 inch (6.4 mm).
 - d. Crossbar Spacing: 2 inches (51 mm) **OR** 4 inches (102 mm), **as directed**, o.c.
 - e. Grating Mark P-11-4 (1 I-Bar) ALUMINUM: 1-inch (25-mm) I-bar bearing bars at 11/16 inch (18 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - f. Grating Mark P-15-2 (1 I-Bar) ALUMINUM: 1-inch (25-mm) I-bar bearing bars at 15/16 inch (24 mm) o.c., and crossbars at 2 inches (51 mm) o.c.
 - g. Grating Mark P-19-4 (1-1/2 I-Bar) ALUMINUM: 1-1/2-inch (38-mm) I-bar bearing bars at 1-3/16 inches (30 mm) o.c., and crossbars at 4 inches (102 mm) o.c.
 - h. Grating Mark: As indicated.
 - i. Traffic Surface: Plain **OR** Grooved **OR** Applied abrasive finish consisting of aluminum-oxide aggregate in an epoxy-resin adhesive **OR** As indicated, **as directed**.
 - j. Aluminum Finish: Mill finish **OR** Class I, clear, anodized finish, **as directed**.

7. Removable Grating Sections: Fabricate with banding bars attached by welding to entire perimeter of each section. Include anchors and fasteners of type indicated or, if not indicated, as recommended by manufacturer for attaching to supports.
 - a. Provide no fewer than four weld lugs for each heavy-duty grating section, with each lug shop welded to two bearing bars.
 - b. Provide no fewer than four saddle clips for each grating section composed of rectangular bearing bars 3/16 inch (4.8 mm) or less in thickness and spaced 15/16 inch (24 mm) or more o.c., with each clip designed and fabricated to fit over two bearing bars.
 - c. Provide no fewer than four weld lugs for each grating section composed of rectangular bearing bars 3/16 inch (4.8 mm) or less in thickness and spaced less than 15/16 inch (24 mm) o.c., with each lug shop welded to three or more bearing bars. Interrupt intermediate bearing bars as necessary for fasteners securing grating to supports.
 - d. Provide no fewer than four flange blocks for each section of aluminum I-bar grating, with block designed to fit over lower flange of I-shaped bearing bars.
 - e. Furnish threaded bolts with nuts and washers for securing grating to supports.
 - f. Furnish self-drilling fasteners with washers for securing grating to supports.
 - g. Furnish galvanized malleable-iron flange clamp with galvanized bolt for securing grating to supports. Furnish as a system designed to be installed from above grating by one person.
8. Fabricate cutouts in grating sections for penetrations indicated. Arrange cutouts to permit grating removal without disturbing items penetrating gratings.
 - a. Edge-band openings in grating that interrupt four or more bearing bars with bars of same size and material as bearing bars.
9. Do not notch bearing bars at supports to maintain elevation.

G. Expanded-Metal Gratings

1. Provide expanded-metal gratings in material, finish, style, size, thickness, weight, and type indicated or, if not indicated, as recommended by manufacturer for indicated applications and as needed to support indicated loads.
 - a. Material: Steel **OR** Stainless steel **OR** Aluminum, **as directed**.
 - b. Steel Finish: Unfinished, oiled **OR** Shop primed **OR** Galvanized, **as directed**.
 - c. Stainless-Steel Finish: Mill finish, as fabricated.
 - d. Aluminum Finish: Mill finish, as fabricated.
 - e. Style Designation (for steel): 4.27 lb **OR** 3/4 number 9, **as directed**.
 - f. Style Designation (for stainless steel): 1-1/2 number 9 **OR** 3/4 number 9, **as directed**.
 - g. Size (for aluminum): 2 lb **OR** 3/4 0.188 **OR** 1-1/2 0.125, **as directed**.
 - h. Type: I, expanded **OR** II, expanded and flattened, **as directed**.
2. Fabricate cutouts in grating sections for penetrations of sizes and at locations indicated. Cut openings neatly and accurately to size. Edge-band openings with bars having a thickness not less than overall grating thickness at contact points.
3. Where gratings are pierced by pipes, ducts, and structural members, cut openings neatly and accurately to size and weld a strap collar not less than 1/8 inch (3 mm) thick to the cut ends. Divide panels into sections only to extent required for installation where grating platforms and runways are to be placed around previously installed pipe, ducts, and structural members.

H. Formed-Metal Plank Gratings

1. C-shaped channels rolled from heavy sheet metal of thickness indicated, and punched in serrated diamond shape to produce raised slip-resistant surface and drainage holes.
 - a. Channel Width: 4-3/4 inches (121 mm) **OR** 7 inches (178 mm) **OR** 9-1/2 inches (241 mm) **OR** 11-3/4 inches (298 mm) **OR** 18-3/4 inches (476 mm) **OR** 24 inches (610 mm) **OR** As indicated **OR** As required to comply with structural performance requirements, **as directed**.
 - b. Channel Depth: 1-1/2 inches (38 mm) **OR** 2 inches (51 mm) **OR** 2-1/2 inches (64 mm) **OR** 3 inches (76 mm) **OR** As indicated **OR** As required to comply with structural performance requirements, **as directed**.
 - c. Material: 0.074-inch- (1.9-mm-) thick steel sheet, shop primed **OR** 0.104-inch- (2.65-mm-) thick steel sheet, shop primed **OR** 0.079-inch- (2.0-mm-) thick, hot-dip galvanized-steel sheet **OR** 0.108-inch- (2.8-mm-) thick, hot-dip galvanized-steel sheet **OR** 0.074-inch- (1.9-mm-) thick steel sheet, hot-dip galvanized after fabrication **OR** 0.104-inch- (2.65-mm-) thick

steel sheet, hot-dip galvanized after fabrication **OR** 0.062-inch- (1.6-mm-) thick, stainless-steel sheet **OR** 0.078-inch- (2.0-mm-) thick, stainless-steel sheet **OR** 0.080-inch- (2.0-mm-) thick aluminum sheet **OR** 0.100-inch- (2.5-mm-) thick aluminum sheet, **as directed**.

2. Fabricate cutouts in grating sections for penetrations of sizes and at locations indicated. Cut openings neatly and accurately to size. Edge-band openings with metal sheet or bars having a thickness not less than grating material.
3. Where gratings are pierced by pipes, ducts, and structural members, cut openings neatly and accurately to size and weld a strap collar not less than 1/8 inch (3 mm) thick to the cut ends. Divide panels into sections only to extent required for installation where grating platforms and runways are to be placed around previously installed pipe, ducts, and structural members.

I. Extruded-Aluminum Plank Gratings

1. Provide extruded-aluminum plank gratings in type, size, and finish indicated or, if not indicated, as recommended by manufacturer for indicated applications and as needed to support indicated loads.
 - a. Type: Extruded-aluminum planks approximately 6 inches (152 mm) wide with multiple flanges approximately 1.2 inches (30 mm) o.c., acting as bearing bars connected by a web that serves as a walking surface. Top surface has raised ribs to increase slip resistance.
 - b. Depth: 1 inch (25 mm) **OR** 1-1/2 inches (38 mm) **OR** 2 inches (51 mm) **OR** As required to comply with structural performance requirements, **as directed**.
 - c. Perforations: None **OR** Rectangular, 19/32 by 3 inches (15 by 76 mm), with adjacent rows staggered **OR** 19/32 inch (15 mm) square, with adjacent rows aligned, **as directed**.
 - d. Finish: Mill finish, as fabricated.
2. Fabricate cutouts in grating sections for penetrations indicated. Arrange cutouts to permit grating removal without disturbing items penetrating gratings.

J. Glass-Fiber-Reinforced Plastic Gratings

1. Molded Glass-Fiber-Reinforced Gratings: Bar gratings made by placing glass-fiber strands that have been saturated with thermosetting plastic resin in molds in alternating directions to form interlocking bars without voids and with a high resin content.
 - a. Configuration: 1-1/2-inch- (38-mm-) square mesh, 1 inch (25 mm) thick **OR** 1-1/2-inch- (38-mm-) square mesh, 1-1/4 inches (32 mm) thick **OR** 1-1/2-inch- (38-mm-) square mesh, 1-1/2 inches (38 mm) thick **OR** 2-inch- (51-mm-) square mesh, 2 inches (51 mm) thick **OR** 1-1/2-inch- (38-mm-) square mesh, thickness as required to comply with structural performance requirements **OR** As required to comply with structural performance requirements, **as directed**.
 - b. Weight: 2.5 lb/sq. ft. (12.2 kg/sq. m) **OR** 2.7 lb/sq. ft. (13.2 kg/sq. m) **OR** 3.2 lb/sq. ft. (15.6 kg/sq. m) **OR** 3.5 lb/sq. ft. (17.1 kg/sq. m) **OR** 3.7 lb/sq. ft. (18.1 kg/sq. m) **OR** 4.1 lb/sq. ft. (20.0 kg/sq. m) **OR** 5.0 lb/sq. ft. (24.4 kg/sq. m), **as directed**.
 - c. Resin: Polyester **OR** Vinylester, **as directed**.
 - 1) Flame-Spread Index: 25 or less when tested according to ASTM E 84.
 - 2) U.S.D.A. Acceptance: Accepted for food-processing applications.
 - d. Color: Beige **OR** Gray **OR** Green **OR** Orange **OR** Yellow **OR** Manufacturer's standard, **as directed**.
 - e. Traffic Surface: Plain, meniscus **OR** Applied abrasive finish **OR** As indicated, **as directed**.
2. Pultruded Glass-Fiber-Reinforced Gratings: Bar gratings assembled from components made by simultaneously pulling glass fibers and extruding thermosetting plastic resin through a heated die under pressure to produce a product without voids and with a high glass-fiber content.
 - a. Configuration: I4010; 1-inch (25-mm) I-bars spaced 1 inch (25 mm) o.c. (40 percent open) **OR** I6010; 1-inch (25-mm) I-bars spaced 1-1/2 inches (38 mm) o.c. (60 percent open) **OR** I4015; 1-1/2-inch (38-mm) I-bars spaced 1 inch (25 mm) o.c. (40 percent open) **OR** I6015; 1-1/2-inch (38-mm) I-bars spaced 1-1/2 inches (38 mm) o.c. (60 percent open) **OR** T3320; 2-inch (51-mm) T-bars spaced 1-1/2 inches (38 mm) o.c. (33 percent open) **OR** T5020; 2-inch (51-mm) T-bars spaced 2 inches (51 mm) o.c. (50 percent open) **OR** As required to comply with structural performance requirements, **as directed**.

- b. Weight: 2.35 lb/sq. ft. (11.5 kg/sq. m) **OR** 2.83 lb/sq. ft. (13.8 kg/sq. m) **OR** 3.10 lb/sq. ft. (15.1 kg/sq. m) **OR** 3.41 lb/sq. ft. (16.6 kg/sq. m) **OR** 4.10 lb/sq. ft. (20.0 kg/sq. m) **OR** 4.13 lb/sq. ft. (20.2 kg/sq. m), **as directed**.
- c. Resin Type: Polyester **OR** Vinylester, **as directed**.
 - 1) Flame-Spread Index: 25 or less when tested according to ASTM E 84.
 - 2) U.S.D.A. Acceptance: Accepted for food processing applications.
- d. Color: Beige **OR** Gray **OR** Green **OR** Orange **OR** Yellow **OR** Manufacturer's standard, **as directed**.
- e. Traffic Surface: Plain, grooved **OR** Applied abrasive finish **OR** As indicated, **as directed**.
3. Fabricate cutouts in grating sections for penetrations indicated. Arrange cutouts to permit grating removal without disturbing items penetrating gratings.

K. Grating Frames And Supports

1. Frames and Supports for Metal Gratings: Fabricate from metal shapes, plates, and bars of welded construction to sizes, shapes, and profiles indicated and as necessary to receive gratings. Miter and weld connections for perimeter angle frames. Cut, drill, and tap units to receive hardware and similar items.
 - a. Unless otherwise indicated, fabricate from same basic metal as gratings.
 - b. Equip units indicated to be cast into concrete or built into masonry with integrally welded anchors. Unless otherwise indicated, space anchors 24 inches (600 mm) o.c. and provide minimum anchor units in the form of steel straps 1-1/4 inches (32 mm) wide by 1/4 inch (6 mm) thick by 8 inches (200 mm) long.
2. Frames and Supports for Glass-Fiber-Reinforced Plastic Gratings: Fabricate from glass-fiber-reinforced plastic shapes of sizes, shapes, and profiles indicated and as necessary to receive gratings. Miter connections for perimeter angle frames. Cut, drill, and tap units to receive hardware and similar items.
 - a. Unless otherwise indicated, use shapes made from same resin as gratings.
 - b. Equip units indicated to be cast into concrete or built into masonry with integral anchors.
3. Galvanize steel frames and supports in the following locations:
 - a. Exterior.
 - b. Interior, where indicated.

L. Aluminum Finishes

1. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
2. Class I, Clear Anodic Finish: AA-M12C22A41 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 611.

M. Steel Finishes

1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
2. Finish gratings, frames, and supports after assembly.
3. Galvanizing: Hot-dip galvanize items as indicated to comply with ASTM A 153/A 153M for steel and iron hardware and with ASTM A 123/A 123M for other steel and iron products.
 - a. Do not quench or apply post galvanizing treatments that might interfere with paint adhesion.
4. Shop prime gratings, frames and supports not indicated to be galvanized unless otherwise indicated.
 - a. Shop prime with universal shop primer **OR** primers specified in Division 07, **as directed**, unless zinc-rich primer is **OR** primers specified in Division 09 Section "High-performance Coatings" are, **as directed**, indicated.
5. Preparation for Shop Priming: Prepare surfaces to comply with SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning" **OR** SSPC-SP 7/NACE No. 4, "Brush-off Blast Cleaning" **OR** requirements indicated below, **as directed**:
 - a. Exterior Items: SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."

- b. Items Indicated to Receive Zinc-Rich Primer: SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
- c. Items Indicated to Receive Primers Specified in Division 9 Section "High-Performance Coatings": SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
- d. Other Items: SSPC-SP 7/NACE No. 4, "Brush-off Blast Cleaning."
- 6. Shop Priming: Apply shop primer to comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting.

1.3 EXECUTION

A. Installation, General

- 1. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing gratings to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.
- 2. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing gratings. Set units accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.
- 3. Provide temporary bracing or anchors in formwork for items that are to be built into concrete or masonry.
- 4. Fit exposed connections accurately together to form hairline joints.
 - a. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade the surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
- 5. Attach toeplates to gratings by welding at locations indicated.
- 6. Field Welding: Comply with the following requirements:
 - a. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 - b. Obtain fusion without undercut or overlap.
 - c. Remove welding flux immediately.
- 7. Corrosion Protection: Coat concealed surfaces of aluminum that will come into contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

B. Installing Metal Bar Gratings

- 1. General: Install gratings to comply with recommendations of referenced metal bar grating standards that apply to grating types and bar sizes indicated, including installation clearances and standard anchoring details.
- 2. Attach removable units to supporting members with type and size of clips and fasteners indicated or, if not indicated, as recommended by grating manufacturer for type of installation conditions shown.
- 3. Attach nonremovable units to supporting members by welding where both materials are same; otherwise, fasten by bolting as indicated above.

C. Installing Expanded-Metal Gratings

- 1. General: Comply with manufacturer's written instructions for installing gratings.
- 2. Place units with straight edge of bond up and with long direction of diamond-shaped openings parallel to direction of span.
- 3. Attach removable units to supporting members by bolting at 6-inch (150-mm) intervals.
- 4. Attach nonremovable units to supporting members by welding unless otherwise indicated. Space welds at 6-inch (150-mm) intervals.
- 5. Attach aluminum units to steel supporting members by bolting at 6-inch (150-mm) intervals.
- 6. Butt edges parallel to long direction of diamond-shaped openings and weld at every second bond point. Place individual grating sections so diamonds of one piece are aligned with those of adjacent sections.

- D. Installing Metal Plank Gratings
1. General: Comply with manufacturer's written instructions for installing gratings. Use manufacturer's standard anchor clips and hold-down devices for bolted connections.
 2. Attach removable units to supporting members by bolting at every point of contact.
 3. Attach nonremovable units to supporting members by welding unless otherwise indicated. Comply with manufacturer's written instructions for size and spacing of welds.
 4. Attach aluminum units to steel supporting members by bolting at side channels at every point of contact and by bolting intermediate planks at each end on alternate sides. Bolt adjacent planks together at midspan.
- E. Installing Glass-Fiber-Reinforced Plastic Gratings
1. Comply with manufacturer's written instructions for installing gratings. Use manufacturer's standard stainless-steel anchor clips and hold-down devices for bolted connections.
- F. Adjusting And Cleaning
1. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material as used for shop painting to comply with SSPC-PA 1 requirements for touching up shop-painted surfaces.
 - a. Apply by brush or spray to provide a minimum 2.0-mil (0.05-mm) dry film thickness.

OR

Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint are specified in Division 07.
 2. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 05 70 00 00 - DECORATIVE METAL**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for ornamental metal. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Decorative window security bars.
 - b. Decorative mechanical grilles and frames.
 - c. Decorative-metal-clad, hollow-metal doors and frames.
 - d. Custom door pulls.
 - e. Combination hall push-button stations.
 - f. Metal reveals at wood paneling.
 - g. Cast-metal rosettes at marble joints.

C. Submittals

1. Product Data: For each type of product indicated, including finishing materials.
2. LEED Submittals:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2, **as directed**: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating costs for each product having recycled content.
3. Shop Drawings: Show fabrication and installation details for decorative metal.
 - a. Include plans, elevations, component details, and attachments to other work.
 - b. Indicate materials and profiles of each decorative metal member, fittings, joinery, finishes, fasteners, anchorages, and accessory items.
4. Patterns, Models, or Plaster Castings: Made from proposed patterns for each design of custom casting required.
5. Samples: For each type of exposed finish required.
 - a. Sections of linear shapes.
 - b. Full-size Samples of castings and forgings.
 - 1) For custom castings, submit finished Samples showing ability to reproduce detail, cast-metal color, and quality of finish. Samples may be of similar previous work.
 - c. Samples of welded and brazed joints showing quality of workmanship and color matching of materials.
6. Qualification Data: For qualified fabricator **OR** organic-coating applicator **OR** anodic finisher **OR** powder-coating applicator, **as directed**.
7. Mill Certificates: Signed by manufacturers of stainless-steel certifying that products furnished comply with requirements.
8. Welding certificates.

D. Quality Assurance

1. Fabricator Qualifications: A firm experienced in producing decorative metal similar to that indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
2. Installer Qualifications: Fabricator of products.

3. Organic-Coating Applicator Qualifications: A firm experienced in successfully applying organic coatings, of type indicated, to aluminum extrusions and employing competent control personnel to conduct continuing, effective quality-control program to ensure compliance with requirements.
4. Anodic Finisher Qualifications: A firm experienced in successfully applying anodic finishes of type indicated and employing competent control personnel to conduct continuing, effective quality-control program to ensure compliance with requirements.
5. Powder-Coating Applicator Qualifications: A firm experienced in successfully applying powder coatings of type indicated and employing competent control personnel to conduct continuing, effective quality-control program to ensure compliance with requirements.
6. Welding Qualifications: Qualify procedures and personnel according to the following:
 - a. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
 - b. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."
 - c. AWS D1.3, "Structural Welding Code - Sheet Steel."
 - d. AWS D1.6, "Structural Welding Code - Stainless Steel."
7. Preinstallation Conference: Conduct conference at Project site.

E. Delivery, Storage, And Handling

1. Store decorative metal in a well-ventilated area, away from uncured concrete and masonry, and protected from weather, moisture, soiling, abrasion, extreme temperatures, and humidity.
2. Deliver and store cast-metal products in wooden crates surrounded by sufficient packing material to ensure that products will not be cracked or otherwise damaged.

F. Project Conditions

1. Field Measurements: Verify actual locations of walls and other construction contiguous with decorative metal by field measurements before fabrication and indicate measurements on Shop Drawings.

G. Coordination

1. Coordinate installation of anchorages for decorative metal items. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

1.2 PRODUCTS

A. Metals, General

1. Metal Surfaces, General: Provide materials with smooth, flat surfaces unless otherwise indicated. Provide materials without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.

B. Aluminum

1. Aluminum, General: Provide alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with strength and durability properties for each aluminum form required not less than that of alloy and temper designated below.
 - a. Extruded Bars and Shapes: ASTM B 221 (ASTM B 221M), Alloy 6063-T5/T52.
 - b. Extruded Structural Pipe and Round Tubing: ASTM B 429/B 429M, Alloy 6063-T6.
 - c. Drawn Seamless Tubing: ASTM B 210 (ASTM B 210M) or ASTM B 483/B 483M, Alloy 6063-T832.
 - d. Plate and Sheet: ASTM B 209 (ASTM B 209M), Alloy 3003-H14 **OR** Alloy 5005-H32 **OR** Alloy 6061-T6, **as directed**.
 - e. Die and Hand Forgings: ASTM B 247 (ASTM B 247M), Alloy 6061-T6.
 - f. Castings: ASTM B 26/B 26M, Alloy A356.0-T6.

C. Copper Alloys

1. Copper and Copper Alloys, General: Provide alloys indicated and temper to suit application and forming methods but with strength and stiffness not less than H01 (quarter-hard) for plate, sheet, strip, and bars and H55 (light-drawn) for tube and pipe.
2. Extruded Shapes, Bronze: ASTM B 455, Alloy UNS No. C38500 (architectural bronze).
3. Extruded Shapes, Brass: ASTM B 249/B 249M, Alloy UNS No. C36000 (free-cutting brass).
4. Extruded Shapes, Nickel Silver: ASTM B 249/B 249M, Alloy UNS No. C79600.
5. Seamless Pipe, Bronze: ASTM B 43, Alloy UNS No. C23000 (red brass, 85 percent copper).
6. Seamless Tube, Bronze: ASTM B 135 (ASTM B 135M), Alloy UNS No. C23000 (red brass, 85 percent copper).
7. Seamless Tube, Brass: ASTM B 135 (ASTM B 135M), Alloy UNS No. C26000 (cartridge brass, 70 percent copper).
8. Seamless Tube, Copper: ASTM B 75 (ASTM B 75M), Alloy UNS No. C12200 (phosphorous deoxidized, high residual phosphorous copper).
9. Castings, Bronze: ASTM B 62, Alloy UNS No. C83600 (85-5-5-5 or No. 1 composition commercial red brass) or ASTM B 584, Alloy UNS No. C86500 (No. 1 manganese bronze).
10. Castings, Brass: ASTM B 584, Alloy UNS No. C85200 (high-copper yellow brass).
11. Castings, Copper: ASTM B 824, with a minimum of 99.9 percent copper.
12. Castings, Nickel Silver: ASTM B 584, Alloy UNS No. C97300 (12 percent lead nickel silver).
13. Plate, Sheet, Strip, and Bars; Bronze: ASTM B 36/B 36M, Alloy UNS No. C28000 (muntz metal, 60 percent copper).
14. Plate, Sheet, Strip, and Bars; Brass: ASTM B 36/B 36M, Alloy UNS No. C26000 (cartridge brass, 70 percent copper).
15. Plate, Sheet, Strip, and Bars; Copper: ASTM B 152/B 152M, Alloy UNS No. C11000 (electrolytic tough pitch copper) or UNS No. C12200 (phosphorous deoxidized, high-residual phosphorous copper).

D. Stainless Steel

1. Tubing: ASTM A 554, Grade MT 304 **OR** Grade MT 316 **OR** Grade MT 316L, **as directed**.
2. Pipe: ASTM A 312/A 312M, Grade TP 304 **OR** Grade TP 316 **OR** Grade TP 316L, **as directed**.
3. Castings: ASTM A 743/A 743M, Grade CF 8 or CF 20 **OR** Grade CF 8M or CF 3M, **as directed**.
4. Sheet, Strip, Plate, and Flat Bar: ASTM A 666, Type 304 **OR** Type 316 **OR** Type 316L, **as directed**.
5. Bars and Shapes: ASTM A 276, Type 304 **OR** Type 316 **OR** Type 316L, **as directed**.
6. Wire Rope and Fittings:
 - a. Wire Rope: 1-by-19 **OR** 7-by-7 **OR** 7-by-19, **as directed**, wire rope made from wire complying with ASTM A 492, Type 316.
 - b. Wire-Rope Fittings: Connectors of types indicated, fabricated from stainless steel, and with capability to sustain, without failure, a load equal to minimum breaking strength of wire rope with which they are used.

E. Steel And Iron

1. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 percent.
2. Tubing: ASTM A 500 (cold formed) or ASTM A 513, Type 5 (mandrel drawn).
3. Bars: Hot-rolled, carbon steel complying with ASTM A 29/A 29M, Grade 1010.
4. Plates, Shapes, and Bars: ASTM A 36/A 36M.
5. Cast Iron: Either gray iron, ASTM A 48/A 48M, or malleable iron, ASTM A 47/A 47M unless otherwise indicated.
6. Steel Sheet, Cold Rolled: ASTM A 1008/A 1008M, either commercial steel or structural steel, exposed.

F. Titanium

1. Titanium Strip, Sheet, and Plate: ASTM B 265, Grade 1.
2. Titanium Bars: ASTM B 348, Grade 1.

G. Fasteners

1. Fastener Materials: Unless otherwise indicated, provide the following:
 - a. Aluminum Items: Aluminum **OR** Type 304 stainless-steel **OR** Type 316 stainless-steel, **as directed**, fasteners.
 - b. Copper-Alloy (Bronze) Items: Silicon bronze (Alloy 651 or Alloy 655) fasteners where concealed, muntz metal (Alloy 280) fasteners where exposed.
 - c. Copper-Alloy (Brass) Items: Silicon bronze (Alloy 651 or Alloy 655) fasteners where concealed, brass (Alloy 260 or 360) fasteners where exposed.
 - d. Stainless-Steel Items: Type 304 **OR** Type 316, **as directed**, stainless-steel fasteners.
 - e. Titanium Items: Type 304 **OR** Type 316, **as directed**, stainless-steel fasteners.
 - f. Uncoated-Steel Items: Plated steel fasteners complying with ASTM B 633, Class Fe/Zn 25 for electrodeposited zinc coating where concealed, Type 304 stainless-steel fasteners where exposed.
 - g. Galvanized-Steel Items: Plated steel fasteners complying with ASTM B 633, Class Fe/Zn 25 for electrodeposited zinc coating.
 - h. Dissimilar Metals: Type 304 **OR** Type 316, **as directed**, stainless-steel fasteners.
2. Fasteners for Anchoring to Other Construction: Unless otherwise indicated, select fasteners of type, grade, and class required to produce connections suitable for anchoring indicated items to other types of construction indicated.
3. Provide concealed fasteners for interconnecting components and for attaching decorative metal items to other work unless otherwise indicated **OR** exposed fasteners are unavoidable, **as directed**.
 - a. Provide Phillips **OR** tamper-resistant **OR** square or hex socket, **as directed**, flat-head machine screws for exposed fasteners unless otherwise indicated.
4. Anchors, General: Anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.
5. Post-Installed Anchors: Torque-controlled expansion type or chemical type.
 - a. Material for Interior Locations: Carbon-steel components zinc plated to comply with ASTM B 633 or ASTM F 1941 (ASTM F 1941M), Class Fe/Zn 5 unless otherwise indicated.
 - b. Material for Exterior Locations and Where Stainless Steel Is Indicated: Alloy Group 1 (A1) **OR** Group 2 (A4), **as directed**, stainless-steel bolts, ASTM F 593 (ASTM F 738M), and nuts, ASTM F 594 (ASTM F 836M).

H. Miscellaneous Materials

1. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
 - a. For aluminum, provide type and alloy as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items.
2. Brazing Rods: For copper alloys, provide type and alloy as recommended by producer of metal to be brazed and as required for color match, strength, and compatibility in fabricated items.
3. Etching Cleaner for Galvanized Metal: Complying with MPI#25.
4. Galvanizing Repair Paint: High-zinc-dust-content paint complying with SSPC-Paint 20 and compatible with paints specified to be used over it.
5. Lacquer for Copper Alloys: Clear, acrylic lacquer specially developed for coating copper-alloy products.
6. Shop Primers: Provide primers that comply with Division 07 **OR** Division 09 Section(s) "High-performance Coatings", **as directed**.
7. Universal Shop Primer for Ferrous Metal: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with MPI#79 and compatible with topcoat.
 - a. Use primer containing pigments that make it easily distinguishable from zinc-rich primer.
8. Epoxy Zinc-Rich Primer: Complying with MPI#20 and compatible with topcoat.
9. Shop Primer for Galvanized Steel: Cementitious galvanized metal primer complying with MPI#26 **OR** Vinyl wash primer complying with MPI#80 **OR** Water-based galvanized metal primer complying with MPI#134, **as directed**.

10. Intermediate Coats and Topcoats for Steel: Provide products that comply with Division 07 OR Division 09 Section(s) "High-performance Coatings" **OR** Division 07 AND Division 09 Section(s) "High-performance Coatings", **as directed**.
11. Epoxy Intermediate Coat for Steel: Complying with MPI#77 and compatible with primer and topcoat.
12. Polyurethane Topcoat for Steel: Complying with MPI#72 and compatible with undercoat.
13. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

I. Fabrication, General

1. Assemble items in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
2. Make up wire-rope assemblies in the shop to field-measured dimensions with fittings machine swaged. Minimize amount of turnbuckle take-up used for dimensional adjustment so maximum amount is available for tensioning wire ropes. Tag wire-rope assemblies and fittings to identify installation locations and orientations for coordinated installation.
3. Form decorative metal to required shapes and sizes, true to line and level with true curves and accurate angles and surfaces. Finish exposed surfaces to smooth, sharp, well-defined lines and arris.
4. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work.
5. Form simple and compound curves in bars, pipe, tubing, and extruded shapes by bending members in jigs to produce uniform curvature for each configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces.
6. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
7. Mill joints to a tight, hairline fit. Cope or miter corner joints. Fabricate connections that will be exposed to weather in a manner to exclude water.
8. Provide weep holes where water may accumulate. Locate weep holes in inconspicuous locations.
9. Provide necessary rebates, lugs, and brackets to assemble units and to attach to other work. Cut, reinforce, drill, and tap as needed to receive finish hardware, screws, and similar items unless otherwise indicated.
10. Comply with AWS for recommended practices in shop welding and brazing. Weld and braze behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded and brazed joints of flux, and dress exposed and contact surfaces.
 - a. Where welding and brazing cannot be concealed behind finished surfaces, finish joints to comply with NOMMA's "Voluntary Joint Finish Standards" for Type 1 Welds: no evidence of a welded joint **OR** Type 2 Welds: completely sanded joint, some undercutting and pinholes okay **OR** Type 3 Welds: partially dressed weld with spatter removed **OR** Type 4 Welds: good quality, uniform undressed weld with minimal splatter, **as directed**.
11. Provide castings that are sound and free of warp, cracks, blowholes, or other defects that impair strength or appearance. Grind, wire brush, sandblast, and buff castings to remove seams, gate marks, casting flash, and other casting marks.

J. Decorative Window Security Bars

1. General: Fabricate decorative window grilles to designs indicated from steel bars and shapes of sizes and profiles indicated. Form steel bars by bending, forging, coping, mitering, and welding.
2. Welding: Interconnect grille members with full-length, full-penetration welds unless otherwise indicated. Use welding method that is appropriate for metal and finish indicated and that develops full strength of members joined. Finish exposed welds and surfaces smooth, flush, and blended to match adjoining surfaces.
3. Brackets, Fittings, and Anchors: Provide wall brackets, fittings, and anchors to connect decorative window grilles to other work unless otherwise indicated.

- a. Furnish inserts and other anchorage devices to connect decorative window grilles to concrete and masonry work. Coordinate anchorage devices with supporting structure.
- b. Fabricate anchorage devices that are capable of withstanding loads indicated.

K. Decorative Mechanical Grilles

1. Fabricate decorative grilles from perforated aluminum **OR** brass **OR** bronze **OR** stainless-steel **OR** steel, **as directed**, sheet or plate of thickness, size, and pattern indicated. Form perforations by punching, cutting, or drilling to produce openings of sizes and shapes indicated. Roll, press, and grind perforated metal to flatten and to remove burrs and deformations.
 - a. Form perforations to match existing grilles.
OR
Drawings indicate perforated metal patterns required and are based on products of one manufacturer. Perforated metal patterns produced by other manufacturers may be considered, provided deviations are minor and do not change design concept as judged solely by The University.
2. Drill and countersink grilles for mounting screws at 2 inches (50 mm) from corners and at 10 inches (250 mm) or less o.c. Provide units with oval-head wood **OR** self-tapping machine, **as directed**, screws.
3. Fabricate grille frames from extruded aluminum **OR** brass **OR** bronze, **as directed**, of profiles, and to sizes and shapes indicated. Miter frame members at corners and connect with concealed splice plates welded **OR** brazed, **as directed**, to back of frames.
 - a. Secure grilles in frames with 0.5-inch- (12-mm-) long welds **OR** brazing, **as directed**, along perimeter of grilles at 4 inches (100 mm) o.c.
 - b. Provide frame profiles to match existing frames.
OR
Drawings indicate frame profiles required and are based on products of one manufacturer. Similar frame profiles produced by other manufacturers may be considered, provided deviations are minor and do not change design concept as judged solely by The University.
4. Drill and countersink frames for mounting screws at 4 inches (100 mm) from corners and at 16 inches (400 mm) or less o.c. Provide units with oval-head wood **OR** self-tapping machine, **as directed**, screws.

L. Decorative-Metal-Clad Doors And Frames

1. Laminate 0.0403-inch- (1.0-mm-) thick, muntz-metal **OR** 0.0403-inch- (1.0-mm-) thick, brass **OR** 0.0375-inch- (0.95-mm-) thick, stainless-steel **OR** 0.024-inch- (0.6-mm-) thick, titanium, **as directed**, sheets to outside face of hollow-metal doors and frames at locations and to comply with details indicated. Use adhesive recommended by metal fabricator that will fully bond metal to metal and that will prevent telegraphing and oil canning.
 - a. Hollow-metal doors and frames are specified in Division 8 Section "Steel Doors and Frames."

M. Custom Door Pulls

1. Fabricate custom door pulls from brass **OR** bronze **OR** stainless-steel, **as directed**, bar stock of profile indicated, fabricated to shapes indicated. Form curves by bending to produce uniform curvature of radii indicated; maintain profile of member throughout entire bend without buckling, twisting, or otherwise deforming exposed surfaces. Where radii of bends are too small to avoid buckling, grind bars after bending to restore original profile. Drill and tap door pulls to receive through bolts for attachment to doors.
2. Fabricate backing plates for custom door pulls from 1/8-inch (3.2-mm) brass **OR** bronze **OR** stainless-steel, **as directed**, sheet. Cut to shape indicated and bevel edges at a 45-degree angle for one-half thickness of metal. Drill and countersink holes where indicated for screws and bolts.
3. Provide units with oval-head through bolts for mounting pulls and with oval-head wood screws for mounting backing plates.

N. Combination Hall Push-Button Stations

1. Fabricate units of brass **OR** bronze **OR** stainless steel, **as directed**, to comply with details indicated. Coordinate with requirements in Division 14 Section "Electric Traction Elevators" to provide integrated, closely fitted assemblies.
 - a. Fabricate faceplates from 1/8-inch- (3.2-mm-) thick sheet with edges beveled at a 45-degree angle for one-half thickness of metal.
 - b. Provide units with rectangular, split-bowl trash receptacle, designed for recess mounting in nominal 4-inch (100-mm) wall depth. Fabricate recessed cabinets, top rings, and split bowls of same metal as face of units; fabricate removable receptacles of drawn aluminum. Nominal dimensions of units are 10 by 10 by 3-1/2 inches (250 by 250 by 90 mm) in depth.
 - c. Provide units with emergency pictorial signs and text, complying with requirements of authorities having jurisdiction, indicating that in fire emergency, elevators should not be used and that stairways should be used instead. Engrave pictorial sign and text into front surface of faceplates to a depth of 1/16 inch (1.6 mm) with engraving painted red. Make signs 5 inches (125 mm) wide by 8 inches (200 mm) high.
 - d. Provide cutouts in faceplates of units for push buttons of elevator hall push-button station, card reader, **as directed**, and elevator key switches. Coordinate locations and sizes of cutouts so additional faceplate is not required and so faces of push buttons are flush with fronts of faceplates and key switches project beyond faceplate only by depth of bezel.

- O. Metal Reveals
 1. Fabricate metal reveals for wood paneling from 3/4-by-3/4-by-1/16-inch (19-by-19-by-3-mm) extruded-bronze **OR** 3/4-by-3/4-by-0.025-inch (19-by-19-by-0.6-mm) brake-formed, stainless-steel **OR** 3/4-by-3/4-by-0.015-inch (19-by-19-by-0.4-mm) brake-formed titanium, **as directed**, channels. Drill for mounting screws 6 inches (150 mm) from ends of channels and not more than 24 inches (600 mm) o.c. Locate mounting screws at same heights for all channels. Provide black-finished, **as directed**, hex-socket, wafer-head screws for mounting reveals.

- P. Cast-Metal Rosettes
 1. Fabricate cast-metal rosettes to design indicated from aluminum **OR** brass **OR** bronze **OR** nickel silver, **as directed**. Drill and tap castings for threaded mounting studs.
 - a. Provide custom castings to match design indicated.
 - b. Manufacturer's stock castings may be considered, provided deviations are minor and do not change design concept as judged solely by The University.
 - c. Drawings indicate cast-metal rosette designs required and are based on products of one manufacturer. Castings produced by other manufacturers may be considered, provided deviations are minor and do not change design concept as judged solely by The University.

- Q. Finishes, General
 1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
 2. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

- R. Aluminum Finishes
 1. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
 2. Clear Anodic Finish: AAMA 611, AA-M12C22A41, Class I, 0.018 mm **OR** AA-M12C22A31, Class II, 0.010 mm, **as directed**, or thicker.
 3. Color Anodic Finish: AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm **OR** AA-M12C22A32/A34, Class II, 0.010 mm, **as directed**, or thicker.
 - a. Color: Champagne **OR** Light bronze **OR** Medium bronze **OR** Dark bronze **OR** Black **OR** As selected from full range of industry colors and color densities, **as directed**.
 4. Baked-Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of 1.5 mils (0.04 mm). Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.

- a. Color and Gloss: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
 5. Siliconized Polyester Finish: Epoxy primer and silicone-modified, polyester-enamel topcoat; with a dry film thickness of not less than 0.2 mil (0.005 mm) for primer and 0.8 mil (0.02 mm) for topcoat.
 - a. Color and Gloss: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
 6. High-Performance Organic Finish: Two-coat fluoropolymer finish complying with AAMA 2604 **OR** AAMA 2605, **as directed**, and containing not less than 50 **OR** 70, **as directed**, percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
 - a. Color and Gloss: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
- OR**
- High-Performance Organic Finish: Three **OR** Four, **as directed**, -coat fluoropolymer finish complying with AAMA 2605 and containing not less than 50 **OR** 70, **as directed**, percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
- b. Color and Gloss: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.

S. Copper-Alloy Finishes

1. Finish designations for copper alloys comply with the system established for designating copper-alloy finish systems defined in NAAMM's "Metal Finishes Manual for Architectural and Metal Products."
2. Buffed Finish: M21 (Mechanical Finish: buffed, smooth specular).
3. Hand-Rubbed Finish: M31-M34 (Mechanical Finish: directionally textured, fine satin; Mechanical Finish: directionally textured, hand rubbed).
4. Medium-Satin Finish: M32 (Mechanical Finish: directionally textured, medium satin).
5. Fine-Matte Finish: M42 (Mechanical Finish: nondirectional finish, fine matte).
6. Buffed Finish, Lacquered: M21-O6x (Mechanical Finish: buffed, smooth specular; Coating: clear organic, air drying, as specified below):
 - a. Clear, Organic Coating: Lacquer specified for copper alloys, applied by air spray in two coats per manufacturer's written instructions, with interim drying, to a total thickness of 1 mil (0.025 mm).
7. Hand-Rubbed Finish, Lacquered: M31-M34-O6x (Mechanical Finish: directionally textured, fine satin; Mechanical Finish: directionally textured, hand rubbed; Coating: clear organic, air drying, as specified below):
 - a. Clear, Organic Coating: Lacquer specified for copper alloys, applied by air spray in two coats per manufacturer's written instructions, with interim drying, to a total thickness of 1 mil (0.025 mm).
8. Medium-Satin Finish, Lacquered: M32-O6x (Mechanical Finish: directionally textured, medium satin; Coating: clear organic, air drying, as specified below):
 - a. Clear, Organic Coating: Lacquer specified for copper alloys, applied by air spray in two coats per manufacturer's written instructions, with interim drying, to a total thickness of 1 mil (0.025 mm).
9. Fine-Matte Finish, Lacquered: M42-O6x (Mechanical Finish: nondirectional finish, fine matte; Coating: clear organic, air drying, as specified below):
 - a. Clear, Organic Coating: Lacquer specified for copper alloys, applied by air spray in two coats per manufacturer's written instructions, with interim drying, to a total thickness of 1 mil (0.025 mm).
10. Statuary Conversion Coating over Satin Finish: M31-C55 (Mechanical Finish: directionally textured, fine satin; Chemical Finish: conversion coating, sulfide), with color matching The University's sample.
11. Patina Conversion Coating: M36-C12-C52 (Mechanical Finish: directionally textured, uniform; Chemical Finish: nonetched cleaned, degreased; Chemical Finish: conversion coating, ammonium sulfate), with color matching The University's sample.

12. Statuary Conversion Coating, Bright Relieved and Lacquered: M12-C55-M2x-O6x (Mechanical Finish: matte finish, as cast; Chemical Finish: conversion coating, sulfide; Mechanical Finish: buffed, as specified; Coating: clear, organic, air drying, as specified below), with color matching The University's sample:
 - a. Clear, Organic Coating: Lacquer specified for copper alloys, applied by air spray in two coats per manufacturer's written instructions, with interim drying, to a total thickness of 1 mil (0.025 mm).
 13. Blackened, Bright Relieved, and Lacquered: M33-O60-M2x-O6x (Mechanical Finish: directionally textured, coarse satin; Coating: black, air drying; Mechanical Finish: buffed, as specified; Coating: clear, organic, air drying, as specified below), with blackening and buffing matching The University's sample:
 - a. Clear, Organic Coating: Lacquer specified for copper alloys, applied by air spray in two coats per manufacturer's written instructions, with interim drying, to a total thickness of 1 mil (0.025 mm).
- T. Stainless-Steel Finishes
1. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.
 2. Polished Finishes: Grind and polish surfaces to produce uniform finish, free of cross scratches.
 - a. Run grain of directional finishes with long dimension of each piece.
 3. Bright, Cold-Rolled, Unpolished Finish: No. 2B.
 4. Directional Satin Finish: No. 4.
 5. Dull Satin Finish: No. 6.
 6. Reflective, Directional Polish: No. 7.
 7. Mirrorlike Reflective, Nondirectional Polish: No. 8.
 8. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
 9. Sputter-Coated Finish: Titanium nitride coating deposited by magnetic sputter-coating process over indicated mechanical finish.
 10. Colored, Oxide-Film Finish: Clear, oxide interference film produced by degreasing and then immersing in a mixture of chromic and sulfuric acids.
 - a. Product: Subject to compliance with requirements, provide INCO colored stainless-steel finish as developed and licensed by International Nickel Co., Ltd.
 - b. Color: Match The University's sample **OR** As selected from finisher's full range, **as directed**.
- U. Steel And Iron Finishes
1. Galvanizing: Hot-dip galvanize products made from rolled, pressed, and forged steel shapes, castings, plates, bars, and strips indicated to be galvanized to comply with ASTM A 123/A 123M.
 - a. Hot-dip galvanize steel and iron hardware indicated to be galvanized to comply with ASTM A 153/A 153M.
 - b. Do not quench or apply post-galvanizing treatments that might interfere with paint adhesion.
 - c. Fill vent and drain holes that will be exposed in finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.
 2. Preparing Galvanized Items for Shop Priming: After galvanizing, thoroughly clean decorative metal of grease, dirt, oil, flux, and other foreign matter, and treat with etching cleaner.
 3. Preparing Nongalvanized Items for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning" **OR** SSPC-SP 7/NACE No. 4, "Brush-off Blast Cleaning" **OR** requirements indicated below, **as directed**:
 - a. Exteriors (SSPC Zone 1B): SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
 - b. Interiors (SSPC Zone 1A): SSPC-SP 7/NACE No. 4, "Brush-off Blast Cleaning."
 4. Primer Application: Apply shop primer to prepared surfaces of items unless otherwise indicated. Comply with requirements in SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting. Primer need not be applied to surfaces to be embedded in concrete or masonry.

- a. Shop prime uncoated ferrous-metal surfaces with universal shop primer **OR** primers specified in Division 07, **as directed**, unless zinc-rich primer is **OR** primers specified in Division 09 Section "High-performance Coatings" are, **as directed**, indicated.
- b. Do not apply primer to galvanized surfaces.
5. Shop-Painted Finish: Comply with Division 09 Section(s) "Exterior Painting" **OR** "High-performance Coatings", **as directed**.
 - a. Color: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
6. High-Performance Coating: Apply epoxy intermediate and polyurethane topcoats to prime-coated surfaces. Comply with coating manufacturer's written instructions and with requirements in SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting. Apply at spreading rates recommended by coating manufacturer.
 - a. Color: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
7. Powder-Coat Finish: Prepare, treat, and coat nongalvanized ferrous metal to comply with resin manufacturer's written instructions and as follows:
 - a. Prepare uncoated ferrous-metal surfaces to comply with SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
 - b. Treat prepared metal with iron-phosphate pretreatment, rinse, and seal surfaces.
 - c. Apply thermosetting polyester or acrylic urethane powder coating with cured-film thickness not less than 1.5 mils (0.04 mm).
 - d. Color: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
8. Powder-Coat Finish: Prepare, treat, and coat galvanized metal to comply with resin manufacturer's written instructions and as follows:
 - a. Prepare galvanized metal by thoroughly removing grease, dirt, oil, flux, and other foreign matter.
 - b. Treat prepared metal with zinc-phosphate pretreatment, rinse, and seal surfaces.
 - c. Apply thermosetting polyester or acrylic urethane powder coating with cured-film thickness not less than 1.5 mils (0.04 mm).
 - d. Color: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.

V. Titanium Finishes

1. General: Fabricate items from finished titanium stock, taking care not to damage finish during fabrication. Protect finish as needed during fabrication by applying a strippable, temporary protective covering.
2. Dull Matte Finish: Pickled and annealed.
3. Bright Matte Finish: Vacuum annealed.

1.3 EXECUTION

A. Examination

1. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of decorative metal.
2. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Installation, General

1. Provide anchorage devices and fasteners where needed to secure decorative metal to in-place construction.
2. Perform cutting, drilling, and fitting required to install decorative metal. Set products accurately in location, alignment, and elevation, measured from established lines and levels. Provide temporary bracing or anchors in formwork for items to be built into concrete, masonry, or similar construction.
3. Fit exposed connections accurately together to form tight, hairline joints or, where indicated, uniform reveals and spaces for sealants and joint fillers. Where cutting, welding, and grinding are

- required for proper shop fitting and jointing of decorative metal, restore finishes to eliminate evidence of such corrective work.
4. Do not cut or abrade finishes that cannot be completely restored in the field. Return items with such finishes to the shop for required alterations, followed by complete refinishing, or provide new units as required.
 5. Install concealed gaskets, joint fillers, insulation, and flashings as work progresses.
 6. Restore protective coverings that have been damaged during shipment or installation. Remove protective coverings only when there is no possibility of damage from other work yet to be performed at same location.
 - a. Retain protective coverings intact; remove coverings simultaneously from similarly finished items to preclude nonuniform oxidation and discoloration.
 7. Field Welding: Comply with applicable AWS specification for procedures of manual shielded metal arc welding and requirements for welding and for finishing welded connections in "Fabrication, General" Article. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations.
 8. Field Brazing: Comply with requirements for brazing and for finishing brazed connections in "Fabrication, General" Article. Braze connections that are not to be left as exposed joints but cannot be shop brazed because of shipping size limitations.
 9. Corrosion Protection: Coat concealed surfaces of aluminum that will be in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.
- C. Installing Decorative Window Security Bars
1. Fasten security bar frames to concrete and masonry walls with cast-in-place or postinstalled anchors. Peen exposed threads of anchors to prevent removal of security bars.
- D. Installing Decorative Mechanical Grilles
1. Mount decorative grilles at heights and in positions indicated, adjusting ductwork to be centered on grilles if any.
 - a. Secure to framing and blocking with specified fasteners.
 - b. On marble, brick, and other solid surfaces, secure with wood screws in lead plugs.
- E. Installing Decorative-Metal-Clad, Hollow-Metal Doors And Frames
1. Install doors and frames to comply with requirements specified in Division 08 Section "Hollow Metal Doors And Frames".
- F. Installing Custom Door Pulls
1. Install door pulls at heights and locations shown. Install with backing plates on both sides of doors. Fasten backing plates to doors with oval-head wood **OR** self-tapping metal, **as directed**, screws and secure pulls through doors and backing plates with oval-head machine screws.
- G. Installing Combination Hall Push-Button Stations
1. Coordinate installation of combination hall push-button stations with installation of related elevator signal equipment components specified in Division 14 Section "Electric Traction Elevators". Secure units in place with faceplate overlapping surrounding wall finish and drawn into contact with surrounding wall finish at entire perimeter of faceplate.
- H. Installing Metal Reveals At Wood Paneling
1. Install metal reveals between wood panels as paneling is installed. Secure to wood grounds with specified screws.
- I. Installing Cast-Metal Rosettes At Marble Joints
1. Install cast-metal rosettes at intersections of marble joints where indicated. Install only after marble work is complete and joints are grouted. Secure to wall by drilling a 3/4-inch- (19-mm-) round hole at intersection of marble joints and by filling hole with molding plaster into which threaded stud is embedded. Angle drill and rotate so bottom of hole is larger than at surface.

- a. Secure rosettes in place with masking tape until plaster sets. After plaster has set, remove masking tape and adhesive residue.

J. Cleaning And Protection

1. Unless otherwise indicated, clean metals by washing thoroughly with clean water and soap, rinsing with clean water, and drying with soft cloths.
2. Clean copper alloys according to metal finisher's written instructions in a manner that leaves an undamaged and uniform finish matching approved Sample.
3. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
 - a. Apply by brush or spray to provide a minimum 2.0-mil (0.05-mm) dry film thickness.

OR

Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint are specified in Division 07 OR Division 09 Section(s) "High-performance Coatings" **OR** Division 07 AND Division 09 Section(s) "High-performance Coatings", **as directed**.

4. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.
5. Protect finishes of decorative metal from damage during construction period with temporary protective coverings approved by decorative metal fabricator. Remove protective covering at time of Substantial Completion.
6. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

END OF SECTION 05 70 00 00

Task	Specification	Specification Description
05 75 00 00	05 70 00 00	Decorative Metal

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 06 10 00 00 - ROUGH CARPENTRY**1.1 GENERAL****A. Description Of Work:**

1. This specification covers the furnishing and installation of materials for rough carpentry. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Framing with dimension lumber.
 - b. Framing with timber.
 - c. Framing with engineered wood products.
 - d. Rooftop equipment bases and support curbs.
 - e. Wood blocking, cants, and nailers.
 - f. Wood furring and grounds.
 - g. Wood sleepers.
 - h. Utility shelving.
 - i. Plywood backing panels.

C. Definitions

1. Exposed Framing: Framing not concealed by other construction.
2. Dimension Lumber: Lumber of 2 inches nominal (38 mm actual) or greater but less than 5 inches nominal (114 mm actual) in least dimension.
3. Timber: Lumber of 5 inches nominal (114 mm actual) or greater in least dimension.
4. Lumber grading agencies, and the abbreviations used to reference them, include the following:
 - a. NeLMA: Northeastern Lumber Manufacturers' Association.
 - b. NLGA: National Lumber Grades Authority.
 - c. RIS: Redwood Inspection Service.
 - d. SPIB: The Southern Pine Inspection Bureau.
 - e. WCLIB: West Coast Lumber Inspection Bureau.
 - f. WWPAA: Western Wood Products Association.

D. Submittals

1. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.
 - a. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used and net amount of preservative retained.
 - b. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Include physical properties of treated materials based on testing by a qualified independent testing agency.
 - c. For fire-retardant treatments specified to be High-Temperature (HT) type, include physical properties of treated lumber both before and after exposure to elevated temperatures, based on testing by a qualified independent testing agency according to ASTM D 5664.
 - d. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.
 - e. Include copies of warranties from chemical treatment manufacturers for each type of treatment.
2. LEED Submittals:

- a. Product Data for Credit EQ 4.1: For adhesives, including printed statement of VOC content.
- b. Product Data for Credit EQ 4.4: For composite-wood products, documentation indicating that product contains no urea formaldehyde.
- c. Certificates for Credit MR 7: Chain-of-custody certificates certifying that products specified to be made from certified wood comply with forest certification requirements. Include evidence that mill is certified for chain of custody by an FSC-accredited certification body.
 - 1) Include statement indicating costs for each certified wood product.
3. Material Certificates: For dimension lumber specified to comply with minimum allowable unit stresses. Indicate species and grade selected for each use and design values approved by the ALSC Board of Review.
4. Research/Evaluation Reports: For the following, showing compliance with building code in effect for Project:
 - a. Wood-preservative-treated wood.
 - b. Fire-retardant-treated wood.
 - c. Engineered wood products.
 - d. Power-driven fasteners.
 - e. Powder-actuated fasteners.
 - f. Expansion anchors.
 - g. Metal framing anchors.

E. Quality Assurance

1. Forest Certification: For the following wood products, provide materials produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship":
 - a. Dimension lumber framing.
 - b. Timber.
 - c. Laminated-veneer lumber.
 - d. Parallel-strand lumber.
 - e. Prefabricated wood I-joists.
 - f. Rim boards.
 - g. Miscellaneous lumber.

F. Delivery, Storage, And Handling

1. Stack lumber flat with spacers between each bundle to provide air circulation. Provide for air circulation around stacks and under coverings.

1.2 PRODUCTS

A. Wood Products, General

1. Lumber: DOC PS 20 and applicable rules of grading agencies indicated. If no grading agency is indicated, provide lumber that complies with the applicable rules of any rules-writing agency certified by the ALSC Board of Review. Provide lumber graded by an agency certified by the ALSC Board of Review to inspect and grade lumber under the rules indicated.
 - a. Factory mark each piece of lumber with grade stamp of grading agency.
 - b. For exposed lumber indicated to receive a stained or natural finish, mark grade stamp on end or back of each piece or omit grade stamp and provide certificates of grade compliance issued by grading agency.
 - c. Where nominal sizes are indicated, provide actual sizes required by DOC PS 20 for moisture content specified. Where actual sizes are indicated, they are minimum dressed sizes for dry lumber.
 - d. Provide dressed lumber, S4S, unless otherwise indicated.
2. Engineered Wood Products: Provide engineered wood products acceptable to authorities having jurisdiction and for which current model code research or evaluation reports exist that show compliance with building code in effect for Project.

- a. Allowable Design Stresses: Provide engineered wood products with allowable design stresses, as published by manufacturer, that meet or exceed those indicated. Manufacturer's published values shall be determined from empirical data or by rational engineering analysis and demonstrated by comprehensive testing performed by a qualified independent testing agency.
- B. Wood-Preservative-Treated Lumber
1. Preservative Treatment by Pressure Process: AWWA C2, except that lumber that is not in contact with the ground and is continuously protected from liquid water may be treated according to AWWA C31 with inorganic boron (SBX).
 - a. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium.
 - b. For exposed items indicated to receive a stained or natural finish, use chemical formulations that do not require incising, contain colorants, bleed through, or otherwise adversely affect finishes.
 2. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent. Do not use material that is warped or does not comply with requirements for untreated material.
 3. Mark lumber with treatment quality mark of an inspection agency approved by the ALSC Board of Review.
 - a. For exposed lumber indicated to receive a stained or natural finish, mark end or back of each piece or omit marking and provide certificates of treatment compliance issued by inspection agency.
 4. Application: Treat all rough carpentry, unless otherwise indicated, **OR** items indicated on Drawings, and the following, **as directed**:
 - a. Wood cants, nailers, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, vapor barriers, and waterproofing.
 - b. Wood sills, sleepers, blocking, furring, stripping, and similar concealed members in contact with masonry or concrete.
 - c. Wood framing and furring attached directly to the interior of below-grade exterior masonry or concrete walls.
 - d. Wood framing members that are less than 18 inches (460 mm) above the ground in crawlspaces or unexcavated areas.
 - e. Wood floor plates that are installed over concrete slabs-on-grade.
- C. Fire-Retardant-Treated Materials
1. General: Comply with performance requirements in AWWA C20 (lumber) and AWWA C27 (plywood).
 - a. Use Exterior type for exterior locations and where indicated.
 - b. Use Interior Type A, High Temperature (HT) for enclosed roof framing, framing in attic spaces, and where indicated.
 - c. Use Interior Type A, unless otherwise indicated.
 2. Identify fire-retardant-treated wood with appropriate classification marking of testing and inspecting agency acceptable to authorities having jurisdiction.
 - a. For exposed lumber indicated to receive a stained or natural finish, mark end or back of each piece or omit marking and provide certificates of treatment compliance issued by inspection agency.
 3. For exposed items indicated to receive a stained or natural finish, use chemical formulations that do not bleed through, contain colorants, or otherwise adversely affect finishes.
 4. Application: Treat all rough carpentry, unless otherwise indicated, **OR** items indicated on Drawings, and the following, **as directed**:
 - a. Framing for raised platforms.
 - b. Concealed blocking.
 - c. Framing for non-load-bearing partitions.
 - d. Framing for non-load-bearing exterior walls.
 - e. Roof construction.
 - f. Plywood backing panels.

D. Dimension Lumber Framing

1. Maximum Moisture Content: 15 percent **OR** 19 percent **OR** 15 percent for 2-inch nominal (38-mm actual) thickness or less, 19 percent for more than 2-inch nominal (38-mm actual) thickness **OR** 15 percent for 2-inch nominal (38-mm actual) thickness or less, no limit for more than 2-inch nominal (38-mm actual) thickness **OR** 19 percent for 2-inch nominal (38-mm actual) thickness or less, no limit for more than 2-inch nominal (38-mm actual) thickness, **as directed**.
2. Non-Load-Bearing Interior Partitions: Construction or No. 2 **OR** Construction, Stud, or No. 3 **OR** Standard, Stud, or No. 3, **as directed**, grade of any species.
3. Exterior and Load-Bearing Walls **OR** Framing Other Than Non-Load-Bearing Interior Partitions **OR** Framing Other Than Interior Partitions, **as directed**: Any species and grade with a modulus of elasticity of at least 1,500,000 psi (10 350 MPa) **OR** 1,300,000 psi (8970 MPa) **OR** 1,100,000 psi (7590 MPa) **OR** 1,000,000 psi (6900 MPa) **OR** 900,000 psi (6210 MPa), **as directed**, and an extreme fiber stress in bending of at least 1000 psi (6.9 MPa) **OR** 850 psi (5.86 MPa) **OR** 700 psi (4.83 MPa) **OR** 600 psi (4.14 MPa) **OR** 500 psi (3.45 MPa), **as directed**, for 2-inch nominal (38-mm actual) thickness and 12-inch nominal (286-mm actual) width for single-member use.
4. Ceiling Joists (Non-Load-Bearing): Construction or No. 2 **OR** Construction, Stud, or No. 3 **OR** Standard, Stud, or No. 3, **as directed**, grade of any species.
5. Joists, Rafters, and Other Framing Not Listed Above: Any species and grade with a modulus of elasticity of at least 1,500,000 psi (10 350 MPa) **OR** 1,300,000 psi (8970 MPa) **OR** 1,100,000 psi (7590 MPa) **OR** 1,000,000 psi (6900 MPa) **OR** 900,000 psi (6210 MPa), **as directed**, and an extreme fiber stress in bending of at least 1000 psi (6.9 MPa) **OR** 850 psi (5.86 MPa) **OR** 700 psi (4.83 MPa) **OR** 600 psi (4.14 MPa) **OR** 500 psi (3.45 MPa), **as directed**, for 2-inch nominal (38-mm actual) thickness and 12-inch nominal (286-mm actual) width for single-member use.
6. Exposed Exterior **OR** Interior, **as directed**, Framing Indicated to Receive a Stained or Natural Finish: Provide material hand-selected for uniformity of appearance and freedom from characteristics, on exposed surfaces and edges, that would impair finish appearance, including decay, honeycomb, knot-holes, shake, splits, torn grain, and wane.
 - a. Species and Grade: As indicated above for load-bearing construction of same type.
 - b. Species and Grade: Hem-fir (north), Select Structural **OR** No. 1, **as directed**, grade; NLGA.
 - c. Species and Grade: Southern pine, Select Structural **OR** No. 1 **OR** No. 2, **as directed**, grade; SPIB.
 - d. Species and Grade: Douglas fir-larch; Select Structural **OR** No. 1, **as directed**, grade; WCLIB, or WWPB.
 - e. Species and Grade: Mixed southern pine, Select Structural **OR** No. 1 **OR** No. 2, **as directed**, grade; SPIB.
 - f. Species and Grade: Spruce-pine-fir, Select Structural **OR** No. 1, **as directed**, grade; NLGA.
 - g. Species and Grade: Douglas fir-south; Select Structural **OR** No. 1, **as directed**, grade; WWPB.
 - h. Species and Grade: Hem-fir; Select Structural **OR** No. 1, **as directed**, grade; WCLIB, or WWPB.
 - i. Species and Grade: Douglas fir-larch (north); Select Structural **OR** No. 1, **as directed**, grade; NLGA.
 - j. Species and Grade: Spruce-pine-fir (south), Select Structural **OR** No. 1, **as directed**, grade; NeLMA, WCLIB, or WWPB.
 - k. Species and Grade: Eastern hemlock-balsam fir or eastern hemlock-tamarack; Select Structural **OR** No. 1, **as directed**, grade; NeLMA.
 - l. Species and Grade: Beech-birch-hickory, Select Structural **OR** No. 1, **as directed**, grade; NeLMA.
 - m. Species and Grade: Northern red oak, Select Structural **OR** No. 1, **as directed**, grade; NeLMA.
 - n. Species and Grade: Redwood, Clear Heart Structural **OR** Clear Structural **OR** Select Structural **OR** No. 1, **as directed**, grade; RIS.
 - o. Species and Grade: Mixed oak, Select Structural **OR** No. 1, **as directed**, grade; NeLMA.
 - p. Species and Grade: Mixed maple, Select Structural **OR** No. 1, **as directed**, grade; NeLMA.

- q. Species and Grade: Western cedars, Select Structural **OR** No. 1, **as directed**, grade; WCLIB, or WWPA.

E. Timber Framing

1. Provide timber framing complying with the following requirements, according to grading rules of grading agency indicated:
 - a. Species and Grade: Douglas fir-larch, Douglas fir-larch (north), or Douglas fir-south; Select Structural **OR** No. 1, **as directed**, grade; NLGA, WCLIB, or WWPA.
 - b. Species and Grade: Eastern hemlock, eastern hemlock-tamarack, or eastern hemlock-tamarack (north); Select Structural **OR** No. 1, **as directed**, grade; NeLMA or NLGA.
 - c. Species and Grade: Hem-fir or hem-fir (north), Select Structural **OR** No. 1, **as directed**, grade; NLGA, WCLIB, or WWPA.
 - d. Species and Grade: Mixed maple, Select Structural **OR** No. 1, **as directed**, grade; NeLMA.
 - e. Species and Grade: Mixed oak, Select Structural **OR** No. 1, **as directed**, grade; NeLMA.
 - f. Species and Grade: Southern pine, Select Structural **OR** No. 1, **as directed**, grade; SPIB.
 - g. Maximum Moisture Content: 20 **OR** 23, **as directed**, percent.
 - h. Additional Restriction: Free of heart centers.

F. Engineered Wood Products

1. Laminated-Veneer Lumber: Structural composite lumber made from wood veneers with grain primarily parallel to member lengths, evaluated and monitored according to ASTM D 5456 and manufactured with an exterior-type adhesive complying with ASTM D 2559 and containing no urea formaldehyde.
 - a. Extreme Fiber Stress in Bending, Edgewise: 3100 psi (21.3 MPa) **OR** 2900 psi (20.0 MPa) **OR** 2600 psi (17.9 MPa) **OR** 2250 psi (15.5 MPa), **as directed**, for 12-inch nominal- (286-mm actual-) depth members.
 - b. Modulus of Elasticity, Edgewise: 2,000,000 psi (13 700 MPa) **OR** 1,800,000 psi (12 400 MPa) **OR** 1,500,000 psi (10 300 MPa), **as directed**.
2. Parallel-Strand Lumber: Structural composite lumber made from wood strand elements with grain primarily parallel to member lengths, evaluated and monitored according to ASTM D 5456 and manufactured with an exterior-type adhesive complying with ASTM D 2559 and containing no urea formaldehyde.
 - a. Extreme Fiber Stress in Bending, Edgewise: 2900 psi (20 MPa) for 12-inch nominal- (286-mm actual-) depth members.
 - b. Modulus of Elasticity, Edgewise: 2,200,000 psi (15 100 MPa).
3. Wood I-Joists: Prefabricated units, I-shaped in cross section, made with solid or structural composite lumber flanges and wood-based structural panel webs, let into and bonded to flanges. Provide units complying with material requirements of and with structural capacities established and monitored according to ASTM D 5055.
 - a. Provide I-joists manufactured without urea formaldehyde.
 - b. Web Material: Either oriented strand board or plywood, complying with DOC PS 1 or DOC PS 2, Exposure 1 **OR** Plywood, complying with DOC PS 1 or DOC PS 2, Exposure 1 **OR** Plywood, complying with DOC PS 1, Exterior grade, **as directed**.
 - c. Structural Properties: Provide units with depths and design values not less than those indicated.
 - d. Provide units complying with APA PRI-400, factory marked with APA trademark indicating nominal joist depth, joist class, span ratings, mill identification, and compliance with APA standard.
4. Rim Boards: Product designed to be used as a load-bearing member and to brace wood I-joists at bearing ends, complying with research/evaluation report for I-joists.
 - a. Manufacturer: Provide products by same manufacturer as I-joists.
 - b. Material: All-veneer product **OR** glued-laminated wood **OR** product made from any combination solid lumber, wood strands, and veneers, **as directed**. Provide rim boards made without urea formaldehyde.
 - c. Thickness: 1 inch (25 mm) **OR** 1-1/8 inches (28 mm) **OR** 1-1/4 inches (32 mm), **as directed**.

- d. Provide performance-rated product complying with APA PRR-401, rim board **OR** rim board plus, **as directed**, grade, factory marked with APA trademark indicating thickness, grade, and compliance with APA standard.

G. Miscellaneous Lumber

1. General: Provide miscellaneous lumber indicated and lumber for support or attachment of other construction, including the following:
 - a. Blocking.
 - b. Nailers.
 - c. Rooftop equipment bases and support curbs.
 - d. Cants.
 - e. Furring.
 - f. Grounds.
 - g. Utility shelving.
2. For items of dimension lumber size, provide Construction or No. 2 **OR** Standard, Stud, or No. 3, **as directed**, grade lumber with 15 **OR** 19, **as directed**, percent maximum moisture content of any species.
3. For items of dimension lumber size, provide Construction or No. 2 **OR** Standard, Stud, or No. 3, **as directed**, grade lumber with 15 **OR** 19, **as directed**, percent maximum moisture content and any of the following species:
 - a. Hem-fir (north); NLGA.
 - b. Mixed southern pine; SPIB.
 - c. Spruce-pine-fir; NLGA.
 - d. Hem-fir; WCLIB, or WWPA.
 - e. Spruce-pine-fir (south); NeLMA, WCLIB, or WWPA.
 - f. Western woods; WCLIB or WWPA.
 - g. Northern species; NLGA.
 - h. Eastern softwoods; NeLMA.
4. For exposed boards, provide lumber with 15 **OR** 19, **as directed**, percent maximum moisture content and any of the following species and grades:
 - a. Eastern white pine, Idaho white, lodgepole, ponderosa, or sugar pine; Premium or 2 Common (Sterling) **OR** Standard or No. 3 Common, **as directed**, grade; NeLMA, NLGA, WCLIB, or WWPA.
 - b. Mixed southern pine, No. 1 **OR** 2, **as directed**, grade; SPIB.
 - c. Hem-fir or hem-fir (north), Select Merchantable or No. 1 Common **OR** Construction or No. 2 Common, **as directed**, grade; NLGA, WCLIB, or WWPA.
 - d. Spruce-pine-fir (south) or spruce-pine-fir, Select Merchantable or No. 1 Common **OR** Construction or No. 2 Common, **as directed**, grade; NeLMA, NLGA, WCLIB, or WWPA.
5. For concealed boards, provide lumber with 15 **OR** 19, **as directed**, percent maximum moisture content and any of the following species and grades:
 - a. Mixed southern pine, No. 2 **OR** 3, **as directed**, grade; SPIB.
 - b. Hem-fir or hem-fir (north), Construction or 2 Common **OR** Standard or 3 Common, **as directed**, grade; NLGA, WCLIB, or WWPA.
 - c. Spruce-pine-fir (south) or spruce-pine-fir, Construction or 2 Common **OR** Standard or 3 Common, **as directed**, grade; NeLMA, NLGA, WCLIB, or WWPA.
 - d. Eastern softwoods, No. 2 **OR** 3, **as directed**, Common grade; NeLMA.
 - e. Northern species, No. 2 **OR** 3, **as directed**, Common grade; NLGA.
 - f. Western woods, Construction or No. 2 Common **OR** Standard or No. 3 Common, **as directed**, grade; WCLIB or WWPA.
6. For blocking not used for attachment of other construction, Utility, Stud, or No. 3 grade lumber of any species may be used provided that it is cut and selected to eliminate defects that will interfere with its attachment and purpose.
7. For blocking and nailers used for attachment of other construction, select and cut lumber to eliminate knots and other defects that will interfere with attachment of other work.
8. For furring strips for installing plywood or hardboard paneling, select boards with no knots capable of producing bent-over nails and damage to paneling.

- H. Plywood Backing Panels
1. Telephone and Electrical Equipment Backing Panels: DOC PS 1, Exposure 1, C-D Plugged, fire-retardant treated, **as directed**, in thickness indicated or, if not indicated, not less than 1/2-inch (13-mm) nominal thickness.
- I. Fasteners
1. General: Provide fasteners of size and type indicated that comply with requirements specified in this Article for material and manufacture.
 - a. Where rough carpentry is exposed to weather, in ground contact, pressure-preservative treated, or in area of high relative humidity, provide fasteners with hot-dip zinc coating complying with ASTM A 153/A 153M **OR** of Type 304 stainless steel, **as directed**.
 2. Nails, Brads, and Staples: ASTM F 1667.
 3. Power-Driven Fasteners: NES NER-272.
 4. Wood Screws: ASME B18.6.1.
 5. Lag Bolts: ASME B18.2.1 (ASME B18.2.3.8M).
 6. Bolts: Steel bolts complying with ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6); with ASTM A 563 (ASTM A 563M) hex nuts and, where indicated, flat washers.
 7. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to 6 times the load imposed when installed in unit masonry assemblies and equal to 4 times the load imposed when installed in concrete as determined by testing per ASTM E 488 conducted by a qualified independent testing and inspecting agency.
 - a. Material:
 - 1) Carbon-steel components, zinc plated to comply with ASTM B 633, Class Fe/Zn 5.
OR
Stainless steel with bolts and nuts complying with ASTM F 593 and ASTM F 594, Alloy Group 1 or 2 (ASTM F 738M and ASTM F 836M, Grade A1 or A4).
- J. Metal Framing Anchors
1. Allowable Design Loads: Provide products with allowable design loads, as published by manufacturer, that meet or exceed those indicated **OR** of basis-of-design products, **as directed**. Manufacturer's published values shall be determined from empirical data or by rational engineering analysis and demonstrated by comprehensive testing performed by a qualified independent testing agency.
 2. Galvanized Steel Sheet: Hot-dip, zinc-coated steel sheet complying with ASTM A 653/A 653M, G60 (Z180) coating designation.
 - a. Use for interior locations where stainless steel is not indicated.
 3. Stainless-Steel Sheet: ASTM A 666, Type 304 **OR** 316, **as directed**.
 - a. Use for exterior locations and where indicated.
 4. Joist Hangers: U-shaped joist hangers with 2-inch- (50-mm-) long seat and 1-1/4-inch- (32-mm-) wide nailing flanges at least 85 percent of joist depth.
 5. I-Joist Hangers: U-shaped joist hangers with 2-inch- (50-mm-) long seat and 1-1/4-inch- (32-mm-) wide nailing flanges full depth of joist. Nailing flanges provide lateral support at joist top chord.
 6. Top Flange Hangers: U-shaped joist hangers, full depth of joist, formed from metal strap with tabs bent to extend over and be fastened to supporting member.
 7. Bridging: Rigid, V-section, nailless type, 0.050 inch (1.3 mm) thick, length to suit joist size and spacing.
 8. Post Bases: Adjustable-socket type for bolting in place with standoff plate to raise post 1 inch (25 mm) above base and with 2-inch- (50-mm-) minimum side cover, socket 0.062 inch (1.6 mm) thick, and standoff and adjustment plates 0.108 inch (2.8 mm) thick.
 9. Joist Ties: Flat straps, with holes for fasteners, for tying joists together over supports.
 10. Rafter Tie-Downs: Bent strap tie for fastening rafters or roof trusses to wall studs below, 1-1/2 inches (38 mm) wide by 0.050 inch (1.3 mm) thick. Tie fastens to side of rafter or truss, face of top plates, and side of stud below.
 11. Rafter Tie-Downs (Hurricane or Seismic Ties): Bent strap tie for fastening rafters or roof trusses to wall studs below, 2-1/4 inches (57 mm) wide by 0.062 inch (1.6 mm) thick. Tie fits over top of rafter or truss and fastens to both sides of rafter or truss, face of top plates, and side of stud below.

12. Floor-to-Floor Ties: Flat straps, with holes for fasteners, for tying upper floor wall studs to band joists and lower floor studs, 1-1/4 inches (32 mm) wide by 0.050 inch (1.3 mm) thick by 36 inches (914 mm) long.
13. Hold-Downs: Brackets for bolting to wall studs and securing to foundation walls with anchor bolts or to other hold-downs with threaded rods and designed with first of two bolts placed seven bolt diameters from reinforced base.
14. Wall Bracing:
 - a. T-shaped bracing made for letting into studs in saw kerf, 1-1/8 inches (29 mm) wide by 9/16 inch (14 mm) deep by 0.034 inch (0.85 mm) thick with hemmed edges.

OR

Wall Bracing: Angle bracing made for letting into studs in saw kerf, 15/16 by 15/16 by 0.040 inch (24 by 24 by 1 mm) thick with hemmed edges.

K. Miscellaneous Materials

1. Sill-Sealer Gaskets:
 - a. Glass-fiber-resilient insulation, fabricated in strip form, for use as a sill sealer; 1-inch (25-mm) nominal thickness, compressible to 1/32 inch (0.8 mm); selected from manufacturer's standard widths to suit width of sill members indicated.

OR

Closed-cell neoprene foam, 1/4 inch (6.4 mm) thick, selected from manufacturer's standard widths to suit width of sill members indicated.
2. Adhesives for Gluing Furring and Sleepers to Concrete or Masonry: Formulation complying with ASTM D 3498 that is approved for use indicated by adhesive manufacturer.
 - a. Use adhesives that have a VOC content of 70 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
3. Water-Repellent Preservative: NWWDA-tested and -accepted formulation containing 3-iodo-2-propynyl butyl carbamate, combined with an insecticide containing chlorpyrifos as its active ingredient.

1.3 EXECUTION

A. Installation, General

1. Set rough carpentry to required levels and lines, with members plumb, true to line, cut, and fitted. Fit rough carpentry to other construction; scribe and cope as needed for accurate fit. Locate furring, nailers, blocking, grounds, and similar supports to comply with requirements for attaching other construction.
2. Framing Standard: Comply with AF&PA's "Details for Conventional Wood Frame Construction," unless otherwise indicated.
3. Framing with Engineered Wood Products: Install engineered wood products to comply with manufacturer's written instructions.
4. Metal Framing Anchors: Install metal framing to comply with manufacturer's written instructions.
5. Do not splice structural members between supports, unless otherwise indicated.
6. Provide blocking and framing as indicated and as required to support facing materials, fixtures, specialty items, and trim.
 - a. Provide metal clips for fastening gypsum board or lath at corners and intersections where framing or blocking does not provide a surface for fastening edges of panels. Space clips not more than 16 inches (406 mm) o.c.
7. Provide fire blocking in furred spaces, stud spaces, and other concealed cavities as indicated and as follows:
 - a. Fire block furred spaces of walls, at each floor level, at ceiling, and at not more than 96 inches (2438 mm) o.c. with solid wood blocking or noncombustible materials accurately fitted to close furred spaces.
 - b. Fire block concealed spaces of wood-framed walls and partitions at each floor level, at ceiling line of top story, and at not more than 96 inches (2438 mm) o.c. Where fire blocking is not inherent in framing system used, provide closely fitted solid wood blocks of same width as framing members and 2-inch nominal- (38-mm actual-) thickness.

- c. Fire block concealed spaces between floor sleepers with same material as sleepers to limit concealed spaces to not more than 100 sq. ft. (9.3 sq. m) and to solidly fill space below partitions.
 - d. Fire block concealed spaces behind combustible cornices and exterior trim at not more than 20 feet (6 m) o.c.
 8. Sort and select lumber so that natural characteristics will not interfere with installation or with fastening other materials to lumber. Do not use materials with defects that interfere with function of member or pieces that are too small to use with minimum number of joints or optimum joint arrangement.
 9. Comply with AWP A M4 for applying field treatment to cut surfaces of preservative-treated lumber.
 - a. Use inorganic boron for items that are continuously protected from liquid water.
 - b. Use copper naphthenate for items not continuously protected from liquid water.
 10. Securely attach rough carpentry work to substrate by anchoring and fastening as indicated, complying with the following:
 - a. NES NER-272 for power-driven fasteners.
 - b. Table 2304.9.1, "Fastening Schedule," in ICC's International Building Code.
 - c. Table 23-II-B-1, "Nailing Schedule," and Table 23-II-B-2, "Wood Structural Panel Roof Sheathing Nailing Schedule," in ICBO's Uniform Building Code.
 - d. Table 2305.2, "Fastening Schedule," in BOCA's BOCA National Building Code.
 - e. Table 2306.1, "Fastening Schedule," in SBCCI's Standard Building Code.
 - f. Table R602.3(1), "Fastener Schedule for Structural Members," and Table R602.3(2), "Alternate Attachments," in ICC's International Residential Code for One- and Two-Family Dwellings.
 - g. Table 602.3(1), "Fastener Schedule for Structural Members," and Table 602.3(2), "Alternate Attachments," in ICC's International One- and Two-Family Dwelling Code.
 11. Use common wire nails, unless otherwise indicated. Select fasteners of size that will not fully penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood; do not countersink nail heads, unless otherwise indicated.
 12. For exposed work, arrange fasteners in straight rows parallel with edges of members, with fasteners evenly spaced, and with adjacent rows staggered.
 - a. Comply with approved **OR** indicated, **as directed**, fastener patterns where applicable. Before fastening, mark fastener locations, using a template made of sheet metal, plastic, or cardboard.
 - b. Use finishing nails, unless otherwise indicated. Do not countersink nail heads **OR** Countersink nail heads and fill holes with wood filler, **as directed**.
- B. Wood Ground, Sleeper, Blocking, And Nailer Installation
1. Install where indicated and where required for screeding or attaching other work. Form to shapes indicated and cut as required for true line and level of attached work. Coordinate locations with other work involved.
 2. Attach items to substrates to support applied loading. Recess bolts and nuts flush with surfaces, unless otherwise indicated.
 3. Provide permanent grounds of dressed, pressure-preservative-treated, key-beveled lumber not less than 1-1/2 inches (38 mm) wide and of thickness required to bring face of ground to exact thickness of finish material. Remove temporary grounds when no longer required.
- C. Wood Furring Installation
1. Install level and plumb with closure strips at edges and openings. Shim with wood as required for tolerance of finish work.
 2. Furring to Receive Plywood or Hardboard Paneling: Install 1-by-3-inch nominal- (19-by-63-mm actual-) size furring horizontally **OR** vertically **OR** horizontally and vertically, **as directed**, at 24 inches (610 mm) **OR** 600 mm, **as directed**, o.c.
 3. Furring to Receive Gypsum Board **OR** Plaster Lath, **as directed**: Install 1-by-2-inch nominal- (19-by-38-mm actual-) size furring vertically at 16 inches (406 mm) **OR** 400 mm, **as directed**, o.c.
- D. Wall And Partition Framing Installation

1. General: Provide single bottom plate and double top plates using members of 2-inch nominal (38-mm actual) thickness whose widths equal that of studs, except single top plate may be used for non-load-bearing partitions and for load-bearing partitions where framing members bearing on partition are located directly over studs. Fasten plates to supporting construction, unless otherwise indicated.
 - a. For exterior walls, provide 2-by-6-inch nominal- (38-by-140-mm actual-) **OR** 2-by-4-inch nominal- (38-by-89-mm actual-), **as directed**, size wood studs spaced 24 inches (610 mm) **OR** 16 inches (406 mm) **OR** 600 mm **OR** 400 mm, **as directed**, o.c., unless otherwise indicated.
 - b. For interior partitions and walls, provide 2-by-6-inch nominal- (38-by-140-mm actual-) **OR** 2-by-4-inch nominal- (38-by-89-mm actual-) **OR** 2-by-3-inch nominal- (38-by-64-mm actual-), **as directed**, size wood studs spaced 24 inches (610 mm) **OR** 16 inches (406 mm) **OR** 600 mm **OR** 400 mm, **as directed**, o.c., unless otherwise indicated.
 - c. Provide continuous horizontal blocking at midheight of partitions more than 96 inches (2438 mm) high, using members of 2-inch nominal (38-mm actual) thickness and of same width as wall or partitions.
2. Construct corners and intersections with three or more studs, except that two studs may be used for interior non-load-bearing partitions.
3. Frame openings with multiple studs and headers. Provide nailed header members of thickness equal to width of studs. Support headers on jamb studs.
 - a. For non-load-bearing partitions, provide double-jamb studs and headers not less than 4-inch nominal (89-mm actual) depth for openings 48 inches (1200 mm) and less in width, 6-inch nominal (140-mm actual) depth for openings 48 to 72 inches (1200 to 1800 mm) in width, 8-inch nominal (184-mm actual) depth for openings 72 to 120 inches (1800 to 3000 mm) in width, and not less than 10-inch nominal (235-mm actual) depth for openings 10 to 12 feet (3 to 3.6 m) in width.
 - b. For load-bearing walls, provide double-jamb studs for openings 60 inches (1500 mm) and less in width, and triple-jamb studs for wider openings. Provide headers of depth indicated or, if not indicated, according to Table R502.5(1) or Table R502.5(2), as applicable, in ICC's International Residential Code for One- and Two-Family Dwellings.
4. Provide diagonal bracing in exterior walls, at both walls of each external corner **OR** walls, at locations indicated, **as directed**, at 45-degree angle, full-story height, unless otherwise indicated. Use 1-by-4-inch nominal- (19-by-89-mm actual-) size boards, let-in flush with faces of studs **OR** metal wall bracing, let into studs in saw kerf, **as directed**.

E. Floor Joist Framing Installation

1. General: Install floor joists with crown edge up and support ends of each member with not less than 1-1/2 inches (38 mm) of bearing on wood or metal, or 3 inches (76 mm) on masonry. Attach floor joists as follows:
 - a. Where supported on wood members, by toe nailing or by using metal framing anchors.
 - b. Where framed into wood supporting members, by using wood ledgers as indicated or, if not indicated, by using metal joist hangers.
2. Fire Cuts: At joists built into masonry, bevel cut ends 3 inches (76 mm) and do not embed more than 4 inches (102 mm).
3. Frame openings with headers and trimmers supported by metal joist hangers; double headers and trimmers where span of header exceeds 48 inches (1200 mm).
4. Do not notch in middle third of joists; limit notches to one-sixth depth of joist, one-third at ends. Do not bore holes larger than 1/3 depth of joist; do not locate closer than 2 inches (50 mm) from top or bottom.
5. Provide solid blocking of 2-inch nominal (38-mm actual) thickness by depth of joist at ends of joists unless nailed to header or band.
6. Lap members framing from opposite sides of beams, girders, or partitions not less than 4 inches (102 mm) or securely tie opposing members together. Provide solid blocking of 2-inch nominal (38-mm actual) thickness by depth of joist over supports.
7. Anchor members paralleling masonry with 1/4-by-1-1/4-inch (6.4-by-32-mm) metal strap anchors spaced not more than 96 inches (2438 mm) o.c., extending over and fastening to 3 joists. Embed

- anchors at least 4 inches (102 mm) into grouted masonry with ends bent at right angles and extending 4 inches (102 mm) beyond bend.
8. Provide solid blocking between joists under jamb studs for openings.
 9. Under non-load-bearing partitions, provide double joists separated by solid blocking equal to depth of studs above.
 - a. Provide triple joists separated as above, under partitions receiving ceramic tile and similar heavy finishes or fixtures.
 10. Provide bridging of type indicated below, at intervals of 96 inches (2438 mm) o.c., between joists.
 - a. Diagonal wood bridging formed from bevel-cut, 1-by-3-inch nominal- (19-by-64-mm actual-) size lumber, double-crossed and nailed at both ends to joists.
 - b. Steel bridging installed to comply with bridging manufacturer's written instructions.
- F. Ceiling Joist And Rafter Framing Installation
1. Ceiling Joists: Install ceiling joists with crown edge up and complying with requirements specified above for floor joists. Face nail to ends of parallel rafters.
 - a. Where ceiling joists are at right angles to rafters, provide additional short joists parallel to rafters from wall plate to first joist; nail to ends of rafters and to top plate and nail to first joist or anchor with framing anchors or metal straps. Provide 1-by-8-inch nominal- (19-by-184-mm actual-) size or 2-by-4-inch nominal- (38-by-89-mm actual-) size stringers spaced 48 inches (1200 mm) o.c. crosswise over main ceiling joists.
 2. Rafters: Notch to fit exterior wall plates and toe nail or use metal framing anchors. Double rafters to form headers and trimmers at openings in roof framing, if any, and support with metal hangers. Where rafters abut at ridge, place directly opposite each other and nail to ridge member or use metal ridge hangers.
 - a. At valleys, provide double-valley rafters of size indicated or, if not indicated, of same thickness as regular rafters and 2 inches (50 mm) deeper. Bevel ends of jack rafters for full bearing against valley rafters.
 - b. At hips, provide hip rafter of size indicated or, if not indicated, of same thickness as regular rafters and 2 inches (50 mm) deeper. Bevel ends of jack rafters for full bearing against hip rafter.
 3. Provide collar beams (ties) as indicated or, if not indicated, provide 1-by-6-inch nominal- (19-by-140-mm actual-) size boards between every third pair of rafters, but not more than 48 inches (1219 mm) o.c. Locate below ridge member, at third point of rafter span. Cut ends to fit roof slope and nail to rafters.
 4. Provide special framing as indicated for eaves, overhangs, dormers, and similar conditions, if any.
- G. Timber Framing Installation
1. Install timber with crown edge up and provide not less than 4 inches (102 mm) of bearing on supports. Provide continuous members, unless otherwise indicated; tie together over supports as indicated if not continuous.
 2. Where beams or girders are framed into pockets of exterior concrete or masonry walls, provide 1/2-inch (13-mm) air space at sides and ends of wood members.
 3. Install wood posts using metal anchors indicated.
 4. Treat ends of timber beams and posts exposed to weather by dipping in water-repellent preservative for 15 minutes.
- H. Stair Framing Installation
1. Provide stair framing members of size, space, and configuration indicated or, if not indicated, to comply with the following requirements:
 - a. Stringer Size: 2-by-12-inch nominal- (38-by-286-mm actual-) size, minimum.
 - b. Stringer Material: Laminated-veneer lumber **OR** parallel-strand lumber **OR** solid lumber, **as directed**.
 - c. Notching: Notch stringers to receive treads, risers, and supports; leave at least 3-1/2 inches (89 mm) of effective depth.
 - d. Stringer Spacing: At least 3 stringers for each 36-inch (914-mm) clear width of stair.

2. Provide stair framing with no more than 3/16-inch (4.7-mm) variation between adjacent treads and risers and no more than 3/8-inch (9.5-mm) variation between largest and smallest treads and risers within each flight.
- I. Protection
 1. Protect wood that has been treated with inorganic boron (SBX) from weather. If, despite protection, inorganic boron-treated wood becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.
 2. Protect rough carpentry from weather. If, despite protection, rough carpentry becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.

END OF SECTION 06 10 00 00

SECTION 06 10 53 00 - MISCELLANEOUS ROUGH CARPENTRY**1.1 GENERAL****A. Description Of Work:**

1. This specification covers the furnishing and installation of materials for miscellaneous carpentry. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Framing with dimension lumber.
 - b. Rooftop equipment bases and support curbs.
 - c. Wood blocking, cants, and nailers.
 - d. Wood furring and grounds.
 - e. Wood sleepers.
 - f. Interior wood trim.
 - g. Wood shelving and clothes rods.
 - h. Plywood backing panels.

C. Definitions

1. Dimension Lumber: Lumber of 2 inches nominal (38 mm actual) or greater but less than 5 inches nominal (114 mm actual) in least dimension.
2. Lumber grading agencies, and the abbreviations used to reference them, include the following:
 - a. NeLMA: Northeastern Lumber Manufacturers' Association.
 - b. NHLA: National Hardwood Lumber Association.
 - c. NLGA: National Lumber Grades Authority.
 - d. SPIB: The Southern Pine Inspection Bureau.
 - e. WCLIB: West Coast Lumber Inspection Bureau.
 - f. WWPAA: Western Wood Products Association.

D. Submittals

1. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.
 - a. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used and net amount of preservative retained.
 - b. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Include physical properties of treated materials based on testing by a qualified independent testing agency.
 - c. For fire-retardant treatments specified to be High-Temperature (HT) type include physical properties of treated lumber both before and after exposure to elevated temperatures, based on testing by a qualified independent testing agency according to ASTM D 5664.
 - d. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.
 - e. Include copies of warranties from chemical treatment manufacturers for each type of treatment.
2. LEED Submittals:
 - a. Product Data for Credit EQ 4.1: For adhesives, including printed statement of VOC content.
 - b. Product Data for Credit EQ 4.4: For composite-wood products, documentation indicating that product contains no urea formaldehyde.

- c. Certificates for Credit MR 7: Chain-of-custody certificates certifying that products specified to be made from certified wood comply with forest certification requirements. Include evidence that mill is certified for chain of custody by an FSC-accredited certification body.
 - 1) Include statement indicating costs for each certified wood product.
- 3. Research/Evaluation Reports: For the following, showing compliance with building code in effect for Project:
 - a. Preservative-treated wood.
 - b. Fire-retardant-treated wood.
 - c. Power-driven fasteners.
 - d. Powder-actuated fasteners.
 - e. Expansion anchors.
 - f. Metal framing anchors.

E. Quality Assurance

- 1. Forest Certification: For the following wood products, provide materials produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship":
 - a. Dimension lumber framing.
 - b. Miscellaneous lumber.
 - c. Interior wood trim.
 - d. Shelving and clothes rods.

F. Delivery, Storage, And Handling

- 1. Stack lumber flat with spacers between each bundle to provide air circulation. Provide for air circulation around stacks and under coverings.
- 2. Deliver interior wood materials that are to be exposed to view only after building is enclosed and weatherproof, wet work other than painting is dry, and HVAC system is operating and maintaining temperature and humidity at occupancy levels.

1.2 PRODUCTS

A. Wood Products, General

- 1. Lumber: DOC PS 20 and applicable rules of grading agencies indicated. If no grading agency is indicated, provide lumber that complies with the applicable rules of any rules-writing agency certified by the ALSC Board of Review. Provide lumber graded by an agency certified by the ALSC Board of Review to inspect and grade lumber under the rules indicated.
 - a. Factory mark each piece of lumber with grade stamp of grading agency.
 - b. For exposed lumber indicated to receive a stained or natural finish, mark grade stamp on end or back of each piece or omit grade stamp and provide certificates of grade compliance issued by grading agency.
 - c. Where nominal sizes are indicated, provide actual sizes required by DOC PS 20 for moisture content specified. Where actual sizes are indicated, they are minimum dressed sizes for dry lumber.
 - d. Provide dressed lumber, S4S, unless otherwise indicated.

B. Wood-Preservative-Treated Materials

- 1. Preservative Treatment by Pressure Process: AWPA C2, except that lumber that is not in contact with the ground and is continuously protected from liquid water may be treated according to AWPA C31 with inorganic boron (SBX).
 - a. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium.
 - b. For exposed items indicated to receive a stained or natural finish, use chemical formulations that do not require incising, contain colorants, bleed through, or otherwise adversely affect finishes.

2. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent. Do not use material that is warped or does not comply with requirements for untreated material.
 3. Mark lumber with treatment quality mark of an inspection agency approved by the ALSC Board of Review.
 - a. For exposed lumber indicated to receive a stained or natural finish, mark end or back of each piece or omit marking and provide certificates of treatment compliance issued by inspection agency.
 4. Application: Treat all miscellaneous carpentry, unless otherwise indicated **OR** items indicated on Drawings, and the following, **as directed**:
 - a. Wood cants, nailers, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, vapor barriers, and waterproofing.
 - b. Wood sills, sleepers, blocking, furring, stripping, and similar concealed members in contact with masonry or concrete.
 - c. Wood framing and furring attached directly to the interior of below-grade exterior masonry or concrete walls.
 - d. Wood framing members that are less than 18 inches (460 mm) above the ground in crawl spaces or unexcavated areas.
 - e. Wood floor plates that are installed over concrete slabs-on-grade.
- C. Fire-Retardant-Treated Materials
1. General: Comply with performance requirements in AWPA C20 (lumber) and AWPA C27 (plywood).
 - a. Use treatment that does not promote corrosion of metal fasteners.
 - b. Use Exterior type for exterior locations and where indicated.
 - c. Use Interior Type A, High Temperature (HT) for enclosed roof framing, framing in attic spaces, and where indicated.
 - d. Use Interior Type A, unless otherwise indicated.
 2. Identify fire-retardant-treated wood with appropriate classification marking of testing and inspecting agency acceptable to authorities having jurisdiction.
 - a. For exposed lumber indicated to receive a stained or natural finish, mark end or back of each piece or omit marking and provide certificates of treatment compliance issued by inspection agency.
 3. For exposed items indicated to receive a stained or natural finish, use chemical formulations that do not bleed through, contain colorants, or otherwise adversely affect finishes.
 4. Application: Treat all miscellaneous carpentry, unless otherwise indicated **OR** items indicated on Drawings, and the following, **as directed**:
 - a. Framing for raised platforms.
 - b. Concealed blocking.
 - c. Roof construction.
 - d. Plywood backing panels.
- D. Dimension Lumber Framing
1. Maximum Moisture Content: 15 percent **OR** 19 percent **OR** 15 percent for 2-inch nominal (38-mm actual) thickness or less, 19 percent for more than 2-inch nominal (38-mm actual) thickness, **as directed**.
 2. Non-Load-Bearing Interior Partitions: Construction or No. 2 **OR** Construction, Stud, or No. 3 **OR** Standard, Stud, or No. 3, **as directed**, grade of any species.
 3. Other Framing: No. 2 **OR** Construction or No. 2 **OR** Construction, Stud, or No., **as directed**, grade and any of the following species:
 - a. Hem-fir (north); NLGA.
 - b. Southern pine; SPIB.
 - c. Douglas fir-larch; WCLIB or WWPA.
 - d. Mixed southern pine; SPIB.
 - e. Spruce-pine-fir; NLGA.
 - f. Douglas fir-south; WWPA.
 - g. Hem-fir; WCLIB or WWPA.
 - h. Douglas fir-larch (north); NLGA.

- i. Spruce-pine-fir (south); NeLMA, WCLIB, or WWPA.

E. Miscellaneous Lumber

1. General: Provide miscellaneous lumber indicated and lumber for support or attachment of other construction, including the following:
 - a. Blocking.
 - b. Nailers.
 - c. Rooftop equipment bases and support curbs.
 - d. Cants.
 - e. Furring.
 - f. Grounds.
 - g. Utility shelving.
2. For items of dimension lumber size, provide Construction or No. 2 **OR** Standard, Stud, or No. 3, **as directed**, grade lumber with 15 **OR** 19, **as directed**, percent maximum moisture content of any species.
3. For exposed boards, provide lumber with 15 **OR** 19, **as directed**, percent maximum moisture content and any of the following species and grades:
 - a. Eastern white pine, Idaho white, lodgepole, ponderosa, or sugar pine; Premium or 2 Common (Sterling) **OR** Standard or No. 3 Common, **as directed**, grade; NeLMA, NLGA, WCLIB, or WWPA.
 - b. Mixed southern pine, No. 1 **OR** 2, **as directed**, grade; SPIB.
 - c. Hem-fir or hem-fir (north), Select Merchantable or No. 1 Common **OR** Construction or No. 2 Common, **as directed**, grade; NLGA, WCLIB, or WWPA.
 - d. Spruce-pine-fir (south) or spruce-pine-fir, Select Merchantable or No. 1 Common **OR** Construction or No. 2 Common, **as directed**, grade; NeLMA, NLGA, WCLIB, or WWPA.
4. For concealed boards, provide lumber with 15 **OR** 19, **as directed**, percent maximum moisture content and any of the following species and grades:
 - a. Mixed southern pine, No. 2 **OR** 3, **as directed**, grade; SPIB.
 - b. Hem-fir or hem-fir (north), Construction or 2 Common **OR** Standard or 3 Common, **as directed**, grade; NLGA, WCLIB, or WWPA.
 - c. Spruce-pine-fir (south) or spruce-pine-fir, Construction or 2 Common **OR** Standard or 3 Common, **as directed**, grade; NeLMA, NLGA, WCLIB, or WWPA.
 - d. Eastern softwoods, No. 2 **OR** 3, **as directed**, Common grade; NELMA.
 - e. Northern species, No. 2 **OR** 3, **as directed**, Common grade; NLGA.
 - f. Western woods, Construction or No. 2 Common **OR** Standard or No. 3 Common, **as directed**, grade; WCLIB or WWPA.
5. For blocking not used for attachment of other construction Utility, Stud, or No. 3 grade lumber of any species may be used provided that it is cut and selected to eliminate defects that will interfere with its attachment and purpose.
6. For blocking and nailers used for attachment of other construction, select and cut lumber to eliminate knots and other defects that will interfere with attachment of other work.
7. For furring strips for installing plywood or hardboard paneling, select boards with no knots capable of producing bent-over nails and damage to paneling.

F. Interior Wood Trim

1. General: Provide kiln-dried finished (surfaced) material without finger-jointing, unless otherwise indicated.
2. Softwood Lumber Trim for Transparent (Stain or Clear) Finish: Provide one of the following species and grade:
 - a. Grade C Select **OR** D Select **OR** Finish **OR** Premium, **as directed**, eastern white pine; NeLMA or NLGA.
 - b. Grade C Select (Choice) **OR** D Select (Quality) **OR** 1 Common (Colonial) **OR** 2 Common (Sterling), **as directed**, Idaho white, lodgepole, ponderosa, or sugar pine; NLGA or WWPA.
 - c. Grade Superior or C & Btr **OR** Prime or D, **as directed**, Finish Douglas fir-larch or Douglas fir-south; NLGA, WCLIB, or WWPA.

- d. Clear Heart **OR** Grade A **OR** Grade B, **as directed**, western red cedar; NLGA, WCLIB, or WHPA.
 3. Hardwood Lumber Trim for Transparent (Stain or Clear) Finish: Clear red oak **OR** white maple, **as directed**, selected for compatible grain and color, **as directed**.
 4. Lumber Trim for Opaque (Painted) Finish: Either finger-jointed or solid lumber, of one of the following species and grades:
 - a. Grade D Select **OR** Finish **OR** Premium, **as directed**, eastern white pine; NeLMA or NLGA.
 - b. Grade D Select (Quality) **OR** 1 Common (Colonial) **OR** 2 Common (Sterling), **as directed**, Idaho white, lodgepole, ponderosa, or sugar pine; NLGA or WHPA.
 - c. Grade A **OR** B, **as directed**, Finish aspen, basswood, cottonwood, gum, magnolia, red alder, soft maple, sycamore, tupelo, or yellow poplar; NHLA.
 5. Moldings: Made to patterns included in WMMPA WM 7 and graded according to WMMPA WM 4.
 - a. Moldings for Transparent (Stain or Clear) Finish: N-grade eastern white, Idaho white, lodgepole, ponderosa, or sugar pine **OR** western red cedar **OR** Douglas fir **OR** red oak **OR** white maple, **as directed**, selected for compatible grain and color.
 - b. Moldings for Opaque (Painted) Finish: P-grade eastern white, Idaho white, lodgepole, ponderosa, or sugar pine **OR** aspen, basswood, cottonwood, gum, magnolia, soft maple, tupelo, or yellow poplar **OR** primed medium-density fiberboard, **as directed**.
- G. Shelving And Clothes Rods
 1. Shelving: Made from one of the following materials, 3/4-inch (19-mm) thick. Do not use particleboard or medium-density fiberboard that contains urea formaldehyde.
 - a. Melamine-faced particleboard with radiused and filled front edge.
 - b. Particleboard with radiused and filled **OR** solid-wood, **as directed**, front edge.
 - c. Medium-density fiberboard with radiused **OR** solid-wood, **as directed**, front edge.
 - d. Wood boards of same species and grade indicated above for interior lumber trim for opaque **OR** transparent, **as directed**, finish.
 2. Shelf Cleats: 3/4-by-3-1/2-inch (19-by-89-mm) boards **OR** 3/4-by-5-1/2-inch (19-by-140-mm) boards with hole and notch to receive clothes rods, **as directed**, of same species and grade indicated above for interior lumber trim for opaque finish.
 3. Shelf Brackets: Prime-painted formed steel with provision to support clothes rod where rod is indicated.
 4. Clothes Rods:
 - a. 1-1/2-inch- (38-mm-) diameter, clear, kiln-dried hardwood rods **OR** clear, kiln-dried softwood rods; either Douglas fir or southern pine **OR** aluminum tubes, **as directed**.
OR
1-1/4-inch- (32-mm-) diameter, chrome-plated steel **OR** stainless-steel, **as directed**, tubes.
 5. Rod Flanges: Clear, kiln-dried hardwood turnings **OR** Clear, kiln-dried softwood turnings **OR** Aluminum **OR** Chrome-plated steel **OR** Stainless steel, **as directed**.
- H. Plywood Backing Panels
 1. Telephone and Electrical Equipment Backing Panels: DOC PS 1, Exposure 1, C-D Plugged, fire-retardant treated, **as directed**, in thickness indicated or, if not indicated, not less than 1/2-inch (13-mm) nominal thickness.
- I. Fasteners
 1. General: Provide fasteners of size and type indicated that comply with requirements specified in this Article for material and manufacture.
 - a. Where carpentry is exposed to weather, in ground contact, pressure-preservative treated, or in area of high relative humidity, provide fasteners with hot-dip zinc coating complying with ASTM A 153/A 153M **OR** of Type 304 stainless steel, **as directed**.
 2. Nails, Brads, and Staples: ASTM F 1667.
 3. Power-Driven Fasteners: NES NER-272.
 4. Wood Screws: ASME B18.6.1.
 5. Screws for Fastening to Cold-Formed Metal Framing: ASTM C 954, except with wafer heads and reamer wings, length as recommended by screw manufacturer for material being fastened.

6. Lag Bolts: ASME B18.2.1 (ASME B18.2.3.8M).
 7. Bolts: Steel bolts complying with ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6); with ASTM A 563 (ASTM A 563M) hex nuts and, where indicated, flat washers.
 8. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to 6 times the load imposed when installed in unit masonry assemblies and equal to 4 times the load imposed when installed in concrete as determined by testing per ASTM E 488 conducted by a qualified independent testing and inspecting agency.
 - a. Material:
 - 1) Carbon-steel components, zinc plated to comply with ASTM B 633, Class Fe/Zn 5.
OR
 Stainless steel with bolts and nuts complying with ASTM F 593 and ASTM F 594, Alloy Group 1 or 2 (ASTM F 738M and ASTM F 836M, Grade A1 or A4).
- J. Metal Framing Anchors
1. Galvanized Steel Sheet: Hot-dip, zinc-coated steel sheet complying with ASTM A 653/A 653M, G60 (Z180) coating designation.
 - a. Use for interior locations where stainless steel is not indicated.
 2. Stainless-Steel Sheet: ASTM A 666, Type 304 **OR** 316, **as directed**.
 - a. Use for exterior locations and where indicated.
- K. Miscellaneous Materials
1. Adhesives for Gluing Furring and Sleepers to Concrete or Masonry: Formulation complying with ASTM D 3498 that is approved for use indicated by adhesive manufacturer.
 - a. Use adhesives that have a VOC content of 70 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

1.3 EXECUTION

A. Installation, General

1. Set carpentry to required levels and lines, with members plumb, true to line, cut, and fitted. Fit carpentry to other construction; scribe and cope as needed for accurate fit. Locate furring, nailers, blocking, grounds, and similar supports to comply with requirements for attaching other construction.
2. Framing Standard: Comply with AF&PA's "Details for Conventional Wood Frame Construction," unless otherwise indicated.
3. Metal Framing Anchors: Install metal framing to comply with manufacturer's written instructions.
4. Do not splice structural members between supports, unless otherwise indicated.
5. Provide blocking and framing as indicated and as required to support facing materials, fixtures, specialty items, and trim.
 - a. Provide metal clips for fastening gypsum board or lath at corners and intersections where framing or blocking does not provide a surface for fastening edges of panels. Space clips not more than 16 inches (406 mm) o.c.
6. Provide fire blocking in furred spaces, stud spaces, and other concealed cavities as indicated and as follows:
 - a. Fire block furred spaces of walls, at each floor level, at ceiling, and at not more than 96 inches (2438 mm) o.c. with solid wood blocking or noncombustible materials accurately fitted to close furred spaces.
 - b. Fire block concealed spaces of wood-framed walls and partitions at each floor level, at ceiling line of top story, and at not more than 96 inches (2438 mm) o.c. Where fire blocking is not inherent in framing system used, provide closely fitted solid wood blocks of same width as framing members and 2-inch nominal- (38-mm actual-) thickness.
 - c. Fire block concealed spaces between floor sleepers with same material as sleepers to limit concealed spaces to not more than 100 sq. ft. (9.3 sq. m) and to solidly fill space below partitions.
 - d. Fire block concealed spaces behind combustible cornices and exterior trim at not more than 20 feet (6 m) o.c.

7. Sort and select lumber so that natural characteristics will not interfere with installation or with fastening other materials to lumber. Do not use materials with defects that interfere with function of member or pieces that are too small to use with minimum number of joints or optimum joint arrangement.
 8. Comply with AWP A M4 for applying field treatment to cut surfaces of preservative-treated lumber.
 - a. Use inorganic boron for items that are continuously protected from liquid water.
 - b. Use copper naphthenate for items not continuously protected from liquid water.
 9. Securely attach carpentry work to substrate by anchoring and fastening as indicated, complying with the following:
 - a. NES NER-272 for power-driven fasteners.
 - b. Table 2304.9.1, "Fastening Schedule," in ICC's International Building Code.
 - c. Table 23-II-B-1, "Nailing Schedule," and Table 23-II-B-2, "Wood Structural Panel Roof Sheathing Nailing Schedule," in ICBO's Uniform Building Code.
 - d. Table 2305.2, "Fastening Schedule," in BOCA's BOCA National Building Code.
 - e. Table 2306.1, "Fastening Schedule," in SBCCI's Standard Building Code.
 - f. Table R602.3(1), "Fastener Schedule for Structural Members," and Table R602.3(2), "Alternate Attachments," in ICC's International Residential Code for One- and Two-Family Dwellings.
 - g. Table 602.3(1), "Fastener Schedule for Structural Members," and Table 602.3(2), "Alternate Attachments," in ICC's International One- and Two-Family Dwelling Code.
 10. Use common wire nails, unless otherwise indicated. Select fasteners of size that will not fully penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood; do not countersink nail heads, unless otherwise indicated.
- B. Wood Ground, Sleeper, Blocking, And Nailer Installation
1. Install where indicated and where required for screeding or attaching other work. Form to shapes indicated and cut as required for true line and level of attached work. Coordinate locations with other work involved.
 2. Attach items to substrates to support applied loading. Recess bolts and nuts flush with surfaces, unless otherwise indicated.
 3. Provide permanent grounds of dressed, pressure-preservative-treated, key-beveled lumber not less than 1-1/2 inches (38 mm) wide and of thickness required to bring face of ground to exact thickness of finish material. Remove temporary grounds when no longer required.
- C. Wood Furring Installation
1. Install level and plumb with closure strips at edges and openings. Shim with wood as required for tolerance of finish work.
 2. Furring to Receive Plywood or Hardboard Paneling: Install 1-by-3-inch nominal- (19-by-63-mm actual-) size furring horizontally **OR** vertically **OR** horizontally and vertically, **as directed**, at 24 inches (610 mm) **OR** 600 mm, **as directed**, o.c.
 3. Furring to Receive Gypsum Board **OR** Plaster Lath, **as directed**: Install 1-by-2-inch nominal- (19-by-38-mm actual-) size furring vertically at 16 inches (406 mm) **OR** 400 mm, **as directed**, o.c.
- D. Wood Trim Installation
1. Install with minimum number of joints practical, using full-length pieces from maximum lengths of lumber available. Do not use pieces less than 24 inches (610 mm) long except where necessary. Stagger joints in adjacent and related standing and running trim. Cope at returns and miter at corners to produce tight-fitting joints with full-surface contact throughout length of joint. Use scarf joints for end-to-end joints.
 - a. Match color and grain pattern across joints.
 - b. Install trim after gypsum board joint-finishing operations are completed.
 - c. Drill pilot holes in hardwood before fastening to prevent splitting. Fasten to prevent movement or warping. Countersink fastener heads and fill holes.
 - d. Install to tolerance of 1/8 inch in 96 inches (3 mm in 2438 mm) for level and plumb. Install adjoining finish carpentry with 1/32-inch (0.8-mm) maximum offset for flush installation and 1/16-inch (1.6-mm) maximum offset for reveal installation.

E. Protection

1. Protect wood that has been treated with inorganic boron (SBX) from weather. If, despite protection, inorganic boron-treated wood becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.
2. Protect rough carpentry from weather. If, despite protection, rough carpentry becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.

END OF SECTION 06 10 53 00

Task	Specification	Specification Description
06 10 53 00	06 10 00 00	Rough Carpentry
06 11 00 00	06 10 00 00	Rough Carpentry

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 06 11 13 00 - ROUGH CARPENTRY RENOVATION**1.1 DESCRIPTION OF WORK**

- A. This specification covers the furnishing and installation of materials for rough carpentry renovation. Products shall be as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

1.2 GENERAL**A. Quality Assurance****1. Regulatory Requirements:**

- a. Fire Retardant Treated Lumber and Plywood: Bear UL FR-S classification label.
- b. Preservative Treated Wood: Provide all heart redwood, cedar, or cyprus; or preservative-treated wood at following conditions in accordance with applicable building code:
 - 1) Wood framing, woodwork, and plywood up to and including subflooring at first-floor level of structures having crawl spaces, when bottoms of such items are 150 mm (6 inches) or less from earth underneath.
 - 2) Exterior wood steps, platforms, and railings.
 - 3) Wood sills, soles, plates, furring, and sleepers that are less than 150 mm (6 inches) from earth, furring and nailers that are set into or in contact with concrete or masonry.
 - 4) Nailers, edge strips, crickets, curbs, and cants for roof decks.
 - 5) Furring strips used on walls or partitions below grade and exterior walls above grade.
 - 6) Wood members used for rough framing of openings in exterior concrete or masonry walls.

B. Delivery, Storage, And Handling

1. General: Deliver material to site, off-load, and handle in manner that will not damage material. Store material off ground and cover with waterproof covering. Provide adequate ventilation.
 - a. Interior Fire-Retardant Treated Wood: Keep dry at all times. Replace material that has become wet. Store off ground, in building, or covered with unbroken water-tight cover in storage yard, during transit, and at job site. Keep ventilated to avoid moisture condensation.

C. Project Conditions

1. Environmental Requirements: Execute demolition and renovation in manner to limit unnecessary dust and noise, and in compliance with applicable codes and federal or state requirements. Burning of materials on site not allowed.
2. Existing Conditions: See Detailed Scope of Work. Do not interfere with use of occupied buildings or portions of buildings. Maintain free and safe passage to and from occupied areas.
3. Protection:
 - a. Provide necessary temporary shoring and bracing to support and protect portions of existing buildings during demolition operations. Leave such shoring in place until permanent supports have been installed. Be solely responsible for design, safety, and adequacy of temporary shoring and bracing and its ability to carry load for which intended.
 - b. Contractor: Protect grounds, plantings, buildings, and any other facilities or property from damage caused by construction operations.
4. Safety: Cease operations at endangered area, and notify The University immediately if safety of structure appears to be endangered. Take precautions to properly support structure. Do not resume work in endangered area until safety is restored.

D. Scheduling And Sequencing

1. Scheduling and Completion: Comply with requirements of Detailed Scope of Work.

1.3 PRODUCTS

A. Materials

1. Materials for Patching, Extending, and Matching:
 - a. Provide same products or types of construction as in existing structure, as needed to patch, extend, or match existing work.
 - 1) Generally, Contract Documents will not define products or standards of workmanship present in existing construction. Determine products by inspection and testing as necessary, and required workmanship by reference to existing as sample of comparison.
 - 2) Patching, extending, and matching existing work and systems shall result in complete, finished system.
 - b. Presence of product, finish, or type of construction requires that patching, extending, or matching be performed as necessary to make work complete and consistent.
2. Lumber: Each Piece of Lumber: Grade stamped by recognized association or independent inspection agency certified by American Lumber Standards Committee's Board of Review.
 - a. New Replacement Studs and Joists: Match existing and complies with Reference Standards.
 - b. Wood Studs and Joists: No. 2 Grade or better.
 - c. Sill Plates on Concrete: All heart redwood, cedar, or cyprus: or preservative-treated wood.
 - d. Blocking and Furring: Standard Grade or Better.
 - e. Preservative-Treated: AWPB LP-2, pressure-treated with waterborne preservative. Penta or creosote not allowed.
 - 1) Treat drilled holes and cuts across grain in accordance with AWPB M4.
 - f. Fire-Retardant Treated:
 - 1) Lumber: AWPB C20 Interior Type A.
 - 2) Plywood: AWPB C27 Interior Type A.
 - 3) Bear UL FR-S classification label.
 - g. Pressure-Treated Lumber: Bear AWPB Quality Mark C-2.
 - h. Seasoning: Kiln dry to following (including treated material):
 - i. Lumber Up to 50 mm (2 inches): 19 percent or less moisture content.
 - j. Preservative- and Fire-Retardant Treated Material: Mill or rip material parallel to grain prior to treatment.
3. Plywood: PS-1: Each panel identified with APA grade trademark.
 - a. Subfloor: APA Rated Sheathing, Tongue and groove, Exposure 1 (interior with exterior glue).
 - 1) Span Rating: Not less than spacing of framing members.
 - 2) Thickness: In accordance with APA Recommendations.
 - b. Roof Sheathing: APA Rated Sheathing, Exposure 1 (interior with exterior glue).
 - 1) Span Rating: Not less than spacing of framing members.
 - 2) Thickness: In accordance with APA Recommendations.
 - c. Wall Sheathing: APA CD, Exposure 1 (Interior with exterior glue).
 - 1) Span Rating: Not less than spacing of framing members.
 - 2) Thickness: As indicated.
 - d. Panel Edge Clips: Extruded aluminum or hot-dipped galvanized steel, H-shaped clips to prevent differential deflection of roof sheathing.
 - e. Fire-Retardant Treated Plywood: Bear UL FR-S classification label.
 - 1) Interior Plywood Fire Retardant Treatment: AWPB C27 Interior Type A.
 - 2) Exterior Plywood Fire Retardant Treatment: AWPB C27 Exterior Type.
 - f. Seasoning: Kiln dry plywood to 15 percent or less moisture content.
 - 1) Pressure Treated Plywood: Kiln dry lumber after treatment.
 - g. Nails: Type and size as recommended by APA.
4. Metal Framing Anchors: Punched and formed for nailing so that nails will be stressed in shear only.
 - a. General: Provide with nails and bolts according to manufacturers requirements.
 - 1) Nails: Zinc coated.
 - b. Types: As indicated and as required to accommodate framing.

- c. Sizes: Of sufficient size and strength to develop full strength of supported member in accordance with applicable building code.
- d. Metal Bridging: Minimum No. 16 U.S. Standard gage.
- e. Finish: Hot-dipped galvanized.
- 5. Anchor Bolts: Furnish anchors to be built into concrete and masonry for anchorage of wood.
- 6. Rough Hardware: Provide necessary bolts, screws, nails, clips, plates, straps, hangers, etc., necessary for completion of renovation work. Provide correct material of proper size and strength for purpose intended, conforming to Reference Standards and applicable building codes.
 - a. Exterior Locations and for Fire-Retardant- and Preservative-Treated Wood: Provide galvanized rough hardware.
- 7. Vapor Barrier at Crawl Spaces: ASTM D 2103, 0.15 mm (6 mil) polyethylene sheeting.
- 8. Insulation: Type and R-value to comply with applicable codes and regulations.
 - a. Blanket Insulation: ASTM C 665 fiberglass blankets. Exposed insulation shall be foil-faced with flame-spread rating of 25 or less in accordance with ASTM E 84, where required by applicable codes and regulations.

1.4 EXECUTION

A. Examination

- 1. Units, Spaces, and Areas to be Renovated: Comply with Detailed Scope of Work.
 - a. Verify that surfaces to receive rough carpentry are prepared to require grades and dimensions.

B. Preparation

- 1. Dust Protection: Comply with Detailed Scope of Work.
- 2. Building Occupation: Carry out demolition and renovation work to cause as little inconvenience to occupants as possible. See Detailed Scope of Work.
- 3. Protection: See Detailed Scope of Work.
- 4. Selective Demolition: Comply with Detailed Scope of Work.

C. Laying Out Work

- 1. Discrepancies: Verify dimensions and elevations indicated in layout of existing work.
 - a. Prior to commencing work, carefully compare and check Drawings (if any) for discrepancies in locations or elevations of work to be executed.
 - b. Refer discrepancies among Drawings (if any), Specifications, and existing conditions to The University for adjustment before work affected is performed.
 - 1) Failure to make such notification shall place responsibility on Contractor to carry out work in satisfactory, workmanlike manner.
- 2. Contractor: Responsible for location and elevation of construction contemplated by Construction Documents.

D. Performance

- 1. Patching: Patch and extend existing work using skilled mechanics who are capable of matching existing quality of workmanship.
 - a. Quality of Patched or Extended Work: Not less than specified for new work. If similar new work is not specified, equal to existing work.
- 2. General: Perform in accordance with AF&PA National Design Specification for Wood Construction, latest Edition.
 - a. Framing: Erect plumb, level and true and rigidly anchor in place. Cut framing square on bearings, closely fit, accurately set to required lines and levels.
 - b. Nail or spike members in accordance with applicable codes.
 - c. Framing: 400 mm (16 inches) OC unless otherwise indicated.
 - d. Shims: Do not use shims for leveling on wood or metal bearings. Use steel or slate shims with full bearing on masonry or concrete.
 - e. Do not splice framing members between bearing points.
 - f. Metal Framing Anchors: Install where required for proper connections in accordance with manufacturer recommendations. Drive nail in each nail hole provided in anchor.

3. Wood Framing:
 - a. Openings: Frame members for passage of pipes and ducts to avoid cutting structural members. Do not cut, notch, or bore framing members for passage of pipes or conduits without The University's permission. Reinforce framing members as directed where damaged by cuffing.
 - b. Firestopping: Firestop concealed spaces in framing. No shutoff by framing members to prevent drafts from one space to another. Use 50 mm (2 inch) nominal thick accurately fit wood blocking to fill opening.
 - c. Joists and Beams: Sizes and spacing as indicated.
 - 1) Set crown edge-up with 90 mm (3-1/2 inch) bearing unless noted otherwise.
 - 2) Toe nail joists to wood sills with 16d nails both sides or secure with metal connectors. Lap and spike joists over supports.
 - 3) Double joists to form headers and trimmers at openings over 1,200 mm (4 feet) and support with metal joist hangers.
 - 4) Provide joist hangers at joists framing into flush wood beams.
 - d. Provide blocking or suitable edge support between members as necessary to support edges of sheathing.
 - e. Replace warped lumber in walls and joists prior to installation of finish surface.
4. Anchors: Unless otherwise indicated, bolt plates firmly to concrete or masonry with anchor bolts in accordance with applicable code.
 - a. In Masonry: Embed anchor bolts minimum 400 mm (16 inches) and provide each with nut and 50 mm (2 inch) diameter washer at bottom end. Grout bolts with mortar.
 - b. In Concrete: Embed anchor bolts minimum 200 mm (8 inches) and provide each with nut and 50 mm (2 inch) diameter washer at bottom end. 90 degree bent end may be substituted for nut and washer.
5. Wood Studs: Install at 400 mm (16 inches) OC with single bottom plate and double top plate with joints staggered.
 - a. Double studs at openings and triple at corners and intersections. Double headers with double trimmers over openings.
6. Plywood Sheathing: Install in accordance with APA Recommendations.
 - a. Provide space at end and side joints as recommended by APA.
 - b. Install panels with face grain perpendicular to supports with end-joints supported. Stagger ends of adjacent sheets 1 200 mm (4 feet) where possible.
 - c. Where support spacing exceeds maximum span for unsupported edge, provide adequate blocking, tongue and groove edges, or panel edge clips, in accordance with APA E30-L.
 - d. Nail in accordance with APA's Recommendations.
7. Preservative- and Fire-Retardant Material: Milling or ripping material parallel to grain not allowed unless material is treated after milling or ripping.
 - a. Preservative-Treated Material: Treat drilled holes and cuts across grain in accordance with AWPA M4.

E. Flooring Work

1. Defective Joists and Subfloor: Remove defective joists and subfloor which no longer satisfy structural requirements with new material to fulfill their structural function.
 - a. Remove ceiling, subfloor, and joists in safe manner and at minimum inconvenience to residents.
 - b. Splice, strengthen, support, or replace rotted or otherwise defective joists to fulfill their anticipated structural function.
 - c. New Replacement Joists: Comply with requirements of appropriate section specifying new flooring, including flooring manufacturer's recommendations.
 - d. Ceiling Replacement: Include removal and replacement of ceiling finish to match existing.
 - 1) Glue and screw new ceiling material to bottom of joists.
 - 2) Paint entire ceiling of space affected by replacement matching color of existing walls in accordance with Division 9 Section "Painting."
 - e. Crawl-Space Insulation: Replace insulation damaged by or removed during construction operations. If there is no existing insulation, provide new insulation, where required.
 - 1) Insulation: Type and R-value to comply with applicable codes and regulations.

- f. New Replacement Subfloor: Install in accordance with APA Recommendations and with requirements of appropriate section specifying new flooring, including flooring manufacturer's recommendations.
 - 1) Glue and nail new subfloor to joists.
 - 2) Nail in accordance with APA's Recommendations and sufficiently to avoid squeaking floors.
 - g. Base at walls: Replace wood base (including coves and corner rounds) with new wood base to match existing.
 2. Above-Grade Floors to Receive Resilient Flooring: Examine to ensure that vapor-barrier sheet is laid over ground, sheets lapped, edge joints sealed and sufficient cross ventilation exists to insure dryness.
 - a. If vapor barrier does not cover ground in crawl space, install vapor barrier in accordance with applicable codes and regulations.
 - 1) Completely cover ground at crawl spaces with minimum 150 mm (6 inch) lapped joints.
 - 2) Tape all lapped joints with water-resistive tape in accordance with manufacturer's recommendations.
 - 3) Protect vapor barrier from puncture and displacement. Lay heavy objects such as pieces of masonry at intervals not over 1 200 mm (4 feet) OC at lapped joints to hold in place. If punctures occur in vapor barrier, repair by placing patches of vapor-barrier material over punctures and taping all lapped joints.
 - b. If crawl space does not have enough ventilation, install additional vents in accordance with applicable codes and regulations.
 3. Floors Damaged by Construction Operations: Patch floor damage to match existing floor surfaces, and comply with requirements for new flooring.
- F. Roofing Work
 1. Removal of Existing Roofing: Roofing may contain asbestos fibers. Comply with applicable codes, laws, and regulations regarding asbestos materials.
 2. Defective Rafters and Sheathing: Remove defective rafters and sheathing which no longer satisfy structural requirements with new material to match existing.
 - a. Remove sheathing and rafters in safe manner and at minimum inconvenience to residents.
 - b. Splice, strengthen, support, or replace rotted or otherwise defective rafters to fulfill their anticipated structural function.
 - c. New Replacement Sheathing: Install in accordance with APA Recommendations and with requirements of applicable Division 7 roofing Sections.
 - 1) Nail in accordance with APA's Recommendations.
- G. Blocking And Furring
 1. Blocking: Install wood blocking as required for proper support of hardware, bath accessories, cabinets, and other wall-mounted items.
 - a. Set true to line, level, or plumb, well-secured in stud wall and flush with back of drywall or other wall finish.
 - b. Coordinate exact locations with other sections.
 2. Rough Wood Bucks: Set true and plumb and anchor to concrete or masonry with steel straps extending into wall minimum 200 mm (8 inches). Place anchors near top and bottom of buck and space uniformly at maximum 600 mm (24 inches) OC. Provide nominal 50 mm (2 inch) thick if not indicated.
 3. Wood Furring: Install wood furring on masonry or concrete walls in sizes and spacing as indicated on Drawings (if any). Provide minimum 25 mm by 75-mm (1 inch by 3 inch) nominal furring strips spaced at maximum of 400 mm (16 inches) OC if not indicated.
 - a. Securely fasten wood furring at maximum 900 mm (3 feet) OC with toggle or expansion bolts, cut concrete nails or ramset anchors as required. Do not use wood plugs.
 - b. Install furring around openings and at corners.
 - c. Erect furring plumb and level, and shim out as required to provide true, even plane with surfaces suitable to receive required finish.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 06 20 13 00 - EXTERIOR FINISH CARPENTRY**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for exterior finish carpentry. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Exterior standing and running trim.
 - b. Lumber, Plywood, and Hardboard siding.
 - c. Plywood and Hardboard soffits.
 - d. Exterior stairs and railings.
 - e. Exterior ornamental wood columns.

C. Definitions

1. Lumber grading agencies, and the abbreviations used to reference them, include the following:
 - a. NeLMA: Northeastern Lumber Manufacturers' Association.
 - b. NLGA: National Lumber Grades Authority.
 - c. RIS: Redwood Inspection Service.
 - d. SPIB: The Southern Pine Inspection Bureau.
 - e. WCLIB: West Coast Lumber Inspection Bureau.
 - f. WWPA: Western Wood Products Association.

D. Submittals

1. Product Data: For each type of process and factory-fabricated product.
2. Samples: For each type of siding indicated.
3. LEED Submittal:
 - a. Certificates for Credit MR 7: Chain-of-custody certificates certifying that products specified to be made from certified wood comply with forest certification requirements. Include evidence that mill is certified for chain of custody by an FSC-accredited certification body.
 - 1) Include statement indicating costs for each certified wood product.
4. Research/Evaluation Reports: For fire-retardant-treated wood.
5. Compliance Certificates:
 - a. For lumber that is not marked with grade stamp.
 - b. For preservative-treated wood that is not marked with treatment quality mark.
 - c. For fire-retardant-treated wood that is not marked with classification marking of testing and inspecting agency.
6. Warranties: Special warranties specified in this Section.

E. Quality Assurance

1. Forest Certification: For the following wood products, provide materials produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship":
 - a. Exterior standing and running trim.
 - b. Exterior lumber, plywood, and hardboard siding.
 - c. Exterior plywood and hardboard soffits.
 - d. Exterior stairs and railings.
 - e. Exterior ornamental wood columns.

F. Delivery, Storage, And Handling

1. Protect materials against weather and contact with damp or wet surfaces. Stack lumber, plywood, and other panels flat with spacers between each bundle to provide air circulation. Provide for air circulation within and around stacks and under temporary coverings.

G. Warranty

1. Special Warranty for Cellular PVC Trim: Manufacturer's standard form, signed by manufacturer, Installer, and Contractor, in which manufacturer agrees to repair or replace trim that fails due to defects in manufacturing within 25 years from date of Substantial Completion. Failures include, but are not limited to rotting, corrosion, delamination, and excessive swelling from moisture.
2. Special Warranty for Hardboard Siding and Trim: Manufacturer's standard form, signed by manufacturer, Installer, and Contractor, in which manufacturer agrees to repair or replace siding that fails in materials or workmanship within specified warranty period. Failures include, but are not limited to, deformation or deterioration beyond normal weathering.
 - a. Warranty Period for Factory-Applied Finish: Five years from date of Substantial Completion.
 - b. Warranty Period for Siding and Trim (Excluding Finish): 25 years from date of Substantial Completion.
3. Special Warranty for Columns: Manufacturer's standard form, signed by manufacturer, Installer, and Contractor, in which manufacturer agrees to repair or replace columns that fail in materials or workmanship within five years from date of Substantial Completion.

1.2 PRODUCTS

A. Materials, General

1. Lumber: DOC PS 20 and applicable grading rules of inspection agencies certified by ALSC's Board of Review.
2. Softwood Plywood: DOC PS 1.
3. Hardboard: AHA A135.4.

B. Wood-Preservative-Treated Materials

1. Water-Repellent Preservative Treatment by Nonpressure Process: AWPA N1 (dip, spray, flood, or vacuum-pressure treatment).
 - a. Preservative Chemicals: 3-iodo-2-propynyl butyl carbamate (IPBC), combined with an insecticide containing chlorpyrifos (CPF).
 - b. Use chemical formulations that do not bleed through or otherwise adversely affect finishes. Do not use colorants in solution to distinguish treated material from untreated material.
 - c. Application: Items not required to be pressure-preservative treated.
 - d. Application: Exterior trim and wood siding.
2. Preservative Treatment by Pressure Process:
 - a. Lumber: AWPA C2 except that lumber that is not in contact with the ground and is continuously protected from liquid water may be treated according to AWPA C31 with inorganic boron (SBX). Kiln dry after treatment to a maximum moisture content of 19 percent.
 - b. Plywood: AWPA C9. Kiln dry after treatment to a maximum moisture content of 18 percent.
 - c. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium.
 - d. For exposed items indicated to receive transparent finish, do not use chemical formulations that contain colorants or that bleed through or otherwise adversely affect finishes.
 - e. Do not use material that is warped or does not comply with requirements for untreated material.
 - f. Mark lumber with treatment quality mark of an inspection agency approved by ALSC's Board of Review.
 - 1) For exposed lumber indicated to receive a stained or natural finish, mark end or back of each piece or omit marking and provide certificates of treatment compliance issued by inspection agency.

- g. Mark plywood with appropriate classification marking of an inspection agency acceptable to authorities having jurisdiction.
 - 1) For exposed plywood indicated to receive a stained or natural finish, mark back of each piece.
 - h. Application: Where indicated **OR** All exterior lumber and plywood, **as directed**.
- C. Fire-Retardant-Treated Materials
 1. Lumber: Comply with performance requirements in AWWA C20, Exterior type. Kiln dry after treatment to a maximum moisture content of 19 percent.
 2. Plywood: Comply with performance requirements in AWWA C27, Exterior type. Kiln dry after treatment to a maximum moisture content of 15 percent.
 3. For exposed items indicated to receive a stained or natural finish, use chemical formulations that do not contain colorants and provide materials that do not have marks from spacer sticks on the exposed face.
 4. Do not use material that does not comply with requirements for untreated material or is warped or discolored.
 5. Identify fire-retardant-treated wood with appropriate classification marking of testing and inspecting agency acceptable to authorities having jurisdiction.
 - a. For exposed lumber indicated to receive a stained or natural finish, mark end or back of each piece or omit marking and provide certificates of treatment compliance issued by inspection agency.
 - b. For exposed plywood indicated to receive a stained or natural finish, mark back of each piece.
 6. Application: Where indicated **OR** All exterior lumber and plywood, **as directed**.
- D. Standing And Running Trim
 1. Lumber Trim for Semitransparent-Stained Finish **OR** Clear Finish **OR** Unfinished Applications, **as directed**:
 - a. Species and Grade: Redwood, Clear All Heart **OR** Hart B **OR** Clear **OR** Grade B, **as directed**; RIS.
 - b. Species and Grade: Western red cedar, Clear Heart VG (Vertical Grain) **OR** Clear Heart **OR** Grade A **OR** Grade B, **as directed**; NLGA, WCLIB, or WWPA.
 - c. Species and Grade: Hem-fir, pressure-preservative treated; 1 **OR** 2, **as directed**, Common; NLGA, WCLIB, or WWPA.
 - d. Species and Grade: Southern pine, pressure-preservative treated; B & B **OR** C & Btr **OR** D, **as directed**; SPIB.
 - e. Maximum Moisture Content: 19 **OR** 15, **as directed**, percent with at least 85 percent of shipment at 12 percent or less, **as directed**.
 - f. Finger Jointing: Not allowed **OR** Allowed if made with wet-use adhesive complying with ASTM D 5572, **as directed**.
 - g. Face Surface: Surfaced (smooth) **OR** Saw textured, **as directed**.
 2. Lumber Trim for Opaque-Stained **OR** Painted, **as directed**, Finish:
 - a. Species and Grade: Redwood, Clear **OR** Grade B, **as directed**; RIS.
 - b. Species and Grade: Western red cedar, Grade A **OR** B, **as directed**; NLGA, WCLIB, or WWPA.
 - c. Species and Grade: Hem-fir, Prime or D finish **OR** 1 Common **OR** 2 Common, **as directed**; NLGA, WCLIB, or WWPA.
 - d. Species and Grade: Eastern white pine, eastern hemlock-balsam fir-tamarack, eastern spruce, or white woods; D Select (Quality) **OR** Finish or 1 Common (Colonial) **OR** Premium or 2 Common (Sterling), **as directed**; NeLMA, NLGA, WCLIB, or WWPA.
 - e. Species and Grade: Northern white cedar, D Select **OR** 1 Common **OR** 2 Common, **as directed**; NeLMA or NLGA.
 - f. Maximum Moisture Content: 19 **OR** 15, **as directed**, percent with at least 85 percent of shipment at 12 percent or less, **as directed**.
 - g. Finger Jointing: Not allowed **OR** Allowed if made with wet-use adhesive complying with ASTM D 5572, **as directed**.
 - h. Face Surface: Surfaced (smooth) **OR** Saw textured, **as directed**.

3. Moldings for Semitransparent-Stained Finish **OR** Clear Finish **OR** Unfinished Applications, **as directed**: WMMPA WM 4, N-grade wood moldings, without finger jointing. Made from kiln-dried stock to patterns included in WMMPA WM 12.
 - a. Species: Redwood **OR** Western red cedar **OR** Eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine, **as directed**.
 - b. Brick-Mold Pattern: WM 180, 1-1/4 by 2 inches (32 by 51 mm).
 - c. Drip-Cap Pattern: WM 197, 11/16 by 1-5/8 inches (17 by 41 mm).
 - d. Bed-Mold Pattern: WM 75, 9/16 by 1-5/8 inches (14 by 41 mm).
 - e. Screen-Bead Pattern: WM 144, 1/4 by 3/4 inch (6 by 19 mm).
4. Moldings for Opaque-Stained **OR** Painted, **as directed**, Finish: WMMPA WM 4, P-grade wood moldings. Made from kiln-dried stock to patterns included in WMMPA WM 12.
 - a. Species: Redwood **OR** Western red cedar **OR** Eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine, **as directed**.
 - b. Finger Jointing: Not allowed **OR** Allowed if made with wet-use adhesive complying with ASTM D 5572, **as directed**.
 - c. Brick-Mold Pattern: WM 180, 1-1/4 by 2 inches (32 by 51 mm).
 - d. Drip-Cap Pattern: WM 197, 11/16 by 1-5/8 inches (17 by 41 mm).
 - e. Bed-Mold Pattern: WM 75, 9/16 by 1-5/8 inches (14 by 41 mm).
 - f. Screen-Bead Pattern: WM 144, 1/4 by 3/4 inch (6 by 19 mm).

E. Lumber Siding

1. Provide kiln-dried lumber siding complying with DOC PS 20, factory coated with exterior alkyl primer, **as directed**.
2. Species and Grade:
 - a. Clear All Heart VG **OR** Clear All Heart **OR** Clear VG (Vertical Grain) **OR** Clear **OR** Grade B, **as directed**, redwood; RIS.
 - b. Clear VG (Vertical Grain) Heart **OR** Grade A **OR** Grade B, **as directed** western red cedar; NLGA, WCLIB, or WWPA.
 - c. Grade 1 **OR** 2, **as directed**, Common spruce-pine-fir; NeLMA, NLGA, WCLIB, or WWPA.
 - d. Grade Prime or D finish **OR** 1 Common **OR** 2 Common, **as directed**, pressure-preservative-treated hem-fir; NLGA, WCLIB, or WWPA.
 - e. Grade D Select (Quality) **OR** Finish or 1 Common (Colonial) **OR** Premium or 2 Common (Sterling), **as directed**, eastern white pine, eastern hemlock-balsam fir-tamarack, eastern spruce, or white woods; NeLMA, NLGA, WCLIB, or WWPA.
 - f. Grade D Select **OR** 1 Common **OR** 2 Common, **as directed**, northern white cedar; NeLMA or NLGA.
 - g. Grade B & B **OR** C & Btr **OR** D **OR** 1 Common **OR** 2 Common, **as directed**, pressure-preservative-treated southern pine; SPIB.
3. Pattern:
 - a. Bevel siding, S1S2E, actual overall dimensions of 5-1/2 by 11/16 inch (140 by 17 mm) **OR** 5-1/2 by 3/4 inch (140 by 19 mm) **OR** 7-1/4 by 3/4 inch (184 by 19 mm) **OR** 9-1/4 by 3/4 inch (235 by 19 mm) **OR** 9-1/4 by 1-3/32 inches (235 by 28 mm), **as directed**, measured on the face and thick edge at 19 percent moisture content.
 - b. Drop siding, SPIB or WWPA pattern No. 105, actual face width (coverage) and thickness of 4-7/8 by 9/16 inch (124 by 14 mm) **OR** 4-7/8 by 23/32 inch (124 by 18 mm) **OR** 6-5/8 by 23/32 inch (168 by 18 mm) **OR** 8-5/8 by 23/32 inch (219 by 18 mm), **as directed**, measured at 19 percent moisture content.
 - c. V-edge, smooth-faced tongue-and-groove pattern with eased edges, actual face width (coverage) and thickness of 3-1/8 by 9/16 inch (79 by 14 mm) **OR** 3-1/8 by 23/32 inch (79 by 18 mm) **OR** 5-1/8 by 23/32 inch (130 by 18 mm) **OR** 6-7/8 by 23/32 inch (175 by 18 mm), **as directed**, measured at 19 percent moisture content.

F. Plywood Siding

1. Plywood Type: APA-rated siding, pressure-preservative treated, **OR** factory coated with exterior acrylic latex stain, **as directed**, in panel sizes indicated.
 - a. Face Grade: 303-OC **OR** OL **OR** NR **OR** SR, **as directed**.
 - b. Face Grade: 303-6 **OR** 18 **OR** 30, **as directed**-S **OR** W **OR** S/W, **as directed**.

2. Thickness: 11/32 inch (8.7 mm) **OR** 3/8 inch (9.5 mm) **OR** 15/32 inch (11.9 mm) **OR** 1/2 inch (12.7 mm) **OR** 19/32 inch (15.1 mm) **OR** 5/8 inch (15.9 mm) **OR** As indicated, **as directed**.
3. Face Species: Southern pine **OR** Douglas fir **OR** Western red cedar **OR** Redwood, **as directed**.
4. Pattern: Plain **OR** Channel groove; grooves 4 inches (101.6 mm) o.c. **OR** Texture 1-11; grooves 4 inches (101.6 mm) o.c. **OR** Reverse board-and-batten; grooves 12 inches (304.8 mm) o.c., **as directed**.
5. Surface: Smooth **OR** Rough sawn, **as directed**.

G. Hardboard Soffits

1. Hardboard Soffits: Primed hardboard, complying with AHA A135.6, with manufacturer's standard exterior primer.
 - a. Type: 7/16-inch- (11-mm-) **OR** 1/2-inch- (12.7-mm-), **as directed**, thick flat panels, smooth **OR** wood-grain textured **OR** stucco textured, **as directed**.
2. Colors, Textures, and Patterns: As selected by The University from manufacturer's full range.

H. Stairs And Railings

1. Stairs:
 - a. Treads: 1-1/4-inch (32-mm) thick, kiln-dried, pressure-preservative-treated stepping with half-round or rounded edge nosing.
 - 1) Species and Grade: Douglas fir, C & Btr VG (Vertical Grain) stepping; NLGA, WCLIB, or WWPA **OR** Hem-fir, C & Btr VG (Vertical Grain) stepping; NLGA, WCLIB, or WWPA **OR** Southern pine, B & B stepping; SPIB, **as directed**.
 - b. Risers: 3/4-inch (19-mm) thick, kiln-dried, pressure-preservative-treated finish boards.
 - 1) Species and Grade: Douglas fir, C & Btr or Superior finish; NLGA, WCLIB, or WWPA **OR** Hem-fir, C & Btr or Superior finish; NLGA, WCLIB, or WWPA **OR** Southern pine, B & B; SPIB, **as directed**
2. Railings: Clear, kiln-dried, solid, yellow poplar **OR** pressure-preservative-treated Douglas fir **OR** pressure-preservative-treated southern pine, **as directed**; railing stock of pattern indicated.
3. Balusters: 1-1/16-inch- (27-mm-) square, clear, kiln-dried, solid, yellow poplar **OR** pressure-preservative-treated Douglas fir **OR** pressure-preservative-treated southern pine, **as directed**.
4. Newel Posts: Clear, kiln-dried, yellow poplar **OR** pressure-preservative-treated, Douglas fir **OR** pressure-preservative-treated, southern pine, **as directed**, turned newel posts of pattern and size indicated.
5. Newel Posts: 2-3/4-inch- (70-mm-) square, clear, kiln-dried yellow poplar **OR** pressure-preservative-treated Douglas fir **OR** pressure-preservative-treated southern pine, **as directed**; either solid or laminated.

I. Ornamental Wood Columns

1. Factory fabricate columns from clear stock, either solid or finger jointed, with a moisture content of not more than 15 **OR** 19, **as directed**, percent.
 - a. Wood Species: Redwood **OR** Western red cedar **OR** Eastern white, Idaho white, lodgepole, ponderosa, or sugar pine, **as directed**.
2. Shafts: Built up from tongue-and-groove staves joined with waterproof glue. Lathe turn shafts to provide base diameter indicated and true architectural entasis taper. Precisely mill flutes as indicated.
3. Capital and Base: Molded glass-fiber-reinforced plastic **OR** Built up from wood components with waterproof glue. Turn circular elements on lathes.
4. Plinths: Cast-aluminum or molded glass-fiber-reinforced plastic, constructed to ventilate the interior of column shaft.
5. Treatment and Finishing:
 - a. Treat wood columns with water-repellant preservative by nonpressure process.
 - b. Coat inside of column shafts with bituminous mastic.
 - c. Prime columns with two coats of exterior alkyd wood primer compatible with specified topcoats.

J. Miscellaneous Materials

1. Fasteners for Exterior Finish Carpentry: Provide nails or screws, in sufficient length to penetrate not less than 1-1/2 inches (38 mm) into wood substrate.
 - a. For face-fastening siding, provide ringed-shank siding nails unless hot-dip galvanized nails are used.
 - b. For redwood, provide brass/bronze **OR** stainless-steel **OR** hot-dip galvanized steel, **as directed**, fasteners.
 - c. For prefinished items, provide matching prefinished aluminum fasteners where face fastening is required.
 - d. For pressure-preservative-treated wood, provide stainless-steel **OR** hot-dip galvanized steel, **as directed**, fasteners.
 - e. For applications not otherwise indicated, provide stainless-steel **OR** hot-dip galvanized steel **OR** aluminum, **as directed**, fasteners.
2. Wood Glue: Waterproof resorcinol glue recommended by manufacturer for exterior carpentry use.
3. Adhesive for Cellular PVC Trim: Product recommended by trim manufacturer.
4. Flashing: Comply with requirements in Division 07 Section "Sheet Metal Flashing And Trim" for flashing materials installed in exterior finish carpentry.
 - a. Horizontal Joint Flashing for Panel Siding: Preformed, galvanized steel **OR** aluminum **OR** prefinished aluminum **OR** stainless-steel, **as directed**, Z-shaped flashing.
5. Insect Screening for Soffit Vents: Aluminum, 18-by-16 (1.4-by-1.6-mm) mesh **OR** PVC-coated glass-fiber fabric, 18-by-14 (1.4-by-1.8-mm) or 18-by-16 (1.4-by-1.6-mm) mesh **OR** Stainless steel, 18-by-18 (1.4-by-1.4-mm) mesh, **as directed**.
6. Continuous Soffit Vents: Aluminum hat channel shape with stamped louvers **OR** perforations, **as directed**, 2 inches (51 mm) wide, and in lengths not less than 96 inches (2438 mm).
 - a. Net Free Area: 4 sq. in./linear ft. (280 sq. cm/m) **OR** 6 sq. in./linear ft. (420 sq. cm/m) **OR** 8 sq. in./linear ft. (560 sq. cm/m), **as directed**.
 - b. Finish: Mill finish **OR** White paint **OR** Brown paint, **as directed**.
7. Round Soffit Vents: Stamped aluminum louvered vents, 2 inches (51 mm) **OR** 2-1/2 inches (64 mm) **OR** 3 inches (76 mm) **OR** 4 inches (102 mm), **as directed**, in diameter, made to be inserted into round holes cut into soffit.
 - a. Finish: Mill finish **OR** White paint **OR** Brown paint, **as directed**.
8. Sealants: Latex, complying with ASTM C 834, Type P, Grade NF and with applicable requirements in Division 07 Section "Joint Sealants", recommended by sealant manufacturer and manufacturer of substrates for intended application.

K. Fabrication

1. Back out or kerf backs of standing and running trim wider than 5 inches (125 mm), except members with ends exposed in finished work.
2. Ease edges of lumber less than 1 inch (25 mm) in nominal thickness to 1/16-inch (1.5-mm) radius and edges of lumber 1 inch (25 mm) or more in nominal thickness to 1/8-inch (3-mm) radius.

1.3 EXECUTION

A. Preparation

1. Clean substrates of projections and substances detrimental to application.
2. Prime lumber to be painted, including both faces and edges. Cut to required lengths and prime ends. Comply with requirements in Division 09 Section "Exterior Painting".

B. Installation, General

1. Do not use materials that are unsound, warped, improperly treated or finished, inadequately seasoned, or too small to fabricate with proper jointing arrangements.
 - a. Do not use manufactured units with defective surfaces, sizes, or patterns.
2. Install exterior finish carpentry level, plumb, true, and aligned with adjacent materials. Use concealed shims where necessary for alignment.
 - a. Scribe and cut exterior finish carpentry to fit adjoining work. Refinish and seal cuts as recommended by manufacturer.

- b. Install to tolerance of 1/8 inch in 96 inches (3 mm in 2438 mm) for level and plumb. Install adjoining exterior finish carpentry with 1/32-inch (0.8-mm) maximum offset for flush installation and 1/16-inch (1.5-mm) maximum offset for reveal installation.
 - c. Install stairs with no more than 3/16-inch (4.7-mm) variation between adjacent treads and risers and with no more than 3/8-inch (9.5-mm) variation between largest and smallest treads and risers within each flight.
 - d. Coordinate exterior finish carpentry with materials and systems in or adjacent to it. Provide cutouts for mechanical and electrical items that penetrate exterior finish carpentry.
- C. Standing And Running Trim Installation
 1. Install flat grain lumber with bark side exposed to weather.
 2. Install cellular PVC trim to comply with manufacturer's written instructions.
 3. Install trim with minimum number of joints practical, using full-length pieces from maximum lengths of lumber available. Do not use pieces less than 24 inches (610 mm) long except where necessary.
 - a. Use scarf joints for end-to-end joints.
 - b. Stagger end joints in adjacent and related members.
 4. Fit exterior joints to exclude water. Cope at returns and miter at corners to produce tight-fitting joints with full-surface contact throughout length of joint. Plane backs of casings to provide uniform thickness across joints, where necessary for alignment.
 5. Unless otherwise indicated, countersink fasteners, fill surface flush, and sand where face fastening is unavoidable.
- D. Siding Installation
 1. Install siding to comply with manufacturer's written instructions and warranty requirements.
 2. Horizontal Lumber Siding: Apply starter strip along bottom edge of sheathing or sill. Install first course of siding with lower edge at least 1/8 inch (3 mm) below starter strip and subsequent courses lapped 1 inch (25 mm) over course below. Nail at each stud. Do not allow nails to penetrate more than one thickness of siding.
 3. Diagonal Lumber Siding: Begin application at corner with tongue edge up. Install subsequent courses with tongue-and-groove edges tightly fitted together. Nail at each stud.
 - a. Leave 1/8-inch (3-mm) gap at trim and corners unless otherwise recommended by manufacturer, and apply sealant.
 - b. Butt joints only over framing or blocking, nailing top and bottom on each side and staggering joints in subsequent courses.
 - c. Install prefabricated outside corners as recommended by manufacturer of siding materials.
 4. Plywood Siding: Install panels with edges over framing or blocking. Nail at 6 inches (150 mm) o.c. at panel perimeter and 12 inches (300 mm) o.c. at intermediate supports unless manufacturer recommends closer spacing. Leave 1/16-inch (1.5-mm) gap between adjacent panels and 1/8-inch (3-mm) gap at perimeter, openings, and horizontal joints unless otherwise recommended by panel manufacturer.
 - a. Seal butt joints at inside and outside corners and at trim locations.
 - b. Install continuous metal flashing at horizontal panel joints.
 - c. Apply battens and corner trim as indicated. Countersink nail heads, fill flush, and sand filler.
 - d. Conceal fasteners to greatest practical extent by countersinking and filling, by placing in grooves of siding pattern or by concealing with applied trim or battens as detailed. Do not nail through overlapping pieces.
 5. Hardboard Siding: Install hardboard siding complying with AHA's "Recommended Basic Application and Painting Instructions for Hardboard Siding." Install panels with edges over framing or blocking. Leave 3/16-inch (5-mm) gap at perimeter, openings, and horizontal panel joints unless otherwise recommended by panel manufacturer.
 - a. Seal butt joints at inside and outside corners and at trim locations.
 - b. Install continuous metal flashing at horizontal panel joints.
 - c. Apply battens and corner trim as indicated.
 - d. Conceal fasteners to greatest practical extent by placing in grooves of siding pattern or by concealing with applied trim or battens as detailed.

6. Flashing: Install metal flashing as indicated on Drawings and as recommended by siding manufacturer.
7. Finish: Apply finish within two weeks of installation.

E. Stair And Railing Installation

1. Treads and Risers at Exterior Stairs: Secure treads and risers by gluing and nailing to carriages. Countersink nail heads, fill flush, and sand filler. Extend treads over carriages and finish with bullnose edge.
2. Balusters: Fit balusters to treads, glue, and nail in place. Countersink nail heads, fill flush, and sand filler. Let into railings and glue in place.
3. Newel Posts: Secure newel posts to stringers and risers with through bolts **OR** lag screws **OR** countersunk-head wood screws and glue, **as directed**.
4. Railings: Secure wall rails with metal brackets. Fasten freestanding railings to newel posts and to trim at walls with countersunk-head wood screws or rail bolts, and glue.

F. Ornamental Column Installation

1. Install columns to comply with manufacturer's written instructions. Comply with requirements below unless manufacturer's written instructions state otherwise.
2. Lay out column locations on soffits and beams and plumb down to locate column locations at supports.
3. Set plinths in location, shim as required to temporarily level, and scribe and trim as required so that top of plinths will sit level without use of shims. Fasten plinths in place to support using pins or fasteners as recommended by manufacturer.
4. Scribe and trim tops of columns to fit to soffits and beams. Maintain ventilation passages to interior of columns.
5. Seal ends of columns with two coats of wood sealer or primer.
6. Install column caps and flashing on columns and fasten to column. Install caps and flashing so that loads are not imposed on caps and so that ventilation of column interior is not blocked.
7. Secure columns in place at top and bottom with fasteners recommended by manufacturer.

G. Adjusting

1. Replace exterior finish carpentry that is damaged or does not comply with requirements. Exterior finish carpentry may be repaired or refinished if work complies with requirements and shows no evidence of repair or refinishing. Adjust joinery for uniform appearance.

H. Cleaning

1. Clean exterior finish carpentry on exposed and semiexposed surfaces. Touch up factory-applied finishes to restore damaged or soiled areas.

I. Protection

1. Protect installed products from damage from weather and other causes during construction.
2. Remove and replace finish carpentry materials that are wet, moisture damaged, and mold damaged.
 - a. Indications that materials are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
 - b. Indications that materials are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

END OF SECTION 06 20 13 00

SECTION 06 20 23 00 - INTERIOR FINISH CARPENTRY**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for interior finish carpentry. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Interior standing and running trim.
 - b. Fire-rated interior door and sidelight frames.
 - c. Plywood, Hardboard, and Board paneling.
 - d. Shelving and clothes rods.
 - e. Interior stairs and railings.
 - f. Interior ornamental wood columns.

C. Definitions

1. Lumber grading agencies, and the abbreviations used to reference them, include the following:
 - a. NeLMA: Northeastern Lumber Manufacturers' Association.
 - b. NHLA: National Hardwood Lumber Association.
 - c. NLGA: National Lumber Grades Authority.
 - d. SPIB: The Southern Pine Inspection Bureau.
 - e. WCLIB: West Coast Lumber Inspection Bureau.
 - f. WWPA: Western Wood Products Association.
2. MDF: Medium-density fiberboard.
3. MDO Plywood: Plywood with a medium-density overlay on the face.

D. Submittals

1. Product Data: For each type of process and factory-fabricated product.
2. Samples: For each type of paneling indicated.
3. LEED Submittals:
 - a. Product Data for Credit EQ 4.1: For adhesives and glues used at Project site, including printed statement of VOC content.
 - b. Product Data for Credit EQ 4.4: For composite-wood products, documentation indicating that product contains no urea formaldehyde.
 - c. Certificates for Credit MR 7: Chain-of-custody certificates certifying that products specified to be made from certified wood comply with forest certification requirements. Include evidence that mill is certified for chain of custody by an FSC-accredited certification body.
 - 1) Include statement indicating costs for each certified wood product.
4. Research/Evaluation Reports: Showing that fire-retardant-treated wood complies with building code in effect for Project.
5. Warranty: Special warranty specified in this Section.

E. Quality Assurance

1. Forest Certification: For the following wood products, provide materials produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship":
 - a. Interior standing and running trim.
 - b. Interior plywood, hardboard, and board paneling.
 - c. Shelving and clothes rods.
 - d. Interior stairs and railings.

e. Interior ornamental wood columns.

F. Delivery, Storage, And Handling

1. Protect materials against weather and contact with damp or wet surfaces. Stack lumber, plywood, and other panels flat with spacers between each bundle to provide air circulation. Provide for air circulation within and around stacks and under temporary coverings.
2. Deliver interior finish carpentry materials only when environmental conditions meet requirements specified for installation areas. If interior finish carpentry materials must be stored in other than installation areas, store only where environmental conditions meet requirements specified for installation areas.

G. Warranty

1. Special Warranty for Columns: Manufacturer's standard form, signed by manufacturer, Installer, and Contractor, in which manufacturer agrees to repair or replace columns that fail in materials or workmanship five years from date of Substantial Completion.

1.2 PRODUCTS

A. Materials, General

1. Lumber: DOC PS 20 and applicable grading rules of inspection agencies certified by ALSC's Board of Review.
2. Softwood Plywood: DOC PS 1.
3. Hardboard: AHA A135.4.
4. MDF: ANSI A208.2, Grade 130, made with binder containing no urea-formaldehyde resin.
5. Particleboard: ANSI A208.1, Grade M-2 **OR** M-2-Exterior Glue **OR** M-2, made with binder containing no urea-formaldehyde resin, **as directed**.
6. Melamine-Faced Particleboard: Particleboard complying with ANSI A208.1, Grade M-2, finished on both faces with thermally fused, melamine-impregnated decorative paper complying with LMA SAT-1.

B. Wood-Preservative-Treated Materials

1. Lumber: AWPAC2 **OR** AWPAC31 (treated with inorganic boron), **as directed**. Kiln dry after treatment to a maximum moisture content of 19 percent.
2. Plywood: AWPAC9. Kiln dry after treatment to a maximum moisture content of 18 percent.
3. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium.
4. For exposed items indicated to receive transparent finish, do not use chemical formulations that contain colorants or that bleed through or otherwise adversely affect finishes.
5. Do not use material that is warped or does not comply with requirements for untreated material.
6. Mark lumber with treatment quality mark of an inspection agency approved by ALSC's Board of Review.
7. Mark plywood with appropriate classification marking of an inspection agency acceptable to authorities having jurisdiction.
8. Application: Where indicated.

C. Fire-Retardant-Treated Materials

1. Lumber: Comply with performance requirements in AWPAC20, Exterior type **OR** Interior Type A, **as directed**. Kiln dry after treatment to a maximum moisture content of 19 percent.
2. Plywood: Comply with performance requirements in AWPAC27, Exterior type **OR** Interior Type A, **as directed**. Kiln dry after treatment to a maximum moisture content of 15 percent.
3. For exposed items indicated to receive a stained or natural finish, use chemical formulations that do not contain colorants and provide materials that do not have marks from spacer sticks on the exposed face.
4. Do not use material that does not comply with requirements for untreated material or is warped or discolored.

5. Identify fire-retardant-treated wood with appropriate classification marking of testing and inspecting agency acceptable to authorities having jurisdiction.
6. Application: Where indicated **OR** All interior lumber and plywood, **as directed**.

D. Standing And Running Trim

1. Softwood Lumber Trim for Transparent Finish (Stain or Clear Finish):
 - a. Species and Grade:
 - 1) Eastern white pine, C Select **OR** D Select **OR** Finish or 1 Common **OR** Premium or 2 Common, **as directed**; NeLMA or NLGA.
 - 2) Idaho white, lodgepole, ponderosa, radiata, or sugar pine; C Select (Choice) **OR** D Select (Quality) **OR** 1 Common (Colonial) **OR** 2 Common (Sterling), **as directed**; NLGA or WWP.
 - 3) Eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine; C Select (Choice) **OR** D Select (Quality) **OR** Finish or 1 Common (Colonial) **OR** Premium or 2 Common (Sterling), **as directed**; NeLMA, NLGA, or WWP.
 - 4) White woods, C Select **OR** D Select **OR** 1 Common **OR** 2 Common, **as directed**; WWP.
 - 5) Douglas fir-larch or Douglas fir south, Superior or C & Btr **OR** Prime or D, **as directed**, finish; NLGA, WCLIB, or WWP.
 - 6) Southern pine, B & B **OR** C & Btr, **as directed**, finish; SPIB.
 - 7) Western red cedar, Clear Heart **OR** Grade A **OR** Grade B, **as directed**; NLGA, WCLIB, or WWP.
 - b. Maximum Moisture Content: 19 **OR** 15, **as directed**, percent with at least 85 percent of shipment at 12 percent or less, **as directed**.
 - c. Finger Jointing: Allowed **OR** Not allowed, **as directed**.
 - d. Face Surface: Surfaced (smooth) **OR** Saw textured, **as directed**.
2. Hardwood Lumber Trim for Transparent Finish (Stain or Clear Finish):
 - a. Species and Grade: Red oak **OR** White maple **OR** Alder **OR** Aspen, basswood, cottonwood, sap gum, sycamore, white maple, or yellow poplar, **as directed**; Clear **OR** A finish **OR** B finish, **as directed**; NHLA.
 - b. Maximum Moisture Content: 13 **OR** 10 **OR** 9, **as directed**, percent.
 - c. Finger Jointing: Not allowed.
 - d. Gluing for Width: Allowed **OR** Not allowed **OR** Use for lumber trim wider than 6 inches (150 mm), **as directed**.
 - e. Veneered Material: Allowed **OR** Not allowed **OR** Use for lumber trim wider than 6 inches (150 mm), **as directed**.
 - f. Face Surface: Surfaced (smooth) **OR** Saw textured, **as directed**.
 - g. Matching: Selected for compatible grain and color.
3. Lumber Trim for Opaque Finish (Painted):
 - a. Species and Grade:
 - 1) Eastern white pine, D Select **OR** Finish or 1 Common **OR** Premium or 2 Common, **as directed**; NeLMA or NLGA.
 - 2) Idaho white, lodgepole, ponderosa, radiata, or sugar pine; D Select (Quality) **OR** 1 Common (Colonial) **OR** 2 Common (Sterling), **as directed**; NLGA or WWP.
 - 3) Eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine; D Select (Quality) **OR** Finish or 1 Common (Colonial) **OR** Premium or 2 Common (Sterling), **as directed**; NeLMA, NLGA, or WWP.
 - 4) White woods, D Select **OR** 1 Common **OR** 2 Common, **as directed**; WWP.
 - 5) Douglas fir-larch or Douglas fir south, Superior or C & Btr **OR** Prime or D, **as directed**, finish; NLGA, WCLIB, or WWP.
 - 6) Spruce-pine-fir, 1 **OR** 2, **as directed**, Common; NeLMA, NLGA, WCLIB, or WWP.
 - 7) Alder, aspen, basswood, cottonwood, gum, magnolia, soft maple, sycamore, tupelo, or yellow poplar; A **OR** B, **as directed**, finish; NHLA.
 - b. Maximum Moisture Content: 19 **OR** 15, **as directed**, percent with at least 85 percent of shipment at 12 percent or less, **as directed**.
 - c. Finger Jointing: Allowed **OR** Not allowed, **as directed**.
 - d. Face Surface: Surfaced (smooth) **OR** Saw textured, **as directed**.

- e. Optional Material: Primed MDF of same actual dimensions as lumber indicated may be used in lieu of lumber.
- 4. Softwood Moldings for Transparent Finish (Stain or Clear Finish): WMMPA WM 4, N-grade wood moldings. Made to patterns included in WMMPA WM 12.
 - a. Species: Eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine **OR** Southern pine **OR** Western red cedar **OR** Douglas fir, **as directed**.
 - b. Maximum Moisture Content: 15 percent with at least 85 percent of shipment at 12 percent or less.
 - c. Finger Jointing: Not allowed.
 - d. Matching: Selected for compatible grain and color.
 - e. Base Pattern: WM 623, 9/16-by-3-1/4-inch (14-by-83-mm) ogee **OR** WM 713, 9/16-by-3-1/4-inch (14-by-83-mm) ranch **OR** WM 753, 9/16-by-3-1/4-inch (14-by-83-mm) beaded-edge **OR** WM 620, 9/16-by-4-1/4-inch (14-by-108-mm) ogee **OR** WM 750, 9/16-by-4-1/4-inch (14-by-108-mm) beaded-edge, **as directed**, base.
 - f. Shoe-Mold Pattern: WM 129, 7/16-by-11/16-inch (11-by-17-mm) quarter-round **OR** WM 126, 1/2-by-3/4-inch (13-by-19-mm) quarter-round **OR** WM 131, 1/2-by-3/4-inch (13-by-19-mm) ogee, **as directed**, shoe mold.
 - g. Casing Pattern: WM 327, 11/16-by-2-1/4-inch (17-by-57-mm) clamshell **OR** WM 366, 11/16-by-2-1/4-inch (17-by-57-mm) featheredge **OR** WM 376, 11/16-by-2-1/4-inch (17-by-57-mm) beaded-edge, **as directed**, casing.
 - h. Mull-Casing Pattern: WM 957, 3/8-by-1-3/4-inch (9.5-by-44-mm) beaded-edge **OR** WM 973, 3/8-by-1-3/4-inch (9.5-by-44-mm) bullnose **OR** WM 983, 3/8-by-1-3/4-inch (9.5-by-44-mm) featheredge, **as directed**, casing.
 - i. Stop Pattern: WM 856, 3/8-by-1-3/8-inch (9.5-by-35-mm) ranch **OR** WM 946, 3/8-by-1-3/8-inch (9.5-by-35-mm) ogee **OR** WM 886, 3/8-by-1-3/8-inch (9.5-by-35-mm) bullnose, **as directed**, stop.
 - j. Chair-Rail Pattern: WM 297, 11/16-by-3-inch (17-by-76-mm) chair rail.
- 5. Hardwood Moldings for Transparent Finish (Stain or Clear Finish): WMMPA HWM 2, N-grade wood moldings made to patterns included in WMMPA HWM 1.
 - a. Species: Red oak **OR** White maple **OR** Aspen, basswood, cottonwood, sap gum, sycamore, white maple, or yellow poplar, **as directed**.
 - b. Kiln-dried softwood or MDF, with exposed surfaces veneered with species indicated, may be used in lieu of solid wood.
 - c. Maximum Moisture Content: 9 percent.
 - d. Finger Jointing: Not allowed.
 - e. Matching: Selected for compatible grain and color.
 - f. Base Pattern: HWM 633, 7/16-by-3-1/4-inch (11-by-83-mm) ogee **OR** HWM 713, 7/16-by-3-1/4-inch (11-by-83-mm) ranch **OR** HWM 753, 7/16-by-3-1/4-inch (11-by-83-mm) beaded-edge **OR** WM 620, 7/16-by-4-1/4-inch (11-by-108-mm) ogee, **as directed**, base.
 - g. Shoe-Mold Pattern: HWM 129, 7/16-by-11/16-inch (11-by-17-mm) quarter-round **OR** HWM 126, 1/2-by-3/4-inch (13-by-19-mm) quarter-round **OR** HWM 131, 1/2-by-3/4-inch (13-by-19-mm) ogee, **as directed**, shoe mold.
 - h. Casing Pattern: HWM 328, 1/2-by-2-1/4-inch (13-by-57-mm) clamshell **OR** HWM 366, 1/2-by-2-1/4-inch (13-by-57-mm) featheredge **OR** HWM 376, 1/2-by-2-1/4-inch (13-by-57-mm) beaded-edge, **as directed**, casing.
 - i. Mull-Casing Pattern: HWM 989, 3/16-by-2-inch (5-by-51-mm) square-edge **OR** HWM 988, 3/8-by-1-1/2-inch (9.5-by-38-mm) featheredge **OR** HWM 987, 3/8-by-2-inch (9.5-by-51-mm) featheredge, **as directed**, casing.
 - j. Stop Pattern: HWM 856, 3/8-by-1-3/8-inch (9.5-by-35-mm) ranch **OR** HWM 946, 3/8-by-1-3/8-inch (9.5-by-35-mm) ogee **OR** HWM 886, 3/8-by-1-3/8-inch (9.5-by-35-mm) bullnose, **as directed**, stop.
 - k. Chair-Rail Pattern: HWM 297, 11/16-by-3-inch (17-by-76-mm) chair rail.
- 6. Moldings for Opaque Finish (Painted): Made to patterns included in WMMPA WM 12.
 - a. Softwood Moldings: WMMPA WM 4, P-grade.
 - 1) Species: Eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine.
 - 2) Maximum Moisture Content: 15 percent with at least 85 percent of shipment at 12 percent or less.

- b. Hardwood Moldings: WMMPA HWM 2, P-grade.
 - 1) Species: Aspen, basswood, cottonwood, gum, magnolia, soft maple, tupelo, or yellow poplar.
 - 2) Maximum Moisture Content: 9 percent.
 - c. Optional Material: Primed MDF.
 - d. Finger Jointing: Allowed **OR** Not allowed, **as directed**.
 - e. Base Pattern: WM 623, 9/16-by-3-1/4-inch (14-by-83-mm) ogee **OR** WM 713, 9/16-by-3-1/4-inch (14-by-83-mm) ranch **OR** WM 753, 9/16-by-3-1/4-inch (14-by-83-mm) beaded-edge **OR** WM 620, 9/16-by-4-1/4-inch (14-by-108-mm) ogee **OR** WM 750, 9/16-by-4-1/4-inch (14-by-108-mm) beaded-edge, **as directed**, base.
 - f. Shoe-Mold Pattern: WM 129, 7/16-by-11/16-inch (11-by-17-mm) quarter-round **OR** WM 126, 1/2-by-3/4-inch (13-by-19-mm) quarter-round **OR** WM 131, 1/2-by-3/4-inch (13-by-19-mm) ogee, **as directed**, shoe mold.
 - g. Casing Pattern: WM 327, 11/16-by-2-1/4-inch (17-by-57-mm) clamshell **OR** WM 366, 11/16-by-2-1/4-inch (17-by-57-mm) featheredge **OR** WM 376, 11/16-by-2-1/4-inch (17-by-57-mm) beaded-edge, **as directed**, casing.
 - h. Mull-Casing Pattern: WM 957, 3/8-by-1-3/4-inch (9.5-by-44-mm) beaded-edge **OR** WM 973, 3/8-by-1-3/4-inch (9.5-by-44-mm) bullnose **OR** WM 983, 3/8-by-1-3/4-inch (9.5-by-44-mm) featheredge, **as directed**, casing.
 - i. Stop Pattern: WM 856, 3/8-by-1-3/8-inch (9.5-by-35-mm) ranch **OR** WM 946, 3/8-by-1-3/8-inch (9.5-by-35-mm) ogee **OR** WM 886, 3/8-by-1-3/8-inch (9.5-by-35-mm) bullnose, **as directed**, stop.
 - j. Chair-Rail Pattern: WM 297, 11/16-by-3-inch (17-by-76-mm) chair rail.
 - 7. PVC-Wrapped Moldings: WMMPA WM 2 and made to patterns included in WMMPA WM 12.
 - a. Base Pattern: WM 623, 9/16-by-3-1/4-inch (14-by-83-mm) ogee **OR** WM 713, 9/16-by-3-1/4-inch (14-by-83-mm) ranch, **as directed**, base.
 - b. Shoe-Mold Pattern: WM 129, 7/16-by-11/16-inch (11-by-17-mm) quarter-round **OR** WM 126, 1/2-by-3/4-inch (13-by-19-mm) quarter-round, **as directed**, shoe mold.
 - c. Casing Pattern: WM 327, 11/16-by-2-1/4-inch (17-by-57-mm) clamshell **OR** WM 366, 11/16-by-2-1/4-inch (17-by-57-mm) featheredge, **as directed**, casing.
 - d. Mull-Casing Pattern: WM 973, 3/8-by-1-3/4-inch (9.5-by-44-mm) bullnose **OR** WM 983, 3/8-by-1-3/4-inch (9.5-by-44-mm) featheredge, **as directed**, casing.
 - e. Stop Pattern: WM 856, 3/8-by-1-3/8-inch (9.5-by-35-mm) ranch **OR** WM 886, 3/8-by-1-3/8-inch (9.5-by-35-mm) bullnose, **as directed**, stop.
 - f. Chair-Rail Pattern: WM 297, 11/16-by-3-inch (17-by-76-mm) chair rail.
 - g. Colors, Textures, and Grain Patterns: As selected by The University from manufacturer's full range.
 - 8. Foam Plastic Moldings: Molded product of shapes indicated, with a tough outer skin on exposed surfaces; factory primed. Exposed surfaces shall not be shaped after molding.
 - a. Density: Not less than 20 lb/cu. ft. (320 kg/cu. m).
 - b. Flame-Spread Index: Not more than 75 when tested according to ASTM E 84.
 - c. Thickness: Not more than 1/2 inch (12.7 mm).
 - d. Width: Not more than 8 inches (204 mm).
 - e. Patterns: As indicated by manufacturer's designations.
- E. Fire-Rated Interior Door And Sidelight Frames
 - 1. Frames, complete with casings, fabricated from fire-retardant particleboard or fire-retardant MDF with veneered exposed surfaces, or from solid fire-retardant-treated wood. Frames shall comply with NFPA 80 and be listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, based on testing according to NFPA 252 **OR** UBC Standard 7-2, **as directed**.
 - a. Species: Red oak **OR** White oak **OR** White maple **OR** Cherry, **as directed**.
 - b. Fire Rating: 20 minutes **OR** 30 minutes **OR** 45 minutes **OR** 60 minutes **OR** 90 minutes **OR** As indicated, **as directed**.

F. Paneling

1. Hardwood Veneer Plywood Paneling: Manufacturer's stock hardwood plywood panels complying with HPVA HP-1, made without urea-formaldehyde adhesive.
 - a. Face Veneer Species and Cut: Rotary-cut white birch **OR** Plain-sliced red oak **OR** Plain-sliced hickory, **as directed**.
 - b. Veneer Matching: Random match **OR** Selected for similar color and grain, **as directed**.
 - c. Backing Veneer Species: Same species as face veneer **OR** Any hardwood compatible with face species, **as directed**.
 - d. Construction: Veneer core.
 - e. Thickness: 1/8 inch (3.2 mm) **OR** 5/32 inch (4 mm) **OR** 5 mm **OR** 1/4 inch (6.4 mm) **OR** 5/16 inch (7.9 mm) **OR** 7/16 inch (11 mm), **as directed**.
 - f. Glue Bond: Type II (interior) **OR** I (exterior), **as directed**.
2. Hardboard Paneling: Interior factory-finished hardboard paneling complying with AHA 135.5.
 - a. Thickness: 1/8 inch (3.2 mm) **OR** 5/32 inch (4 mm) **OR** 1/4 inch (6.4 mm), **as directed**.
 - b. Finish: Class I **OR** II, **as directed**.
 - c. Surface-Burning Characteristics: As follows, tested per ASTM E 84:
 - 1) Flame-Spread Index: 25 or less.
 - 2) Smoke-Developed Index: 450 or less.
3. Board Paneling: Interior wood board paneling complying with WMMPA WM 9.
 - a. Species: Eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine **OR** Southern pine **OR** Western red cedar **OR** Figured red gum, **as directed**.
 - b. Grade: Clear No. 1 **OR** Clear No. 2 **OR** Knotty No. 1 **OR** Knotty No. 2 **OR** Finger jointed, **as directed**.
 - c. Maximum Moisture Content: 15 percent with at least 85 percent of shipment at 12 percent or less **OR** 9 percent, **as directed**.
4. Board Paneling:
 - a. Species and Grade:
 - 1) Eastern white pine, C Select **OR** D Select **OR** Finish or 1 Common **OR** Premium or 2 Common, **as directed**; NeLMA or NLGA.
 - 2) Idaho white, lodgepole, ponderosa, radiata, or sugar pine; C Select (Choice) **OR** D Select (Quality) **OR** 1 Common (Colonial) **OR** 2 Common (Sterling), **as directed**; NLGA or WWPA.
 - 3) Eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine; C Select (Choice) **OR** D Select (Quality) **OR** Finish or 1 Common (Colonial) **OR** Premium or 2 Common (Sterling), **as directed**; NeLMA, NLGA, or WWPA.
 - 4) Southern pine, B & B **OR** C & Btr **OR** No. 2, **as directed**, Paneling; SPIB.
 - 5) Western red cedar, Clear Heart **OR** Grade A **OR** Grade B, **as directed**; NLGA, WCLIB, or WWPA.
 - b. Maximum Moisture Content: 19 **OR** 15, **as directed**, percent with at least 85 percent of shipment at 12 percent or less, **as directed**.

G. Shelving And Clothes Rods

1. Exposed **OR** Closet **OR** Utility, **as directed**, Shelving: Made from one of the following materials, **as directed**, 3/4 inch (19 mm) thick. Do not use particleboard or MDF that contains urea formaldehyde.
 - a. Particleboard with radiused and filled **OR** solid-wood, **as directed**, front edge.
 - b. MDF with radiused **OR** solid-wood, **as directed**, front edge.
 - c. MDO softwood plywood with solid-wood edge.
 - d. Melamine-faced particleboard with radiused and filled **OR** applied PVC, **as directed**, front edge.
 - e. Wood boards as specified above for lumber trim for opaque **OR** softwood lumber trim for transparent **OR** hardwood lumber trim for transparent, **as directed**, finish.
 - f. Softwood Boards: Eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine; C Select (Choice) **OR** D Select (Quality) **OR** Finish or 1 Common (Colonial) **OR** Premium or 2 Common (Sterling), **as directed**; NeLMA, NLGA, or WWPA; kiln dried.
 - g. Softwood Boards: Douglas fir-larch, Douglas fir south, or hem-fir; Superior or C & Btr **OR** Prime or D, **as directed**, finish; NLGA, WCLIB, or WWPA; or southern pine, B & B **OR** C, **as directed**, finish; SPIB; kiln dried.

2. Shelf Cleats: 3/4-by-3-1/2-inch (19-by-89-mm) boards **OR** 3/4-by-5-1/2-inch (19-by-140-mm) boards **OR** 3/4-by-5-1/2-inch (19-by-140-mm) boards with hole and notch to receive clothes rods, **as directed**, as specified above for shelving **OR** lumber trim for opaque finish **OR** softwood lumber trim for transparent finish **OR** hardwood lumber trim for transparent finish, **as directed**.
3. Shelf Brackets with Rod Support: BHMA A156.16, B04051; prime-painted formed steel.
4. Shelf Brackets without Rod Support: BHMA A156.16, B04041; prime-painted formed steel.
5. Standards for Adjustable Shelf Brackets: BHMA A156.9, B04102; powder-coat finished **OR** brass-finished **OR** zinc-plated, **as directed**, steel.
6. Adjustable Shelf Brackets: BHMA A156.9, B04112; powder-coat finished steel **OR** brass-finished steel **OR** zinc-plated steel **OR** bronze-anodized aluminum **OR** black-anodized aluminum **OR** natural aluminum, **as directed**.
7. Standards for Adjustable Shelf Supports: BHMA A156.9, B04071; powder-coat finished **OR** brass-finished **OR** zinc-plated, **as directed**, steel.
8. Adjustable Shelf Supports: BHMA A156.9, B04081 or B04091; powder-coat finished **OR** brass-finished **OR** zinc-plated, **as directed**, steel.
9. Clothes Rods: 1-1/2-inch- (38-mm-) diameter, clear, kiln-dried hardwood **OR** clear, kiln-dried softwood; either Douglas fir or southern pine, **as directed**.
10. Clothes Rods: 1-5/16-inch- (33-mm-) diameter, aluminum tubes **OR** chrome-plated steel tubes **OR** chrome-plated steel telescoping tubes with end brackets for mounting on shelf cleats, **as directed**.
11. Rod Flanges: Clear, kiln-dried, Douglas fir or southern pine **OR** eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine **OR** red oak **OR** white maple **OR** aspen, basswood, cottonwood, sap gum, white maple, or yellow poplar, **as directed**, turnings.
12. Rod Flanges: Aluminum **OR** Chrome-plated steel **OR** Stainless steel, **as directed**.

H. Stairs And Railings

1. Treads: 1-1/16-inch (27-mm), clear, kiln-dried, edge-glued, rift-sawn red oak **OR** red oak **OR** hard maple **OR** poplar, **as directed**, stepping with half-round nosing.
2. Risers: 13/16-inch (21-mm), clear, kiln-dried, edge-glued red oak **OR** hard maple **OR** poplar, **as directed**, stock.
3. Risers: 3/4-inch (19-mm) finish boards as specified above for interior lumber trim for opaque finish.
4. Finished Stringers: 3/4-inch (19-mm) finish boards as specified above for interior lumber trim for opaque finish.
5. Interior Railings: Clear, kiln-dried red oak **OR** hard maple **OR** yellow poplar, **as directed**.
6. Balusters: Clear, kiln-dried, red oak **OR** hard maple **OR** yellow poplar, **as directed**.
7. Newel Posts: Clear, kiln-dried, red oak **OR** hard maple **OR** yellow poplar, **as directed**.
8. Factory fabricate columns for transparent finish from clear, kiln-dried eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine **OR** aspen, basswood, cottonwood, sap gum, white maple, or yellow poplar **OR** red oak **OR** white maple **OR** mahogany, **as directed**.
9. Factory fabricate columns for opaque finish from clear, kiln-dried eastern white, Idaho white, lodgepole, ponderosa, radiata, or sugar pine **OR** aspen, basswood, cottonwood, sap gum, white maple, or yellow poplar, **as directed**. Column staves may be finger jointed.
10. Shafts: Built up from tongue-and-groove staves joined with waterproof glue. Lathe turn shafts to provide indicated base diameter and true architectural entasis taper. Precisely mill flutes as indicated.
11. Capital and Base: Molded glass-fiber-reinforced plastic **OR** Built up from wood components with waterproof glue. Turn circular elements on lathes, **as directed**.
12. Prime columns for opaque finish with one coat of interior wood primer compatible with specified topcoats.

I. Miscellaneous Materials

1. Fasteners for Interior Finish Carpentry: Nails, screws, and other anchoring devices of type, size, material, and finish required for application indicated to provide secure attachment, concealed where possible.
 - a. Where galvanized finish is indicated, provide fasteners and anchorages with hot-dip galvanized coating complying with ASTM A 153/A 153M.

2. Glue: Aliphatic-resin, polyurethane, or resorcinol wood glue recommended by manufacturer for general carpentry use.
 - a. Use wood glue that has a VOC content of 30 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
3. Installation Adhesive for Foam Plastic Moldings: Product recommended for indicated use by foam plastic molding manufacturer.
 - a. Use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
4. Paneling Adhesive: Comply with paneling manufacturer's written recommendations for adhesives.
 - a. Use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
5. Multipurpose Construction Adhesive: Formulation complying with ASTM D 3498 that is recommended for indicated use by adhesive manufacturer.
 - a. Use adhesive that has a VOC content of 70 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

J. Fabrication

1. Back out or kerf backs of the following members except those with ends exposed in finished work:
 - a. Interior standing and running trim except shoe and crown molds.
 - b. Wood board paneling.
2. Ease edges of lumber less than 1 inch (25 mm) in nominal thickness to 1/16-inch (1.5-mm) radius and edges of lumber 1 inch (25 mm) or more in nominal thickness to 1/8-inch (3-mm) radius.

1.3 EXECUTION

A. Preparation

1. Clean substrates of projections and substances detrimental to application.
2. Before installing interior finish carpentry, condition materials to average prevailing humidity in installation areas for a minimum of 24 hours unless longer conditioning is recommended by manufacturer.

B. Installation, General

1. Do not use materials that are unsound, warped, improperly treated or finished, inadequately seasoned, or too small to fabricate with proper jointing arrangements.
 - a. Do not use manufactured units with defective surfaces, sizes, or patterns.
2. Install interior finish carpentry level, plumb, true, and aligned with adjacent materials. Use concealed shims where necessary for alignment.
 - a. Scribe and cut interior finish carpentry to fit adjoining work. Refinish and seal cuts as recommended by manufacturer.
 - b. Countersink fasteners, fill surface flush, and sand where face fastening is unavoidable.
 - c. Install to tolerance of 1/8 inch in 96 inches (3 mm in 2438 mm) for level and plumb. Install adjoining interior finish carpentry with 1/32-inch (0.8-mm) maximum offset for flush installation and 1/16-inch (1.5-mm) maximum offset for reveal installation.
 - d. Install stairs with no more than 3/16-inch (4.7-mm) variation between adjacent treads and risers and with no more than 3/8-inch (9.5-mm) variation between largest and smallest treads and risers within each flight.
 - e. Coordinate interior finish carpentry with materials and systems in or adjacent to it. Provide cutouts for mechanical and electrical items that penetrate interior finish carpentry.

C. Standing And Running Trim Installation

1. Install with minimum number of joints practical, using full-length pieces from maximum lengths of lumber available. Do not use pieces less than 24 inches (610 mm) long, except where necessary. Stagger joints in adjacent and related standing and running trim. Cope at returns and

miter at corners to produce tight-fitting joints with full-surface contact throughout length of joint. Use scarf joints for end-to-end joints. Plane backs of casings to provide uniform thickness across joints where necessary for alignment.

- a. Match color and grain pattern of trim for transparent finish (stain or clear finish) across joints.
- b. Install trim after gypsum board joint finishing operations are completed.
- c. Drill pilot holes in hardwood before fastening to prevent splitting. Fasten to prevent movement or warping. Countersink fastener heads on exposed carpentry work and fill holes.

D. Paneling Installation

1. Plywood Paneling: Select and arrange panels on each wall to minimize noticeable variations in grain character and color between adjacent panels. Leave 1/4-inch (6-mm) gap to be covered with trim at top, bottom, and openings. Install with uniform tight joints between panels.
 - a. Attach panels to supports with manufacturer's recommended panel adhesive and fasteners. Space fasteners as recommended by panel manufacturer.
 - b. Conceal fasteners to greatest practical extent.
 - c. Arrange panels with grooves and joints over supports. Fasten to supports with nails of type and at spacing recommended by panel manufacturer. Use fasteners with prefinished heads matching groove color.
2. Hardboard Paneling: Install according to manufacturer's written recommendations. Leave 1/4-inch (6-mm) gap to be covered with trim at top, bottom, and openings. Butt adjacent panels with moderate contact. Use fasteners with prefinished heads matching paneling color.
 - a. Wood Stud or Furring Substrate: Install with 1-inch (25-mm) annular-ring shank hardboard nails.
 - b. Plaster or Gypsum Board Substrate: Install with 1-5/8-inch (41-mm) annular-ring shank hardboard nails.
 - c. Nailing: Space nails 4 inches (100 mm) o.c. at panel perimeter and 8 inches (200 mm) o.c. at intermediate supports unless otherwise required by manufacturer.
3. Board Paneling: Install according to manufacturer's written instructions. Arrange in random-width pattern suggested by manufacturer unless boards or planks are of uniform width.
 - a. Install in full lengths without end joints.
OR
Stagger end joints in random pattern to uniformly distribute joints on each wall.
 - b. Install with uniform end joints with only end-matched (tongue-and-groove) joints within each field of paneling.
OR
Install with uniform end joints. Locate end joints only over furring or blocking.
 - c. Select and arrange boards on each wall to minimize noticeable variations in grain character and color between adjacent boards. Install with uniform tight joints between boards.
 - d. Fasten paneling by face nailing, setting nails, and filling over nail heads.
OR
Fasten paneling with trim screws, set below face and filled.
OR
Fasten paneling by blind nailing through tongues.
OR
Fasten paneling with paneling system manufacturer's concealed clips.
OR
Fasten paneling to gypsum wallboard with panel adhesive.

E. Shelving And Clothes Rod Installation

1. Cut shelf cleats at ends of shelves about 1/2 inch (13 mm) less than width of shelves and sand exposed ends smooth.
2. Install shelf cleats by fastening to framing or backing with finish nails or trim screws, set below face and filled. Space fasteners not more than 16 inches (400 mm) o.c. Use 2 fasteners at each

framing member or fastener location for cleats 4 inches nominal (89 mm actual) in width and wider.

- a. Apply a bead of multipurpose construction adhesive to back of shelf cleats right before installing. Remove adhesive that is squeezed out immediately after fastening shelf cleats in place.
3. Install shelf brackets according to manufacturer's written instructions, spaced not more than 36 inches (900 mm) o.c. Fasten to framing members, blocking, or metal backing, or use toggle bolts or hollow wall anchors.
4. Install standards for adjustable shelf supports according to manufacturer's written instructions. Fasten to framing members, blocking, or metal backing, or use toggle bolts or hollow wall anchors. Space fasteners not more than 12 inches (300 mm) o.c.
5. Install standards for adjustable shelf brackets according to manufacturer's written instructions, spaced not more than 36 inches (900 mm) o.c. and within 6 inches (150 mm) of end of shelves. Fasten to framing members, blocking, or metal backing, or use toggle bolts or hollow wall anchors.
6. Cut shelves to neatly fit openings with only enough gap to allow shelves to be removed and reinstalled. Install shelves, fully seated on cleats, brackets, and supports.
 - a. Fasten shelves to cleats with finish nails or trim screws, set flush.
 - b. Fasten shelves to brackets to comply with bracket manufacturer's written instructions.
7. Install rod flanges for rods as indicated. Fasten to shelf cleats, framing members, blocking, or metal backing, or use toggle bolts or hollow wall anchors. Install rods in rod flanges.

F. Stair And Railing Installation

1. Treads and Risers at Interior Stairs: Secure treads and risers by gluing and nailing to rough carriages.
 - a. Closed Stringers: House treads and risers into wall stringers, glue, and wedge into place **OR** Cope wall stringers to fit tightly over treads and risers, **as directed**.
 - b. Open Stringers: Miter risers and stringer at open stringers. Extend tread over open stringers and finish with bullnose edge cut from tread stock and fitted to tread with mitered return at nosing.
2. Balusters: Dovetail or mortise balusters into treads, glue, and nail in place. Let into railings and glue in place.
3. Newel Posts: Secure newel posts to stringers, rough carriages, and risers with countersunk-head wood screws and glue.
4. Railings: Secure wall rails with metal brackets. Fasten freestanding railings to newel posts and to trim at walls with countersunk-head wood screws or rail bolts, and glue. Assemble railings at goosenecks, easements, and splices with rail bolts and glue.

G. Ornamental Column Installation

1. Install columns to comply with manufacturer's written instructions. Comply with requirements below unless manufacturer's written instructions state otherwise.
2. Lay out column locations on ceiling and plumb down to locate column locations at floor.
3. Set plinths in location, shim to temporarily level, and scribe and trim as required so that tops of plinths will sit level without use of shims. Seal cut surfaces with wood sealer or primer and fasten plinths to floor using pins or fasteners as recommended by manufacturer.
4. Set columns in location, shim as required to temporarily plumb, scribe and trim as required so that columns will sit plumb without shims.
5. Scribe and trim tops of columns to fit to ceiling.
6. Seal ends of columns with wood sealer or primer.
7. Install column caps on columns and fasten to columns.
8. Secure columns in place at top and bottom with fasteners recommended by manufacturer.

H. Adjusting

1. Replace interior finish carpentry that is damaged or does not comply with requirements. Interior finish carpentry may be repaired or refinished if work complies with requirements and shows no evidence of repair or refinishing. Adjust joinery for uniform appearance.

- I. Cleaning
 - 1. Clean interior finish carpentry on exposed and semiexposed surfaces. Touch up factory-applied finishes to restore damaged or soiled areas.
- J. Protection
 - 1. Protect installed products from damage from weather and other causes during remainder of the construction period.
 - 2. Remove and replace finish carpentry materials that are wet, moisture damaged, and mold damaged.
 - a. Indications that materials are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
 - b. Indications that materials are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

06 22 13 00	06 20 23 00	Interior Finish Carpentry

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 06 41 00 00 - ARCHITECTURAL WOOD CASEWORK**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Firm experienced in successfully producing architectural woodwork similar to that indicated for this Project, with sufficient production capacity to produce required units without causing delay in the Work.
- B. Single Source Manufacturing and Installation Responsibility: Engage the Manufacturer to assume undivided responsibility for woodwork specified in this section, including fabrication, finishing, and installation.
- C. AWI Quality Standard: Comply with applicable requirements of "Architectural Woodwork Quality Standards" published by the Architectural Woodwork Institute (AWI) except as otherwise indicated.

1.04 SUBMITTALS

- A. Samples:
 - 1. Samples for initial selection purposes of the following in form of manufacturer's color charts consisting of actual units or sections of units showing full range of colors, textures, and patterns available for each type of material indicated.
 - a. Plastic laminate.
 - b. Solid surfacing materials.
 - c. Factory applied opaque finishes.
 - 2. Samples for verification purposes of the following:
 - a. Lumber with or for transparent finish, 50 square inches, for each species and cut, finished on one side and one edge.
 - b. Veneer leaves representative of and selected from flitches to be used for transparent finished woodwork.

- c. Wood veneer faced panel products; with or for transparent finish, 8½ inches by 11 inches, for each species and cut with one half of exposed surface finished, with separate samples of unfaced panel product used for core.
- d. Lumber and panel products with factory applied opaque finish, 8½ inches by 11 inches for panels and 50 square inches for lumber, for each finish system and color, with one half of exposed surface finished.
- e. Laminate clad panel products, 8½ inches, by 11 inches for each type, color, pattern, and surface finish, with separate samples of unfaced panel product used for core.
- f. Corner pieces as follows:
 - 1) Cabinet front frame joints between stiles and rail as well as exposed end pieces, 18 inches high by 18 inches wide by 6 inches deep.
 - 2) Miter joints for standing trim.
- g. Exposed cabinet hardware, one unit of each type and finish.
- h. Solid surfacing materials.

B. Record Documents:

- 1. Shop drawings showing location of each item, dimensioned plans and elevations, large scale details, attachment devices, and other components.
 - a. Show elevation drawings of all millwork items. Scale of drawings shall be minimum ¾"=1'-0"
 - b. Show plan section drawings at each unique condition. Scale of drawings shall be minimum 1"=1'-0"
 - c. Show vertical section drawings at each unique condition. Scale of drawings shall be 3"=1'-0"
 - d. Show other details full size.
 - e. Indicate all field measurements and all proposed deviations from the contract documents.
 - f. Graphically indicate all plastic laminate and/or painted surfaces as applicable. General notes indicating location of these finishes is not acceptable.
 - g. Show all approved change orders, clarification, and addendum items related to the scope of the architectural woodwork.
 - h. Show locations and size of furring, blocking, and hanging strips, including concealed blocking and reinforcing specified in other Sections.
 - i. Show locations and sizes of cutouts and holes for plumbing fixtures and other items installed in architectural woodwork.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Protect woodwork during transit, delivery, storage, and handling to prevent damage, soilage, and deterioration.

- B. Do not deliver woodwork until painting, wet work, grinding, and similar operations that could damage, soil, or deteriorate woodwork have been completed in installation areas. If woodwork must be stored in other than installation areas, store only in areas whose environmental conditions meet requirements specified in "Project Conditions."

1.06 PROJECT CONDITIONS

- A. Environmental Conditions: Obtain and comply with Woodwork Manufacturer's and Installer's coordinated advice for optimum temperature and humidity conditions for woodwork during its storage and installation. Do not install woodwork until these conditions have been attained and stabilized so that woodwork is within plus or minus 1.0 percent of optimum moisture content from date of installation through remainder of construction period.
- B. Field Measurements: Where woodwork is indicated to be fitted to other construction, check actual dimensions of other construction by accurate field measurements before manufacturing woodwork; show recorded measurements on final shop drawings. Coordinate manufacturing schedule with construction progress to avoid delay of Work.
 - 1. Where field measurements cannot be made without delaying the Work, guarantee dimensions and proceed with manufacture of woodwork without field measurements. Coordinate other construction to ensure that actual dimensions correspond to guaranteed dimensions.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 HIGH PRESSURE DECORATIVE LAMINATE MANUFACTURERS

- A. The notes and schedules on the Drawings establish manufacturer and model/design required for the Project. Provide the products listed unless Owner approves products of other manufacturer specifically for this Project.

2.03 PLASTIC LAMINATE MATERIAL SCHEDULE

- A. WilsonArt Products or approved equal.

2.04 WOODWORK MATERIALS

- A. Provide materials that comply with requirements of the AWI woodworking standard for each type of woodwork and quality grade indicated and, where the following products are part of woodwork, with requirements of the referenced product standards, that apply to product characteristics indicated:
 - 1. Hardboard: ANSI/AHA A11
 - 2. High Pressure Laminate: NEMA LD 3
 - 3. Softwood Plywood: PS 1
 - 4. Formaldehyde Emission Levels: Comply with formaldehyde emission requirements of each voluntary standard referenced below:
 - a. Hardwood Plywood: Hardwood Plywood and Veneer Association

2.05 FABRICATION, GENERAL

- A. Wood Moisture Content: Comply with requirements of referenced quality standard for moisture content of lumber in relation to relative humidity conditions existing during time of fabrication and in installation areas.
- B. Fabricate woodwork to dimensions, profiles, and details indicated. Ease edges to radius indicated for the following:
 - 1. Corners of cabinets and edges of solid wood (lumber) members less than 1 inch in nominal thickness: 1/16 inch.
 - 2. Edges of rails and similar members more than 1 inch in nominal thickness: 1/8 inch.
- C. Complete fabrication, including assembly, finishing, and hardware application, before shipment to the Project Site to maximum extent possible. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at the Project Site, provide ample allowance for scribing, trimming, and fitting.
- D. Factory cut openings, to maximum extent possible, to receive hardware, appliances, plumbing fixtures, electrical work, and similar items. Locate openings accurately and use templates or roughing in diagrams to produce accurately sized and shaped openings. Smooth edges of cutouts and, where located in countertops and similar exposures, seal edges of cutouts with a water resistant coating.

2.06 FIRE RETARDANT TREATED LUMBER

- A. Where indicated, pressure impregnate lumber with fire retardant chemicals of formulation indicated to produce materials with fire performance characteristics specified.
- B. Fire Retardant Chemicals: Use chemical formulations specified that do not bleed through or otherwise adversely affect finishes. Do not use colorants in solution to distinguish treated lumber from untreated lumber.
 - 1. Organic Resin Based Formulation: Exterior type per AWPA C20 consisting of organic resin solution, relatively insoluble in water, thermally set in wood by kiln drying that does not bleed through or otherwise adversely affect finishes. Do not use colorants in solution to distinguish treated lumber from untreated lumber.
- C. Fire Performance Characteristics: Provide materials identical to those tested for the following fire performance characteristics per ASTM test methods indicated by UL or other testing and inspecting organizations acceptable to authorities having jurisdiction. Identify treated lumber with classification marking of inspecting and testing organization in the form of separable paper label or, where required by authorities having jurisdiction, of imprint on lumber surfaces that will be concealed from view after installation.
 - 1. Surface Burning Characteristics: Not exceeding values indicated below, tested per ASTM E 84 for 30 minutes with no evidence of significant combustion.
 - a. Flame Spread: 25
 - b. Smoke Developed: 50
- D. Discard treated lumber that does not comply with requirements of referenced woodworking standard. Do not use twisted, warped, bowed, discolored, or otherwise damaged or defective lumber.

2.07 STANDING AND RUNNING TRIM AND RAILS

- A. Quality Standard: Comply with AWI Section 300

- B. Backout or groove backs of flat trim members and kerf backs of other wide flat members, except for members with ends exposed in finished work.
- C. Assemble casings in plant except where limitations of access to place of installation require field assembly.
- D. Grade: Premium
- E. Lumber Species for Transparent Finish (Interior): Red oak, rift sawn
- F. Lumber Species: Match species and cut indicated for other types of transparent finished architectural woodwork located in same area of building unless otherwise indicated.
 - 1. Provide split species on trim that face areas with different wood species, matching each face of woodwork to species and cut of finish wood surfaces in areas finished.
- G. Lumber Species for Opaque Finish: Eastern white pine, sugar pine.

2.08 WOOD CABINETS (CASEWORK) FOR TRANSPARENT FINISH

- A. Quality Standard: Comply with AWI Section 400 and its Division 400A "Wood Cabinets."
- B. Grade: Premium.
 - 1. Grain Matching: Run and match grain vertically for drawer fronts, doors, and fixed panels.
- C. Wood Species for Semiexposed Surfaces: Match species and cut indicated for exposed surfaces.

2.09 WOOD CABINETS (CASEWORK) FOR OPAQUE FINISH

- A. Overlay door with Frame reveal
- B. Materials for Semi-exposed Surfaces: Match materials indicated for exposed surfaces.

2.10 LAMINATE CLAD CABINETS (PLASTIC COVERED CASEWORK)

- A. Quality Standard: Comply with AWI Section 400 and its Division 400B "Laminate Clad Cabinets."
- B. Type of Cabinet: High pressure decorative laminate over plywood (no particleboard) core complying with the following:
 - 1. Grade: Premium
- C. AWI Type of Cabinet Construction: Flush overlay.
- D. AWI Type of Cabinet Construction: Reveal overlay.
- E. AWI Type of Cabinet Construction: As indicated.
- F. Laminate Cladding: High pressure decorative laminate complying with the following requirements:
 - 1. Colors, Patterns, and Finishes: Provide materials and products that result in colors and textures of exposed laminate surfaces complying with the following requirements:
 - a. Match Owner's sample.
 - b. Match color, pattern, and finish indicated by reference to laminate manufacturer's standard designations for these characteristics.

- c. Provide selections made by Owner from laminate manufacturer's full range of WilsonArt standard colors and finishes in the following categories:
 - 1) Solid colors
 - 2) Wood grains
 - 3) Patterns
- 2. Laminate Grade for Exposed Surfaces: Provide laminate cladding complying with the following requirements for type of surface and grade.
 - a. Postformed Surfaces: PF 42 (0.042 inch nominal thickness)
- 3. Edges: Three millimeter thick PVC, Solid, high impact, purified, color-thru, acid resistant, PVC edging machine-applied with hot melt adhesives. Machine profile all door and drawer edges and outside corners, exposed to view when doors and drawers are closed, to a 1/8 inch radius. Color to match exterior laminate.
- 4. Edges: GP 50 (0.050 inch nominal thickness)
- 5. Edges: GP 28 (0.028 inch nominal thickness)
- 6. Semiexposed Surfaces: Provide surface materials indicated below:
 - a. High pressure laminate, GP 28. (0.028 inch nominal thickness)

2.11 CABINET HARDWARE AND ACCESSORY MATERIALS

- A. Refer to schedule at end of this section for cabinet hardware required for architectural cabinets.

2.12 ARCHITECTURAL CABINET TOPS (COUNTERTOPS)

- A. Quality Standard: Comply with AWI Section 400 and its Division 400C.
- B. Type of Top: High pressure decorative laminate ¾ inch particleboard
 - 1. Grade: Premium
 - 2. Laminate Cladding for Horizontal Surface: High pressure decorative laminate as follows:
 - a. Colors, Patterns, and Finishes: Provide materials and products that result in colors and textures of exposed laminate surfaces complying with the following requirements:
 - 1) Provide selections made by Owner from manufacturer's full range of standard colors and finishes in the following categories:
 - a) Solid colors
 - b) Wood grains
 - c) Patterns
 - b. Grade: GP 50 (0.050 inch nominal thickness)
 - c. Grain Direction: Parallel to longest dimension

3. Edges: Three millimeter thick PVC, Solid, high impact, purified, color-thru, acid resistant, PVC edging machine-applied with hot melt adhesives. Machine profile all edges and outside corners exposed to view to a 1/8 inch radius. Color to match surface laminate.
 4. Edge Treatment: Same as laminate cladding on horizontal surfaces.
 5. Edge Treatment: Lumber edge for transparent finish matching wood species and cut on cabinet surfaces.
 6. Edge Treatment: As indicated.
- C. Type of Top: Premium Grade Plywood for transparent finish as follows:
1. Grade: Premium.
 2. Lumber Species: As indicated.
- D. Type of Top: Panel product for transparent finish (wood veneer laminated over exterior grade plywood: no particleboard) as follows:
1. Grade: Premium.
 2. Veneer Species: As indicated.
 3. Edge Treatment: Lumber matching wood veneer face for species and cut.
 4. Edge Treatment: As indicated.

2.13 FLUSH WOOD PANELING FOR TRANSPARENT FINISH

- A. Grade: Premium.
- B. Veneer Species: As indicated.
- C. Panel Matching Method: Match panels to one another within each separate area by the following method:
1. Blueprint matched panels and components.
 2. Premanufactured sets used full width.
 3. Premanufactured sets selectively reduced in width.
 4. Sequence matched panel sets.
- D. Fire Performance Characteristics: Provide paneling composed of panels of wood veneer density and fire retardant particleboard that are identical in construction to units tested for the following surface burning characteristics per ASTM E 84 by UL or other testing and inspecting organization acceptable to authorities having jurisdiction. Identify panels with appropriate markings of applicable testing and inspecting organization on surfaces that will be concealed from view after installation.
1. Flame Spread: 75 or less.
 2. Smoke Developed: 40 or less.

2.14 INTERIOR DOORS AND DOOR FRAMES

- A. Quality Standard: Comply with AWI Section 900B.
- B. Grade: Premium.

- C. Grade: Custom.
- D. Lumber Species for Transparent Finish: Match species and cut indicated for other types of transparent finished architectural woodwork located in same areas of building unless otherwise indicated.
- E. Lumber Species for Opaque Finish: Any closed grain hardwood listed in referenced woodworking standard.
- F. Fire Rated Doors and Frames: Provide fire rated wood frames for wood doors that are identical to units tested in door and frame assemblies per ASTM E152 and that are labeled and listed for ratings indicated by UL, Warnock Hersey, or other testing and inspection organization acceptable to authorities having jurisdiction.

2.15 FASTENERS AND ANCHORS

- A. Screws: Select material, type, size, and finish required for each use. Comply with FS FF S 111 for applicable requirements.
 - 1. For metal framing supports, provide screws as recommended by metal framing manufacturer.
- B. Nails: Provide the following of type and size required for each use. Comply with FS FF N 105 for applicable requirements.
 - 1. Stainless steel nails.
 - 2. Aluminum nails.
 - 3. Hot dipped galvanized nails.
 - 4. Any material indicated above.
- C. Anchors: Select material, type, size, and finish required by each substrate for secure anchorage. Provide nonferrous metal or hot dip galvanized anchors and inserts on inside face of exterior walls and elsewhere as required for corrosion resistance. Provide toothed steel or lead expansion bolt devices for drilled in place anchors. Furnish inserts and anchors, as required, to be set into concrete or masonry work for subsequent woodwork anchorage.

2.16 FACTORY FINISHING OF INTERIOR ARCHITECTURAL WOODWORK

- A. Quality Standard: Comply with AWI Section 1500 unless otherwise indicated.
- B. The entire finish of interior architectural woodwork is specified in this section, regardless of whether factory applied or applied after installation.
 - 1. Factory Finishing: To the greatest extent possible, finish architectural woodwork at factory. Defer only final touch up, cleaning, and polishing until after installation.
- C. Preparations for Finishing: Comply with referenced quality standard for sanding, filling countersunk fasteners, sealing concealed surfaces and similar preparations for finishing of architectural woodwork, as applicable to each unit of work.
- D. Washcoat for Stained Finish: Apply a vinyl washcoat to woodwork made from closed-grain wood before staining and finishing.
- E. Filled Finish for open-Grain Woods: After staining (if any) apply paste wood filler to open-grain woods and wipe off excess. Tint filler to match stained wood.

F. Transparent Finish: Comply with requirements indicated below for grade, finish system, staining, effect, and sheen, with sheen measured on 60 degrees gloss meter per ASTM D 523.

1. Grade: Premium.
2. Staining: Match approved sample for color.
3. Sheen: Medium gloss rubbed effect 35 45 degrees.

2.17 FACTORY FINISHING OF INTERIOR ARCHITECTURAL WOODWORK

A. Quality Standard: Comply with AWI Section 1500 unless otherwise indicated.

B. The entire finish of interior architectural woodwork is specified in this section, regardless of whether factory applied or applied after installation.

1. Factory Finishing: To the greatest extent possible, finish architectural woodwork at factory. Defer only final touch up, cleaning, and polishing until after installation.

C. Preparations for Finishing: Comply with referenced quality standard for sanding, filling countersunk fasteners, sealing concealed surfaces and similar preparations for finishing of architectural woodwork, as applicable to each unit of work.

D. Washcoat for Stained Finish: Apply a vinyl washcoat to woodwork made from closed-grain wood before staining and finishing.

E. Filled Finish for open-Grain Woods: After staining (if any) apply paste wood filler to open-grain woods and wipe off excess. Tint filler to match stained wood.

F. Transparent Finish: Comply with requirements indicated below for grade, finish system, staining, effect, and sheen, with sheen measured on 60 degrees gloss meter per ASTM D 523.

1. Grade: Premium.
2. AWI Finish System #TR-5: Catalyzed vinyl lacquer.
3. Staining: Match approved sample for color.
4. Sheen: Medium gloss rubbed effect 35 45 degrees.

2.18 FACTORY FINISHING OF INTERIOR ARCHITECTURAL WOODWORK

A. Quality Standard: Comply with AWI Section 1500 unless otherwise indicated.

B. The entire finish of interior architectural woodwork is specified in this section, regardless of whether factory applied or applied after installation.

1. Factory Finishing: To the greatest extent possible, finish architectural woodwork at factory. Defer only final touch up, cleaning, and polishing until after installation.

C. Preparations for Finishing: Comply with referenced quality standard for sanding, filling countersunk fasteners, sealing concealed surfaces and similar preparations for finishing of architectural woodwork, as applicable to each unit of work.

D. Washcoat for Stained Finish: Apply a vinyl washcoat to woodwork made from closed-grain wood before staining and finishing.

E. Open Finish for open-Grain Woods: Do not apply filler to open-grain woods.

- F. Filled Finish for open-Grain Woods: After staining (if any) apply paste wood filler to open-grain woods and wipe off excess. Tint filler to match stained wood.
- G. Transparent Finish: Comply with requirements indicated below for grade, finish system, staining, effect, and sheen, with sheen measured on 60 degrees gloss meter per ASTM D 523.
 - 1. Grade: Premium.
 - 2. Grade: Custom.
 - 3. AWI Finish System #TR-7: Clear polyester.
 - 4. Staining: None required.
 - 5. Staining: Match approved sample for color.
 - 6. Staining: Match Owner's sample.
 - 7. Sheen: Medium gloss rubbed effect 35 45 degrees.
 - 8. Sheen: Semigloss bright rubbed effect 55 60 degrees.
- H. Opaque Finish: Comply with requirements indicated below for grade, finish system, color, effect, and sheen:
 - 1. Grade: Premium.
 - 2. Grade: Custom.
 - 3. AWI Finish System #OP-1: Standard lacquer.
 - 4. AWI Finish System #OP-2: Catalyzed lacquer.
 - 5. AWI Finish System #OP-3: Water-Reducible acrylic lacquer.
 - 6. AWI Finish System #OP-4: Conversion varnish.
 - 7. AWI Finish System #OP-5: Catalyzed vinyl lacquer.
 - 8. AWI Finish System #OP-6: Catalyzed polyurethane.
 - 9. AWI Finish System #OP-7: Polyester pigmented.
 - 10. AWI Finish System #OP-8: Polyester polyurethane pigmented.
 - 11. Color: Match Owner's sample.
 - 12. Color: Match color indicated by reference to a coating manufacturer's standard designations for this characteristic.
 - 13. Color: Provide selections made by Owner from full range of standard colors available in finish system specified.
 - 14. Sheen: Dull satin 15 20 degrees.
 - 15. Sheen: Medium gloss rubbed effect 35 45 degrees.
 - 16. Sheen: Semigloss bright rubbed effect 55 60 degrees.

17. Sheen: Full gloss 85 100 degrees.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Condition woodwork to average prevailing humidity conditions in installation areas before installing.
- B. Deliver concrete inserts and similar anchoring devices to be built into substrates well in advance of time substrates are to be built.
- C. Before installing architectural woodwork, examine shop fabricated work for completion and complete work as required, including back priming and removal of packing.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Quality Standard: Install woodwork to comply with AWI Section 1700 for same grade specified in Part 2 of this section for type of woodwork involved.
- D. Install woodwork plumb, level, true, and straight with no distortions. Shim as required with concealed shims. Install to a tolerance of 1/8 inch in 8' 0" for plumb and level (including tops) and with no variations in flushness of adjoining surfaces.
- E. Scribe and cut woodwork to fit adjoining work and refinish cut surfaces or repair damaged finish at cuts.
- F. Fire Retardant Treated Wood: Handle, store, and install fire retardant treated wood to comply with recommendations of chemical treatment manufacturer including those for adhesives where are used to install woodwork.
- G. Anchor woodwork to anchors or blocking built in or directly attached to substrates. Secure to grounds, stripping and blocking with countersunk, concealed fasteners and blind nailing as required for a complete installation. Except where prefinished matching fastener heads are required, use fine finishing nails for exposed nailing, countersunk and filled flush with woodwork and matching final finish where transparent finish is indicated.
- H. Standing and Running Trim and Rails: Install with minimum number of joints possible, using full length pieces (from maximum length of lumber available) to the greatest extent possible. Stagger joints in adjacent and related members. Cope at returns and miter at corners.
- I. Cabinets: Install without distortion so that doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings and to provide unencumbered operation. Complete the installation of hardware and accessory items as indicated. Maintain veneer sequence matching (if any) of cabinets with transparent finish.
- J. Tops: Anchor securely to base units and other support systems as indicated.
- K. Paneling: Anchor paneling to supporting substrate with concealed panel hanger clips and by blind nailing on backup strips, splined connection strips, and similar associated trim and framing. Do not face nail unless otherwise indicated.
- L. Complete the finishing work specified in this section to whatever extent not completed at shop or before installation of woodwork.

3.03 ADJUSTMENT AND CLEANING

- A. Repair damaged and defective woodwork where possible to eliminate defects functionally and visually; where not possible to repair, replace woodwork. Adjust joinery for uniform appearance.
- B. Clean, lubricate, and adjust hardware.
- C. Clean woodwork on exposed and semi-exposed surfaces. Touch up factory applied finishes to restore damaged or soiled areas.

3.04 PROTECTION

- A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, which ensures that woodwork is being without damage or deterioration at time of Substantial Completion.

3.05 HARDWARE SCHEDULE

- A. Provide the following items of cabinet hardware at locations indicated and required for proper operation of doors, drawers, and accessories.
 - 1. Hinges:
 - a. Blum 120 Full Overlay
 - 2. Drawer/Door Pulls:
 - a. Ives PA-28 3 inch on center
 - 3. Door Catches: Stanley No. SP41, US 28 at single doors, provide two at doors over 48 inches high. Stanley No. SP45, US 28 at double doors or KV918 heavy duty catch.
 - 4. Drawer Slides: Full extension type, KV-8400D, provide one pair at each drawer.
 - 5. Pilaster Shelf Standards: KV 255NP, recessed.
 - 6. Adjustable Shelf Supports:
 - a. Type 1 - KV 256 NP.
 - b. Type 2 – B 45 NP.
 - 7. End Sockets for Closet Rod: KV 734 and KV 735.
 - 8. Closet Rods: KV 660.
 - 9. Cabinet Cylinder-locks: Best Lock Corporation, 5L Series (verify keying with Owner).
 - 10. Glass Door Slides.
 - 11. Standard wall bracket shelving (S.W.B.S.): KV-51NP Standards with KV-52NP supports.
 - 12. Keyboard Drawer Slides: KV 8100
 - 13. Recessed Cabinet (flipper) Door Hardware: KV 8080

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 07 05 00 00 - COMMON WORK RESULTS FOR THERMAL AND MOISTURE PROTECTION**PART 1: GENERAL****1.01 Scope Of Standard**

A. This standard provides general guidance concerning the specific preferences of the University of Texas at Austin for roofing systems.

B. UT recognizes that project conditions and requirements vary, thus precluding the absolute adherence to the items identified herein in all cases. However, unless there is adequate written justification, it is expected that these guidelines will govern the design and specifications for UT projects.

1.02 Related Standards

A. Structural Systems (currently The University of Texas Office of Facilities Planning and Construction Owner's Design Guidelines, Section K, Structural Criteria).

B. Plazas and Decks. Section 07050

C. Jointing of Exterior Vertical Surfaces. Section 07940

D. The Secretary of the US Department of the Interior's Standards for Rehabilitation.

1.03 Reference Standards

A. National Roofing Contractors Association (NRCA) Roofing and Waterproofing Manual

B. Sheet Metal and Air Conditioning Contractors' National Association (SMACNA) Architectural Sheet Metal

1.04 Quality Control

A. Roofing contractors shall be certified by the roofing system manufacturer as qualified to install the specified system and to receive the specified warranty.

B. A minimum of one-half day, on-site inspection by an independent quality control observer shall be provided for each day of roofing installation. Once a week, Observer shall submit to UT project representative, copies of his daily reports. Weekly reports shall also include photographs to document the relative completion of project and any specific details or items of concern.

1.05 General Requirements

A. Roof shall be historically accurate and shall be coordinated with Master Plan.

B. Always provide slope.

C. Provide minimum 6 inch diameter roof drains. Always provide cast iron, domed strainers at drains. Provide Roof Drain Rings or Collars

Common Work Results for Thermal And Moisture
Protection

May 2013

- D. Entire assembly shall resist UL Wind Uplift 190.
- E. Minimum insulation value equal to wall insulation, but never less than R = 30. Minimum of 3 inches.
- F. At vertical projections through roof, provide minimum 8" clearance between top of flashing and roof surface. Always provide cricket on uphill side of any projection that interferes with drainage.
- G. It is desirable to avoid pitch pans. If a pitch pan cannot be avoided, provide gooseneck or hood over pan and fill pan completely with urethane pourable sealant. Pitch Pans installed with TYP for nailers, min. inch clearance around penetration.
- H. At areas where frequent foot traffic will occur (mechanical units, particularly), provide walk pads. Walking pad location will be approved by UTHSCSA.
- I. Provide two-year contractor's warranty in addition to manufacturer's warranty.

PART 2: PRODUCTS

2.01 Built-Up

A. General

- 1. Provide 20-year manufacturer's no dollar limit warranty on labor and materials.
- 2. All base flashing shall be granular surfaced modified bitumen or match existing.

B. Substrate: No lightweight fill shall be allowed. Unless approved by UTHSCSA

C. Insulation: Provide minimum two layers of near equal thickness. Tapered layer shall not count as layer.

D. Systems

- 1. Four-ply Asphalt with Aggregate.
 - a. Mop four plies Type VI fiber glass felts.
 - b. Type III asphalt.
 - c. ASTM D 1863 aggregate.
- 2. Three-ply Asphalt and Rubber/SEBS (Styrene Ethylene Butadiene Styrene) Modified Cap Sheet.
 - a. Mop two Type IV fiberglass felts.
 - b. Mop one reinforced modified cap sheet (Stress-Ply by The Garland Co., or approved equal) with granular surface or cover with ASTM D 1863 aggregate in asphalt flood coat.

- c. Use Type III asphalt for all moppings and flood coat.

2.02 Tile

A. Substrate

- 1. Shall be able to receive screw and withstand specified wind loading (see above). Specified in paragraph 1.05(c) of this section.

B. Underlayment

- 1. "Peel and stick" Ice and Water Shield by W.R. Grace Co., or approved equal.
- 2. Minimize ultraviolet exposure (maximum allowable shall be 30 days).

C. Nailers (if required)

- 1. 2X6 No. 1 Southern Yellow Pine, CCA 40 treated "Wolmanized"®. Use 10' lengths to minimize warping.
- 2. Use Stainless Steel or copper nails.

D. Tile

- 1. Use full corner Spanish tile in blend to be sympathetic with other existing University of Texas roofs as manufactured by Ludiwici Roof Tile Co., or approved equal. Specifications shall include a proposed tile blend with a requirement for a mock-up and approval prior to ordering.
- 2. Prior to ordering tile, install field sample at roof height of proposed blend for Owner's approval.

- E. Accessories: Use preformed accessories, i.e. bird stops, hip and ridge corners, etc. Always use bird stops.

2.03 Shingles

NOTE: Shingles are not a standard roof on a University of Texas building. Special permission from The University is required prior to specifying shingles.

- A. Provide minimum 3/4" plywood substrate.
- B. Elk "Prestige" line shingles, or approved equal.
- C. No wood shingles shall be allowed, except where historically required, i.e. Winedale.

2.04. Metal Roofing

NOTE: Metal roofs are infrequently used on a University of Texas building. Special permission from The University is required prior to specifying metal roofing.

- A. Copper is first choice. If steel is used, provide 24 gage minimum with Kynar 500 finish, or approved equal, from manufacturer's standard colors (exemption possible by special permission of University).

Common Work Results for Thermal And Moisture
Protection

May 2013

- B. Provide standing seam, double-lock connections.

2.05 Urethane Foam

NOTE: Foam roofs are not used on University of Texas buildings except on odd shaped structures or in the very dry climate of west Texas. Special permission from the University is required prior to specifying foam roofing.

2.06 Sheet Metal

A. Counter flashing

1. Copper is first choice. If steel is used, provide 22 gage minimum. For exposed steel, provide Kynar 500 finish, or approved equal, from manufacturer's standard colors (exemption possible by special permission of UT project representative). Metal not visible from ground or windows, may be Stainless Steel..
2. No surface mounted counter flashing shall be allowed. Always provide reglet. Unless Approved by UTHSCSA.

B. Scuppers/Gutters/Down spouts

1. General

- a. All detailing shall conform to SMACNA standards. (Refer to item 1.03.)
- b. Where architecturally acceptable, 16 oz. copper is preferred. If steel (22 gauge minimum) is used, provide Kynar 500 finish, or approved equal, from the manufacturer's standard colors, and galvanized if not visible. Match existing, where historical demands require.

2. Overflow Scuppers: Make exterior perimeter high and place overflow scuppers such that bottom of scupper is 1/2" above top of finished roof.

3. Scuppers and gutters as part of roof drainage system. Shall be Stainless steel or copper, unless otherwise approved by UTHSCSA

- a. Place crickets between scuppers.
- b. Provide conductor head with down spout at scupper or top of down spout.
- c. Where possible, connect all down spouts to underground storm drainage systems. If not, configure down spout so that it, and its discharge, drain away from base of building. Provide cleanout at base of down spout.
- d. Provide expansion joints in gutters.
- e. Avoid internal gutters.

PART 3: EXECUTION

Common Work Results for Thermal And Moisture Protection

May 2013

3.01 General

A. Built-up

1. Minimum 1/4" per foot slope.
2. Install per manufacturer's requirements.
3. No torches nor kettles allowed on roof without special permission of UT project representative (a fire protection plan shall also be submitted with the request).
4. When determining set-up location, keep well away from fresh air intakes on adjacent buildings (and existing buildings on re-roofs).

B. Tile

1. Minimum 5" per foot slope.
2. Minimize ultraviolet exposure of underlayment (maximum allowable should be 30 days).
3. Attach nailers to substrate with sheet metal strap. Screw strap to substrate.
4. Cover nailer (and straps) with continuous strip of underlayment.
5. Use chalk lines in three directions; vertical, horizontal, and diagonal.
6. Lay tile in diagonal patterns.
7. Provide Minimum two nails per tile. Nail into holes preformed into the tile.

C. Shingles: Minimum 5" per foot slope.

D. Metal Roofing: Minimum 5" per foot slope.

3.02 Re-roofing

A. Inspect existing roof:

1. Core existing roof to verify conditions.
2. Determine whether pull-out testing is required.
3. If existing roof is mechanically fastened, determine how to remove roof and methods to repair substrate.

B. Test for asbestos, lead, and asphaltic substances whose removal may require abatement or special environmental considerations. Do not install asbestos containing material.

C. Inspect existing skylights and report to UT project representative whether it would be prudent to include skylight re-work with roof repairs. Likewise, for roof scuttle and other rooftop accessories.

D. Remove existing roof to substrate. Never remove more roof than can be dried-in prior to completion of day's work or in the event of rain. 20% or more.

F. Replace all nailers. Provide unit prices with bid to allow existing nailers to remain if determined to be satisfactory.

G. Re-use of existing counter flashing is permissible if UT project representative agrees. Verify height of finished roof and include repairs to counter flashing in Base Bid. Re-caulk top of existing counter flashing where caulking exists.

H. Sump roof insulation to existing drains, unless drain is adjustable

END OF SECTION 07 05 00 00

Task	Specification	Specification Description
07 05 13 00	07 05 00 00	Common Work Results for Thermal And Moisture Protection
07 20 00 00	07 05 00 00	Common Work Results for Thermal And Moisture Protection

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 07 21 00 00 - THERMAL INSULATION**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 DEFINITIONS

- A. Thermal Resistivity: Where the thermal resistivity of insulation products is designated by "r values," they represent the reciprocal of thermal conductivity (k values). Thermal conductivity is the rate of heat flow through a homogenous material exactly 1 inch thick. Thermal resistivities are expressed by the temperature difference in degrees F between the two exposed faces required to cause one BTU to flow through one square foot per hour at mean temperatures indicated.

1.04 QUALITY ASSURANCE

- A. Fire Performance Characteristics: Provide insulation materials identical to those whose indicated fire performance characteristics have been determined per the ASTM test method indicated below, by UL or other testing and inspecting organizations acceptable to authorities having jurisdiction. Identify products with appropriate markings of applicable testing and inspecting organization.
 - 1. Surface Burning Characteristic: ASTM E 84
 - 2. Fire Resistance Ratings: ASTM E 119
- B. Single Source Responsibility for Insulation Products: Obtain each type of building insulation from a single source with resources to provide products of consistent quality in appearance and physical properties without delaying progress of the Work.

1.05 SUBMITTALS

- A. Product Data:
 - 1. Submit a complete listing of all manufacturers, products, model numbers, and designs proposed for use in the Work of this Section.
 - 2. Include code compliance verification, R-values, moisture permeability, fire ratings and installation instructions.
- B. Record Documents:

1. Maintain two copies of all shop drawings, product data, and samples, manufacturer's specifications, recommendations, installation instructions, and maintenance data at the Project Site.
2. At Project Closeout, turn over both copies to the Architect who will transmit one copy to The University.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Protect insulation materials from physical damage and from deterioration by moisture, soiling, and other sources. Store inside and in a dry location.
- B. Comply with manufacturer's recommendations for handling, storage, and protection during installation.
- C. Protect plastic insulation as follows:
 1. Do not expose to sunlight, except to extent necessary for period of installation and concealment.
 2. Protect against ignition at all times. Do not deliver plastic insulating materials to the Project Site ahead of installation time.
 3. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 INSULATING MATERIALS

- A. Provide insulating materials that comply with requirements and with referenced standards.
 1. Preformed Units: Sizes to fit applications indicated, selected from manufacturer's standard thicknesses, widths, and lengths.
- B. Extruded Polystyrene Board Insulation: Rigid, cellular polystyrene thermal insulation with closed cells and integral high density skin, formed by the expansion of polystyrene base resin in an extrusion process to comply with ASTM C 578 for type indicated; with 5 year aged α values of 5.4 and 5 at 40 and 75 degrees F (4.4 and 23.9 degrees C), respectively; and as follows:
 1. Type IV, 1.6 pcf min. density, unless otherwise indicated.
 2. Type V, 3.0 pcf min. density where indicated.
 3. Type VI, 1.8 pcf min. density.
 4. Type VII, 2.2 pcf min. density.
 5. Type X, 1.35 pcf min. density.
 6. Surface Burning Characteristics: Maximum flame spread and smoke developed values of 75 and 450, respectively.
 7. Manufacturers:

- a. Tenneco Building Products Co.
 - b. DiversiFoam Products.
 - c. Dow: The Dow Chemical Company.
 - d. UC Industries, Inc.
- C. Fabric Faced Extruded Polystyrene Board Insulation: Rigid, cellular polystyrene thermal insulation with closed cells and integral high density skin, formed by the expansion of polystyrene base resin in an extrusion process to comply with ASTM C 578 for type indicated; fabricated with tongue and groove edges and with one side having a matrix of vertical and horizontal drainage channels faced with manufacturer's standard spunbonded filtration fabric; with 5 year aged r value of 4.4 at 75 degrees F (23.9 degrees C).
1. Dow "Styrofoam Thermadry".
 2. Type IV, 1.6 pcf min. density.
 3. Type VI, 1.8 pcf min. density.
 4. Type VII, 2.2 pcf min. density.
- D. Molded Polystyrene Board Insulation: Rigid, cellular thermal insulation formed by the expansion of polystyrene resin beads or granules in a closed mold to comply with ASTM C 578 for type indicated; and as follows:
1. Type I, 0.9 pcf min. density, aged r values of 4.0 and 3.6 at 40 and 75 degrees F (4.4 and 23.9 degrees C), respectively.
 2. Type II, 1.35 pcf min. density, aged r values of 4.4 and 4.0 at 40 and 75 degrees F (4.4 and 23.9 degrees C), respectively.
 3. Type VIII, 1.15 pcf min. density, aged r values of 4.2 and 3.8 at 40 and 75 degrees F (4.4 and 23.9 degrees C), respectively.
 4. Surface Burning Characteristics: Maximum flame spread and smoke developed values of 75 and 450, respectively.
 5. Manufacturers:
 - a. AFM Corporation.
 - b. DiversiFoam Products.
 - c. Grace Construction Products Div., W.R. Grace & Co.
 - d. Manufacturers with a third party certification program satisfying mandatory requirements for foam plastics of model building codes.
- E. Polyisocyanurate Board Insulation: Rigid, cellular thermal insulation with glass fiber reinforced polyisocyanurate closed cell foam core and aluminum foil facing laminated to both sides; complying with FS HH I 1972/1, Class 2; aged r values of 8 and 7.2 at 40 and 75 degrees F (4.4 and 23.9 degrees C), respectively; and as follows:
1. Surface Burning Characteristics: Maximum flame spread and smoke developed values of 75 and 450, respectively.
 2. Celotex "Thermax".

- F. Cellular Glass Block Insulation: Rigid cellular glass thermal insulation with closed cell structure, passing ASTM E 136 for testing of combustion characteristics, in flat or tapered block form complying with ASTM C 552 for Type I; with r values of 3.03 and 2.86 at 50 and 75 degrees F (10 and 23.9 degrees C), respectively.
1. Pittsburgh Corning Corporation "FOAMGLAS".
- G. Unfaced, Flexible Glass Fiber Board Insulation: Thermal insulation produced by combining glass fibers with thermosetting resin binders to comply with ASTM C 553, Class B 4, and ASTM C 612, Class 1; with nominal density of not less than 1.5 nor more than 1.65 pcf, r value of 4.13 at 75 degrees F (23.9 degrees C), and maximum flame spread and smoke developed values of 25 and 50, respectively.
1. Products:
 - a. CertainTeed "WP 165".
 - b. Knauf "IB 1.6".
 - c. Schuller "Insul-Shield 150"
 - d. Owens Corning "701".
- H. Foil Faced, Flexible Glass Fiber Board Insulation: Thermal insulation produced by combining glass fibers with thermosetting resin binders to comply with ASTM C 553, Class B 4, and ASTM C 612, Class 1; with nominal density of 1.5 pcf and r value of 4.13 at 75 degrees F (23.9 degrees C); foil scrim kraft vapor retarder facing on one side with maximum flame spread and smoke developed values of 25 and 50, respectively.
1. Products:
 - a. CertainTeed "WP 165".
 - b. Knauf "IB 2.25".
 - c. Schuller "Insul-Shield 150"
 - d. Owens Corning "703".
- I. Unfaced Glass Fiber Board Insulation: Thermal insulation produced by combining glass fibers with thermosetting resin binders to comply with ASTM C 612 for Class indicated; and as follows:
1. Low Density Semi Rigid Board: Class 1, nominal density of 2.25 pcf, r value of 4.3 at 75 degrees F (23.9 degrees C).
 2. Medium Density Semi Rigid Board: Class 1 and 2, nominal density of 3.0 pcf, r value of 4.3 at 75 degrees F (23.9 degrees C).
 3. Rigid Board: Class 1 and 2, nominal density of 6.0 pcf, r value of 4.3 at 75 degrees F (23.9 degrees C).
 - a. CertainTeed "WP 225".
 - b. Knauf "IB 2.25".
 - c. Schuller "Insul-Shield 225"
 - d. Owens Corning "225".

- J. Foil Faced Glass Fiber Board Insulation: Thermal insulation produced by combining glass fibers with thermosetting resin binders to comply with ASTM C 612 for Class indicated; foil scrim kraft or foil scrim polyethylene vapor retarder facing on one side with maximum flame spread and smoke developed values of 25 and 50, respectively; and as follows:
1. Low Density Semi Rigid Board: Class 1, nominal density of 2.25 pcf, r value of 4.3 at 75 degrees F (23.9 degrees C).
 2. Medium Density Semi Rigid Board: Class 1 and 2, nominal density of 3.0 pcf, r value of 4.3 at 75 degrees F (23.9 degrees C).
 3. Rigid Board: Class 1 and 2, nominal density of 6.0 pcf, r value of 4.3 at 75 degrees F (23.9 degrees C).
 4. Products:
 - a. Knauf <"IB 3.0"><"IB 4.5"><"IB 6.0">.
 - b. Schuller "Insul-Shield <"300"><"600">.
 - c. Owens Corning <"703"><"705">.
- K. Glass Mat Faced Glass Fiber Board Insulation: Thermal insulation produced by combining glass fibers with thermosetting resin binders to comply with ASTM C 612 for Class indicated; black glass fiber mat facing on one side with maximum flame spread and smoke developed values of 25 and 50, respectively; and as follows:
1. Low Density Semi Rigid Board: Class 1, nominal density of 2.25 pcf, r value of 4.3 at 75 degrees F (23.9 degrees C).
 2. Medium Density Semi Rigid Board: Class 1 and 2, nominal density of 3.0 pcf, r value of 4.3 at 75 degrees F (23.9 degrees C).
 3. Rigid Board: Class 1 and 2, nominal density of 6.0 pcf, r value of 4.55 at 75 degrees F (23.9 degrees C).
 4. Schuller "Insul-Shield Black <"225"><"300"><"600">.
- L. Unfaced Semi Refractory Fiber Board Insulation: Thermal insulation produced by combining semi refractory mineral fibers manufactured from slag with thermosetting resin binders to comply with ASTM C 612 for class indicated; passing ASTM E 136 for combustion characteristics; and as follows:
1. Low Density Semi Rigid Board: Class 1 and 2, nominal density of 4.0 pcf, r value of 4.0 at 75 degrees F (23.9 degrees C).
 2. Medium Density Semi Rigid Board: Class 3, nominal density of 6.0 pcf, r value of 4.16 at 75 degrees F (23.9 degrees C).
 3. Rigid Board: Class 4, nominal density of 8.0 pcf, r value of 4.35 at 75 degrees F (23.9 degrees C).
 4. Fiber Color: Regular color, unless otherwise indicated.
 5. Fiber Color: Darkened, where indicated.
 6. Products:
 - a. Cafco "Omni-Board <"3.0"><"4.5"><"6.0">.
 - b. Fibrex "FBX <"CW40"><"CW70"><"CW90">.

- c. USG "Thermafiber <"CW40"><"CW70"><"CW90">.
- M. Foil Faced Semi Refractory Fiber Board Insulation: Thermal insulation produced by combining semi refractory mineral fibers manufactured from slag with thermosetting resin binders to comply with ASTM C 612 for Class indicated; passing ASTM E 136 for combustion characteristics of unfaced board; foil scrim kraft or foil scrim polyethylene vapor retarder facing on one side with maximum flame spread and smoke developed values of 25 and 10, respectively; and as follows:
1. Low Density Semi Rigid Board: Class 1 and 2, nominal density of 4.0 pcf, r value of 4.0 at 75 degrees F (23.9 degrees C).
 2. Medium Density Semi Rigid Board: Class 3, nominal density of 6.0 pcf, r value of 4.16 at 75 degrees F (23.9 degrees C).
 3. Rigid Board: Class 4, nominal density of 8.0 pcf, r value of 4.35 at 75 degrees F (23.9 degrees C).
 4. Products:
 - a. Fibrex "FBX <"CW40"><"CW70"><"CW90">.
 - b. USG "Thermafiber <"CW40"><"CW70"><"CW90">.
- N. Glass Mat Faced Semi Refractory Fiber Board Insulation: Thermal insulation produced by combining semi refractory mineral fibers manufactured from slag with thermosetting resin binders to comply with ASTM C 612 for Class indicated; passing ASTM E 136 for combustion characteristics of unfaced board; faced on one side with black glass fiber mat; with maximum flame spread and smoke developed values of 10 and 5, respectively; and as follows:
1. Low Density Semi Rigid Board: Class 1 and 2, nominal density of 4.0 pcf, r value of 4.0 at 75 degrees F (23.9 degrees C).
 2. Medium Density Semi Rigid Board: Class 3, nominal density of 6.0 pcf, r value of 4.16 at 75 degrees F (23.9 degrees C).
 3. Rigid Board: Class 4, nominal density of 8.0 pcf, r value of 4.35 at 75 degrees F (23.9 degrees C).
 4. Fiber Color: Darkened.
 5. Products:
 - a. Fibrex "FBX <"CW40"><"CW70"><"CW90">.
 - b. USG "Thermafiber <"CW40"><"CW70"><"CW90">.
- O. Unfaced Mineral Fiber Blanket/Batt Insulation: Thermal insulation produced by combining mineral fibers of type described below with thermosetting resins to comply with ASTM C 665 for Type I (blankets without membrane facing); and as follows:
1. Mineral Fiber Type: Fibers manufactured from glass or slag.
 2. Surface Burning Characteristics: Maximum flame spread and smoke developed values of 25 and 50, respectively.
 3. Products:
 - a. CertainTeed "Building Insulation".

- b. Knauf "Light Density".
 - c. Schuller "C.I. Unfaced".
 - d. Owens Corning "Fire-Core 60 S.A. Batts".
- P. Faced Mineral Fiber Blanket/Batt Insulation: Thermal insulation produced by combining mineral fibers of type described below with thermosetting resins to comply with ASTM C 665 for Type III, Class A (blankets with reflective vapor retarder membrane facing with flame spread of 25 or less); foil scrim kraft or foil scrim polyethylene vapor retarder membrane on one face, and as follows:
- 1. Mineral Fiber Type: Fibers manufactured from glass or slag.
 - 2. Surface Burning Characteristics: Maximum flame spread and smoke developed values of 25 and 50, respectively.
 - 3. Flanged Units: Provide blankets/batts fabricated with facing incorporating 4 inch wide flanges along their edges for attachment to framing members.
 - 4. Products:
 - a. CertainTeed "Building Insulation".
 - b. Knauf "FSK-25".
 - c. Schuller "Panel Deck Insulation FSK-25".
 - d. Owens Corning "FS-25".
- Q. Perlite Loose Fill Insulation: Expanded perlite complying with ASTM C 549, Type II (surface treated for water repellency and limited moisture absorption) or IV (surface treated for water repellency and limited moisture absorption), r values of 3.3, 2.8 for densities of 4.1, 7.4 pcf at 75 degrees F (23.9 degrees C).
- R. Glass Fiber Loose Fill Insulation: Glass fibers processed to comply with ASTM C 764 for Type (method of application) indicated below; maximum flame spread and smoke developed values of 5 and 5, respectively, and as follows:
- 1. Type 1 for pneumatic application.
 - 2. Type 2 for poured application.

2.03 SAFING INSULATION AND ACCESSORIES

- A. Semi Refractory Fiber Board Safing Insulation: Semi rigid boards designed for use as a fire stop at openings between edge of slab and exterior wall panels, produced by combining semi refractory mineral fiber manufactured from slag with thermosetting resin binders to comply with ASTM C 612, Class 1 and 2; nominal density of 4.0 pcf; passing ASTM E 136 for combustion characteristics; r value of 4.0 at 75 degrees F (23.9 degrees C).
- 1. Fibrex Inc., "FBX Safing Insulation".
 - 2. USG "Thermafiber Safing Insulation".
- B. Caulking Compound: Material approved by manufacturer of safing insulation for sealing joint between foil backing of safing insulation and edge of concrete floor slab against penetration of smoke.
- C. Safing Clips: Galvanized steel safing clips approved by manufacturer of safing insulation for holding safing insulation in place.

2.04 RADIANT BARRIERS

- A. Radiant Barrier Coating: Silver colored, not thickness dependent, low emissivity coating, formulated for adherence to substrates indicated.
- B. Foil Kraft Laminate: Two layers of 0.0035 inch thick aluminum foil laminated to an inner layer of 100 pound basic weight kraft paper, with maximum flame spread and smoke developed ratings of 20 and 10, respectively, in sheets of the following width covering 500 sq. ft.:
 - 1. Sheet Width: 24 inches.
 - 2. Sheet Width: 48 inches.
- C. Foil Scrim Polyethylene Laminate: Two layers of aluminum foil laminated with scrim reinforcing on polyethylene with an overall thickness of 7.5 mils, with maximum flame spread and smoke developed ratings of 5 and 10, in sheets 48 inches wide up to 375 feet long.
- D. Available Products: Subject to compliance with requirements, products that may be incorporated in the Work include, but are not limited to, the following:
 - 1. Radiant Barrier Coating:
 - a. "LO/MIT 1," Solar Energy Corp.
 - 2. Foil Kraft Laminate:
 - a. "RX 2 Reflective Aluminum Foil Insulation," R Fax Technologies, Inc.
 - 3. Foil Scrim Polyethylene Laminate:
 - a. "Foil Ray DS Radiant Barrier," Energy Savers Imports, Inc.

2.05 VAPOR RETARDERS

- A. Reinforced Polyethylene Vapor Retarder: Multiple layers of polyethylene film reinforced with inner layers of nylon cord reinforcing and laminated together with a rubber adhesive to produce the following product in roll form:
 - 1. Number of Layers: Two outer layers of polyethylene film and one inner layer of nylon reinforcing, with an overall thickness of 6.0 to 8.0 mils.
 - 2. Number of Layers: Three layers of polyethylene film and two layers of nylon cord reinforcing, with an overall thickness of 10.0 to 12.0 mils.
- B. Fire-Retardant, Reinforced-Polyethylene Vapor Retarders: Two outer layers of polyethylene film laminated to an inner reinforcing layer consisting of either a nonwoven grid of nylon cord or polyester scrim and weighing not less than 26 lb/1000 sq. ft. (13 kg/100 sq.m), with maximum permeance rating of 0.0403 perm (2.3 ng/PA x s x sq. m) and flame-spread and smoke-developed indicates of not more than 5 and 75, respectively.
- C. Foil Polyester Film Vapor Retarder: Two layers of 0.5 mil thick polyester film laminated to an inner layer of 1.0 mil thick aluminum foil, with maximum flame spread and smoke developed ratings of 15 and 5, respectively.
- D. Tape for Vapor Retarder: Pressure sensitive tape of type recommended by vapor retarder manufacturer for sealing joints and penetrations in vapor retarder.

- E. Available Products: Subject to compliance with requirements, products that may be incorporated in the Work include, but are not limited to, the following:
1. Reinforced Polyethylene Vapor Retarder:
 - a. "Griffolyn T 65," Griffolyn Div., Reef Industries, Inc.
 - b. "Griffolyn T 85," Griffolyn Div., Reef Industries, Inc.
 2. Fire-Retardant, Reinforced-Polyethylene Vapor Retarders:
 - a. DURA-SKRIM 2FR; Raven Industries, Inc.
 - b. Griffolyn T-55 FR; Reef Industries, Inc. Griffolyn Div.
 3. Foil Polyester Film Vapor Retarder:
 - a. "Alumiseal Zero Perm," Alumiseal Corp.

2.06 AUXILIARY INSULATING MATERIALS

- A. Adhesive for Bonding Insulation: Product with demonstrated capability to bond insulation or mechanical anchors securely to substrates indicated without damaging or corroding either insulation, anchors, or substrates.
- B. Adhesively Attached Pin Anchors: Perforated plate, 2 inches square, welded to projecting pin, with self locking washer, complying with the following requirements:
1. Plate: Zinc plated steel, 0.106 inch thick.
 2. Pin: Copper coated low carbon steel, fully annealed, 0.106 inches in diameter, length to suit depth of insulation indicated and, with washer in place, to hold insulation tightly to substrate behind insulation.
 3. Self Locking Washer: Mild steel, 0.016 inch thick, size as required to hold insulation securely.
 - a. Where spindles will be exposed to human contact after installation, protect ends with capped self locking washers.
- C. Asphalt Coating for Cellular Glass Block Insulation: Cutback asphalt or asphalt emulsion of type recommended by cellular glass block insulation manufacturer.
1. Available Products: Subject to compliance with requirements, products that may be incorporated in the Work include, but are not limited to, the following:
 - a. "PITTCOTE 300 Coating," Pittsburgh Corning Corp.
 - b. "Karnak 100," Karnak Corp.
- D. Protection Board: Premolded, semi rigid asphalt/fiber composition board, 1/4 inch thick, formed under heat and pressure, standard sizes.
- E. Eave Ventilation Troughs: Preformed rigid fiberboard or plastic sheets designed and sized to fit between roof framing members and to provide cross ventilation between insulated attic spaces and vented eaves.

PART 3 - EXECUTION**3.01 PREPARATION**

- A. Examine substrates and conditions with Installer present, for compliance with requirements of the Sections in which substrates and related work are specified and to determine if other conditions affecting performance of insulation are satisfactory. Do not proceed with installation of insulation until unsatisfactory conditions have been corrected.
- B. Clean substrates of substances harmful to insulations or vapor retarders, including removal of projections that might puncture vapor retarders.
- C. Close off openings in cavities receiving poured in place insulation to prevent the escape of insulation. Provide bronze or stainless steel screen (inside) where openings must be maintained for drainage or ventilation.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

3.03 INSTALLATION OF GENERAL BUILDING INSULATION

- A. Apply insulation units to substrate by method indicated, complying with manufacturer's recommendations. If no specific method is indicated, bond units to substrate with adhesive or use mechanical anchorage to provide permanent placement and support of units.
 - 1. Where insulation units are not held tightly in place by adjacent materials on all sides, provide wire ties or other acceptable mechanical means to prevent displacement or sagging of insulation.
- B. Extend insulation full thickness as indicated to envelop entire area to be insulated. Cut and fit tightly around obstructions, and fill voids with insulation. Remove projections that interfere with placement.
- C. Apply a single layer of insulation of required thickness, unless otherwise shown or required to make up total thickness.
- D. Seal joints between closed cell (nonbreathing) insulation units by applying adhesive, mastic, or sealant to edges of each unit to form a tight seal as units are shoved into place. Fill voids in completed installation with adhesive, mastic, or sealant as recommended by insulation manufacturer.
- E. Set vapor retarder faced units with vapor retarder to warm side of construction, except as otherwise indicated. Do not obstruct ventilation spaces, except for firestopping.
 - 1. Tape joints and ruptures in vapor retarder, and seal each continuous area of insulation to surrounding construction to ensure airtight installation.
- F. Set reflective, foil faced units accurately with not less than 0.75 inch air space in front of foil as indicated.
- G. Place glass fiber loose fill insulation into spaces and onto surfaces as shown, either by pouring or by machine blowing. Level horizontal applications to uniform thickness as indicated, lightly settle to uniform density, but do not excessively compact.
- H. Stuff glass fiber loose fill insulation into miscellaneous voids and cavity spaces where shown. Compact to approximately 40 percent of normal maximum volume (to a density of approximately 2.5 pcf).

3.04 INSTALLATION OF PERIMETER AND UNDER SLAB INSULATION

- A. On vertical surfaces, set units in adhesive applied in accordance with manufacturer's instructions. Use type of adhesive recommended by manufacturer of insulation.
- B. Protect below grade insulation on vertical surfaces (from damage during back filling) by application of protection board. Set in adhesive in accordance with recommendations of manufacturer of insulation.
- C. Protect top surface of horizontal insulation (from damage during concrete work) by application of protection board.

3.05 INSTALLATION OF CAVITY WALL AND MASONRY CELL INSULATION

- A. On units of plastic insulation, install small pads of adhesive spaced approximately 1' 0" on center both ways on inside face, as recommended by manufacturer. Fit courses of insulation between wall ties and other confining obstructions in cavity, with edges butted tightly both ways. Press units firmly against inside wythe of masonry or other construction as shown.
 - 1. Supplement adhesive attachment of insulation by securing boards with two piece wall ties designed for this purpose and specified under Division 04 "Unit Masonry."
- B. On units of cellular glass insulation, apply insulation with closely fitting joints using method indicated below:
 - 1. Gob Method: Install four gobs of adhesive per unit and apply firmly against inside wythe of masonry or other construction as shown. Apply gobs at each corner; spread gobs to form pads 4 inches in diameter by 1/4 inch thick.
 - 2. Serrated Trowel Method: Apply adhesive to entire surface of each cellular glass insulation unit with a serrated trowel complying with insulation manufacturer's specifications.
 - 3. Coat edges of insulation units with a full bed of adhesive to seal joints between insulation and between insulation and adjoining construction.
 - 4. Coat exterior face (cold face) of installed cellular glass block insulation course with asphalt coating recommended by insulation manufacturer for this purpose.
- C. Pour granular insulation into cavities indicated to receive insulation, taking care to fill void spaces completely. Maintain inspection ports to show presence of insulation at extremities of each pour area. Close ports after confirming complete coverage. Limit fall of insulation to one story in height, but not to exceed 20 feet.

3.06 INSTALLATION OF SAFING INSULATION

- A. Install safing insulation to fill gap between edge of concrete floor slab and back of exterior spandrel panels on safing clips spaced as needed to support insulation but not further apart than 24 inches on center.
- B. Cut safing insulation wider than gap to be filled to ensure compression fit and seal joint between insulation and edge of slab with caulking approved by safing insulation manufacturer for this purpose. Leave no voids in completed installation.

3.07 INSTALLATION OF RADIANT BARRIERS

- A. Install radiant barriers in locations indicated to comply with radiant barrier insulation manufacturer's recommendations.

3.08 INSTALLATION OF VAPOR RETARDERS

- A. General: Extend vapor retarder to extremities of areas to be protected from vapor transmission. Secure in place with adhesives or other anchorage system as indicated. Extend vapor retarder to cover miscellaneous voids in insulated substrates, including those filled with loose fiber insulation.
- B. Seal vertical joints in vapor retarders over framing by lapping not less than 2 wall studs. Fasten vapor retarders to framing at top, end, and bottom edges, at perimeter of wall openings, and at lap joints; space fasteners 16 inches on center.
- C. Seal overlapping joints in vapor retarders with adhesives or tape per vapor retarder manufacturer's printed directions. Seal butt joints and fastener penetrations with tape of type recommended by vapor retarder manufacturer. Locate all joints over framing members or other solid substrates.
- D. Firmly attach vapor retarders to substrates with mechanical fasteners or adhesives as recommended by vapor retarder manufacturer.
- E. Seal joints caused by pipes, conduits, electrical boxes, and similar items penetrating vapor retarders with tape of type recommended by vapor retarder manufacturer to create an airtight seal between penetrating objects and vapor retarder.
- F. Repair any tears or punctures in vapor retarders immediately before concealment by other work. Cover with tape or another layer of vapor retarder.

3.09 PROTECTION

- A. General:
 - 1. Protect installed insulation and vapor retarders from damage due to harmful weather exposures, physical abuse, and other causes.
 - 2. Provide temporary coverings or enclosures where insulation will be subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

SECTION 07 71 00 00 - ROOF SPECIALTIES**1.1 GENERAL****A. Description Of Work:**

1. This specification covers the furnishing and installation of materials for manufactured roof specialties. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Copings.
 - b. Roof-edge flashings.
 - c. Roof-edge drainage systems.
 - d. Reglets and counterflashings.

C. Performance Requirements

1. General Performance: Roof specialties shall withstand exposure to weather and resist thermally induced movement without failure, rattling, leaking, or fastener disengagement due to defective manufacture, fabrication, installation, or other defects in construction.
2. FM Approvals' Listing (if Project is FM Global insured or if FM Approvals' requirements set a minimum quality standard): Manufacture and install copings and roof-edge flashings that are listed in FM Approvals' "RoofNav" and approved for windstorm classification, Class 1-60 **OR** Class 1-75 **OR** Class 1-90 **OR** Class 1-105 **OR** Class 1-120, **as directed**. Identify materials with FM Approvals' markings.
3. SPRI Wind Design Standard (if Project is governed by the IBC or if SPRI ES-1 sets a minimum quality standard): Manufacture and install copings and roof-edge flashings tested according to SPRI ES-1 and capable of resisting the following design pressures:
 - a. Design Pressure: As indicated on Drawings **OR** As directed.
4. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes to prevent buckling, opening of joints, hole elongation, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Provide clips that resist rotation and avoid shear stress as a result of thermal movements. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
 - a. Temperature Change (Range): 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

D. Submittals

1. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Shop Drawings: For roof specialties. Include plans, elevations, expansion-joint locations, keyed details, and attachments to other work. Distinguish between plant- and field-assembled work. Include the following:
 - a. Details for expansion and contraction; locations of expansion joints, including direction of expansion and contraction.
 - b. Pattern of seams and layout of fasteners, cleats, clips, and other attachments.
 - c. Details of termination points and assemblies, including fixed points.
 - d. Details of special conditions.
3. Samples: For copings **OR** roof-edge flashings **OR** roof-edge drainage systems **OR** reglets and counterflashings, **as directed**, made from 12-inch (300-mm) lengths of full-size components including fasteners, cover joints, accessories, and attachments.
4. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for copings and roof-edge flashings.

5. Maintenance Data: For roofing specialties to include in maintenance manuals.
6. Warranty: Sample of special warranty.

E. Quality Assurance

1. Preinstallation Conference: Conduct conference at Project site.

F. Delivery, Storage, And Handling

1. Do not store roof specialties in contact with other materials that might cause staining, denting, or other surface damage. Store roof specialties away from uncured concrete and masonry.
2. Protect strippable protective covering on roof specialties from exposure to sunlight and high humidity, except to extent necessary for the period of roof specialties installation.

G. Warranty

1. Special Warranty on Painted Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace roof specialties that show evidence of deterioration of factory-applied finishes within specified warranty period.
 - a. Fluoropolymer Finish: Deterioration includes, but is not limited to, the following:
 - 1) Color fading more than 5 Hunter units when tested according to ASTM D 2244.
 - 2) Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
 - 3) Cracking, checking, peeling, or failure of paint to adhere to bare metal.
 - b. Finish Warranty Period: 20 **OR** 10, **as directed**, years from date of Substantial Completion.

1.2 PRODUCTS

A. Exposed Metals

1. Copper Sheet: ASTM B 370, cold-rolled copper sheet, H00 or H01 temper.
 - a. Non-Patinated Exposed Finish: Mill.
 - b. Pre-Patinated Copper-Sheet Finish: Pre-patinated according to ASTM B 882.
2. Aluminum Sheet: ASTM B 209 (ASTM B 209M), alloy as standard with manufacturer for finish required, with temper to suit forming operations and performance required.
 - a. Surface: Smooth, flat **OR** Embossed, **as directed**, finish.
 - b. Mill Finish: As manufactured.
 - c. Exposed Coil-Coated Finishes: Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
 - 1) Two-Coat Fluoropolymer: AAMA 620. System consisting of primer and fluoropolymer color topcoat containing not less than 70 percent PVDF resin by weight.
 - 2) Three-Coat Fluoropolymer: AAMA 620. System consisting of primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent PVDF resin by weight.
 - 3) Concealed Surface: Pretreat with manufacturer's standard white or light-colored acrylic or polyester backer finish, consisting of prime coat and wash coat with a minimum total dry film thickness of 0.5 mil (0.013 mm).
 - d. Clear Anodic Finish, Coil Coated: AAMA 611, AA-M12C22A41, Class I, 0.018 mm or thicker.
 - e. Color Anodic Finish, Coil Coated: AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.
3. Aluminum Extrusions: ASTM B 221 (ASTM B 221M), alloy and temper recommended by manufacturer for type of use and finish indicated, finished as follows:
 - a. Exposed High-Performance Organic Finish: Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

- 1) Two-Coat Fluoropolymer: AAMA 2604 **OR** AAMA 2605, **as directed**. System consisting of primer and fluoropolymer color topcoat containing not less than 70 percent PVDF resin by weight.
 - 2) Three-Coat Fluoropolymer: AAMA 2605. System consisting of primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent PVDF resin by weight.
 - b. Clear Anodic Finish, Coil Coated: AAMA 611, AA-M12C22A41, Class I, 0.018 mm or thicker.
 - c. Color Anodic Finish, Coil Coated: AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.
 4. Stainless-Steel Sheet: ASTM A 240/A 240M or ASTM A 666, Type 304.
 5. Zinc-Coated (Galvanized) Steel Sheet: ASTM A 653/A 653M, G90 (Z275) coating designation.
 - a. Surface: Smooth, flat **OR** Embossed, **as directed**, finish.
 - b. Mill-Phosphatized Finish: Manufacturer's standard for field painting.
 - c. Exposed Coil-Coated Finishes: Prepainted by the coil-coating process to comply with ASTM A 755/A 755M. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
 - 1) Two-Coat Fluoropolymer: AAMA 621. System consisting of primer and fluoropolymer color topcoat containing not less than 70 percent PVDF resin by weight.
 - 2) Three-Coat Fluoropolymer: AAMA 621. System consisting of primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent PVDF resin by weight.
- B. Concealed Metals
1. Aluminum Sheet: ASTM B 209 (ASTM B 209M), alloy and temper recommended by manufacturer for type of use and structural performance indicated, mill finished.
 2. Aluminum Extrusions: ASTM B 221 (ASTM B 221M), alloy and temper recommended by manufacturer for type of use and structural performance indicated, mill finished.
 3. Stainless-Steel Sheet: ASTM A 240/A 240M or ASTM A 666, Type 304.
 4. Zinc-Coated (Galvanized) Steel Sheet: ASTM A 653/A 653M, G90 (Z275) coating designation.
- C. Underlayment Materials
1. Felt: ASTM D 226, Type II (No. 30), asphalt-saturated organic felt, nonperforated.
 2. Self-Adhering, High-Temperature Sheet: Minimum 30 to 40 mils (0.76 to 1.0 mm) thick, consisting of slip-resisting polyethylene-film top surface laminated to layer of butyl or SBS-modified asphalt adhesive, with release-paper backing; cold applied. Provide primer when recommended by underlayment manufacturer.
 - a. Thermal Stability: ASTM D 1970; stable after testing at 240 deg F (116 deg C).
 - b. Low-Temperature Flexibility: ASTM D 1970; passes after testing at minus 20 deg F (29 deg C).
 3. Polyethylene Sheet: 6-mil- (0.15-mm-) thick polyethylene sheet complying with ASTM D 4397.
 4. Slip Sheet: Building paper, 3-lb/100 sq. ft. (0.16-kg/sq. m) minimum, rosin sized.
- D. Miscellaneous Materials
1. General: Provide materials and types of fasteners, protective coatings, sealants, and other miscellaneous items required by manufacturer for a complete installation.
 2. Fasteners: Manufacturer's recommended fasteners, suitable for application and designed to meet performance requirements. Furnish the following unless otherwise indicated:
 - a. Exposed Penetrating Fasteners: Gasketed screws with hex washer heads matching color of sheet metal.
 - b. Fasteners for Copper Sheet: Copper, hardware bronze, or passivated Series 300 stainless steel.
 - c. Fasteners for Aluminum: Aluminum or Series 300 stainless steel.
 - d. Fasteners for Stainless-Steel Sheet: Series 300 stainless steel.
 - e. Fasteners for Zinc-Coated (Galvanized) Steel Sheet: Series 300 stainless steel or hot-dip zinc-coated steel according to ASTM A 153/A 153M or ASTM F 2329.

3. Elastomeric Sealant: ASTM C 920, elastomeric polyurethane **OR** silicone, **as directed**, polymer sealant of type, grade, class, and use classifications required by roofing-specialty manufacturer for each application.
4. Butyl Sealant: ASTM C 1311, single-component, solvent-release butyl rubber sealant; polyisobutylene plasticized; heavy bodied for hooked-type expansion joints with limited movement.
5. Bituminous Coating: Cold-applied asphalt emulsion complying with ASTM D 1187.
6. Asphalt Roofing Cement: ASTM D 4586, asbestos free, of consistency required for application.
7. Solder for Copper: ASTM B 32, lead-free solder **OR** Grade Sn50, 50 percent tin and 50 percent lead, **as directed**.

E. Copings

1. Copings: Manufactured coping system consisting of formed-metal coping cap in section lengths not exceeding 12 feet (3.6 m), concealed anchorage; corner units, end cap units, and concealed splice plates with same finish as coping caps.
 - a. Coping-Cap Material: Copper, 20 oz./sq. ft. (0.68 mm thick) **OR** weight (thickness) as required to meet performance requirements, **as directed**.
 - 1) Finish: Non-patinated, mill **OR** Pre-patinated dark brown **OR** Pre-patinated verdigris, **as directed**.

OR

Coping-Cap Material: Formed **OR** Extruded, **as directed**, aluminum, 0.040 inch (1.02 mm) thick **OR** 0.050 inch (1.27 mm) thick **OR** 0.063 inch (1.60 mm) thick **OR** 0.080 inch (2.03 mm) thick **OR** 0.125 inch (3.18 mm) thick **OR** thickness as required to meet performance requirements, **as directed**.
 - 1) Finish: Mill **OR** Two-coat fluoropolymer **OR** Three-coat fluoropolymer **OR** Clear anodic **OR** Color anodic, **as directed**.
 - 2) Color: Light bronze **OR** Medium bronze **OR** Dark bronze **OR** Black **OR** As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.

OR

Coping-Cap Material: Zinc-coated steel, nominal 0.028-inch (0.71-mm) thickness **OR** 0.034-inch (0.86-mm) thickness **OR** thickness as required to meet performance requirements, **as directed**.
 - 1) Finish: Mill phosphatized for field painting **OR** Two-coat fluoropolymer **OR** Three-coat fluoropolymer, **as directed**.
 - 2) Color: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
- b. Corners: Factory mitered and soldered **OR** continuously welded **OR** mechanically clinched and sealed watertight, **as directed**.
- c. Special Fabrications: Radiused sections **OR** Arched sections **OR** Bullnose face leg **OR** Two-way sloped coping cap, **as directed**.
- d. Coping-Cap Attachment Method: Snap-on **OR** Face leg hooked to continuous cleat with back leg fastener exposed, **as directed**, fabricated from coping-cap material.
- e. Snap-on-Coping Anchor Plates: Concealed, galvanized-steel sheet, 12 inches (300 mm) wide, with integral cleats.

OR

Face Leg Cleats: Concealed, continuous galvanized-steel sheet **OR** stainless steel, **as directed**.

F. Roof-Edge Flashings

1. Canted Roof-Edge and Fascia **OR** Fascia and Gravel Stop, **as directed**: Manufactured, two-piece, roof-edge fascia consisting of snap-on **OR** compression-clamped, **as directed**, metal fascia cover in section lengths not exceeding 12 feet (3.6 m) and a continuous formed galvanized-steel sheet cant, 0.028 inch (0.71 mm) thick, minimum, with extended vertical leg terminating in a drip-edge cleat. Provide matching corner units.
 - a. Fascia Cover: Fabricated from the following exposed metal:

- 1) Formed Aluminum: 0.040 inch (1.02 mm) thick **OR** 0.050 inch (1.27 mm) thick **OR** 0.063 inch (1.60 mm) thick **OR** Thickness as required to meet performance requirements, **as directed**.
- 2) Extruded Aluminum: 0.080 inch (2.03 mm) thick **OR** Thickness as required to meet performance requirements, **as directed**.
- 3) Zinc-Coated Steel: Nominal 0.028-inch (0.71-mm) thickness **OR** 0.034-inch (0.86-mm) thickness **OR** thickness as required to meet performance requirements, **as directed**.
- b. Corners: Factory mitered and soldered **OR** continuously welded **OR** mechanically clinched and sealed watertight, **as directed**.
- c. Splice Plates: Concealed **OR** Exposed, **as directed**, of same material, finish, and shape as fascia cover.
- d. Special Fabrications: Radiussed sections **OR** Arched sections **OR** Bullnose fascia cover **OR** Cornice fascia cover **OR** Cove fascia cover, **as directed**.
- e. Fascia Accessories: Fascia extenders with continuous hold-down cleats **OR** Wall cap **OR** Soffit trim **OR** Overflow scuppers **OR** Overflow scuppers with perforated screens **OR** Spillout scuppers **OR** Downspout scuppers with integral conductor head and downspout adapters **OR** Downspout scuppers with integral conductor head and downspout adapters and perforated screens, **as directed**.
2. Roof-Edge Fascia: Manufactured, two-piece, roof-edge fascia consisting of snap-on metal fascia cover in section lengths not exceeding 12 feet (3.6 m) and a continuous formed- or extruded-aluminum anchor bar with integral drip-edge cleat to engage fascia cover. Provide matching corner units.
 - a. Fascia Cover: Fabricated from the following exposed metal:
 - 1) Formed Aluminum: 0.032 inch (0.81 mm) thick **OR** 0.040 inch (1.02 mm) thick **OR** 0.050 inch (1.27 mm) thick **OR** 0.063 inch (1.60 mm) thick **OR** Thickness as required to meet performance requirements, **as directed**.
 - 2) Zinc-Coated Steel: Nominal 0.028 inch (0.71 mm) thick **OR** 0.034 inch (0.86 mm) thick **OR** thickness as required to meet performance requirements, **as directed**.
 - b. Corners: Factory mitered and soldered **OR** continuously welded **OR** mechanically clinched and sealed watertight, **as directed**.
 - c. Splice Plates: Concealed **OR** Exposed, **as directed**, of same material, finish, and shape as fascia cover.
 - d. Special Fabrications: Radiussed sections **OR** Arched sections **OR** Bullnose fascia cover **OR** Cornice fascia cover **OR** Cove fascia cover, **as directed**.
 - e. Fascia Accessories: Fascia extenders with continuous hold-down cleats **OR** Wall cap **OR** Soffit trim **OR** Overflow scuppers **OR** Overflow scuppers with perforated screens **OR** Spillout scuppers **OR** Downspout scuppers with integral conductor head and downspout adapters **OR** Downspout scuppers with integral conductor head and downspout adapters and perforated screens, **as directed**.
3. One-Piece Gravel Stops: Manufactured, one-piece, metal gravel stop in section lengths not exceeding 12 feet (3.6 m), with a horizontal flange and vertical leg, drain-through, **as directed**, fascia terminating in a drip edge, **as directed**, and concealed splice plates of same material, finish, and shape as gravel stop. Provide matching corner units.
 - a. Fabricate from the following exposed metal:
 - 1) Copper: 16 oz./sq. ft. (0.55 mm thick) **OR** Weight (thickness) as required to meet performance requirements, **as directed**.
 - 2) Formed Aluminum: 0.032 inch (0.81 mm) thick **OR** 0.040 inch (1.02 mm) thick **OR** 0.050 inch (1.27 mm) thick **OR** Thickness as required to meet performance requirements, **as directed**.
 - 3) Extruded Aluminum: 0.080 inch (2.03 mm) thick **OR** Thickness as required to meet performance requirements, **as directed**.
 - 4) Stainless Steel: 0.025 inch (0.64 mm) thick **OR** Thickness as required to meet performance requirements, **as directed**.
 - 5) Zinc-Coated Steel: Nominal 0.028-inch (0.71-mm) thickness **OR** 0.034-inch (0.86-mm) thickness **OR** thickness as required to meet performance requirements, **as directed**.

- b. Corners: Factory mitered and soldered **OR** continuously welded **OR** mechanically clinched and sealed watertight, **as directed**.
- c. Accessories: Fascia extenders with continuous hold-down cleats **OR** Wall cap **OR** Soffit trim, **as directed**.
- 4. Copper Finish: Non-patinated, mill **OR** Pre-patinated dark brown **OR** Pre-patinated verdigris, **as directed**.
- 5. Aluminum Finish: Mill **OR** Two-coat fluoropolymer **OR** Three-coat fluoropolymer **OR** Clear anodic **OR** Color anodic, **as directed**.
 - a. Color: Light bronze **OR** Medium bronze **OR** Dark bronze **OR** Black **OR** As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
- 6. Stainless-Steel Finish: No. 2B (bright, cold rolled) **OR** No. 3 (coarse, polished directional satin) **OR** No. 4 (bright, polished directional satin), **as directed**.
- 7. Zinc-Coated Steel Finish: Mill phosphatized for field painting **OR** Two-coat fluoropolymer **OR** Three-coat fluoropolymer, **as directed**.
 - a. Color: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.

G. Roof-Edge Drainage Systems

- 1. Gutters: Manufactured in uniform section lengths not exceeding 12 feet (3.6 m), with matching corner units, ends, outlet tubes, and other accessories. Elevate back edge at least 1 inch (25 mm) above front edge. Furnish flat-stock gutter straps, gutter brackets, expansion joints, and expansion-joint covers fabricated from same metal as gutters.
 - a. Fabricate from the following exposed metal:
 - 1) Copper: 16 oz./sq. ft. (0.55 mm thick) **OR** 20 oz./sq. ft. (0.68 mm thick), **as directed**.
 - 2) Formed Aluminum: 0.032 inch (0.81 mm) **OR** 0.040 inch (1.02 mm) **OR** 0.050 inch (1.27 mm) **OR** 0.063 inch (1.60 mm), **as directed**, thick.
 - 3) Zinc-Coated Steel: Nominal 0.028-inch (0.71-mm) **OR** 0.034-inch (0.86-mm), **as directed**, thickness.
 - b. Gutter Profile: Style A **OR** Style B **OR** Style F **OR** Style G **OR** Style H **OR** Style I **OR** Style K **OR** Style K highback **OR** Half-round single bead **OR** Half-round highback **OR** Quarter round **OR** Ogee **OR** As indicated, **as directed**, according to SMACNA's "Architectural Sheet Metal Manual."
 - c. Embossed Surface: Embossed with design as indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
 - d. Applied Fascia Cover (Concealed Gutter): Exposed, formed copper, 16 oz./sq. ft. (0.55 mm thick) **OR** aluminum, 0.040 inch (1.02 mm) thick, **as directed**, with factory-mitered corners, ends, and concealed splice joints.
 - e. Corners: Factory mitered and soldered **OR** continuously welded **OR** mechanically clinched and sealed watertight, **as directed**.
 - f. Gutter Supports: Gutter brackets **OR** Straps **OR** Spikes and ferrules **OR** Manufacturer's standard supports as selected by The University, **as directed**, with finish matching the gutters.
 - g. Special Fabrications: Radiussed sections.
 - h. Gutter Accessories: Continuous screened leaf guard with sheet metal frame **OR** Continuous hinged leaf guard of solid metal designed to shed leaves **OR** Continuous snap-in plastic leaf guard **OR** Bronze wire ball downspout strainer **OR** Wire ball downspout strainer **OR** Flat ends **OR** Bullnose ends for half-round gutter, **as directed**.
- 2. Downspouts: Plain round **OR** Corrugated round **OR** Plain rectangular **OR** Corrugated rectangular **OR** Open-face rectangular, **as directed**, complete with machine-crimped **OR** mitered **OR** smooth-curve, **as directed**, elbows, manufactured from the following exposed metal. Furnish with metal hangers, from same material as downspouts, and anchors.
 - a. Copper: 16 oz./sq. ft. (0.55 mm thick).
 - b. Formed Aluminum: 0.032 inch (0.81 mm) **OR** 0.040 inch (1.02 mm) **OR** 0.050 inch (1.27 mm) **OR** 0.063 inch (1.60 mm), **as directed**, thick.
 - c. Extruded Aluminum: 0.125 inch (3.18 mm) thick.

- d. Zinc-Coated Steel: Nominal 0.028-inch (0.71-mm) **OR** 0.034-inch (0.86-mm), **as directed**, thickness.
3. Parapet Scuppers: Manufactured with closure flange trim to exterior, 4-inch- (100-mm-) wide wall flanges to interior, and base extending 4 inches (100 mm) beyond cant or tapered strip into field of roof. Fasten gravel guard angles to base of scuppers, **as directed**.
 - a. Fabricate from the following exposed metal:
 - 1) Copper: 16 oz./sq. ft. (0.55 mm thick).
 - 2) Formed Aluminum: 0.032 inch (0.81 mm) thick.
 - 3) Stainless Steel: 0.019 inch (0.48 mm) thick.
 - 4) Zinc-Coated Steel: Nominal 0.028-inch (0.71-mm) thickness.
4. Conductor Heads: Manufactured conductor heads, each with flanged back and stiffened top edge and of dimensions and shape indicated, complete with outlet tube that nests into upper end of downspout, exterior flange trim, **as directed**, and built-in overflow, **as directed**.
 - a. Fabricate from the following exposed metal:
 - 1) Copper: 16 oz./sq. ft. (0.55 mm thick).
 - 2) Formed Aluminum: 0.032 inch (0.81 mm) thick.
 - 3) Stainless Steel: 0.016 inch (0.40 mm) thick.
 - 4) Zinc-Coated Steel: Nominal 0.028-inch (0.71-mm) thickness.
5. Splash Pans: Fabricate from the following exposed metal:
 - a. Copper: 16 oz./sq. ft. (0.55 mm thick).
 - b. Formed Aluminum: 0.040 inch (1.02 mm) thick.
 - c. Stainless Steel: 0.019 inch (0.48 mm) thick.
 - d. Zinc-Coated Steel: Nominal 0.028-inch (0.71-mm) thickness.
6. Copper Finish: Non-patinated, mill **OR** Pre-patinated dark brown **OR** Pre-patinated verdigris, **as directed**.
7. Aluminum Finish: Mill **OR** Two-coat fluoropolymer **OR** Three-coat fluoropolymer **OR** Clear anodic **OR** Color anodic, **as directed**.
 - a. Color: Light bronze **OR** Medium bronze **OR** Dark bronze **OR** Black **OR** As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
8. Stainless-Steel Finish: No. 2B (bright, cold rolled, unpolished) **OR** No. 3 (coarse, polished directional satin) **OR** No. 4 (bright, polished directional satin), **as directed**.
9. Zinc-Coated Steel Finish: Mill phosphatized for field painting **OR** Two-coat fluoropolymer **OR** Three-coat fluoropolymer, **as directed**.
 - a. Color: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.

H. Reglets And Counterflashings

1. Reglets: Manufactured units formed to provide secure interlocking of separate reglet and counterflashing pieces, from the following exposed metal:
 - a. Copper: 16 oz./sq. ft. (0.55 mm thick).
 - b. Formed Aluminum: 0.024 inch (0.61 mm) **OR** 0.050 inch (1.27 mm), **as directed**, thick.
 - c. Stainless Steel: 0.019 inch (0.48 mm) **OR** 0.025 inch (0.64 mm), **as directed**, thick.
 - d. Zinc-Coated Steel: Nominal 0.022-inch (0.56-mm) **OR** 0.028-inch (0.71-mm), **as directed**, thickness.
 - e. Corners: Factory mitered and soldered **OR** continuously welded **OR** mechanically clinched and sealed watertight, **as directed**.
 - f. Surface-Mounted Type: Provide reglets with slotted holes for fastening to substrate, with neoprene or other suitable weatherproofing washers, and with channel for sealant at top edge.
 - g. Stucco Type, Embedded: Provide reglets with upturned fastening flange and extension leg of length to match thickness of applied finish materials.
 - h. Concrete Type, Embedded: Provide temporary closure tape to keep reglet free of concrete materials, special fasteners for attaching reglet to concrete forms, and guides to ensure alignment of reglet section ends.
 - i. Masonry Type, Embedded: Provide reglets with offset top flange for embedment in masonry mortar joint.

- j. Multiuse Type, Embedded: For multiuse embedment in cast-in-place concrete **OR** masonry mortar joints, **as directed**.
- 2. Counterflashings: Manufactured units of heights to overlap top edges of base flashings by 4 inches (100 mm) and in lengths not exceeding 12 feet (3.6 m) designed to snap into reglets or through-wall-flashing receiver and compress against base flashings with joints lapped, from the following exposed metal:
 - a. Copper: 16 oz./sq. ft. (0.55 mm thick).
 - b. Formed Aluminum: 0.024 inch (0.61 mm) **OR** 0.032 inch (0.81 mm), **as directed**, thick.
 - c. Stainless Steel: 0.019 inch (0.48 mm) **OR** 0.025 inch (0.64 mm), **as directed**, thick.
 - d. Zinc-Coated Steel: Nominal 0.022-inch (0.56-mm) **OR** 0.028-inch (0.71-mm), **as directed**, thickness.
- 3. Accessories:
 - a. Flexible-Flashing Retainer: Provide resilient plastic or rubber accessory to secure flexible flashing in reglet where clearance does not permit use of standard metal counterflashing or where reglet is provided separate from metal counterflashing.
 - b. Counterflashing Wind-Restraint Clips: Provide clips to be installed before counterflashing to prevent wind uplift of counterflashing lower edge.
- 4. Copper Finish: Non-patinated, mill **OR** Pre-patinated dark brown **OR** Pre-patinated verdigris, **as directed**.
- 5. Aluminum Finish: Mill **OR** Two-coat fluoropolymer **OR** Three-coat fluoropolymer **OR** Clear anodic **OR** Color anodic, **as directed**.
 - a. Color: Light bronze **OR** Medium bronze **OR** Dark bronze **OR** Black **OR** As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
- 6. Stainless-Steel Finish: No. 2B (bright, cold rolled, unpolished) **OR** No. 3 (coarse, polished directional satin) **OR** No. 4 (bright, polished directional satin), **as directed**.
- 7. Zinc-Coated Steel Finish: Mill phosphatized for field painting **OR** Two-coat fluoropolymer **OR** Three-coat fluoropolymer, **as directed**.
 - a. Color: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.

I. General Finish Requirements

- 1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- 2. Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- 3. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

1.3 EXECUTION

A. Examination

- 1. Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions, and other conditions affecting performance of the Work.
- 2. Examine walls, roof edges, and parapets for suitable conditions for roof specialties.
- 3. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored.
- 4. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Underlayment Installation

- 1. Felt Underlayment: Install with adhesive for temporary anchorage to minimize use of mechanical fasteners under roof specialties. Apply in shingle fashion to shed water, with lapped joints of not less than 2 inches (50 mm).
- 2. Self-Adhering Sheet Underlayment: Install wrinkle free. Apply primer if required by underlayment manufacturer. Comply with temperature restrictions of underlayment manufacturer for installation; use primer rather than nails for installing underlayment at low temperatures. Apply in

- shingle fashion to shed water. Overlap edges not less than 3-1/2 inches (90 mm). Roll laps with roller. Cover underlayment within 14 days.
- 3. Polyethylene Sheet: Install with adhesive for temporary anchorage to minimize use of mechanical fasteners under roof specialties. Apply in shingle fashion to shed water, with lapped and taped joints of not less than 2 inches (50 mm).
- 4. Slip Sheet: Install with tape or adhesive for temporary anchorage to minimize use of mechanical fasteners under roof specialties. Apply in shingle fashion to shed water, with lapped joints of not less than 2 inches (50 mm).

C. Installation, General

- 1. General: Install roof specialties according to manufacturer's written instructions. Anchor roof specialties securely in place, with provisions for thermal and structural movement. Use fasteners, solder, protective coatings, separators, sealants, and other miscellaneous items as required to complete roof-specialty systems.
 - a. Install roof specialties level, plumb, true to line and elevation; with limited oil-canning and without warping, jogs in alignment, buckling, or tool marks.
 - b. Provide uniform, neat seams with minimum exposure of solder and sealant.
 - c. Install roof specialties to fit substrates and to result in watertight performance. Verify shapes and dimensions of surfaces to be covered before manufacture.
 - d. Torch cutting of roof specialties is not permitted.
 - e. Do not use graphite pencils to mark metal surfaces.
- 2. Metal Protection: Protect metals against galvanic action by separating dissimilar metals from contact with each other or with corrosive substrates by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.
 - a. Coat concealed side of uncoated aluminum and stainless-steel roof specialties with bituminous coating where in contact with wood, ferrous metal, or cementitious construction.
 - b. Underlayment: Where installing metal flashing directly on cementitious or wood substrates, install a course of felt underlayment and cover with a slip sheet **OR** self-adhering, high-temperature sheet underlayment **OR** polyethylene sheet, **as directed**.
 - c. Bed flanges in thick coat of asphalt roofing cement where required by manufacturers of roof specialties for waterproof performance.
- 3. Expansion Provisions: Allow for thermal expansion of exposed roof specialties.
 - a. Space movement joints at a maximum of 12 feet (3.6 m) with no joints within 18 inches (450 mm) of corners or intersections unless otherwise shown on Drawings.
 - b. When ambient temperature at time of installation is between 40 and 70 deg F (4 and 21 deg C), set joint members for 50 percent movement each way. Adjust setting proportionately for installation at higher ambient temperatures.
- 4. Fastener Sizes: Use fasteners of sizes that will penetrate wood blocking or sheathing not less than 1-1/4 inches (32 mm) for nails and not less than 3/4 inch (19 mm) for wood screws **OR** substrate not less than recommended by fastener manufacturer to achieve maximum pull-out resistance, **as directed**.
- 5. Seal joints with elastomeric **OR** butyl, **as directed**, sealant as required by roofing-specialty manufacturer.
- 6. Seal joints as required for watertight construction. Place sealant to be completely concealed in joint. Do not install sealants at temperatures below 40 deg F (4 deg C).
- 7. Soldered Joints: Clean surfaces to be soldered, removing oils and foreign matter. Pre-tin edges of sheets to be soldered to a width of 1-1/2 inches (38 mm) except reduce pre-tinning where pre-tinned surface would show in completed Work. Tin edges of uncoated copper sheets using solder for copper. Do not use torches for soldering. Heat surfaces to receive solder and flow solder into joint. Fill joint completely. Completely remove flux and spatter from exposed surfaces.

D. Coping Installation

- 1. Install cleats, anchor plates, and other anchoring and attachment accessories and devices with concealed fasteners.
- 2. Anchor copings to meet performance requirements.

- a. Interlock face and back leg drip edges of snap-on coping cap into cleated anchor plates anchored to substrate at 30-inch (760-mm) centers **OR** 40-inch (1015-mm) centers **OR** manufacturer's required spacing that meets performance requirements, **as directed**.
 - b. Interlock face leg drip edge into continuous cleat anchored to substrate at 24-inch (600-mm) centers **OR** 16-inch (400-mm) centers **OR** manufacturer's required spacing that meets performance requirements, **as directed**. Anchor back leg of coping with screw fasteners and elastomeric washers at 24-inch (600-mm) centers **OR** 16-inch (400-mm) centers **OR** manufacturer's required spacing that meets performance requirements, **as directed**.
- E. Roof-Edge Flashing Installation
1. Install cleats, cants, and other anchoring and attachment accessories and devices with concealed fasteners.
 2. Anchor roof edgings with manufacturer's required devices, fasteners, and fastener spacing to meet performance requirements.
- F. Roof-Edge Drainage-System Installation
1. General: Install components to produce a complete roof-edge drainage system according to manufacturer's written instructions. Coordinate installation of roof perimeter flashing with installation of roof-edge drainage system.
 2. Gutters: Join and seal gutter lengths. Allow for thermal expansion. Attach gutters to firmly anchored gutter supports spaced not more than 12 inches (305 mm) **OR** 24 inches (610 mm) **OR** 30 inches (762 mm), **as directed**, apart. Attach ends with rivets and seal with sealant **OR** solder, **as directed**, to make watertight. Slope to downspouts.
 - a. Install gutter with expansion joints at locations indicated but not exceeding 50 feet (15.2 m) apart. Install expansion joint caps.
 - b. Install continuous leaf guards on gutters with noncorrosive fasteners, removable **OR** hinged to swing open, **as directed**, for cleaning gutters.
 3. Downspouts: Join sections with manufacturer's standard telescoping joints. Provide hangers with fasteners designed to hold downspouts securely to walls and 1 inch (25 mm) away from walls; locate fasteners at top and bottom and at approximately 60 inches (1500 mm) o.c.
 - a. Provide elbows at base of downspout to direct water away from building.
OR
Connect downspouts to underground drainage system indicated.
 4. Splash Pans: Install where downspouts discharge on low-slope roofs. Set in asphalt roofing cement **OR** elastomeric sealant, **as directed**.
 5. Parapet Scuppers: Install scuppers through parapet where indicated. Continuously support scupper, set to correct elevation, and seal flanges to interior wall face, over cants or tapered edge strips, and under roofing membrane.
 - a. Anchor scupper closure trim flange to exterior wall and seal or solder to scupper.
 - b. Loosely lock front edge of scupper with conductor head.
 - c. Seal or solder exterior wall scupper flanges into back of conductor head.
 6. Conductor Heads: Anchor securely to wall with elevation of conductor top edge 1 inch (25 mm) below scupper **OR** gutter, **as directed**, discharge.
- G. Reglet And Counterflashing Installation
1. General: Coordinate installation of reglets and counterflashings with installation of base flashings.
 2. Embedded Reglets: See Division 03 Section "Cast-in-place Concrete" and Division 04 Section "Unit Masonry" for installation of reglets.
 3. Surface-Mounted Reglets: Install reglets to receive flashings where flashing without embedded reglets is indicated on Drawings. Install at height so that inserted counterflashings overlap 4 inches (100 mm) over top edge of base flashings.
 4. Counterflashings: Insert counterflashings into reglets or other indicated receivers; ensure that counterflashings overlap 4 inches (100 mm) over top edge of base flashings. Lap counterflashing joints a minimum of 4 inches (100 mm) and bed with elastomeric **OR** butyl, **as directed**, sealant. Fit counterflashings tightly to base flashings.

H. Cleaning And Protection

1. Clean exposed metal surfaces of substances that interfere with uniform oxidation and weathering.
2. Clean and neutralize flux materials. Clean off excess solder and sealants.
3. Remove temporary protective coverings and strippable films as roof specialties are installed. On completion of installation, clean finished surfaces including removing unused fasteners, metal filings, pop rivet stems, and pieces of flashing. Maintain roof specialties in a clean condition during construction.
4. Replace roof specialties that have been damaged or that cannot be successfully repaired by finish touchup or similar minor repair procedures.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 07 76 00 00 - PLAZA AND DECKS, CONSTRUCTION STANDARD**PART 1 - GENERAL****1.01 Scope of standard**

- A. The scope of this standard includes recommendations for the design and maintenance (retro-fit) of plazas and decks over occupied space(s). In general, plazas and decks over occupied space are not recommended. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 Related Standard

- A. Structural Systems (currently The University of Texas Office of Facilities Planning and Construction Owner's Design Guidelines, Section K, Structural Criteria).

1.03 General Requirements

- A. All plazas and decks situated over occupied space(s) shall have a redundant, bi- level drainage system to protect the occupied space(s) from water infiltration and damage.
 - 1. The primary drainage system shall be at the top wearing surface exposed to weather and traffic.
 - 2. Secondary drainage shall be provided below the wearing surface, at the membrane level, to drain any moisture that infiltrates down below the primary level protection at the wearing surface. The secondary drainage shall be provided by a pre-fabricated drainage grid, paver pedestals, or other method as required to provide free flow to the drains at the secondary level.
- B. It is preferable to select a system that allows water to flow both on top of and below the wearing surface. Two systems that can be used separately or in a hybrid system are as follows:
 - 1. An open joint system generally consists of individual paver units supported on pedestals with approximate 0.25 inch gaps between units.
 - 2. A closed joint system generally consists of concrete surfaces or individual paver units with gaps filled with porous grout or sand, or the individual paver units placed in a lean mortar setting bed.
- C. Paver units are preferable to large, monolithic concrete sections because pavers enhance drainage at the secondary level and long-term maintenance is simplified due to accessibility of the substrate (both the structural deck and the waterproofing system).
- D. Provide a sloped substrate to insure adequate drainage at both the primary and secondary levels. Tapered insulation, sloped structural deck, variable pedestal heights, or other method(s) shall be used to accomplish this goal.
- E. THE DESIGN OF PLAZAS AND DECKS SITUATED OVER OCCUPIED SPACE(S) SHOULD BE CONSIDERED EARLY IN THE DESIGN DEVELOPMENT OF A PROJECT SINCE THE EFFECT ON THE STRUCTURAL DESIGN AND OVERALL COST CAN BE SIGNIFICANT. The following items shall be considered in the design of plazas and decks situated over occupied space(s):
 - 1. Slope of the structural deck (or if it currently is, in retro-fit applications).
 - 2. Slope or contour of the wearing surface (or if it currently is, in retro-fit applications).

3. True clearance available between the substrate and the bottom of the wearing surface. At new conditions, this clearance should be optimized to assure proper drainage at the secondary level. In retro-fit applications, limitations may dictate the design of the overall system.
 4. Type of drainage system and the limitations on drainage capacity.
 5. Flashing at drains, rising walls, light pole supports, expansion joints, or any other feature that could effect overall adequacy of the drainage system.
 6. Traffic and site feature loadings, as well as any possible pedestrian hazards caused by gaps between pavers, etc.
 7. Aesthetics.
- F. Walking surfaces shall be designed to be nominally level. Abrupt changes in elevation of walking surfaces shall not exceed 1/4 inch. The slope in the direction of travel shall not exceed 1 in 20. The slope perpendicular to the direction of travel shall not exceed 1 in 48.

PART 2 - PRODUCTS

2.01 SECONDARY DRAINAGE DETAILS

- A. Secondary drainage shall be accomplished through the specification of one of the products indicated herein.
- B. Insulation boards shall be a high density type that does not absorb moisture, have drainage slots scored in two directions into the bottom surface, and is able to withstand the superimposed loads without deflection, with resulting cracking, of the wearing surface.

2.02 MEMBRANE

- A. A liquid-applied membrane completely adhered to the substrate will isolate leaks at their source and provide an easier way to trace locations requiring maintenance.
- B. The membrane shall be a hot-applied, rubberized compound dispersed in asphalt with mineral fillers.
- C. In high stress areas (rising wall flashings, penetrations, etc.) provide fabric reinforcing.

2.03 PAVER SYSTEM

- A. The paver support system shall consist of one of the following types, depending on the needs for maintenance, accessibility, and loadings:
 1. Individual pedestals constructed from high density polyethylene or blocks of high density foam board. Variable height pedestals may be required to provide the proper slope at the primary drainage level.
 2. Continuous support on a pre-fabricated drainage grid. Pre-fabricated drainage grids allow for fast and efficient drainage of water at the membrane level.
 3. Continuous support on a 1-2 inch pea gravel setting bed.
 4. Continuous support on high density insulation board (approximately 100- 125 psi compressive strength) with drainage slots scored in two directions into the bottom surface.

5. Rigid supports fabricated from precast masonry units. This method of support is recommended in areas where pavers could be subjected to high density loading.
- B. Where smaller poured concrete sections are required and the resulting system is closer in nature to a paver system than to a purely monolithic system, the support system shall consist of one of the following types, depending on the needs for maintenance, accessibility, and loadings:
 1. Continuous support on a pre-fabricated drainage grid.
 2. Continuous support on high density insulation board (approximately 100- 125 psi compressive strength) with drainage slots scored in two directions into the bottom surface.
 3. Continuous support on a 1-2 inch pea gravel setting bed.
 4. The method specified shall provide for proper placement of the concrete without blocking flow of water to or through the secondary drainage level.

2.04 MONOLITHIC CONCRETE SYSTEM

- A. Paver systems are preferred. However, in the following cases a monolithic concrete system may need to be utilized:
 1. Insufficient clearance to allow for the required clearance between the wearing surface and the substrate (structural deck).
 2. The required finish contour of the plaza or deck will not accommodate a paver system.
- B. Where a monolithic system is required, the monolithic concrete sections shall be designed in such sizes as to be removable for future repair of the substrate, including jointed, sealed sections with lifting inserts, or other method as may accomplish this goal.
- C. Where applicable and cost effective, a combination of paver support systems and monolithic support systems may be considered to minimize the amount of monolithic concrete.

PART 3 - EXECUTION

3.01 Membrane

- A. The membrane shall be constructed in the field by spreading the hot rubberized liquid over the structural deck to form a continuous, monolithic, seamless membrane completely adhered to the substrate.

3.02 Detailing

- A. Detailing shall be in strict conformance with the manufacturer's technical literature for the respective products.
- B. Any products used shall conform to the waterproofing manufacturer's recommendations and shall be supplied and installed in such a manner so as not to void or reduce the anticipated warranty. It is recommended that approval of the overall proposed design be obtained from the prospective waterproofing manufacturer(s) during the design development and final design processes.

1.3. PERFORMANCE REQUIREMENTS

- A. Provide systems that are listed by at least one the following:
 - 1. Underwriters Laboratories Inc. (UL), in "Fire Resistance Directory".
 - 2. Intertek Testing Service (Formerly known as Omega Point Laboratories), in "Directory of Listed Products".
 - 3. Factory Mutual (FM), in FMRC Approval Guide.
 - 4. Any other qualified independent testing and inspection agency that conducts periodic follow-up inspections and is acceptable to authorities having jurisdiction.
- B. Provide firestop products that are flexible enough to allow for pipe vibration in a through penetration application.
- C. Provide fire resistive sealants and sprays for construction joint applications that are flexible enough to satisfy the movement criteria per the test standards ASTM E 1399, ASTM E 1966 or ANSI/UL 2079.
- D. Provide products with the appropriate flame spread index and smoke develop index, when tested in accordance with ASTM E 84.
- E. Provide products that meet the intent of the L rating classification for the movement of smoke per ANSI/UL 1479 for through penetrations and ANSI/UL 2079 for construction joints.

- F. Provide products identical to those tested and listed for classification by UL, Intertek or any other qualified independent testing agency.
- G. Provide products that bear classification marking of qualified independent testing agency.
- H. Where firestop systems not listed by any listing agency are required due to project conditions, submit a substitution proposal with evidence specified.
- I. Use only products specifically listed for use in listed systems.
- J. Provide products that are compatible with each other, with the substrates forming openings, and with the items, if any, penetrating the firestopping, under the conditions represented by this project, based on testing and field performance demonstrated by manufacturer.
- K. Firestopping materials must meet and be acceptable for use by all building codes and NFPA codes cited in this section.
- L. Provide products that meet the intent of the state or local guidelines on volatile organic compounds (VOC).
- M. Where applicable provide products that meet the intent of the F rating classification for passage of flame per ANSI/UL 1479 for through penetrations.
- N. Where applicable provide products that meet the intent of the T rating classification for the transfer of temperature per ANSI/UL 1479 for through penetrations.
- O. Provide products that meet the intent of the L rating classification for the movement of smoke per ANSI/UL 1479 for through penetrations and ANSI/UL 2079 for construction joints.
- P. Where applicable provide products that meet the intent of the W rating classification for passage of water per ANSI/UL 1479 for through penetrations.

1.4. SUBMITTALS

- A. Submit under provisions of the Contract and Division 01 – General Requirements.
- B. Shop Drawings: For each firestopping system, provide the following:
 - 1. Listing agency's detailed drawing showing opening, penetrating item(s), and firestopping materials, identified with listing agency's name and number or designation and fire rating achieved.
 - 2. For proposed systems that do not conform strictly to the listing, submit written instructions showing modifications and approved by firestop system manufacturer.
 - 3. Submit under provisions of the International Building Code (IBC) section 107 and 703 requiring a submittal package for fire-resistance ratings and fire tests.
- C. Product Certificates: Submit certificates of conformance signed by firestop system manufacturer certifying that materials furnished comply with requirements.
- D. Product Data: Furnish manufacturer's product data sheets on each material to be used in firestop systems. Information on manufacturer's product data sheet should include:
 - 1. Product characteristics including compliance with appropriate ASTM/UL/ANSI test

- standards.
- 2. Storage and handling requirements and recommendations.
- E. Installation Instruction: Furnish manufacturer's installation instructions.

1.5. QUALITY ASSURANCE

- A. General: All through-penetration firestop systems and construction gap fire resistive systems shall be installed with approved methods using materials that have been tested and classified to produce an approved assembly.
- B. Manufacturer Qualifications: All primary products specified in this section will be supplied by a single manufacturer with a minimum of twenty five (25) years experience.
 - 1. Products shall be manufactured in a facility that follows ISO 9001 best practices.
- C. Installer Qualifications: Firm must be qualified by having experience, staff, and be properly trained to install the specified products, and meets the following criteria:
 - 1. Contractor is a 3M Master Contractor.
 - 2. Contractor is a Certified 3M Trained contractor.
 - 3. Contractor is acceptable to manufacturer.
 - 4. Contractor is acceptable to Authority Having Jurisdiction (AHJ).
 - 5. Contractor has completed the manufacturer's certified product installation training.
 - 6. Contractor must provide a list of completed projects as evidence of experience; include project name and address, owner's name and address, and architect's name and phone number.
 - 7. Certificate: Contractor should provide certificate of qualification.
- D. Codes: Where manufacturer's application procedures are in conflict with those of the local Authority Having Jurisdiction, the more strict guidelines will prevail.
- E. Pre-installation Meetings: Meetings to agree on firestop requirements, conditions, manufacturer's instructions.

1.6. DELIVERY, STORAGE, AND HANDLING

- A. Deliver and store products until ready for installation in manufacturer's original unopened packaging, legibly marked with manufacturer's name and product identification, date of manufacture, lot number, listing agency's classification marking, curing/dry time, mixing instructions (if applicable) and MSDS reference number.
- B. Store and handle in such a manner as to prevent deterioration or damage due to moisture, temperature changes, contaminants, and other causes; follow manufacturer's instructions.
- C. Store and dispose of hazardous materials, and materials contaminated by hazardous materials, in accordance with requirements of local Authority Having Jurisdiction.

1.7. PROJECT CONDITIONS

- A. Coordinate construction and cutting of openings so that each particular firestop system may be

installed in accordance with its listing, including assembly rating, L rating, sizing, sleeves, manufacturer's published STC rating and penetrating items.

- B. Coordinate firestopping of dynamic and static construction joints (top-of-wall, bottom-of-wall, floor-to-floor, floor-to-wall), wall-to-wall, perimeter so that each particular system may be installed in accordance with its listing, including assembly rating, sizing, movement capabilities and manufacturer's published STC rating.
- C. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install firestopping under environmental conditions outside manufacturer's absolute limits.
- D. Provide ventilation as required by firestopping manufacturer, including mechanical ventilation if required.

1.8. WARRANTY

- A. At project closeout, provide to Owner or Owners Representative an executed copy of the manufacturer's standard limited warranty against manufacturing defect, outlining its terms, conditions, and exclusions from coverage.

PART 2 - PRODUCTS

2.1. MANUFACTURERS

- A. Acceptable Manufacturer: 3M Fire Protection Products, www.3m.com/firestop.
- B. Requests for substitutions will be considered in accordance with provisions of Division 1- General Requirements.
- C. Single Source: To maintain control and integrity of the firestop applications a single manufacturer should be used. Specific UL or approved listing agencies systems applicable to each type of firestop condition should be supplied by one manufacturer.

2.2. SCOPE/APPLICATION

- A. Provide installed firestop products that limit the spread of fire, heat, smoke, and gasses through otherwise unprotected openings in rated assemblies, including walls, partitions, floors, roof/ceilings, and similar locations, restoring the integrity of the fire rated construction to its original fire rating.
- B. Provide firestop systems listed for the specific combination of fire-rated construction, type of penetrating item, annular space requirements, and fire rating, and the following criteria:
 - 1. F-Rating: Equal to or greater than the fire-resistance rating of the assembly in which the firestopping will be installed.
 - 2. T-Rating: In habitable areas where penetrating items are exposed to potential contact with materials on fire side(s) of rated assembly, T-rating must equal its F-rating.
 - 3. L-Rating: L-rating of 1 cfm per linear foot (5.5 cu m/h/m) maximum at ambient temperatures.
 - 4. W-Rating: meets UL Water Leakage Test, W Rating – Class 1 requirements for systems tested and listed in accordance with ANSI/UL 1479.

5. Wall Penetrations: Through penetration systems must be symmetrical, with the same rating from both sides of the wall. Membrane penetrations may be asymmetrical.
 6. Testing: Determine ratings in accordance with ASTM E 814 or UL 1479.
- C. Provide fire-resistive systems listed for construction gaps per the specific combination of fire-rated construction type, configuration, gap dimensions, and fire rating, and the following criteria:
1. Fire resistance rating must be equal to or greater than that of the assembly in which it is to be installed.
 2. Movement capability must be appropriate to the potential movement of the gap, demonstrated by testing in accordance with ASTM E 1399/ASTM E 1966/UL 2079 for minimum of 500 cycles at 10 cycles per minute.
 3. L-Rating: L-rating of 1 cfm per linear foot (5.5 cu m/h/m) maximum.
 4. Determine ratings in accordance with ASTM E 1966/UL 2079.

2.3. THROUGH PENETRATION FIRESTOP PRODUCTS

- A. 3M Fire Barrier Sealant 2000 NS: Single-part, non-slump elastomeric silicone firestop sealant. Sag-resistant, low VOC. Light grey color. Used in mechanical, electrical and plumbing applications to firestop openings and penetrations through fire-rated floor or wall assemblies. Typical penetrants include: metallic pipe, nonmetallic pipe (FGG/BM system CPVC compatible), conduit, power and communication cable and telephone or electrical wiring.
1. Fire Resistance: For use in 1, 2, 3 or 4 hour fire-rated systems.
 2. Locations: Vertical and horizontal assemblies.
 3. STC-Rating of 56 when tested in STC 56-rated wall assembly.
- B. 3M Fire Barrier Moldable Putty+: One-part, 100 percent solids intumescent firestop. Remains pliable, flexible and easily re-enterable. Non-toxic synthetic formula. Versatile putty for pipes, cables, cable tray, blank opening and other penetrations along with mineral wool or other fire-rated assembly products.
1. Type: Stick or Pad
 2. Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
 3. Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- C. 3M Fire Barrier 2001 Silicone RTV Foam: Two-part, liquid-silicone elastomer, foams in place when mixed. For use sealing large or complex openings such as cable bundles, cable trays and conduit banks.
1. Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
 2. Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- D. 3M Fire Barrier Pillow: Self-contained, intumescent firestop product. Meets fire rating without the use of wire mesh. For use in firestopping larger openings
1. Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems..
 2. Locations: Vertical assemblies, horizontal assemblies and smoke barrier.

2.4. FIRESTOPPING FOR SINGLE MEMBRANE PENETRATIONS

- A. 3M Fire Barrier Moldable Putty+: One-part, 100 percent solids intumescent firestop. Remains pliable, flexible and easily re-enterable. Non-toxic synthetic formula.

- 1. Type: Pad.
 - 2. Fire Resistance: For use in 1, 2 or 3 hour fire rated systems.
- B. 3M Endothermic Mat E-5A-4: Endothermic heat absorbing mat.
- 1. Type: Mat.
 - 2. Fire Resistance: For use in 1 or 2 hour fire rated systems.

PART 3 – EXECUTION

3.1. EXAMINATION

- A. Do not begin installation until substrates have been properly prepared.
- B. Conduct tests according to manufacturer's written recommendations to verify that substrates are free of oil, grease, rolling compounds, incompatible primers, loose mill scale, dirt and other foreign substances capable of impairing bond of firestopping.
- C. Verify that items penetrating fire rated assemblies are securely attached, including sleeves, supports, hangers, and clips.
- D. Verify that openings and adjacent areas are not obstructed by construction that would interfere with installation of firestopping, including ducts, piping, equipment, and other suspended construction.
- E. Verify that environmental conditions are safe and suitable for installation of firestopping.
- F. If substrate preparation is the responsibility of another installer, notify Architect or Engineer of Record of unsatisfactory preparation before proceeding.

3.2. PREPARATION

- A. Prepare substrates in accordance with manufacturer's instructions and recommendations.
- B. Install masking and temporary coverings as required to prevent contamination or defacement of adjacent surfaces due to firestopping installation.

3.3. INSTALLATION

- A. Install in strict accordance with manufacturer's detailed installation instructions and procedures.
- B. Install so that openings are completely filled and material is securely adhered.
- C. Where firestopping surface will be exposed to view, finish to a smooth, uniform surface flush with adjacent surfaces.
- D. After installation is complete, remove combustible forming materials and accessories that are not part of the listed system.
- E. Repair or replace defective installations in accordance with manufacturer's recommendations, listed systems details and applicable code requirements.
- F. At each through penetration or fire-resistive joint system, attach identification labels on both sides in location where label will be visible to anyone seeking to remove penetrating items or firestopping.
- G. Clean firestop materials off surfaces adjacent to openings as work progresses, using methods and cleaning materials approved in writing by firestop system manufacturer and which will not

damage the surfaces being cleaned.

- H. Notify Authority Having Jurisdiction when firestopping installation is ready for inspection; obtain advance approval of anticipated inspection dates and phasing, if any, required to allow subsequent construction to proceed.
- I. Do not cover firestopping with other construction until approval of authority having jurisdiction has been received.

3.4. FIELD QUALITY CONTROL

- A. Owner will engage an independent testing agency to inspect installed firestopping and to prepare reports indicating whether the installed work complies with the contract documents.
- B. Notify testing agency at least 7 days prior to date when firestopping installation will be ready for inspection; obtain advance approval of general schedule and phasing, if any, required to allow subsequent construction to proceed.

3.5. CLEANING AND PROTECTION

- A. Remove left over material and debris from Work area. Use necessary means to protect fire protection product(s) before, during, and after installation.
- B. Touch-up, repair or replace damaged products before Substantial Completion.
- C. Install identification Labels for Through Penetration and Construction Joint Systems: Pressure sensitive self-adhesive vinyl labels, preprinted with the following information:
 - 1. The applicable words "Warning - Through Penetration Firestop System – Do not Disturb. Notify Building Management of Any Damage." or "Warning – Construction Gap Fire Resistive System - Do not Disturb. Notify Building Management of Any Damage."
 - 2. Listing agency's system number or designation.
 - 3. System manufacturer's name, address, and phone number.
 - 4. Installer's name, address, and phone number.
 - 5. General contractor's name, address, and phone number (if applicable).
 - 6. Date of installation.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 07 91 26 00 - JOINTING FILLERS**PART 1 - GENERAL**1.01 Scope of Standard

A. This standard provides general guidance concerning the specific preferences of UTHSCSA for jointing of exterior vertical surfaces for the following materials:

- 1 Concrete
- 2 Masonry

B. UTHSCSA recognizes that project conditions and requirements vary, thus precluding the absolute adherence to the items identified herein in all cases. However, unless there is adequate written justification, it is expected that these guidelines will govern the design and specifications for UT projects.

1.02 Related Standards

- A. The Secretary of the US Department of the Interior's Standards for Rehabilitation.
- B. Conservation of Building and Decorative Stone, 2 vols., John Asbury.
- C. Technical Notes on Brick Construction, Brick Industry Association.
- D. Masonry Veneer (Second Edition), Masonry Institute of America.

1.03 Definitions

- A. Construction joint
 - 1 Construction joints shall be located where construction will be facilitated or where the lack of a joint could cause the lack of structural integrity in the completed structure.
 - 2 Construction joints are theoretically undetectable in the completed structure and shall not cause any reduction in structural capacity or integrity.
- B. Control joint
 1. Control joints include expansion and contraction joints and are intended to provide for movement in the structure in order to "control" any possible movements that may have an impact on the structural integrity of the completed structure.
 2. Control joints also act as construction joints.
 3. Control joints are often referred to as movement joints.
- C. Expansion joint

1 Expansion joints are control joints that are designed to allow for the expansion of the concrete or masonry.

2 Expansion joints also act as contraction joints.

D. Contraction joint

1. Contraction joints are control joints that are designed to allow for the contraction of the concrete or masonry.

1.04 General Requirements:

A. Jointing shall be integral with the architectural/ structural design and detailing, not added at the end of the design process to satisfy minimum requirements.

B. This standard gives some general guidelines for the locations and sizes of joints. However, jointing design is dependent on the materials selected, the makeup of the materials, environmental conditions, and the architectural/structural design and detailing. Factors to be considered are:

1 Temperature effects.

2 Shrinkage effects.

3 Creep.

4 Stresses caused by the architectural/structural design.

5 Moisture effects.

C. All expansion and contraction joints shall be shown and detailed by the Engineer or Architect.

D. Critical construction joints shall be planned for and shown on the drawings, with guidelines for other construction joints specified in section 03300, Cast-in-place Concrete, to be prepared as a part of the contract documents. Other proposed construction joints as specified in section 03300 shall be submitted by the Contractor to the Engineer for review and approval during construction.

PART 2: PRODUCTS

2.01 Joint Sealant

A. Unless otherwise required for specialized conditions, joint sealant shall be a moisture-cured, single- or multi-component (depending on the application and required expansion/contraction capabilities), polyurethane-base, non-sag, elastomeric sealant.

- B. Sealant depth-to-width ratio at the center of the joint shall be 1:2.
- C. Allowable expansion/contraction of the joint shall be $\pm 25 - 50\%$ of joint width, depending on the product capabilities.
- D. Where applicable, provide a compatible sealant primer.

2.02 Backer

- A. Joint sealant backer is required for all applications.
- B. Unless otherwise required for specialized conditions, joint sealant backer shall be a closed-cell, polyethylene rod.
- C. Where limitations prevent the use of a backer rod, specify a polyethylene, self-adhesive, bond-breaker tape shall be used.

2.03 Filler

- A. Joint filler shall be specified to provide filling of the gap and to prevent displacement and improper location of the backer.
- B. Joint filler shall be a continuous, non-bleeding material compatible with the joint conditions.

PART 3: EXECUTION

3.01 Construction Joints

- A. Locate construction joints where anticipated stresses are low.
- B. Before placing new material against the completed side of the joint, clean the joint thoroughly and specify a bonding agent, mortar, lean grout, etc., as required to meet the definition and function of a construction joint.
- C. Structural reinforcing shall be 100% continuous across the joint.
- D. Where applicable, waterstops shall be provided for watertightness.

3.02 Control Joints

- A. Expansion joints
 - 1. Locate expansion joints to accommodate anticipated expansion at abrupt changes in the structure, where butting up to existing structures, and at least one corner of windows, doors, and other rectangular openings.
 - 2. The spacing of joints shall be contingent on the material's capacity to sustain expansion without damage to the concrete or masonry (usually based on the amount of reinforcing).

3. Structural reinforcing shall be discontinuous across the joint. Terminate reinforcing a minimum of two (2) inches from the faces of the joint.
4. Smooth reinforcing dowels, properly detailed, shall be provided to prevent movement out of the plane of the vertical surface and to provide for shear transfer (as required).
5. The minimum expansion joint width shall be 1/4".
6. Expansion joints shall be sealed.
7. Where applicable, waterstops shall be provided for watertightness.

B. Contraction joints

- 1 Locate contraction joints to accommodate anticipated contraction, usually at a spacing of between 15 - 30 feet.
- 2 The spacing of joints is contingent on the material's capacity to sustain expansion without damage to the concrete or masonry (usually based on the amount of reinforcing).
- 3 Maximum structural reinforcing shall be 50% continuous across the joint. Terminate non-continuous reinforcing a minimum of two (2) inches from the faces of the joint.
- 4 Smooth reinforcing dowels properly detailed can be provided to prevent movement out of the plane of the vertical surface and for shear transfer across the joint if the normal reinforcing detailed is not adequate.
- 5 The minimum contraction joint depth shall be 3/4 - 1 inch.
- 6 Typically, contraction joints are sealed.
- 7 Where applicable, waterstops shall be provided for watertightness.

C. Control joints shall not abruptly terminate in the middle of a vertical surface. (For example, do not discontinue joints at parapets, but continue joints through the parapet.)

3.03 Concrete: The following guidelines are in addition to those noted above and refer specifically to concrete:

A. Contraction joints in concrete shall be installed according to one of the following methods:

1. Pre-manufactured strips that are set in with the concrete and removed during or after the curing process of the concrete.

2. Saw-cutting. To be effective, saw-cutting must occur as soon as possible after concrete placement. Many factors influence the timing of saw-cutting, including weather conditions, concrete mix design, curing, and time of placement. However, the following general guidelines shall apply:

Hot/dry conditions. Saw-cut within 4- 12 hours.

Cool moist conditions. Saw-cut within 24 hours.

B. Contraction joints in concrete shall be provided at the following locations:

1. At major changes in wall heights.

2. At changes in wall thickness.

3.04 Masonry: The following guidelines are in addition to those noted above and refer specifically to masonry:

A. Expansion joints in masonry shall be provided at the following locations:

1. Below shelf angles or structural frames supporting masonry walls or panels.

2. Above masonry walls or panels abutting structural frames.

3. At major changes in wall heights.

4. Near wall intersections.

5. At regular intervals, not to exceed 25'-0."

B. Contraction joints in masonry shall be provided at the following locations:

1. At major changes in wall heights.
2. At changes in wall thickness.
3. Above joints in foundations.
4. At columns and pilasters.
5. At one or both sides of wall openings.
6. Near wall intersections.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 07 95 13 00 - EXPANSION JOINT COVER ASSEMBLIES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Single Source Responsibility: Obtain expansion joint cover assemblies specified in this Section from one source from a single manufacturer. Coordinate compatibility with expansion joint cover assemblies specified in other sections.
- B. Fire Test Response Characteristics: Where indicated, provide expansion joint cover assemblies identical to those assemblies whose fire resistance has been determined per ANSI/UL 263, NFPA 251, U.B.C. 43 1, or ASTM E 119, including hose stream test of vertical wall assemblies, by a testing and inspecting agency acceptable to authorities having jurisdiction.
 - 1. Fire Resistance Ratings: Not less than the rating of adjacent construction.

1.04 SUBMITTALS

- A. Samples:
 - 1. Samples for initial selection purposes in the form of manufacturer's color charts, actual units, or sections of units showing full range of colors, textures, and patterns available for each exposed metal and elastomeric material of expansion joint cover assembly indicated.
 - 2. Samples for verification purposes in full size units of each type of expansion joint cover assembly indicated; in sets for each finish, color, texture, and pattern specified, showing full range of variations expected in these characteristics.
 - a. Install elastomeric material for joints samples to verify color selected.
- B. Record Documents:
 - 1. Shop drawings showing fabrication and installation of expansion joint cover assembly including plans, elevations, sections, details of components, joints, splices, and attachments to other units of Work.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. To establish standards of manufacture, operation, performance, and appearance, Drawings and Specifications are based on products scheduled for each joint type. Provided compliance with requirements, products of the following manufacturers will also be acceptable:

1. Balco Inc.
2. Or Approved Equal

2.03 EXPANSION JOINT COVER ASSEMBLIES

- A. Provide expansion joint cover assemblies of design, basic profile, materials, and operation indicated. Provide units comparable to those indicated or required to accommodate joint size, variations in adjacent surfaces, and dynamic structural movement without material degradation or fatigue when tested according to ASTM E 1399. Furnish units in longest practicable lengths to minimize number of end joints. Provide hairline mitered corners where joint changes directions or abuts other materials. Include closure materials and transition pieces, tee joints, corners, curbs, cross connections, and other accessories as required to provide continuous joint cover assemblies.
- B. Moisture Barrier: Provide manufacturer's continuous, standard, flexible vinyl moisture barrier under covers at locations indicated.
- C. Fire Rated Joint Covers: Provide expansion joint cover assemblies with manufacturer's continuous, standard, flexible fire barrier seals under covers at locations indicated to provide fire resistive rating not less than the rating of adjacent construction.
- D. Coverless Fire Barrier: Provide manufacturer's continuous standard flexible fire barrier seals at locations indicated to provide fire resistive rating not less than the rating of adjacent construction.

2.04 JOINT COVER SCHEDULE

- A. Provide the following expansion joint cover types at locations indicated:
 1. Expansion Joint Type 1: Floor; Construction Specialties Model ELY, 1 inch Width.
 2. Expansion Joint Type 2: Floor; Construction Specialties Model ELY, 2 inch Width.
 3. Expansion Joint Type 3: Floor; Construction Specialties Model ALR-M, 1 inch Width.
 4. Expansion Joint Type 4: Wall & Ceiling; Construction Specialties Model EAFW, 1 inch and 2 inch Width.
 5. Expansion Joint Type 5: Roof to Roof, Roof to Wall; 1-1/2 inch to 4-1/2 inch width; Schuller Corporation Model TL-6.
- B. Expansion Joint Cover Types for Bertner Complex; Patient Care Tower and Research Building:
 1. Expansion Joint Type 3; Floor to Floor: D & B Expansion Joints Model FA 100-T.
 2. Expansion Joint Type 4; Floor to Floor: Construction Specialties Model ALR-1.
 3. Expansion Joint Type 5; Wall to Wall: Construction Specialties Model AFW-1.

4. Expansion Joint Type 6; Ceiling to Ceiling: Construction Specialties Model HC-1.
 5. Expansion Joint Type 7; Wall to Wall/Ceiling to Ceiling: Construction Specialties Model SM-1N.
 6. Expansion Joint Type 8; Floor to Wall: Construction Specialties Model ALRW-1.
 7. Expansion Joint Type 9; Wall to Wall: Construction Specialties Model AFWC-1.
 8. Expansion Joint Type 10; Floor to Floor: MM Systems Model FS-100.
 9. Expansion Joint Type 11; Wall to Wall: MM Systems Model FS-W.
 10. Expansion Joint Type 12; Floor to Wall/Floor: MM Systems Model FS-NE-100.
 11. Expansion Joint Type 13; Wall to Wall: MM Systems Model FS-W.
 12. Expansion Joint Type 14; Wall to Wall/Corner: MM Systems Model FS-W-(Corner).
- C. Expansion Joint Cover Types for Clinic Services and Gimbel Mechanical:
1. Expansion Joint Type 1; Floor to Floor: Construction Specialties Model ALR-1M.
 2. Expansion Joint Type 2; Floor to Floor: Construction Specialties Model ALR-2.
 3. Expansion Joint Type 3; Wall to Wall: Construction Specialties Model EAFW-1.
 4. Expansion Joint Type 4; Ceiling to Ceiling: Construction Specialties Model FWF-100.
 5. Expansion Joint Type 5; Floor to Wall: Construction Specialties Model ALAW-1.
 6. Expansion Joint Type 6; Wall to Wall: Construction Specialties Model EACW-1.
 7. Expansion Joint Type 7; Wall to Wall: Construction Specialties Model EAFW-1 1/2.
 8. Expansion Joint Type 8; Floor to Floor: Construction Specialties Model ALR-1 1/2.
- D. Fire Barrier Insert: Construction Specialties Model FB-88.

2.05 MATERIALS

- A. Aluminum: ASTM B 221, alloy 6063 T5 for extrusions; ASTM B 209, alloy 6061 T6, sheet and plate.
1. Protect aluminum surfaces to be placed in contact with cementitious materials with a protective coating.
- B. Bronze: ASTM B 455, alloy C38500 for extrusions; alloy C28000 Muntz Metal for plates.
- C. Brass: UNS alloy C26000 for half hard sheet and coil.
- D. Stainless Steel: ASTM A 167, Type 304 with 2B finish, unless indicated otherwise, for plates, sheet, and strips.
- E. Extruded Preformed Seals: Single or multicellular elastomeric profiles as classified under ASTM D 2000, designed with or without continuous, longitudinal, internal baffles. Formed to fit compatible frames, in color indicated or, if not indicated, as selected by Owner from manufacturer's standard colors.
- F. Preformed Sealant: Manufacturer's standard elastomeric sealant complying with ASTM C 920, Use T, factory formed and bonded to metal frames or anchor members; in color indicated or, if not indicated, as selected by Owner from manufacturer's standard colors.

1. Joints 2 Inches Wide and Less: Withstand plus or minus 35 percent movement of the joint width without failure.
 2. Joints Greater Than 2 Inches to 4 Inches Wide: Withstand plus or minus 50 percent movement of the joint width without failure.
- G. Seismic Seals: Typically for exterior application, two single layered elastomeric profiles, one interior and one exterior, as classified under ASTM D 2000; retained in a set of compatible frames, in color indicated or, if not indicated, as selected by Owner from manufacturer's standard colors. At manufacturer's option, omit interior profile for interior application.
- H. Fire Barriers: Designed for indicated or required dynamic structural movement without material degradation or fatigue when tested according to ASTM E 1399. Tested in maximum joint width condition with a field splice as a component of an expansion joint cover per ANSI/UL 263, NFPA 251, U.B.C. 43 1, or ASTM E 119, including hose stream test of vertical wall assemblies by a nationally recognized testing and inspecting agency acceptable to authorities having jurisdiction.
- I. Accessories: Manufacturer's standard anchors, fasteners, set screws, spacers, flexible moisture barrier and filler materials, drain tubes, lubricants, adhesive, and other accessories compatible with material in contact, as indicated or required for complete installations.

2.06 METAL FINISHES

- A. Comply with NAAMM "Metal Finishes Manual" for finish designations and application recommendations, except as otherwise indicated. Apply finishes to products in factory after fabrication. Protect finishes on exposed surfaces before shipment.
- B. Coordinate expansion joint cover work with similar work in adjacent areas and match finishes of metal and elastomeric components to those in adjacent areas unless otherwise indicated.
- C. Aluminum Finishes: Finish designations prefixed by AA conform to the system established by the Aluminum Association for designating aluminum finishes.
1. Mill Finish: AA M10 (unspecified mill finish).
 2. Class II, Clear Anodized Finish: AA M12C22A31 (Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class II Architectural, clear film thicker than 0.4 mil).
 3. Class I, Clear Anodized Finish: AA M12C22A41 (Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class I Architectural, clear film thicker than 0.7 mil) complying with AAMA 607.1.
 4. Class II, Color Anodized Finish: AA M12C22A32/A34 (Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class II Architectural, film thicker than 0.4 mil with integral color or electrolytically deposited color).
 5. Class I, Color Anodized Finish: AA M12C22A42/A44 (Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class I Architectural, film thicker than 0.7 mil with integral color or electrolytically deposited color) complying with AAMA 606.1 or AAMA 608.1.
 - a. Color: Light bronze
 - b. Color: Medium bronze
 - c. Color: Dark bronze
 - d. Color: Black

- e. Color: Match Architect's sample
 - f. Color: As selected by Owner from within standard industry colors and color density range.
6. Factory Primed Concealed Surfaces: Protect concealed metal surfaces to be placed in contact with concrete or masonry with a shop coat of manufacturer's standard primer on the contact surfaces.
- D. Bronze Finish: Comply with NAAMM "Metal Finishes Manual" for recommendations relative to application and designations of finishes.
- 1. Natural Satin Finish: CDA Designation M32, mechanical finish, directional textured, medium satin.
- E. Stainless Steel Finishes: Comply with NAAMM "Metal Finishes Manual" for recommendations relative to application and designations of finishes.
- 1. Bright, Cold Rolled Unpolished Finish: AISI No. 2B finish
 - 2. Bright, Directional Polish: AISI No. 3 finish
- F. Factory Finish: Manufacturer's standard factory finish

PART 3 - EXECUTION

3.01 PREPARATION

- A. In addition to requirements of these specifications, comply with manufacturer's instructions and recommendations for phases of Work, including preparing substrate, applying materials, and protecting installed units.
- B. Coordinate and furnish anchorages, setting drawings, templates, and instructions for installation of expansion joint cover assemblies to be embedded in or anchored to concrete or to have recesses formed into edges of concrete slab for later placement and grouting in of frames.
- C. Fastening to In Place Construction: Provide anchorage devices and fasteners where necessary to secure expansion joint cover assemblies to in place construction, including threaded fasteners with drilled in expansion shields for masonry and concrete where anchoring members are not embedded in concrete. Provide fasteners of metal, type, and size to suit type of construction indicated and provide for secure attachment of expansion joint cover assemblies.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Perform cutting, drilling, and fitting required to install expansion joint covers. Install joint cover assemblies in true alignment and proper relationship to expansion joints and adjoining finished surfaces measured from established lines and levels. Allow adequate free movement for thermal expansion and contraction of metal to avoid buckling. Set floor covers at elevations to be flush with adjacent finished floor materials. Locate wall, ceiling, roof, and soffit covers in continuous contact with adjacent surfaces. Securely attach in place with required accessories. Locate anchors at interval recommended by manufacturer, but not less than 3 inches from each end and not more than 24 inches on center.

- D. Maintain continuity of expansion joint cover assemblies with a minimum number of end joints and align metal members mechanically using splice joints. Cut and fit ends to produce joints that will accommodate thermal expansion and contraction of metal to avoid buckling of frames. Adhere flexible filler materials (if any) to frames with adhesive or pressure sensitive tape as recommended by manufacturer.
- E. Extruded Preformed Seals: Install seals complying with manufacturer's instructions and with minimum number of end joints. For straight sections provide preformed seals in continual lengths. Vulcanize or heat weld field splice joints in preformed seal material to provide watertight joints using procedures recommended by manufacturer. Apply adhesive, epoxy, or lubricant adhesive approved by manufacturer to both frame interfaces before installing preformed seal. Seal transitions according to manufacturer's instructions.
- F. Elastomeric Sealant Joint Assemblies: Seal end joints within continuous runs and joints at transitions according to manufacturer's directions to provide a watertight installation.
- G. Seismic Seals: Install interior seals in continual lengths; vulcanize or heat weld field splice joints in interior seal material to provide watertight joints using manufacturer's recommended procedures. Install exterior seal in standard lengths. Seal transitions and end joints according to manufacturer's instructions.
- H. Fire Barriers: Install fire barriers, including transitions and end joints, according to manufacturer's instructions so that fire rated construction is continuous.

3.03 CLEANING AND PROTECTION

- A. Do not remove protective covering until finish work in adjacent areas is complete. When protective covering is removed, clean exposed metal surfaces to comply with manufacturer's instructions.

END OF SECTION 07 95 13 0092 00 0095 13

Task	Specification	Specification Description
07 95 13 00	07 05 00 00	Common Work Results for Thermal And Moisture Protection
07 95 13 00	07 76 00 00	Plaza and Decks, Construction Standard

08 01 81 00	08 81 00 00	Glass Glazing
08 05 13 00	08 11 13 00	Hollow Metal Doors and Frames
08 05 13 00	08 14 16 00	Flush Wood Doors

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 11 13 00 - HOLLOW METAL DOORS AND FRAMES**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Doors, panels, and frames shall be from a current member of the Steel Door Institute and comply with all SDI Standards and Guidelines for fabrications and execution of manufactured products.
- B. Provide custom steel doors and frames manufactured by a single firm specializing in the production of this type of work, unless otherwise acceptable to the Architect.
- C. Fire-Rated Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing according to NFPA 252.
 - 1. Test Pressure: Test at atmospheric pressure.
 - 2. Oversize Fire-Rated Door Assemblies: For units exceeding sizes of tested assemblies, provide manufacturer's certification that doors conform to all standard construction requirements of tested and labeled fire-rated door assemblies except for size.
 - 3. Temperature Rise Rating: At stairwell enclosures, provide doors that have a temperature rise rating of 450 degrees F (232 degrees C) maximum in 30 minutes of fire exposure.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Product data for each type of door and frame specified, including details of construction, materials, dimensions, hardware preparation, core, label compliance, sound ratings, profiles, and finishes.
- B. Record Documents:
 - 1. Shop Drawings: For fabrication and installation of custom steel doors and frames work. Include details of each frame type, elevations of door design types, conditions at openings, details of construction, location and installation requirements of finish hardware and reinforcements, and details of joints and connections, and glazing installation details and trim.

- a. Coordinate submittals with other doors, frames, and hardware and use the same "opening number identification" as given on the Drawings and the Door Schedule.
 - 1) Submittals not using the numbering identification shown on Drawings and Schedules will be rejected.
2. Label Construction Certification: For door assemblies required to be fire-rated and that exceed limitations of labeled assemblies, submit manufacturer's certification that each door and frame assembly has been constructed to conform to design, materials and construction equivalent to requirements for labeled construction.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Frames shall include shipping bar at bottom to insure frame integrity during shipping. All shipping bars shall be removed prior to frame installation.
- B. Inspect doors and frames upon delivery for damage. Minor damages may be repaired provided refinished items are equal in all respects to new work and acceptable to the Architect; otherwise remove and replace damaged items as directed.
- C. Store doors and frames at the building Site under cover. Place units on minimum 4-inch high wood blocking. Avoid the use of nonvented plastic or canvas shelters that could create a humidity chamber. If cardboard wrappers on doors become wet, remove cartons immediately. Provide ¼-inch spaces between stacked doors to promote air circulation.

1.06 WARRANTY

- A. All hollow metal work shall be warranted from defects in workmanship and quality for a period of one (1) year from the date of substantial completion.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products that may be incorporated in the Work include:
 1. Hollow Metal Doors
 - a. Curries Manufacturing Inc., 747 Series
 - b. CECO, Medallion
 - c. Steelcraft, B Series
 - d. Or Approved Equal
 2. Hollow Metal Frames
 - a. Curries Manufacturing Inc., M Series
 - b. CECO, SU Series
 - c. Steelcraft, F Series

- d. Or Approved Equal
- 3. Stainless Steel Doors and Frames
 - a. Krieger
 - b. Overly
 - c. Fleming
 - d. Or Approved Equal

2.03 MATERIALS

- A. Hot-Rolled Steel Sheets: ASTM A 569/A 569M, CS (Commercial Steel), Type B; free of scale, pitting or surface defects; pickled and oiled.
- B. Cold-Rolled Steel Sheets: ASTM A 366/A 366M, CS (Commercial Steel), Type B.
- C. Metallic-Coated (Galvanized) Steel Sheets: ASTM A 653/A 653M, CS (Commercial Steel), Type B; with G60 (Z180) zinc (galvanized) or A60 (AZ180) zinc-iron-alloy (galvannealed) coating.
- D. Stainless-Steel Sheets: Tension leveled stainless steel to ASTM A167-92b, Type 319.
- E. Supports and Anchors: Fabricate of not less than 16-gage sheet metal. Galvanize after fabrication units to be built into exterior walls, complying with ASTM A 153, Class B.
- F. Inserts, Bolts, and Fasteners: Manufacturer's standard units, except hot-dip galvanize items to be built into exterior walls, complying with ASTM A 153, Class C or D as applicable.
- G. Shop-Applied Paint: Rust-inhibitive enamel or paint, either air-drying or baking, suitable as base for specified finish paints on steel surfaces.

2.04 FABRICATION, GENERAL

- A. Fabricate hollow metal units to be rigid, neat in appearance, and free from defects, warp, or buckle. Accurately form metal to required sizes and profiles. Wherever practicable, fit and assemble units in the manufacturer's plant. Clearly identify work that cannot be permanently factory-assembled before shipment, to assure proper assembly at the Project Site. Weld exposed joints continuously; grind, fill, dress, and make smooth, flush, and invisible. Metallic filler to conceal manufacturing defects is not acceptable.
 - 1. Interior Doors: Minimum 16-gauge face sheets.
 - 2. Exterior Doors: Minimum 14-gauge face sheets.
- B. Unless otherwise indicated, provide countersunk flat or oval heads for exposed screws and bolts.
- C. Sound-Rated (Acoustical) Assemblies: Wherever shown or scheduled, provide door and frame assemblies that have been fabricated as sound-reducing type, tested in accordance with ASTM E 90, and classified in accordance with ASTM E 413.
 - 1. Unless otherwise indicated, provide acoustical assemblies with sound ratings of STC 33 or better.
- D. Finish Hardware: Prepare doors and frames to receive finish hardware, including cutouts, reinforcing, mortising, drilling, and tapping with reinforcing plated from same steel finish (not gauge) as door face sheets, in accordance with final Finish Hardware Schedule and templates provided by hardware supplier. Comply with applicable requirements of ANSI/SDI A250.6 standards for door and frame preparation for hardware.

1. Reinforce doors and frames to receive surface-applied hardware. Drilling and tapping for surface-applied finish hardware may be done at Project Site.
 2. Stainless steel doors shall be internally reinforced with Type 316 Stainless Steel for surface mounted hardware and cutout, drilled and tapped to receive mortised hardware according to ANSI/SDI A250.6 with reinforcing plates from the same steel finish (not gauge) as door face sheets.
 3. Locate finish hardware as shown on final Shop Drawings, or if not shown, in accordance with "Recommended Locations for Builder's Hardware for Custom Steel Doors and Frames," published by Door and Hardware Institute.
 4. Finish Hardware Reinforcement: Minimum gauges of steel reinforcing plates for the following hardware:
 - a. Hinges and Pivots: 7 gauge thick by 1.5" wide by 6" longer than hinge, secured by no less than six (6) spot welds.
 - b. Strikes, Flush Bolts and Closers: 12 gauges.
 - c. Surface-mounted Hold-Open Arms and Panic Devices: 12 gauge.
 5. All hollow metal doors over 3 feet in width (requiring heavy weight hinges) shall receive a full mortise, aluminum, continuous geared hinge.
- E. Clean, treat, and paint exposed surfaces of steel doors and frames, including galvanized surfaces, but excluding stainless steel surfaces.
1. Clean steel surfaces of mill scale, rust, oil, grease, dirt, and other foreign materials before application of paint.
 2. Apply pretreatment to cleaned metal surfaces, using cold phosphate solution (SSPC-PT2), hot phosphate solution (SSPC-PT4), or basic zinc chromate-vinyl butyryl solution (SSPC-PT3).
 3. Apply shop coat of prime paint within time limits recommended by pretreatment manufacturer. Apply a smooth coat of even consistency to provide a uniform dry film thickness of not less than 0.7 mils.
- F. Provide stops and moldings around solid, glazed, and louvered panels where indicated.
1. Form fixed stops and moldings integral with frame, unless otherwise indicated.
 2. Provide removable stops and moldings where indicated or required, formed of not less than 20-gage steel sheets matching steel of frames. Secure with countersunk flat or oval head machine screws spaced uniformly not more than 12 inches on center. Form corners with butted hairline joints.
 3. Coordinate width of rabbet between fixed and removable stops with type of glass or panel and type of installation indicated.

2.05 DOORS

- A. Provide flush design doors, 1-³/₄ inches thick:
1. Interior Doors
 - a. Series: 747
 - b. Gauge: 16 (14 at interior sensitive openings)

- c. Core: 22 gauge steel stiffeners spaced not more than 6 inches apart with fiberglass batting between the channels.
 - d. Steel: Cold-rolled
 - e. Edges: SEAMLESS-Intermittently welded edge, grind smooth, fill and touch-up with primer paint, free from blemishes.
- 2. Exterior Doors
 - a. Series: 747
 - b. Gauge: 14
 - c. Steel: A60 Galvannealed
 - d. Edges: SEAMLESS-Intermittently welded edge, grind smooth, fill and touch-up with primer paint, free from blemishes.
- 3. For single-acting swing doors, bevel both vertical edges 1/8 inch in 2 inches lock and hinge edge, unless doors are double acting or sliders.. For double-acting swing doors, round vertical edges with 2-1/8 inch radius.
- 4. Unless otherwise required for acoustical or thermal doors, provide filler of fiberboard, mineral-wool board, or other insulating material solidly packed full door height to fill voids between inner core reinforcing members.
- 5. Reinforce doors with rigid tubular frame where stiles and rails are less than 8 inches wide. Form tubular frame with 16-gage steel, welded to outer sheets.
- 6. Provide internal core constructed of galvanized, stretcher-leveled steel sheets not less than 18-gage, vertically reinforced with galvanized sheet steel sections not less than 22 gage, spaced 6 inches on center, extending full height of door and spot welded to both face sheets at not more than 5 inches on center.
 - a. Continuous truss-form reinforcement of 28-gage galvanized steel may be provided in lieu of spaced steel sections. Spot weld truss-form reinforcement 3 inches on center vertically and horizontally over entire core surface on both sides.
- 7. Reinforce tops and bottoms of doors with galvanized, 18-gage, horizontal steel channels, welded continuously to core faces. For exterior stainless steel doors, close top and bottom edges to provide weather seal.

B. Stainless Steel Doors

- 1. Interior Doors
 - a. Series: Doors shall be completely fabricated from commercial grade; tension leveled stainless steel to ASTM A167-92b, Type 316. Face sheets and glazing trims shall be (XL Blend S-Brushed) finish. Balance components shall be Mill finish.
 - b. Gauge: 16
 - c. Core: 22 gauge steel stiffeners space no more than 6 inches apart with fiberglass batting between the channels of polystyrene core.
 - d. Stainless Steel: Tension leveled stainless steel to ASTM A167-92b, Type 316

- e. Edges: Visible Edge seam is permitted; if Seamless edge is required by UTHSC-SA Project Manager, then continuously weld edge, grind smooth, free from blemished with and XL blend S-brushed Finish.
- 2. Doors shall be beveled 1/8" in 2" lock and hinge edge, unless doors are double acting sliders.
- 3. Provide stainless steel hardware at stainless steel doors.
- 4. Stainless steel cladding doors will not be accepted.
- 5. Provide #4 polish on exposed surfaces with vertical grain direction unless shown otherwise.
- C. Fire rated doors require metal applied label indicating rating designation.
- D. Provide High Frequency High Reinforcement at all top hinge location for doors 3'-0" in width and 7'-0" in height and over or provide continuous 12 gauge continuous one piece formed and tapped for hinges.
- E. Electrified Openings
 - 1. Doors shall be pre-wired with sufficient number of concealed wires to accommodate electric function of specified hardware. Provide Molex type standardized plug in connectors to accommodate up to 12 wires.

2.06 FRAMES

- A. Fabricate frames of full-welded unit construction, with corners mitered, reinforced, continuously welded full depth and width of frame. Knock-down type frames are not acceptable.
 - 1. Interior Frames:
 - a. Profile: M Series(No double drywall returns), Equal Rabbet at new construction over 50 openings.
 - b. Gauge: 16 at openings up to and including 3'-0" wide (14 at interior security sensitive openings).
 - c. Steel: Cold-rolled steel or: A60 galvanized at restrooms with showers, clean rooms such as "Surgery and Laboratories," and other rooms where high moisture content is applicable.
 - d. Welding: Continuous face welded, dressed and ground smooth, prime paint.
 - 2. Exterior Frames:
 - a. Profile: M Series(No double drywall returns), Equal Rabbet.
 - b. Gauge: 14.
 - c. Steel: A60 galvanized.
 - d. Welding: Continuous face welded, back weld, dressed and ground smooth, prime paint.
 - 3. Form frames of stainless steel sheets with #4 polish for openings indicated to receive stainless steel doors.
 - 4. Stainless Steel Frames:
 - a. Profile: No double drywall returns
 - b. Gauge: 16 at openings up to and including 3'-0" wide. 14 at openings over 3'-0" wide.

- c. Stainless Steel: Type 316 as designed in "Surgery and Laboratories" per UTHSC-SA Project Manager.
 - d. Welding: Continuous face welded corners, dressed and ground smooth, with brushed finish (XL Blend S).
 - e. Provide 316 welded in place anchors for attaching to wall framing members.
 - f. Provide stainless steel door hardware at stainless steel frames.
- B. Provide closed or tubular mullions and transom bars where indicated. Fasten mullions and transom bars at crossings and to jambs by butt welding. Reinforce joints between frame members with concealed clip angles or sleeves of same metal and thickness as frame.
1. Provide false head member to receive lower ceiling where frames extend to finish ceilings of different heights.
- C. Provide High Frequency Reinforcement at all top hinge locations for frames 3'-0" in width and 7'-0" in height and over.
- D. Jamb Anchors: Furnish jamb anchors as required to secure frames to adjacent construction, formed of not less than 16-gage galvanized steel.
1. Masonry Construction: Adjustable, flat, corrugated, or perforated, t-shaped to suit frame size, with leg not less than 2 inches wide by 10 inches long. Furnish at least two (2) anchors per jamb up to 7 feet 6 inches in height; Three (3) anchors up to an 8 feet 0 inches in jamb height; one (1) additional anchor for each 24 inches or fraction thereof over 8 feet 0 inches in height.
 2. Metal Stud Partitions: Insert type with notched clip to engage metal stud, welded to back of frames. Provide at least three (3) anchors for each jamb for frames up to 7 feet 6 inches height; five (5) anchors up to 8 feet 0 inches in jamb height; one (1) additional anchor each 24 inches or fraction thereof over 8 feet 0 inches in height.
 3. In-Place Concrete or Masonry: Anchor frame jambs with minimum 3/8 inch concealed bolts into expansion shields or inserts at 6 inches from top and bottom and 26 inches on center, unless otherwise shown. Reinforce frames at anchor locations. Except for fire-rated openings, apply removable stop to cover anchor bolts unless otherwise indicated.
- E. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor, formed of not less than 14-gage galvanized steel sheet, as follows:
1. Monolithic Concrete Slabs: Clip-type anchors, with two holes to receive fasteners, welded to bottom of jambs and mullions.
 2. Separate Topping Concrete Slabs: Adjustable type with extension clips, allowing not less than 2-inch height adjustment. Terminate bottom of frames at finish floor surface.
- F. Head Anchors: Provide two anchors at head of frames exceeding 42 inches wide for frames mounted in steel stud walls.
- G. Head Strut Supports: Provide 3/8 inch by 2 inch vertical steel struts extending from top of frame at each jamb to supporting construction above, unless frame is anchored to masonry or to other structural support at each jamb. Bend top of struts to provide flush contact for securing to supporting construction above. Provide adjustable wedged or bolted anchorage to frame jamb members in compliance with UL 63.
- H. Structural Reinforcing Members: Provide as part of frame assembly, where indicated at mullions, transoms, or other locations that are to be built into frame.

- I. Head Reinforcing: For frames over 4 feet 0 inches wide in masonry wall openings, provide continuous steel channel or angle stiffener, not less than 12-gage for full width of opening, welded to back of frame at head. Lave vertical mullions in frames open at top for grouting.
- J. Spreader Bars: Provide removable spreader bar across bottom of frames, tack welded to jambs and mullions.
- K. Rubber Door Silencers: Except on weather stripped doors, drill stop in strike jamb to receive three (3) silencers on single-door frames add drill head jamb stop to receive four (4) silencers on double-door frames. Install plastic plugs to keep holes clear during construction.
- L. Plaster Guards: Provide 26-gage steel plaster guards or dust cover boxes, welded to frame, at back of finish hardware cutouts where mortar or other materials might obstruct hardware operation and to close off interior of openings.
- M. Fire rated frames require metal applied label or embossed label indicating rating designation.
- N. Electrified Openings: Doors shall be pre-wired with sufficient number of concealed wires to accommodate electric function of specified hardware. Provide Molex type standardized plug in connectors to accommodate up to twelve wires. Provide welded in place electric knock out box for field connection of ¾ inch conduit electrical contractor. Wire nuts are not acceptable.

2.07 STEEL FINISHES

- A. Surface Preparation: Clean surfaces to comply with SSPC-SP1, "Solvent Cleaning"; remove dirt, oil, grease, or other contaminants that could impair paint pond. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 3, "Power Tool Cleaning," or SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
- B. Factory Priming for Field-Painted Finish: Apply shop primer specified below immediately after surface preparation and pretreatment. Apply a smooth coat of even consistency to provide a uniform dry film thickness of not less than 0.7 mils (0.02 mm).
- C. Galvanized Steel Surface Preparation: Clean surfaces with non-petroleum solvent so surfaces are free of oil and other contaminants. After cleaning, apply a conversion coating suited to the organic coating to be applied over it. Clean welds, mechanical connections, and abraded areas, and apply galvanizing repair paint specified below to comply with ASTM A 780.
 - 1. Galvanizing Repair Paint: High-zinc dust content paint for reglazing welds in steel, complying with SSPC-Paint 20.
- D. Galvanized Steel Factory Priming for Field-Painted Finish: Apply shop primer specified below immediately after surface preparation and pretreatment. Apply a smooth coat of even consistency to provide a uniform dry film thickness of not less than 0.7 mils (0.02 mm).
- E. Shop Primer: Manufacturer's or fabricator's standard, fast-curing, corrosion-inhibiting, lead and chromate-free, universal primer complying with ANSI A224.1 acceptance criteria; compatible with substrate and field-applied finish paint system indicated; and providing a sound foundation for field-applied topcoats despite prolonged exposure.

2.08 STAINLESS STEEL FINISHES

- A. Finish designations prefixed by AISI conform with the system established by the American Iron and Steel Institute for designating finishes for stainless steel sheet.
- B. Unless otherwise indicated, provide Bright, Directional Polish, AISI No. 4 finish on all stainless steel items.
 - 1. On doors, align direction of polish marks to be vertical.

2. On frames, align direction of polish marks to be vertical on both jambs and head.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. Install doors and frames per manufacturer's requirements and SDI standards and instructions.
- C. Install accessories in accordance with Shop Drawings, manufacturer's data, and as herein specified.
 1. Setting Masonry Anchorage Devices: Provide masonry anchorage devices where required for securing frames to in-place concrete or masonry construction.
 - a. Set anchorage devices opposite each anchor location, in accordance with details on final Shop Drawings and anchorage device manufacturer's instructions. Leave drilled holes rough, not reamed, and free from dust and debris.
 2. Floor anchors may be set with powder-actuated fasteners instead of masonry anchorage devices and machine screws, if so indicated on final Shop Drawings.
- D. Placing Frames: Set frames accurately in position, plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces and spreaders, leaving surfaces smooth and undamaged.
 1. At in-place concrete or masonry construction, set frames and secure in place with machine screws and masonry anchorage devices.
 2. Place frames at fire-rated openings in accordance with NFPA Standard No. 80.
 3. Make field splices in frames as detailed on final Shop Drawings, welded and finished to match factory work.
 4. Remove spreader bars only after frames or bucks have been properly set and secured.
- E. Install doors after adjacent work is completed and dry. Do not install doors until closers or stops and holders can be installed simultaneously for protection of doors.
- F. Fit non-fire rated doors accurately in their respective frames, with the following clearances:
 1. Jambs and Head: 3/32 inch.
 2. Meeting Edges, Pairs of Doors: 1/8 inch.
 3. Bottom: 3/8 inch, where no threshold or carpet.
 4. Bottom: 1/8 inch, at threshold or carpet.
- G. Place fire-rated doors with clearances as specified in NFPA Standard No. 80.

3.02 ADJUST AND CLEAN

- A. Final Adjustments: Check and readjust operating hardware items just prior to final inspection. Leave work in complete and proper operating condition. Remove and replace defective work, including doors or frames that are warped, bowed or otherwise unacceptable.
- B. Prime Coat Touch-Up: Immediately after erection, sand smooth any rusted or damaged areas of prime coat and apply touch-up of compatible air-drying primer.

1. Repair installed dented and damaged units to new condition by filling with automotive body putty.
2. Fill exposed countersunk anchor screws in countersunk screw holes with automotive body putty after units are installed in place.
3. Grind puttied areas smooth, true and even with surrounding surfaces. Repaint puttied areas with one additional coat of the specified primer before proceeding with field painting.

END OF SECTION 08 11 13 00

Task	Specification	Specification Description

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 14 16 00 - FLUSH WOOD DOORS**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Quality Standards: Comply with the following standards:
 - 1. AWS Quality Standards: Edition 1, AWI with quality certification program; or WDMA Industry Standard IS-1A-11.
 - 2. Fire Ratings Compliance: Fire-rated wood doors to comply with NEPA-80.
 - a. UL10B – Fire Tests for Door Assemblies- Neutral Pressure (neutral pressure plain is approx.. 40 inches above finish floor)
 - b. UL10C – Fire Tests for Door Assemblies – Positive pressure for Category “A” doors.
 - 3. Regulatory Requirements: Comply with following
 - a. Fire Rated Label: Bear label of UL or other recognized fire-rating program acceptable to authorities having jurisdiction,
 - 1) If any door or frame scheduled to be fire-rated cannot qualify for appropriate labeling because of its design, hardware, or any other reason, advise the University prior to submission of bids.
 - 4. Sound rated doors, including test report indicating STC rating per ASTM E90 from test laboratory.

- B. Obtain doors from a single manufacturer.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Door manufacturer's product data for each type of door, including details of core and edge construction, trim for openings and louvers, and factory-finishing specifications.
- B. Record Documents:

1. Shop Drawings: Submit Shop Drawings indicating location and size of each door, elevation of each kind of door, details of construction, location and extent of hardware blocking, fire ratings, requirements for factory finishing and other pertinent data. Include catalog cuts and descriptive data for glazing, sound gasketing, weather-stripping and thresholds to be used.
2. Door schedule: Submit manufacturers'; schedule, including door dimensions, cutouts, species, finish and hardware. Coordinate submittals with other doors, frames, and hardware and use the same "opening number identification" as given on the Drawings and the Door Schedule. Submittals not using the numbering identification system shown on Drawings and Schedules will be rejected.
3. Samples: Submit manufacturer's door finish samples, showing range of color variation.
4. Manufacturer's certification: Submit manufacturer's certification that doors comply with specified requirements and are suitable for intended application. Include information that manufacturer is in good standing with Window and Door Manufacturers Association (WDMA).
5. Environmental Documentation (when required on Drawings): Submit manufacturer's environmental documentation.
 - a. Forest Stewardship Council (FSC) Stave Lumber Core Construction: Chain on custody certificate.
 - b. Scientific Certification Systems (SCS) Particle Core Construction: Recovered fiber content certification.
 - c. Rapidly Renewable Materials – Agrifiber Core Construction: Product data.
 - d. Manufacturer's Information: Describe available LEED points.
6. Manufacturer's full lifetime warranty sample. Refer to Section 1.06 Warranty.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Protect doors during transit, storage and handling to prevent damage, soiling and deterioration. Comply with requirements of referenced standards and recommendations of WDMA pamphlet "How to Store, Handle, Finish, Install, and Maintain Wood Doors", as well as with manufacturer's instructions.
- B. Identify each door with individual opening numbers which correlate with designation system used on Shop Drawings for door, frames, and hardware, using temporary, removable or concealed markings.
- C. Acceptance at Site: Inspected door system upon delivery. Replace damaged or defective materials before installation. Do not store in damp or wet areas. HVAC systems must be operating and balanced prior to arrival of doors. Acceptable humidity shall be no less than 25% or greater than 55%. Certain wood species are light sensitive. Protect doors from exposure to natural and artificial light after delivery. Temperature to be maintained between 60-99 F. Reference AWI quality standard including Section 100-S-3 "Moisture Content".
 1. Field measure openings for door systems before start of fabrication.

1.06 WARRANTY

- A. Warranties shall be in addition to, and not a limitation of, other rights The University may have under the Contract Documents.
- B. Door Manufacturer's Warranty: Submit written agreement in door manufacturer's standard form signed by Manufacturer, Installer and Contractor, agreeing to repair or replace defective doors that have warped (bow, cup or twist) or that show telegraphing of core construction in face veneers, or do not conform to tolerance limitations of referenced quality standards.

1. Warranty shall also include reinstallation which may be required due to repair or replacement of defective doors where defect was not apparent prior to hanging.
2. Warranty shall be in effect during the life of the installation.
- C. Contractor's Responsibilities: Replace or refinish doors where Contractor's Work contributed to rejection or to voiding of manufacturer's warranty.
- D. Special Warranty
 1. Swinging Doors and Standard Closet Door Warranty: Provide one-year written warranty covering materials and installation for wood doors.
 - a. Include coverage hardware
 - b. Cover warping (bow, cup, or twist) photographing of construction below face veneers, tolerance limitations of WDMA I.S. 1-A
 - c. Cover delimitation
 - d. Glazing not included
 - e. Defects resulting from vandalism not included
 2. Heavy Duty Closet Doors Warranty: Provide manufactures five-year written warranty covering materials and installation for bifold doors and sliding doors.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

1. Subject to compliance with requirements. Manufacturers offering products that may be incorporated in the work include:
 - a. Algoma
 - b. Mohawk
 - c. Haley
 - d. Graham
 - e. VT Industries
 - f. Hager
 - g. Or Approved Equal

2.02 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Fire rated doors: All required intumescent seals shall be concealed into the edge of the door: frame applied intumescent seals are not acceptable.

- C. Electrified Openings: Doors shall be pre-wired with sufficient number of concealed wires to accommodate electric function of specified hardware. Provide Molex type standardized plug in connectors to accommodate up to twelve wires.

2.03 FLUSH SOLID CORE WOOD DOORS - GENERAL

- A. Adhesive: Type II.
- B. Face Panels: Manufacturer's standard 2 or 3-ply face panels.
- C. Stiles: 1-1/16 inch to 1-½ inch wide, one or two ply closed grain, solid hardwood. Provide fire retardant treated, UL approved, one or two ply hardwood stiles at fire-rated doors.
- D. For transparent finish doors, provide manufacturer's standard thickness face veneers per ANSI/WDMA I.S. 1A, Premium Grade.
 - 1. Face Veneer: Plain Sliced Red Oak, unless noted otherwise. Book and Balance match for color and grain at veneer joints.
 - 2. Vertical Edges: Same species, cut, and color as face veneer, no finger jointed material permitted.
 - 3. Finish: Shop finished as specified herein.
- E. Low Emitting Materials: Provide doors made with adhesives and composite wood products that do not contain urea formaldehyde.
- F. For paint finish doors provide manufacturer's standard thickness face veneer per ANSI/WDMA I.S.1A, Good Grade rotary cut Birch.
 - 1. Finish: Pre-sanded on faces and all edges, ready for field finishing as part of the work of Section 09 91 00.
- G. Thickness: 1 ¾" unless noted otherwise.

2.04 FIRE RATED (20 MINUTE) FLUSH SOLID CORE WOOD DOORS

- A. Core: 5-ply bonded low density wood blocks, random lengths, kiln dried.
 - 1. Bonding: Stiles and rails bonded to core, then entire unit abrasive planed before veneering.
- B. Subject to compliance with requirements, provide manufacturer and product from one of the following:
 - 1. VT Industries, Inc.
 - 2. Or Approved equal

2.05 FIRE RATED FLUSH SOLID CORE WOOD DOORS

- A. Core: Incombustible mineral.
 - 1. Provide fire retardant treated, UL approved 5 inch deep solid hard wood or Structural Composite Lumber top rail.
 - 2. Provide fire retardant treated, UL approved lock block reinforcement where mortised hardware is scheduled.
- B. Subject to compliance with requirements, provide manufacturer and product from one of the following:
 - 1. VT Industries, Inc.

2. Or Approved equal

2.06 PLASTIC LAMINATE FACED SOLID CORE DOORS, GENERAL

- A. AWI grade: Custom

- B. Bond: type II water resistant.

C. Plastic Laminate Face Panels:

1. Low Pressure Decorative Laminate Faces:

- a. Core: Particleboard type M-2 (42lbs-ft).

- b. Color/Wood Pattern: as approved by The University.

- 1) Low-pressure decorative laminates faces shall be thermally fused to cores under heat and pressure, complying with Laminating Materials Association's Product Standard and Typical Physical Properties of Decorative Overlays, LMA 2003.

- 2) Exposed edges shall be of an impact-resistant polymer edging, minimum .040" thick, applied to all four edges after faces; color or wood grain pattern shall be the same as the faces.

- 3) Provide doors with pilot holes factory-drilled for vertical edge hinges and lock sets.

- c. Manufacturers of Low Pressure Decorative Laminate Faces:

- 1) Maiman Company: LPDL

2. High Pressure Decorative Laminate Faces

- a. Particleboard type NEMA LD 2 (28lb-ft),

- b. Color/Wood Pattern: as approved by The University.

- 1) Stiles and rails shall be bonded to the core, with the entire unity abrasive planed before faces and crossbands are applied.

- 2) Provide premium grade plastic-laminate faces with high-pressure decorative laminates complying with NEMA LD 2 (28lb-ft). Grade HGS.

- D. Colors, Patterns, and Finishes: As selected by Architect

- E. Stiles: 1 1/6 inch to 1 1/2 inch wide, one or two ply closed grain, solid hardwood; paint edge to match laminate faces. Provide fire retardant treated, UL approved, one or two ply hardwood stiles at fire-rated doors.

- F. Rails:

1. Top Rail: 5 inch one to three ply closed grain, solid hardwood or Structural Composite Lumber.

2. Bottom Rail: Hardwood or Structural Composite Lumber. Provide 5 inch deep rail where concealed door seal or kick plate is scheduled.

3. Provide 5 inch fire retardant treated, UL approved hardwood or Structural Composite Lumber top rails at fire-rated doors.

4. Provide 5 inch fire retardant treated, UL approved hardwood or Structural Composite Lumber bottom rail at fire-rated doors where concealed door seal or kick plate is scheduled.

G. Blocking:

1. Provide lock block reinforcement where mortised hardware is scheduled.
2. Provide 5 inch hardwood or Structural Composite Lumber at intermediate-height where exit devices are scheduled.
3. Provide 5 inch fire retardant treated, UL approved hardwood or Structural Composite Lumber blocking at intermediate height at fire-rated doors

H. Low Emitting Materials: Provide doors made with adhesives and composite wood products that do not contain urea formaldehyde.

2.07 FIRE RATED (20 MINUTE) FLUSH WOOD DOORS, PLASTIC LAMINATE FACED

A. Construction: Five plies. Mat formed wood particleboard core, complying with ANSI A 208.1, Grade LD-2.

1. Bonding: Stiles and rails bonded to core, with entire unit abrasive planed before faces and crossbands are applied.

2.08 FIRE RATED FLUSH WOOD DOORS, PLASTIC LAMINATE FACED

A. Construction: Incombustible non-asbestos mineral core.

1. Bonding: Stiles and rails bonded to core.
2. Treatment: Components shall be salt free.

2.09 LOUVERS AND LIGHT FRAMES

A. Metal Louvers: Size, type and profile shown and fabricated from the following:

1. Steel: 20-gage, galvanized and factory primed for paint finish.
2. Color: Match Building.

C. Metal Frames for Light Openings in Fire Doors: VLF-EZ by air louvers Inc. or approved equal. Refer to drawing for sizes.

2.10 POCKET DOORS

A. Standard Sliding Pocket Door: Conforms to ANSI A156.14/ Type: 08671, D8701.

1. Provide complete manufacturer's standard hardware, including track headers, guides, and pulls to provide complete operating sliding doors.

a. Doors: Solid core red oak veneer (1-3/8 inch) thick, unless otherwise indicated.

2.11 FABRICATION

A. Factory fit doors to suit frame-opening sizes indicated. Field measure all openings for door systems prior to fabrication. Comply with clearance requirements of referenced quality standard for fitting unless otherwise indicated.

1. Comply with requirements in NFPA 80 for fire-rated doors.

- B. Factory machine doors for hardware that is not surface applied. Locate hardware to comply with DHI-WDHS-3. Comply with final hardware schedules, door frame Shop Drawings, DHI-WDHS-3 series standards, and hardware templates.
 - 1. Coordinate with hardware mortises in metal frames to verify dimensions and alignment before factory machining.
 - 2. Metal Astragals: Factory machine astragals and formed-steel edges for hardware for pairs of fire-rated doors.
- C. Transom and Side Panels: Fabricate matching panels with same construction, exposed surfaces, and finish as specified for associated doors. Finish bottom edges of transoms and top edges of rabbeted doors same as door stiles.
 - 1. Fabricate door and transom panels with full-width, solid-lumber, rabbeted, meeting rails. Provide factory-installed spring bolts for concealed attachment into jambs of metal door frames.
- D. Openings: Cut and trim openings through doors in factory.
 - 1. Light Openings: Trim openings with moldings of material and profile indicated.
 - 2. Glazing: Factory install glazing in doors indicated to be factory finished. Comply with applicable requirements in Section 08 80 00 "Glazing."

2.12 SHOP PRIMING

- A. Doors for Opaque Finish: Shop prime exposed portions of doors for paint finish with one (1) coat of wood primer specified in Division 09 section "Painting".
- B. Transparent Finish: Shop seal faces and edges of doors for transparent finish with stain (if required) and other required pretreatments and first coat of finish as specified in Division 09.

2.13 FACTORY FINISHING

- A. General: For transparent finish wood doors, perform finishing operation at the factory in compliance with referenced AWI quality standard including Section 1500 "Factory Finishing".
- B. Transparent Finish: Comply with requirements indicated for grade, finish system, staining effect and sheen.
- C. Stain to be Sherwin Williams, color selected by owner.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine installed door frames prior to hanging door:
 - 1. Verify that frames comply with indicated requirements for type, size, location, and swing characteristics and have been installed with plumb jambs and level heads.
 - 2. Reject doors with defects.
- B. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. Manufacturer's Instructions: Install wood doors to comply with manufacturer's instructions and of referenced AWI standard and as indicated.
 - 1. Install fire rated doors in corresponding fire rated frames in accordance with requirements of NFPA No. 80.
- C. Job Fitted Doors: Align and fit doors in frames with uniform clearances and bevels as indicated below; do not trim stiles and rails in excess of limits set by manufacturer or permitted with fire rated doors. Machine doors for hardware. Seal cut surfaces after fitting and machining.
 - 1. Fitting Clearances for Non Rated Doors: Provide 1/8 inch at jambs and heads; 1/16 inch per leaf at meeting stiles for pairs of doors; and 1/8 inch from bottom of door to top of decorative floor finish or covering. Where threshold is shown or scheduled, provide ¼ inch clearance from bottom of door to top of threshold.
 - 2. Fitting Clearances for Fire Rated Doors: Complying with NFPA 80.
 - 3. Bevel non rated doors 1/8 inch in 2 inches at lock and hinge edges.
 - 4. Bevel fire rated doors 1/8 inch in 2 inches at lock edge; trim stiles and rails only to extent permitted by labeling agency.
- D. Factory-Fitted Doors: Fit to frames for uniform clearance at each edge.
- E. Factory Finished Doors: Restore finish before installation, if fitting or machining is required at the Project Site.

3.03 ADJUSTING AND PROTECTION

- A. Operation: Re-hang or replace doors which do not swing or operate freely.
- B. Finished Doors: Refinish or replace doors damaged during installation.
- C. Protect doors as recommended by door manufacturer to ensure that wood doors will be without damage or deterioration at time of Substantial Completion.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 31 13 00 - ACCESS DOORS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Single-source Responsibility: Obtain access doors for entire Project from one source from a single manufacturer.
- B. Fire-Resistance Ratings: Wherever access doors are required in construction where a fire-resistance classification is indicated, provide access door assembly with panel door, frame, hinge, and latch from manufacturer listed in Underwriters Laboratories, Inc.'s "Building Materials Directory" for rating shown.
 - 1. Provide UL label on each fire-rated access door.
- C. Size Variations: Obtain Architect's acceptance of manufacturer's standard size units, which may vary slightly from sizes indicated.
- D. Coordination: Furnish inserts and anchoring devices that must be built into other work for installation of access doors. Coordinate delivery with other work to avoid delay.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Product data in form of manufacture's technical data and installation instructions for each type of access door assembly, including setting Drawings, templates, instructions, and directions for installation of anchorage devices.
 - a. Include complete schedule, including types, general locations, sizes, wall and ceiling construction details, finishes, latching or locking provisions, and other data pertinent to installation.
- B. Samples:
 - 1. Samples, 3 inches by 5 inches minimum size, of each panel face material showing factory-finished color and texture.
- C. Shop Drawings:

1. Show fabrication and installation of customized access doors and frames, including details of each frame type, elevations of door design types, anchorage and accessory items.

1.05 PROJECT CONDITIONS

- A. Verification: Obtain specific locations and sizes for required access doors from trades requiring access to concealed equipment, and indicate on submittal schedule.
- B. Special-Size Access Doors: Use where required or requested; indicate on schedule.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. To establish standards of manufacturer, operation, performance, and appearance, Drawings and Specifications are based on products of Babcock Davis. Provided compliance with requirements, products of the following manufacturers will also be acceptable:
 1. Babcock Davis
 2. Or Approved Equal

2.03 MATERIALS AND FABRICATION

- A. General: Furnish each access door assembly manufactured as an integral unit, complete with all parts, and ready for installation.
- B. Steel Access Doors and Frames: Fabricate units of continuous welded steel construction unless otherwise indicated. Grind welds smooth and flush with adjacent surfaces. Furnish attachment devices and fasteners of type required to secure access panels to types of support shown.
- C. Frames: Fabricate from 16-gage steel.
- D. Frames: Fabricate from 16-gage, #4 satin-finished stainless steel.
 1. Fabricate frame with exposed flange nominal 1 inch wide around perimeter of frame for units installed in the following construction:
 - a. Exposed masonry.
 - b. Exposed concrete.
 - c. Drywall finish.
 - d. Ceramic tile finish.
 - e. Wood paneling.
 2. For gypsum drywall or gypsum veneer plaster, furnish perforated frames with drywall bead.
 3. For installation in masonry construction, furnish frames with adjustable metal masonry anchors.

4. For full-bed plaster applications, furnish frames with galvanized expanded metal lath and exposed casing bead, welded to perimeter of frame.
- E. Flush Panel Doors: Fabricate from not less than 14-gage sheet steel, with concealed spring hinges or concealed continuous piano hinge set to open 175 degrees. Finish with manufacturer's factory-applied prime paint.
- F. Flush Panel Doors: Fabricate from not less than 14-gage stainless steel sheet, with concealed spring hinges or concealed piano hinge set to open 175 degrees. Buff exposed surface to #4 satin finish.
 1. For fire-rated units, provide manufacture's standard insulated flush panel/doors, with continuous piano hinge and self-closing mechanism.
- G. Recessed Panel Doors: Fabricate from not less than 18-gage sheet steel with face of panel formed to provide recess below surface of applied finish. Reinforce panel as required to proven buckling. Finish with manufacturer's factory-applied prime paint.
 1. Furnish recessed panels for concealed installation in acoustic tile ceiling systems.
 2. Furnish recessed panels and frames with expanded metal lath for concealed installation in plaster.
- H. Locking Devices: Furnish flush, screwdriver-operated cam locks of number required to hold door in flush, smooth plane when closed.
 1. Provide one (1) cylinder lock per access door. Furnish two (2) keys per lock. Key all locks alike, unless otherwise scheduled.
 2. Where shown or scheduled, provide one (1) cylinder lock per access door. Furnish two (2) keys per lock. Key all locks alike unless otherwise indicated.
 3. For recessed panel doors, provide access sleeves for each locking device. Furnish plastic grommets and install in holes cut through finish.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Coordinate installation with work of other trades.
- D. Set frames accurately in position and securely attach to supports with face panels plumb or level in relation to adjacent finish surfaces.

3.02 ADJUST AND CLEAN

- A. Adjust hardware and panels after installation for proper operation.
- B. Remove and replace panels or frames that are warped, bowed, or otherwise damaged.

END OF SECTION 08 31 13 00

THIS PAGE INTENTIONALLY LEFT BLANK

Task	Specification	Specification Description
08 33 13 00	08 33 23 00	Overhead Coiling Doors

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 33 23 00 - OVERHEAD COILING DOORS**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Furnish each overhead coiling door as a complete unit produced by one manufacturer, including hardware, accessories, mounting and installation components.
 - 1. Furnish overhead coiling door units by one manufacturer for entire Project.
- B. Insert and Anchorages: Furnish inserts and anchoring devices that must be set in concrete or built into masonry to install units. Provide setting drawings, templates, instructions, and directions to install anchorage devices. Coordinate delivery with other work to avoid delay.
 - 1. See concrete and masonry Sections of these Specifications regarding installation of inserts and anchorage devices.
- C. Wind Loading: Design and reinforce overhead coiling doors to withstand a 20 psf (85 mph) wind loading pressure.

1.04 SUBMITTALS

- A. Submit the following in accordance with Conditions of Contract and Division 01 Specification Sections.
 - 1. Product Data: Submit manufacturer's product data, roughing in diagrams, and installation instructions for each type and size of overhead coiling door. Provide operating instructions and maintenance information, and complete information describing fire release system including electrical rough in instructions.
 - 2. Shop Drawings: Submit shop drawings for special components and installations which are not fully dimensioned or detailed on manufacturer's data sheets.
 - 3. Label Certification: Submit UL certification for oversize fire rated doors and frames that each assembly has been constructed with materials and methods equivalent to requirements for labeled construction.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Cornell
- B. Overhead Door Company
- C. Or approved Equal

2.03 FIRE RATED ROLLING SERVICE DOORS

- A. Provide fire door assemblies which comply with NFPA No. 80 and have been fire tested, rated and labeled in accordance with ASTM E 152. Furnish each door with a metal UL label as evidence of rating, with label indicating rating in hours of duration of exposure to fire and letter designation of location for which assembly is designed.
 - 1. Where fire door assemblies exceed size for which testing and labeling service is offered, furnish UL "Certificate of Inspection" for oversize doors, in lieu of label, certifying that design, materials and construction are equivalent to doors tested and labeled by UL.
- B. Automatic Closing: Provide automatic closing device and governor, operating when activated by temperature rise and melting of 160 degrees F (71 degrees C) fusible link. Construct governor unit to be inoperative during normal door operations. Design release mechanism to reset easily.
 - 1. Provide governor device in all automatic-closing doors to control rate of descent. Governor device shall be factory, or field, adjustable to set descent rate to the minimum (slowest) allowed by the requirements of NFPA 80.
- C. Provide UL Listed time delay release device designed to delay closing of fire doors for 10 seconds after alarm signal or power loss: Overhead Door Corporation "Fire Sentinel Model B2".
- D. Overhead Door Corporation "630 Series" interior face mounted, motor operated, steel rolling fire door.
- E. Overhead Door Corporation "630 Series" interior face mounted, chain operated, steel rolling fire door.
- F. Overhead Door Corporation "630 Series" interior face mounted, push up manually operated, steel rolling fire door.
- G. Overhead Door Corporation "630 Series" between jamb mounted, chain operated, steel rolling fire door.
- H. Overhead Door Corporation "630 Series" between jamb mounted, push up manually operated, steel rolling fire door.
- I. Door Curtain: Type C275 interlocking slats, fabricated of 20-gage (minimum) phosphatized, zinc coated steel. Provide endlocks and bottom bar in accordance with UL requirements.

2.04 DOOR CURTAIN MATERIALS AND CONSTRUCTION

- A. Door Curtain: Fabricate overhead coiling door curtain of interlocking slats, designed to withstand required wind loading, in a continuous length for width of door without splices. Unless otherwise indicated, provide slats of material gage recommended by door manufacturer for size and type of door required, and as follows:
 - 1. Steel Door Curtain Slats: Structural quality, cold rolled galvanized steel sheets complying with ASTM A 446, Grade A, with G90 zinc coating, complying with ASTM A 525.
- B. Endlocks: Malleable iron castings galvanized after fabrication, secured to curtain slats with galvanized rivets. Provide locks on alternate curtain slats for curtain alignment and resistance against lateral movement.
- C. Windlocks: Malleable iron castings secured to curtain slats with galvanized rivets. Unless otherwise recommended by door manufacturer, provide windlocks on doors exceeding 16 feet wide. Space windlocks approximately 24 inches on center on both edges of curtain.
- D. Bottom Bar: Consisting of two angles, each not less than 1-1/2 by 1-1/2 by 1/8 inch thick, either galvanized or stainless steel or aluminum extrusions to suit type of curtain slats.
 - 1. Provide a replaceable gasket of flexible vinyl or neoprene between angles as a weather seal and cushion bumper for manually operated doors, unless shown as an overlapping joint.
- E. Curtain Jamb Guides: Fabricate curtain jamb guides of steel angles, or channels and angles with sufficient depth and strength to retain curtain loading. Build up units with minimum 3/16 inch thick steel sections, galvanized after fabrication. Slot bolt holes for track adjustment.
- F. Secure continuous wall angle to wall framing with a minimum of 3/8 inch bolts at not more than 30 inches on center., unless closer spacing recommended by door manufacturer. Extend wall angles above door opening head to support coil brackets, unless otherwise indicated. Place anchor bolts on exterior wall guides so they are concealed when door is in closed position. Provide removable stops on guides to prevent over travel of curtain and a continuous bar for holding windlocks.
- G. Vision Panels: Provide vision panels in arrangement as indicated, consisting of 1/4 inch thick cast thermoplastic, methyl methacrylate flat glazing sheet with smooth mirror finish. Set panels in neoprene or vinyl glazing channel secured to curtain slats.
- H. Weather Seals: Provide vinyl or neoprene weatherstripping for exterior exposed doors, except where otherwise indicated. At door heads, use 1/8 inch thick continuous sheet secured to inside of curtain coil hood. At door jambs, use 1/8 inch thick continuous strip secured to exterior side of jamb guide.

2.05 COUNTERBALANCING MECHANISM

- A. Counterbalance doors by means of adjustable steel helical torsion spring, mounted around a steel shaft and in a spring barrel, and connected to door curtain with required barrel rings. Use grease sealed bearings or self lubricating graphite bearings for rotating members.
- B. Counterbalance Barrel: Fabricate spring barrel of hot formed structural quality carbon steel, welded or seamless pipe, of sufficient diameter and wall thickness to support roll up of curtain without distortion of slats and to limit barrel deflection to not more than 0.03 inch per foot of span under full load.
- C. Provide spring balance of one or more oil tempered, heat treated steel helical torsion springs. Size springs to counterbalance weight of curtain, with uniform adjustment accessible from outside barrel. Provide cast steel barrel plugs to secure ends of springs to barrel and shaft.
- D. Fabricate torsion rod for counterbalance shaft of cold rolled steel in size required to hold fixed spring ends and carry torsional load.

- E. Brackets: Provide mounting brackets of manufacturer's standard design, either cast iron or cold rolled steel plate with bell mouth guide groove for curtain.
- F. Hood: Form to entirely enclose coiled curtain and operating mechanism at opening head and act as weather seal. Contour to suit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Provide closed ends for surface mounted hoods and any portion of between jamb mounting projecting beyond wall face. Provide intermediate support brackets as required to prevent sag.
 - 1. Fabricate steel hoods for doors of not less than 0.0276 inch thick (24-gage) hot dip galvanized steel sheet with G 90 zinc coating, complying with ASTM A 525.
 - 2. Furnish automatic drop baffle to guard against passage of smoke or flame.
 - 3. Fabricate aluminum hoods for aluminum doors of Alloy 3003 or 5052 aluminum sheet not less than 0.032 inch thick, mill finish.

2.06 PRIME PAINTING

- A. Shop clean and prime ferrous metal and galvanized surfaces, exposed and unexposed, except tightly joined and lubricated surfaces, with door manufacturer's standard rust inhibitive primer. Use primer that is compatible with finish painting.

2.07 MANUAL DOOR OPERATORS

- A. Provide manual operators except where electric door operators are indicated. When not shown, provide chain hoist operator unit.
- B. Manual Push Up Operation: Design counterbalance mechanism so that required lift or pull for door operation does not exceed 25 pounds.
 - 1. Provide galvanized steel lifting handle and slide bolt lock on inside bottom bar.
- C. Chain Hoist Operator: Provide manual chain hoist operator consisting of endless steel hand chain, chain pocket wheel and guard, and geared reduction unit with a maximum 35 pound pull for door operation. Furnish alloy steel hand chain with chain holder secured to operator guide.
- D. Crank Hoist Operator: Provide crank hoist operator consisting of crank and crank gear box, steel crank drive shaft and gear reduction unit. Size gear to require no more than a 25 pound effort to turn crank. Fabricate gear box to completely enclose operating mechanism and be oil tight. Provide manufacturer's standard crank locking device.

2.08 ELECTRIC DOOR OPERATORS

- A. Furnish electric door operator assembly of size and capacity recommended and provided by door manufacturer; complete with electric motor and factory prewired motor controls, gear reduction unit, solenoid operated brake, remote control stations, control devices, conduit and wiring from controls to motor and central stations, and accessories required for proper operation.
- B. Provide hand crank operated disconnect or a mechanism for automatically engaging an operator and releasing brake for emergency manual operation. Mount disconnect and operator so they are accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.
- C. Design operator so that motor may be removed without disturbing limit switch adjustment and without affecting emergency auxiliary operator.

- D. Door Operator Type: Provide wall or bracket mounted door operator units consisting of electric motor, worm gear drive from motor to reduction gear box, chain or worm gear drive from reduction box to gear wheel mounted on counterbalance shaft, and a disconnect release for manual operation. Provide motor and drive assembly of horsepower and design as determined by door manufacturer for size of door required.
- E. Electric Motors: Provide high starting torque, reversible, Class A insulated electric motors with overload protection. Size motor to move door in either direction, from any position, at not less than 2/3 foot or more than 1 foot per second.
 - 1. Coordinate wiring requirements and current characteristics of motors with building electrical system.
 - 2. Furnish open drip proof type motor.
 - 3. Furnish totally enclosed, nonventilated type motors, fitted with plugged drain, for exterior applications and where indicated.
- F. Remote Control Station: Provide key-operated "sustained pressure" type switch labeled "Open" and "Close" with automatic spring-return to the center "Stop" position.
- G. Remote Control Station: Provide momentary contact, three button control station with push button controls labeled "Open," "Close," and "Stop."
 - 1. Provide interior units, full guarded, surface mounted, heavy duty, with general purpose NEMA Type 1 enclosure.
 - 2. Provide exterior units, full guarded type, standard duty, surface mounted, weatherproof, NEMA Type 4 enclosure, key operated.
- H. Automatic Reversing Control: Furnish each door with an automatic safety switch, extending the full width of door bottom, and located within neoprene or rubber astragal mounted to bottom door rail. Contact with switch before fully closing will immediately stop downward travel and reverse direction to fully opened position.
 - 1. Connect to control circuit through retracting safety cord and reel, or self coiling cable.
 - 2. Provide electrically actuated automatic bottom bar.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Comply with manufacturer's instructions and recommendations for installing door units, hardware, accessories, and other components.
- D. Install door and operating equipment complete with necessary hardware, jamb and head mold strips, anchors, inserts, hangers, and equipment supports according to final shop drawings, manufacturer's instructions, and as specified.
 - 1. Install fire rated doors to comply with NFPA 80.

E. After completing installation, including work by other trades, lubricate, test, and adjust doors to operate easily, free from warp, twist, or distortion.

1. Test door closing when activated by smoke detector fire release system. Reset door closing mechanism after successful test.

3.02 TRAINING

A. Train Owner's personnel on procedures and schedules related to door operation, servicing, preventive maintenance, and procedures for resetting closing devices after activation.

END OF SECTION 08 33 23 00

SECTION 08 35 13 13 - ACCORDIAN FOLDING DOORS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of material for folding doors. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the products manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Accordion folding doors.
 - b. Panel folding doors.
 - c. Bifold doors.
 - d. Bifold mirror doors.
 - e. Fire-rated folding doors.

C. Submittals

1. Product Data: For each type of product indicated.
2. Shop Drawings: Include plans, elevations, sections, details, attachments to other work.
 - a. Fire-Release System: Describe system, including testing and resetting instructions.
 - b. Wiring Diagrams: For power, signal, and control wiring.
3. Samples: For each exposed product and for each color and texture specified.
4. Product Schedule: For folding doors. Use same designations indicated on Drawings.
5. Product certificates.
6. Maintenance data.

D. Quality Assurance

1. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - a. Flame-Spread Index: 25 or less.
 - b. Smoke-Developed Index: 50 **OR** 450, **as directed**, or less.
2. Fire-Rated Folding Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection ratings indicated, based on testing according to NFPA 252 **OR** UBC Standard 7-2 **OR** UL 10B, **as directed**.
 - a. Oversize Fire-Rated Folding Doors: For units exceeding sizes of tested assemblies, provide certification by a qualified testing agency that doors comply with standard construction requirements for tested and labeled fire-rated door assemblies except for size.
3. Project Conditions
 - a. Environmental Limitations: Do not deliver or install folding doors until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
 - b. Field Measurements: Verify actual dimensions of openings by field measurements before fabrication

1.2 PRODUCTS**A. Accordion Folding Doors**

1. Wood Fold Series 240 or approved equal.

2. General: Top-supported, horizontal-sliding, manually operated accordion folding doors, with chain controlling the spacing and extension of pantographic or X-type accordion folding frames. Inner and outer covers are continuous surface facings that attach to and completely cover the folding frames and are pleated as the door is retracted.
3. Outer Covering: Of type indicated below, complying with indicated surface-burning characteristics; attached to door support frames in a concealed manner at sufficient intervals to prevent sagging and separation and to permit on-site removal and repair, with vertical seams located in valleys and material hemmed at top and bottom.
 - a. Vinyl reinforced with woven backing weighing not less than 20 oz./linear yd. (567 g/m).
 - 1) Color, Texture, and Pattern: As selected from manufacturer's full range.
 - b. Fabric weighing not less than 16 oz./linear yd. (496 g/m), treated to resist stains.
 - 1) Color, Texture, and Pattern: As selected from manufacturer's full range.
 - c. Manufacturer's standard nonwoven carpet, needle punched with fused fibers to prevent unraveling.
 - 1) Color, Texture, and Pattern: As selected from manufacturer's full range.
4. Sweep Seals: Manufacturer's standard top and bottom sweep seals on both **OR** one, **as directed**, side(s).
5. Carriers: Four-wheel carriers at lead post and two-wheel carriers at intermediate spacing, as necessary for size and weight of partition, to ensure secure, easy, and quiet operation.
 - a. Doors 96 Inches (2438 mm) High or Less: Nylon wheels on steel shafts.
 - b. Doors More Than 96 Inches (2438 mm) High: Ball-bearing wheels with nylon tread and steel shafts.
6. Tracks: Manufacturer's standard metal track made of extruded aluminum or formed steel with factory-applied, corrosion-resistant finish. Limit track deflection, independent of structural supporting system, to no more than 80 percent of bottom clearance. Design and fabricate track to support accordion folding doors and enable their operation without damage to track, folding unit, or adjacent surfaces; complying with the following requirements:
 - a. Head Trim: Prefinished wood molding for surface-mounted tracks.
 - b. Center stop for center-opening partitions.
 - c. Galvanized-steel sheet or aluminum subchannel for forming pocket for recessed suspension track.
 - d. Metal ceiling contact guard to protect finished ceiling surface from damage by moving top sweep seals; with finish matching other exposed metal.
 - e. Curved track sections with ceiling clips to accommodate configuration indicated.
 - f. Glide switch to divert door to auxiliary track.
 - g. Pivot switch to change track direction.
 - h. Cross-track switch to allow one door to cross another.
7. Hardware: Manufacturer's standard heavy-duty, manually operated metal pulls and latches as follows:
 - a. Finish: Clear-anodized aluminum **OR** Satin stainless steel **OR** Dull chromium-finish brass **OR** Dull chromium-finish steel, **as directed**.
 - b. Latch: Operable from both **OR** one, **as directed**, side(s) of closed door with coin-slot release on opposite side, **as directed**.
 - c. Lock: Manufacturer's standard key-operated cylinder lock, operable from both sides **OR** Manufacturer's standard key-operated cylinder lock, operable from one side; privacy lock on other side **OR** Deadlock to receive cylinder, operable from both sides. Refer to Division 08 Section "Door Hardware" for cylinder requirements **OR** Deadlock to receive cylinder, operable from both sides, **as directed**.
 - d. Foot bolts on lead post where indicated. Secure to post to avoid interference with seals.
8. Jamb Molding: Manufacturer's standard wood or metal molding at closing jamb as required for light-tight jamb closure.
9. Lead Posts and Jamb Posts: Not less than 0.048-inch- (1.2-mm-) thick steel **OR** extruded aluminum, **as directed**, formed for rigidity and light seal at supporting construction.
 - a. Nonferrous jamb strip for single-operating partitions to ensure tight closure by engaging rubber bumper on lead post.
10. Meeting Post: Fixed single jamb for single-stacked doors **OR** Center meeting post for center-opening doors, **as directed**.

11. Stacking: Tiebacks to maintain door in stacked position.
12. Stacking Configuration: Stack single doors at one end of opening **OR** center-opening doors at both ends of opening **OR** doors in pockets with hinged pocket doors, **as directed**.
13. Opening Size: As directed or as indicated on Drawings.

B. Panel Folding Doors

1. General: Top-supported, horizontal-sliding, manually operated panel folding doors, with panels joined by continuous hinge connectors for the full height of panels.
2. Core Material and Thickness: Manufacturer's standard.
3. Panel Width: 4-inch (100-mm) **OR** 5-inch (125-mm) **OR** 6-inch (150-mm) **OR** 8-inch (200-mm), **as directed**, nominal width.
4. Panel Facing: Facings that comply with indicated surface-burning characteristics.
 - a. Vinyl Facing: Vinyl not less than 7 mils (0.175 mm) thick, factory bonded to core.
 - 1) Color and Texture: As selected from manufacturer's full range.
 - b. Vinyl Facing with Woven Backing: Vinyl reinforced with woven backing weighing not less than 12 oz./linear yd. (372 g/m), factory bonded to core.
 - 1) Color and Texture: As selected from manufacturer's full range.
 - c. Plastic-Laminate Facing: Grade VGS, high-pressure plastic laminate complying with NEMA LD 3; adhesive applied under pressure to core.
 - 1) Color, Texture, and Pattern: As selected from manufacturer's full range.
 - d. Wood-Veneer Facing: as approved by The University, wood veneer, laminated to core, with manufacturer's standard clear **OR** stained, **as directed**, transparent finish.
 - 1) Stain Color: As selected from manufacturer's full range.
5. Carriers: Four-wheel carriers at lead post and two-wheel carriers at intermediate spacing, as necessary for size and weight of partition, to ensure secure, easy, and quiet operation.
 - a. Panels 5 Inches (125 mm) Wide or Less: Nylon wheels and axles.
 - b. Panels More Than 5 Inches (125 mm) Wide: Ball-bearing wheels with nylon tread and steel shafts.
6. Tracks: Manufacturer's standard surface-mounted **OR** recessed, **as directed**, extruded-aluminum or steel track with factory-applied, corrosion-resistant finish. Limit track deflection, independent of structural supporting system, to no more than 80 percent of bottom clearance. Design and fabricate track to support operation without damage to track, folding unit, or adjacent surfaces; complying with the following requirements:
 - a. Prefinished ceiling guard/channel for recessed tracks.
 - b. Center stop for biparting partitions.
 - c. Galvanized-steel sheet or aluminum subchannel for forming pocket for recessed suspension track.
 - d. Nonferrous jamb strip for single-operating partitions to ensure tight closure by engaging rubber bumper on lead post.
 - e. Curved track sections to accommodate configuration indicated.
 - f. Glide switch to divert door to auxiliary track.
 - g. Pivot switch to change track direction.
 - h. Cross-track switch to allow one door to cross another.
7. Hinge Connector: Manufacturer's standard extruded-vinyl hinge connector.
 - a. Color: As selected from manufacturer's full range **OR** Match or coordinate with facing color, **as directed**.
8. Hardware: Manufacturer's standard heavy-duty, manually operated metal pulls and latches as follows:
 - a. Finish: Clear-anodized aluminum **OR** Satin stainless steel **OR** Dull chromium-finish brass **OR** Dull chromium-finish steel, **as directed**.
 - b. Latch: Operable from both **OR** one, **as directed**, side(s) of closed door.
 - c. Lock: Manufacturer's standard key-operated cylinder lock, operable from both sides **OR** Manufacturer's standard key-operated cylinder lock, operable from one side; privacy lock on other side **OR** Deadlock to receive cylinder, operable from both sides. Refer to Division 08 Section "Door Hardware" for cylinder requirements **OR** Deadlock to receive cylinder, operable from both sides, **as directed**.
 - d. Foot bolts on lead post where indicated. Secure to post to avoid interference with seals.

9. Jamb Molding: Manufacturer's standard wood or metal molding at closing jamb as required for light-tight jamb closure.
 - a. Wood: Match species and finish of panel facing.
 - b. Metal: Manufacturer's standard finish.
10. Wood Track Molding: Manufacturer's standard wood molding on each side of surface-mounted track to match species and finish of panel facings. Install with tight, hairline joints with all fasteners concealed.
11. Meeting Post: Fixed single jamb for single-stacked doors **OR** Center meeting post for biparting doors, **as directed**.
12. Stacking: Tiebacks to maintain door in stacked position.

C. Pocket Door:

- a. 1 3/8" solid core red oak veneer door
- b. Pocket door kit #9630 by Hager Co. or approved equal
- c. Pocket door pull # 330L by Hager Co. US260 finish or approved equal
- d. Custom WD. Frame with 2" trim refer to drawings for additional details

1.3 EXECUTION

A. Preparation

1. For folding doors supported by or anchored to permanent construction, advise installers of specific requirements for placement of anchorage devices. Furnish installers of other work with templates and drawings showing locations of anchorage devices and similar items.
2. In path of fire-rated folding doors, level floor with header to tolerance of plus or minus 1/16 inch (1.6 mm) across opening; grind or fill floor as necessary.

B. Installation

1. General: Install folding doors complying with manufacturer's written installation instructions. Install track in one piece.
 - a. Comply with NFPA 80 for installing fire-rated folding doors.
2. Standard Floor Clearances: 1/4 to 3/4 inch (6.4 to 19 mm) maximum (above floor finish).
 - a. Comply with NFPA 80 for clearances required for fire-rated folding doors.
3. Coordinate provisions for electrical service, sensing devices, and final connections for fire-rated folding doors.

C. Adjusting

1. Adjust units as necessary to ensure smooth, quiet operation without warping or binding. Adjust hardware to function smoothly. Confirm that latches engage accurately and securely without forcing or binding.
 - a. Fire-Rated Folding Doors: Verify that all operations are functional and comply with requirements of authorities having jurisdiction.
2. Pocket Doors: Adjust to operate smoothly and easily, without binding or warping. Adjust hardware to function smoothly. Confirm that latches and locks engage accurately and securely without forcing or binding.

D. Demonstration

1. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain fire-rated folding doors.

END OF SECTION 08 35 13 13

Task	Specification	Specification Description
08 36 13 00	08 33 23 00	Overhead Coiling Doors

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 41 13 00 - ALUMINUM-FRAMED ENTRANCES AND STOREFRONTS**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Provide aluminum entrance and storefront assemblies that comply with performance characteristics specified, as demonstrated by testing the manufacturer's corresponding stock assemblies according to test methods indicated.
- B. Thermal Movement: Design the aluminum entrance and storefront framing systems to provide for expansion and Contraction of the component materials. Entrance doors shall function normally over the specified temperature range.
 - 1. The system shall be capable of withstanding a metal surface temperature range of 180 degrees F (100 degrees C) without buckling, failure of joint seals, undue stress on structural elements, damaging loads on fasteners, reduction of performance, stress on glass, or other detrimental effects.
- C. Wind Loads: Provide entrance and storefront systems, including anchorage, capable of withstanding windload design pressures calculated according to requirements of authorities having jurisdiction or the American Society of Civil Engineers' ASCE 7, Section 6.5, "Method 2- Analytical Procedure."
 - 1. Deflection of framing members in a direction normal to wall plane is limited to 1/175 of clear span or 3/4 inch (19 mm), whichever is smaller, unless otherwise indicated.
 - 2. Static-Pressure Test Performance: Provide entrance and storefront systems that do not evidence material failures, structural distress, failure of operating components to function normally, or permanent deformation of main framing members exceeding 0.2 percent of clear span when tested according to ASTM E 330.
 - a. Test Pressure: 150 percent of inward and outward wind-load design pressures.
 - b. Duration: As required by design wind velocity; fastest 1 mile (1.609 km) of wind for relevant exposure category.
- D. Hurricane-Resistance Test Performance: Provide entrance and storefront systems that pass large and small missile-impact tests, as required by systems' location above grade, and cyclic-pressure tests according to testing requirements of authorities having jurisdiction.
- E. Dead Loads: Provide entrance- and storefront-system members that do not deflect an amount which will reduce glazing bite below 75 percent of design dimensions when carrying full dead load.
 - 1. Provide a minimum 1/8 inch (3.18-mm) clearance between members and top of glazing or other fixed part immediately below.
 - 2. Provide a minimum 1/16 inch (1.59-mm) clearance between members and operable windows and doors.

- F. Live Loads: Provide entrance and storefront systems, including anchorage, that accommodate the supporting structures' deflection from uniformly distributed and concentrated live loads indicated without failure of materials or permanent deformation.
- G. Air Infiltration: Provide entrance and storefront systems with permanent resistance to air leakage through fixed glazing and frame areas of not more than 0.06 cfm/sq. ft. (0.3 L/s/sq. m) of fixed wall area when tested according to ASTM E 283 at a static-air-pressure differential of 6.24 psf (30Pa).
- H. Water Penetration: Provide entrance and storefront systems that do not evidence water leakage through fixed glazing and frame areas when tested according to ASTM E 331 at minimum differential pressure of 20 percent of inward-acting wind-load design pressure as defined by ASCE 7 "Method 2- Analytical Procedure", but not less than 6.24 lbf/sq. ft (300 Pa). There shall be no leakage at minimum static air pressure differential of 8psf(383Pa) as defined in AAMA 501. Water leakage is defined as follows:
 - 1. Uncontrolled water infiltrating systems or appearing on systems' normally exposed interior surfaces from sources other than condensation. Water controlled by flashing and gutters that is drained back to the exterior and cannot damage adjacent materials or finishes is not water leakage.
- I. Thermal Movements: Provide entrance and storefront systems, including anchorage, that accommodate thermal movements of systems and supporting elements resulting from the following maximum change (range) in ambient and surface temperature without buckling, damaging stresses on glazing, failure of joint sealants, damaging loads on fasteners, failure of doors or other operating units to function properly, and other detrimental effects.
 - 1. Temperature Change (Range): 120 degrees F (67 degrees C), ambient; 180 degrees F (100 degrees C), material surfaces.
- J. Structural-Support Movement: Provide entrance and storefront systems that accommodate structural movement including, but not limited to, sway and deflection.
- K. Condensation Resistance: Where framing systems are "thermal-break" construction, provide units tested for thermal performance in accordance with AAMA 1503 showing condensation resistance factor (CRF) is not less than 45.
- L. Thermal Transmittance: Provide framing systems that have an overall U-value of not more than 0.65 BTU/(hr. x sq. ft. x degrees F) at 15 mph exterior wind velocity when tested in accordance with AAMA 1503.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within all applicable references.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: Engage an experienced Installer who has completed installations of aluminum storefront and entrances similar in design and extent to those required for the Project and whose Work has resulted in construction with a record of successful in service performance.

- B. **Manufacturer's Qualifications:** Provide aluminum entrances and storefront systems produced by a firm experienced in manufacturing systems that are similar to those indicated for this project and that have a record of successful in service performance.
- C. **Fabricator Qualifications:** Provide aluminum entrances and storefront systems fabricated by a firm experienced in producing systems that are similar to those indicated for this Project, and that have a record of successful in service performance. The fabricator shall have sufficient production capacity to produce components required without causing delay in progress of the Work.
- D. **Single Source Responsibility:** Obtain aluminum entrance and storefront systems from one (1) source and from a single manufacturer.
- E. **Design Criteria:** The Drawings indicate the size, profile, and dimensional requirements of aluminum entrance and storefront Work required and are based on the specific types and models indicated. Aluminum entrance and storefront by other manufacturers may be considered, provided deviations in dimensions and profiles are minor and do not change the design concept as judged by the Architect. The burden of proof of equality is on the proposer.
- F. **Mockups:** Build mockups to verify selections made under sample submittals and to demonstrate aesthetic affects and set quality standards for materials and execution.
 - 1. Build mockup for types of storefront elevations in indicated. In locations shown on Drawings.
- G. **Structural-Sealant Glazing:** Comply with ASTM C 1401, "Guide of Structural Sealant Glazing" for design and installation of structural glazed systems.
- H. **Structural-Sealant Joints:** Design reviewed and approved by structural-sealant manufacturer.

1.05 SUBMITTALS

- A. **Product Data:**
 - 1. Product data for each aluminum entrance and storefront system required, including:
 - a. Manufacturer's standard details and fabrication methods.
 - b. Data on finishing, hardware and accessories.
 - c. Recommendations for maintenance and cleaning of exterior surfaces.
- B. **Record Documents:**
 - 1. Shop Drawings for each aluminum entrance and storefront system required, including:
 - a. Layout and installation details, including relationship to adjacent Work.
 - b. Elevations at 1/4 inch scale.
 - c. Detail sections of typical composite members.
 - d. Anchors and reinforcement.
 - e. Hardware mounting heights.
 - f. Provisions for expansion and Contraction.
 - g. Glazing details.

2. **Hardware Schedule:** Submit complete hardware schedule organized into sets based on hardware specified. Coordinate hardware with doors, frames, and related Work to ensure proper size, thickness, hand, function, and finish. Include item name, name of the manufacturer and complete designations of every item required for each door opening.
3. **Samples for Initial Color Selection:** Submit pairs of samples of each specified color and finish on 12 inch long sections of extrusions or formed shapes. Where normal color variations are anticipated, include two (2) or more units in each set of samples indicating extreme limits of color variations. Include samples of hardware and accessories involving color selection.
4. **Samples for Verification Purposes:** The Architect reserves the right to require additional samples, that show fabrication techniques and workmanship, and design of hardware and accessories.
5. **Fabrication Sample:** Of each vertical to horizontal intersection of aluminum-framed systems, made from 12" lengths of full-size components and showing details of the followings
 - a. Joinery, including concealed welds.
 - b. Anchorage.
 - c. Expansion provisions.
 - d. Glazing.
 - e. Flashing and drainage.
6. **Test Reports:** Provide certified test reports from a qualified independent testing laboratory showing that aluminum entrance and storefront systems have been tested in accordance with specified test procedures and comply with performance characteristics indicated.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver aluminum entrance and storefront components in the manufacturer's original protective packaging.
- B. Store aluminum components in a clean weather-tight, dry location away from uncured masonry or concrete. Cover components with waterproof paper, tarpaulin or polyethylene sheeting in a manner to permit circulation of air.
 1. Stack framing components in a manner that will prevent bending and avoid significant or permanent damage.

1.07 PROJECT CONDITIONS

- A. **Field Measurements:** Check openings by accurate field measurement before fabrication. Show recorded measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delay of the Work.
 1. Where necessary, proceed with fabrication without field measurements, and coordinate fabrication tolerances to ensure proper fit.

1.08 WARRANTY

- A. Submit a written warranty, executed by the manufacturer, agreeing to repair or replace units that fail in materials or workmanship within the specified warranty period. Failures include, but are not necessarily limited to:
 1. Structural failures including excessive deflection, excessive leakage or air infiltration.

2. Faulty operation.
 3. Deterioration of metals, metal finishes and other materials beyond normal weathering.
- B. Warranty Period: Two (2) years after the date of Substantial Completion.
- C. The warranty shall not deprive The University of other rights or remedies The University may have under other provisions of the Contract Documents, and is in addition to and runs concurrent with other warranties made by the Contractor under requirements of the Contract Documents.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Specifications are based on Kawneer Company "Tri-Fab VG '450' Framing System". Subject to compliance with requirements, products of the following will also be acceptable:
1. Cuuples.
 2. EFCO Corporation.
 3. Pittco Architectural Metals.
 4. U.S. Aluminum.
 5. Vistawall Architectural Products.
 6. Or Approved Equal.

2.03 MATERIALS

- A. Aluminum Members: Alloy and temper recommended by the manufacturer for strength, corrosion resistance, and application of required finish; comply with ASTM B 221 for aluminum extrusions, ASTM B 209 for aluminum sheet or plate, and ASTM B 211 for aluminum bars, rods and wire.
- B. Carbon steel reinforcement of aluminum framing members shall comply with ASTM A 36 for structural shapes, plates and bars, ASTM A 611 for cold rolled sheet and strip, or ASTM A 570 for hot rolled sheet and strip.
- C. Glass and Glazing Materials: Comply with requirements of "Glass and Glazing" Section of these Specifications.
- D. Glazing Gaskets: Manufacturer's standard pressure-glazing system of black, resilient glazing gaskets, setting blocks, and shims or spacers, fabricated from an elastomer of type and in hardness recommended by system and gasket manufacturer to comply with system performance requirements. Provide gasket assemblies that have corners sealed with sealant recommended by gasket manufacturer.
- E. Spacers, Setting Blocks, Gaskets, and Bond Breakers: Manufacturer's standard permanent, nonmigrating types in hardness recommended by manufacturer, compatible with sealants, and suitable for system performance requirements.

- F. Structural Silicone Sealant: Type recommended by sealant and system manufacturers that complies with ASTM C 1184 requirements, is compatible with system components with which it comes in contact, and is specifically formulated and tested for use as a structural sealant.
 - 1. Color: As selected by Architect from manufacturer's full range of colors.
 - 2. Tensile Strength: 100 psi (689.5 kPa) minimum.
 - 3. Provide sealant with modules of elasticity that will not allow movement of more than 25 percent of joint width, unless less movement is required by structural-sealant-glazed systems' design.
 - 4. Use neutral-cure silicone sealant with insulating-glass units.
- G. Secondary Sealant: For use as weatherseal, compatible with structural silicone sealant and other system components with which it comes in contact, and that accommodates a 50 percent increase or decrease in joint width at the time of application when measured according to ASTM C 719.
 - 1. Color: As selected by Architect from manufacturer's full range of colors.
 - 2. Use neutral-cure silicone sealant with insulating-glass units.
- H. Panel Core Material: Resin impregnated Kraft paper honeycomb.
- I. Panel Core Material: Rigid, closed cell polyurethane insulation.
- J. Panel Core Material: Rigid, noncombustible mineral insulation board.
- K. Fasteners: Provide fasteners of aluminum, nonmagnetic stainless steel, zinc plated steel, or other material warranted by the manufacturer to be noncorrosive and compatible with aluminum components, hardware, anchors and other components.
 - 1. Reinforcement: Where fasteners screw anchor into aluminum members less than 0.125 inches thick, reinforce the interior with aluminum or nonmagnetic stainless steel to receive screw threads, or provide standard noncorrosive pressed in splined grommet nuts.
 - 2. Exposed Fasteners: Do not use exposed fasteners except for application of hardware. For application of hardware, use Phillips flat head machine screws that match the finish of member or hardware being fastened.
- L. Concealed Flashing: 0.0179 inch (26-gage) minimum dead soft stainless steel, or 0.026 inch thick minimum extruded aluminum of alloy and type selected by manufacturer for compatibility with other components.
- M. Brackets and Reinforcements: Provide high strength aluminum brackets and reinforcements; where use of aluminum is not feasible provide nonmagnetic stainless steel or hot dip galvanized steel complying with ASTM A 123.
- N. Concrete and Masonry Inserts: Provide cast iron, malleable iron, or hot dip galvanized steel inserts complying with ASTM A 123.
- O. Compression Weatherstripping: Manufacturer's standard replaceable compressible weatherstripping gaskets of molded neoprene complying with ASTM D 2000 or molded PVC complying with ASTM D 2287.
- P. Sliding Weatherstripping: Manufacturer's standard replaceable weatherstripping of wool, polypropylene, or nylon woven pile, with nylon fabric or aluminum strip backing, complying with AAMA 701.2.

2.04 HARDWARE

- A. Refer to Specification Section 08 71 00 00 "Door Hardware."

2.05 COMPONENTS

- A. Storefront Framing System: Provide storefront and entrance framing systems fabricated from extruded aluminum members of size and profile indicated. Include subframes and other reinforcing members of the type indicated. Provide for flush glazing storefront from the exterior on all sides without projecting stops. Shop fabricates and preassembles frame components where possible. Provide storefront frame sections without exposed seams.
1. Mullion Configurations: Provide pockets at the inside glazing face to receive resilient elastomeric glazing. Mullions and horizontals shall be one (1) piece. Make provisions to drain moisture accumulation to the exterior. Make accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearance.
 2. Infill Panels: Provide flush laminated infill panels of thickness indicated, fabricated with panel core material laminated with waterproof glue between two (2) sheets of aluminum.
- B. Entrance Door Frames: Provide tubular and channel frame entrance door frame assemblies, as indicated, with welded or mechanical joints in accordance with manufacturer's standards. Reinforce as necessary to support required loads.
- C. Stile and Rail Type Entrance Doors: Provide tubular frame members, fabricated with mechanical joints using heavy inserted reinforcing plates and concealed tie rods or j bolts.
1. Glazing: Fabricate doors to facilitate replacement of glass or panels, without disassembly of stiles and rails. Provide snap on extruded aluminum glazing stops, with exterior stops anchored for non-removal.
 2. Design: Provide 1-3/4 inch thick doors of design indicated.
 - a. Thin stile (less than 1-3/4 inches wide).
 - b. Narrow stile (2 inch nominal width).
 - c. Medium stile (3-1/2 inch nominal width).
 - d. Wide stile (over 4 inches wide).
 - e. Center panel (door glazed with 2 or 3 lights).
 3. At perimeter and main exterior public openings use aluminum framed, wide stile 4 1/2" minimum glass doors. Tempered shatter-resistant glass.
 4. Weather-stripping: Replaceable wool pile continuous in head, jambs, bottom, and meeting rails at exterior doors and frames, in meeting rails at interior.
- D. Flush Panel Type Aluminum Doors: Provide flush panel type doors fabricated with tubular frame members with reinforced mechanical or welded joints; limit frame exposure to 3/4 inch maximum width on door faces. Provide minimum 0.064 inch thick aluminum face sheets, mechanically interlocked with frame members or laminated to panel core material and framing with waterproof glue.
1. Design: Provide 1-3/4 inch thick doors of design indicated.
 2. Lights: Provide glazed openings as indicated, with aluminum moldings and stops. Provide non-removable stops on the exterior.

2.06 FABRICATIONS

- A. Fabricate aluminum entrance and storefront components to designs, sizes and thicknesses indicated and to comply with indicated standards. Sizes and profile requirements are indicated on the Drawings. Variable dimensions are indicated, with maximum and minimum dimensions required, to achieve design requirements and coordination with other Work.
 - 1. Thermal Break Construction: Fabricate storefront framing system with an integrally concealed, low conductance thermal barrier, located between exterior materials and exposed interior members to eliminate direct metal to metal contact. Use manufacturer's standard construction that has been in use for similar projects for period of not less than three (3) years.
- B. Prefabrication: Complete fabrication, assembly, finishing, hardware application, and other work to the greatest extent possible before shipment to the Project Site. Disassemble components only as necessary for shipment and installation.
 - 1. Perform fabrication operations, including cutting, fitting, forming, drilling and grinding of metal work to prevent damage to exposed finish surfaces. Complete these operations for hardware prior to application of finishes.
 - 2. Do not drill and tap for surface mounted hardware items until time of installation at Project Site.
 - 3. Pre-glaze door and frame units to greatest extent possible.
- C. Welding: Comply with AWS recommendations. Grind exposed welds smooth to remove weld spatter and welding oxides. Restore mechanical finish.
 - 1. Welding behind finished surfaces shall be performed in such a manner as to minimize distortion and discoloration on the finished surface.
- D. Reinforcing: Install reinforcing as required for hardware and as necessary for performance requirements, sag resistance and rigidity.
- E. Dissimilar Metals: Separate dissimilar metals with bituminous paint, or a suitable sealant, or a nonabsorptive plastic or elastomeric tape, or a gasket between the surfaces. Do not use coatings containing lead.
- F. Continuity: Maintain accurate relation of planes and angles with hairline fit of contacting members.
 - 1. Uniformity of Metal Finish: Abutting extruded aluminum members shall not have an integral color or texture variation greater than half the range indicated in the sample pair submittal.
- G. Fasteners: Conceal fasteners wherever possible.
- H. Weatherstripping: For exterior doors, provide compression weatherstripping against fixed stops. At other edges, provide sliding weatherstripping retained in adjustable strip mortised into door edge.
 - 1. Provide EPDM or vinyl blade gasket weatherstripping in bottom door rail, adjustable for contact with threshold.
 - 2. At interior doors and other locations without weatherstripping, provide neoprene silencers on stops to prevent metal to metal contact.
- I. Provide finger guards of collapsible neoprene or PVC gasketing securely anchored into frame at hinge jamb of center pivoted doors.

2.07 FINISHES

- A. Comply with NAAMM AMP 500 Series "Metal Finishes Manual" for recommendations relative to application and designations of finishes.
- B. Finish designations prefixed by "AA" conform to the system established by the Aluminum Association for designating aluminum finishes.
- C. Finish aluminum entrance and storefront to match other adjacent glazed aluminum curtain wall components. Refer to "Glazed Aluminum Curtain Wall" Section for finish requirements.
- D. Class II Clear Anodized Finish: AA M12C22A31 (Mechanical Finish: As fabricated, nonspecular; Chemical Finish: Etched, medium matte; Anodic Coating: Class II Architectural, clear film thicker than 0.4 mil).
- E. Class I Clear Anodized Finish: AA M12C22A41 (Mechanical Finish: As fabricated, nonspecular; Chemical Finish: Etched, medium matte; Anodic Coating: Class I Architectural, clear film thicker than 0.7 mil) complying with AAMA 607.1.
- F. Class I Color Anodized Finish: AA M12C22A42/A44 (Mechanical Finish: As fabricated, nonspecular; Chemical Finish: Etched, medium matte; Anodic Coating: Class I Architectural, film thicker than 0.7 mil with integral color or electrolytically deposited color) complying with AAMA 606.1 or AAMA 608.1.
 1. Color: As selected by Architect from within standard industry colors and color density range.
- G. Baked Enamel Finish: AA C12C42R1x (Chemical Finish: Cleaned with inhibited chemicals; Chemical Finish: Chemical conversion coating, acid chromate fluoride phosphate pretreatment; Organic Coating: As specified below). Apply baked enamel in compliance with paint manufacturer's Specifications for cleaning, conversion coating, and painting.
 1. Organic Coating: Thermosetting modified acrylic enamel primer/topcoat system complying with AAMA 603.8 except with minimum dry film thickness of 1.5 mils, medium gloss.
 2. Color: As selected by Architect from manufacturer's standard colors.
- H. High Performance Organic Coating: AA C12C42R1x (Chemical Finish: Cleaned with inhibited chemicals; Chemical Finish: Chemical conversion coating, acid chromate fluoride phosphate pretreatment; Organic Coating: As specified below). Prepare, pre-treat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturer's instructions.
 1. Fluorocarbon 2 Coat Coating System: Manufacturer's standard two (2) coat thermo cured system, composed of specially formulated inhibitive primer and fluorocarbon color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; comply with AAMA 605.2.
 2. Fluorocarbon 3 Coat Coating System: Manufacturer's standard three (3) coat thermo cured system, composed of specially formulated inhibitive primer and fluorocarbon color coat, and clear fluorocarbon topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; comply with AAMA 605.2.
 3. Color and Gloss: As selected by Architect from manufacturer's standard colors and gloss.
- I. Stainless Steel Trim: Provide custom-designed snap-on extrusions for exterior mullion framing in design indicated. Provide exposed surfaces with ASTM A167-92b, Type 316 stainless steel with a No. 4 polished finish. Make bends in stainless steel with a maximum radius of 1/32 inch at all corners. Protect dissimilar metals from galvanic action by coating meeting surfaces with bituminous paint or other method.
 1. Stainless steel cladding for doors will not be accepted.

PART 3 - EXECUTION**3.01 PREPARATION**

- A. Examine substrates and supports, with the Installer present, for compliance with requirements indicated, installation tolerances, and other conditions that affect installation of aluminum entrances and storefronts. Correct unsatisfactory conditions before proceeding with the installation.
- B. Do not proceed with installation until unsatisfactory conditions are corrected.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Set units plumb, level, and true to line, without warp or rack of framing members, doors, or. Panels, or impeding thermal movement. Install components in proper alignment and relation to established lines and grades indicated. Provide proper support and anchor securely in place.
- D. Construction Tolerances: Install aluminum entrance and storefront to comply with the following tolerances:
 - 1. Variation from Plane: Do not exceed 1/8 inch in 12 feet of length or 1/4 inch in any total length.
 - 2. Offset from Alignment: The maximum offset from true alignment between two (2) identical members abutting end to end in line shall not exceed 1/16 inch.
 - 3. Diagonal Measurements: The maximum difference in diagonal measurements shall not exceed 1/8 inch.
 - 4. Offset at Corners: The maximum out of plane offset of framing at corners shall not exceed 1/32 inch.
- E. Separate aluminum and other corrodible metal surfaces from sources of corrosion or electrolytic action at points of contact with other materials.
 - 1. Zinc or cadmium plate steel anchors and other unexposed fasteners after fabrication.
 - 2. Paint dissimilar metals where drainage from them passes over aluminum.
 - 3. Paint aluminum surfaces in contact with mortar, concrete or other masonry with alkali resistant coating.
 - 4. Paint wood and similar absorptive material in contact with aluminum and exposed to the elements or otherwise subject to wetting, with two (2) coats of aluminum house paint. Seal joints between the materials with sealant.
- F. Drill and tap frames and doors and apply surface mounted hardware items. Comply with hardware manufacturer's instructions and template requirements. Use concealed fasteners wherever possible.
- G. Set sill members and other members in bed of sealant as indicated, or with joint fillers or gaskets as indicated to provide weather tight construction. Comply with requirements of Division 07 for sealants, fillers, and gaskets.
- H. Refer to "Glass and Glazing" Section of Division 08 for installation of glass and other panels indicated to be glazed into doors and framing, and not pre-glazed by manufacturer.

- I. Install aluminum framed storefront system and components to drain condensation, water penetrating, joints, and moisture migrating within aluminum framed storefront system to the exterior.

3.03 FIELD QUALITY CONTROL

- A. Field Tests: Architect shall select storefront units to be tested as soon as a representative portion of the project has been installed, glazed, perimeter caulked and cured. Conduct tests for air infiltration and water penetration with manufacturer's representative present. Tests not meeting specified performance requirements and units having deficiencies shall be corrected as part of the contract amount.
 1. Testing: Testing shall be performed by a qualified independent testing agency. Refer to Testing Section for payment of testing and testing requirements. Testing Standard per AAMA 503, including reference to ASTM E 783 for Air Infiltration Test and ASTM E 1105 Water Infiltration Test.
 - a. Air infiltration Tests: Conduct tests in accordance with ASTM E783. Allowable air infiltration shall not exceed 1.5times the amount indicated in the performance requirements or 0.09 cfm/ft², whichever is greater.
 - b. Water Infiltration Tests: Conduct tests in accordance with ASTM E 1105. No uncontrolled water leakage s permitted when tested at a static test pressure of two-thirds the specified water penetration pressure but not less than 6.24 psf (300 Pa).
- B. Manufacturer's Field Services: Upon Owners written request, provide periodic site visit by manufacturer's field service representative.
- C. Aluminum-Framed

3.04 ADJUSTING, CLEANING AND PROTECTION

- A. Adjust operating hardware to function properly, for smooth operation without binding, and for weathertight closure.
- B. Clean the completed aluminum framed system, inside and out, promptly after installation, exercising care to avoid damage to coatings. Remove excess sealant compounds, dirt and other substances from aluminum surfaces.
- C. Clean glass surfaces after installation, complying with requirements from glass manufacturer's written recommendations and from those contained in the "Glass and Glazing" Section for cleaning and maintenance. Remove excess glazing and sealant compounds, dirt and other substances from aluminum surfaces.
- D. Institute protective measures required throughout the remainder of the construction period to ensure that aluminum entrances and storefronts will be without damage or deterioration, other than normal weathering, at time of acceptance.

END OF SECTION 08 41 13 00

THIS PAGE INTENTIONALLY LEFT BLANK

Task	Specification	Specification Description
08 43 13 00	08 41 13 00	Aluminum-Framed Entrances And Storefronts
08 70 00 00	08 71 00 00	Door Hardware

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 71 00 00 - DOOR HARDWARE**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.
- C. In addition, reference Section 26 "Electrical" and Section 27 "Communications."
- D. All aluminum doors specified in Section 08 41 13 "Aluminum Framed Entrances and Storefronts" shall receive hardware in compliance with this section.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Supplier Qualifications: Hardware shall be scheduled as detailed by Architect Hardware Consultant (AHC) certified by Door and Hardware Institute (DHI).
- B. Provide door hardware manufactured by a single firm specializing in the production of this type of work, unless otherwise acceptable to the Architect. Provide electrified door hardware from the same manufacturer as mechanical door hardware, unless noted otherwise.
- C. Fire-Rated Door Assemblies: Provide hardware complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing at positive pressure according to NFPA 252.
- D. Smoke- and Draft-Control Door Assemblies: Where smoke- and draft-control door assemblies are required, provide door hardware that meet requirements of assemblies tested according to UI1784 and Installed in compliance with NFPA 105.
 - 1. Air leakage Rate: Maximum air leakage of 0.3 cfm/sq. ft. (3 cu.m per minute/sq. m) at the tested pressure differential of 0.3-inch wg (75 Pa) of water.
- E. Electrified Door Hardware: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction.
- F. Means of Egress Doors: Latches do not require more than 15 lbf (67 N) to release the latch. Locks do not require use of a key, tool, or special knowledge for operation.
- G. Accessibility Requirements: For door hardware on doors in an accessible route, comply with the current edition of the Texas Accessibility Standards (TAC).
 - 1. Provide operating devices that do not require tight grasping, pinching, or twisting of the wrist and that operate with a force of not more than 5 lbf (22.2N).

2. Comply with the following maximum opening-force requirements:
 - a. Interior, Non Fire-Rated Hinged Doors: 5lbf (22.2N) applied perpendicular to door.
 - b. Sliding or Folding Doors 5lbf (22.2N) applied parallel to door at latch
 - c. Fire Doors: Minimum opening force allowable by authorities having jurisdiction.
3. Refer to TAS, Section 404.2.5 for exception.
4. Door closers and gate closers shall be adjusted so that from an open position of 90 degrees, the time required to move the door to a position of 12 degrees from the latch is 5 seconds minimum.

1.04 SUBMITTALS

A. Product Data:

1. Product data for each type of hardware specified, including function descriptions, materials, dimensions, hardware preparation, finishes, and power requirements for electrified items, and installation and interface requirements.

B. Record Documents:

Door Hardware Schedule: Prepared by or under the supervision of supplier, detailing fabrication and assembly of door hardware, as well as procedures and diagrams. Coordinate the final Door Hardware Schedule with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of door hardware. Submit the final Door Hardware Schedule at earliest possible date, particularly where approval of the Door Hardware Schedule must precede fabrication of the other work that is critical in the project schedule. Include product samples. Shop Drawings of other work affected by Door Hardware and other information essential to the coordinated review of the Door Hardware Schedule.

1. Format: Comply with scheduling sequence and vertical format in DHI's "Sequence and Format or the Hardware Schedule."
2. Organization: Organize the Door Hardware Schedule into door hardware sets indicating complete designations of every item required for each door or opening.
 - a. Use same identifying "set numbers" given in this Section. Coordinate submittal with doors and frames submittals and use same "opening number" identification as given on Drawings and in the Door Schedule.
 - b. Submittals not using numbering identification system shown on Architect's Drawings and Schedules will be rejected.
3. Content: Include the following information:
 - a. Type, style, function, size, label, hand, and finish of each door hardware item.
 - b. Manufacturer of each item.
 - c. Fastenings and other pertinent information.
 - d. Location of each door hardware set cross-referenced to Drawings, both on floor plans and in door and frame schedule.
 - e. Explanation of abbreviations, symbols, and codes contained in schedule.
 - f. Mounting locations for door hardware.
 - g. Door and frame sizes and materials.

- h. Description of each electrified door hardware function, including location, sequence of operation, and interface with other building control systems and security items provided by others.
 - 1) The Sequence of Operation Include description of component functions that occur in the following situations: authorized person wants to enter; authorized person wants to exit: unauthorized person wants to enter; unauthorized person wants to exit.
 - 2) Shop Drawings: For fabrication and installation of hardware. Include details of each frame type, elevations of door designs types, conditions at openings, details of construction, location and installation requirements of finish hardware and reinforcements, and details of joints and connections, and glazing installation details and trim.
 - a) Details of electrified door hardware shall indicated the following:
 - 1. Wiring Diagrams: Detail wiring for power, signal, and control systems and differentiate between manufacturer-installed and field- installed wiring. Include the following:
 - a. System schematic
 - b. Point-to-point wiring diagram
 - c. Riser diagram
 - d. Elevation of each door
 - 2. Detail interface between electrified door hardware and fire alarm, access control, security, and building control system.
 - 3) Meeting: Preliminary Hardware Installation Conference to take place prior to installation of hardware:
 - a) Manufacturer's Representative along with the Project Architect shall arrange and hold a jobsite meeting to instruct the installing contractor's personnel on the proper installation of their respective products. Seminar shall be attended by installers of hardware (including electrical hardware of aluminum, hollow metal and wood doors. Training to include the use of installation manuals, hardware schedule, templates and physical product samples.

1.05 WARRANTY

- 1. Guarantee workmanship and material provided against defective manufacture. Repair or replace defective workmanship and material appearing within period of one year after Substantial Completion.
- 2. Product Warranties'
 - a. Hinges: Lifetime Warranty
 - b. Mortise Locks: Ten Year Limited Warranty
 - c. Exit Devices: Five Year Limited Warranty
 - d. Closers: Ten Year limited Warranty

- e. Electromechanical: Two Year Limited Warranty
 - f. Balance of door hardware: Minimum of one year from substantial installation.
3. At completion of project, qualified factory representative shall inspect closer installations. After this inspection, letter shall be sent to Architect reporting on conditions, verifying that closers have been properly installed and adjusted.

PART 2 - EXECUTION

2.01 GENERAL

- A. All material shall meet or exceed all applicable reference standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 BUTTS AND HINGES

- A. Acceptable Manufacturers and Types:

Hinge Description	Type	McKinney	Hager	Bommer	
Full Mortise (Ferrous)	Type 4	T4A3786	BB1168	BB5004	
Full Mortise (Non-Ferrous)	Type 5	T4A3386	BB1199	BB5005	

- B. Application:

- 1. Exterior outswinging doors Type 5
- 2. Vestibule doors Type 5
- 3. Exterior in swinging doors Type 4
- 4. Interior doors Type 4
- 5. Provide NRP (non-removable pins) at out-swinging lockable security doors and exterior locations.

- C. Hinge Size:

- 1. Doors over 36" in Width 5 inch by 4 1/2 inch

- D. Quantity:

- 1.2 - Hinges per leaf for openings through 60 inches high.
- 2.1 - Additional hinge per leaf for each additional 30 inches in height or fraction thereof.
- 3.4 - Dutch doors up to 90 inches in height.

- E. Factory Pre-Drilled 5/32 inch hole and use No. 12, 1-1/4 inch steel threaded to the head wood screws for hinges on wood doors.

- F. Qualifications:

- 1. Heavy Weight Hinges are the standard hinge type on the UTHSC-SA facilities.
- 2. Standard weight hinges are only acceptable at openings without closers.
- 3. Electrical thru wire hinges required to be quick connecting, wire nuts are not allowed for ease of installation and maintenance.

2.03 FLUSH BOLTS AND DUSTPROOF STRIKES

- A. Acceptable manufacturers:

Description	Rockwood	Trimco
Manual flush bolts (hollow metal doors)	555	3917
Automatic flush bolts (hollow metal doors)	1845	
Manual flush bolts (wood doors)	557	3913
Automatic flush bolts (wood doors)	1945	
Dust proof strike	570 x 571	3911

- B. Provide mortise dust proof strike at openings with bottom flush bolts on doors.
- C. Non-labeled Openings: Provide 2 flush bolts for inactive leaf of pairs of locked and latched doors. Locate centerline of top bolt not more than 72 inches from finished floor.
- D. Labeled Openings:
 - 1. Provide automatic flush bolt sets as applicable, for inactive leaf of pairs of doors. Provide dustproof strike for bottom bolt.

2.04 MORTISE LOCKSETS

	Series	Lever Trim
Corbin Russwin	ML2000	NSA
No Substitution	-	-

- A. Locksets shall meet the requirements of ANSI/BHMA A156.13-1994, Operational Grade 1, and Security Grade 1.
- B. Backsets: 2-3/4 inches.
- C. Strikes: Provide wrought boxes and strikes with proper lip length to protect trim but not to project more than 1/8 inch beyond trim, frame or inactive leaf. Where required, provide open back strike and protected to allow practical and secure operation.
- D. Provide electrified locksets ML20903 Fail Safe at high rise stairwells and ML20905 Fail Secure at all other openings access control openings. Limit the use of electric strikes by the use of electrified locksets. Provide M92 Request to Exit Monitoring at all electrified locksets. Provide M91 Latchbolt Monitoring as requested by USHSC-SA Access Control Coordinator. Provide electrified lockset with an internal rectifier. Provide "ElectroLynx" connectors for serviceability and ease of installation. Provide wire harnesses from the hinge to the locksets.
- E. Provide HES Smart Pac II 2005 controller for electric locksets for reduction of voltage when in continuous use to extend the life of the electric strike.
- F. Office Entry function mortise locks shall be model ADA thumb turn.
- G. Fail secure electrified mortise locks are the preferred hardware at secure access controlled openings.

2.05 CYLINDRICAL LOCKSETS

	Series	Lever Trim
Corbin Russwin	CL3300	NZD
No Substitution	-	-

- A. For use only in Existing Facilities with Cylindrical Locksets and by written approval by USHSC-SA per project basis.
- B. Locksets shall meet the requirements of ANSI/BHMA A156.2-1994 Grade 1.
- C. Backsets: 2-3/4 inches.
- D. Strikes: Provide wrought boxes and strikes with proper lip length to protect trim but not to project more than 1/8 inch beyond trim, frame or inactive leaf. Where required, provide open back strike and protected to allow practical and secure operation.

2.06 PRE-ASSEMBLED UNIT LOCKSETS

	Series	Lever Trim
Corbin Russwin	UT5200	ESE
No Substitution	-	-

A. For use only in Existing Facilities built before December 01 2006 with Pre-Assembled Unit Locksets and by written approval by USHSC-SA per project basis.

- B. Locksets shall meet the requirements of ANSI/BHMA A156.2-2000.
- C. Backsets: 2-3/4 inches.
- D. Strikes: Provide wrought boxes and strikes with proper lip length to protect trim but not to project more than 1/8 inch beyond trim, frame or inactive leaf. Where required, provide open back strike and protected to allow practical and secure operation.

2.07 EXIT DEVICES

A. Acceptable Manufacturers:

	Narrow Stile Doors	Wide Stile Doors	Exterior Trim	Interior Trim
Corbin Russwin	ED4200S Series	ED5200S	Newport N9	Newport N9
No Substitution	-	-	-	-

- B. All exit devices shall be UL listed for panic. Fire Exit devices for labeled doors shall be UL listed as "Fire Exit Hardware".
- C. Where lever trim is specified, provide lever design to match lockset levers; Break away trim is not required at exit devices.
- D. Provide one cylinder at exterior pair of doors or bank of doors.
- E. Provide cylinders for exit devices with locking trim and keyed cylinder dogging.
- F. Provide keyed **cylinder dogging** feature for all non-rated exit devices.
- G. Exit Devices on Mechanical-Electrical rooms shall receive storeroom function trim.
- H. Provide Corbin Russwin Secure Bolt at all exterior openings, with only 63 lbs. of force against the frame from a 400 pound pull on the door, thus limiting the separation of door and frame under pull force.
- I. At exterior pair of doors use of Keyed Removable Mullion with two rim exit devices. Provide keyed removable mullions at exterior pair of doors only; provide wall mount retainer kit for storing of removable mullions when mullion is not in use. At shipping or receiving doors provide concealed vertical rod exit devices for greater ease of transporting equipment through the opening.
- J. Surface vertical rod exit devices should only be used on cross corridor and double egress openings which are on magnetic hold opens. Provide surface vertical rods with No Bottom Rods. Surface Vertical rods are not allowed in gym or auditorium openings. Concealed exit devices should only be used where rim exits and surface vertical rods are not applicable for the opening use on UTHSC-SA facilities.
- K. At exterior locations with card access use remote electric latch retraction (M94) for the release of exit device latches and provide signal switch (M92) for monitoring rail. Electric Latch Retraction Exit Devices are the preferred hardware at secure access controlled openings. Provide 781N Corbin Russwin power supply with EPT for power transfer.
1. Provide signal switch (Request to Exit) at adjacent doors in a pair or bank of doors which has electric latch retraction.
 2. Remote release of electric latch retraction exit devices is required at Police dispatch.
- L. Provide Sex Nut Bolts at all wood doors.

2.08 ELECTRIC STRIKES

A. Acceptable Manufacturers and Series required at interior security doors with cylindrical locks:

HES	Folger-Adam
1006 or 9600 Series	310 Series

- B. Provide electric strikes designed for use with the type of locks shown at each opening where specified.
- C. Electric Strikes shall be UL Listed as Burglary-Resistant Electric Door Strikes and where required shall be UL Listed as Electric Strikes for Fire Doors and Frames. Provide non fail-safe type electric strikes, unless specified otherwise.
- D. Provide HES Smart Pac II controller for electric strikes for reduction of voltage when in continuous use to extend the life of the electric strike.

2.09 KEYING

- A. At keyed openings provide patented security interchangeable cylinders utilizing a unique factory code pattern that is both geographically and time zoned protected that is already established key way per UTHSC-SA Keying standards. A letter of authorization under the letterhead of the End User must accompany purchases of any products which involve patented cylinders, keys and accessories. The End User is required to have the ability for on-site cylinder pinning and original key cutting.
- B. Cylinders: Same manufacturer as for locks and latches: Corbin Russwin
- C. At interior
 - 1. Cylinders:
 - 1) Corbin Russwin Architectural Hardware (CR):
 - (a) Exterior and Interior Openings: Pyramid High Security Interchangeable Cores
 - 2. Standards: Comply with the following:
 - a. Cylinders: BHMA A156.5.
 - b. Key Control System: BHMA A156.5.
 - 3. Delivery Method:
 - a. Keys, permanent cylinders, bitting list and other related keying information is required to be directly from keying manufacture to owner via registered mail.
 - 4. Bitting Records:
 - a. Provide owner with electronic file of bitting and keying instructions on a disk format after each order of keys and cylinders.
 - 5. Cylinder Grade: BHMA Grade 1.
 - 6. Cylinders: Manufacturer's standard tumbler type, constructed from brass or bronze, stainless steel, or nickel silver, and complying with the following:
 - a. Number of Pins: Seven.
 - b. Mortise Type: Threaded cylinders with rings and straight- or clover-type cam.
 - c. Rim Type: Cylinders with back plate, flat-type vertical or horizontal tailpiece, and raised trim ring.
 - d. Bored-Lock Type: Cylinders with tailpieces to suit locks.
 - 1) Grade: BHMA Grade 1.
 - 7. Permanent Cores: Manufacturer's standard; finish face to match lockset; complying with the following:
 - a. Interchangeable Cores: Core insert, removable by use of a special key, and usable with other manufacturers' cylinders.
 - 8. Construction Keying: Comply with the following:
 - a. Construction Master Keys: Provide 20 construction master keys.
 - b. Construction Cores: Provide construction cores that are replaceable by permanent cores.
 - 1) Provide construction cores at exterior openings and ten interior openings as designated by owner.
 - 2) Replace construction cores with permanent cores by Owner.
 - 9. Keying System: Unless otherwise indicated, provide a factory-registered keying system complying with the following requirements:
 - a. Existing System: Master key or grand master key locks to Owner's existing system.
 - 1) Cylinders shall be master keyed into The University's existing system.
 - 2) Each facility should be designated as a separate grand master key system.
 - 10. Keys: Provide nickel-silver keys complying with the following:
 - a. Stamping: Permanently inscribe each key with a visual key control number. Permanently inscribe each core/cylinder with a concealed key control number.
 - 1) Notation: Information to be furnished by Owner.
 - b. Quantity: In addition to one extra blank key for each lock, provide the following:

- 1) Cylinder Change Keys: Three.
- 2) Master Keys: Five.
- 3) Grand Master Keys: Five.
- 4) Great-Grand Master Keys: Five.

2.10 DOOR TRIM

A. Acceptable Manufacturers and Types:

Type	Rockwood	Trimco
Push Plate – 6" x 16"	70E	1001-9
Pull & Plate – 10" ctc X 4" x 16"	111 x 70C	1018-3B
Kickplate	K1050	KO050

B. Push Plates:

- 1.6 inches by 16 inch unless otherwise indicated.
2. Where width of door stile prevents use of 6 inch wide plate, provide push plate one inch less than width of stile but not less than 4 inches wide.

C. Pulls:

1. 10 inches center to center, with 1" diameter pull.
2. Where required, mount back to back with push bars.

D. Kick Plates and Armor Plates: Minimum of 0.050 inch thick, beveled 3 edges.

1. Provide width 2 inch less than Door Width on push side at doors with closers.
2. Height of 10 inches at kick plates.
3. Height of 36 inches at armor plates.
4. Armor or Kick plates are not required at FRP doors.
5. Provide kickplates at all classroom and corridor doors regardless of whether door has closer on installed on it.

2.11 DOOR CLOSERS

A. Acceptable Manufacturer:

Manufacture:	Exterior	Interior
Corbin Russwin	DC6000 Series	DC6000 Series
Only at CTRC:		
Norton	7500 Series	7500 Series

- B. Provide non-sized and non-handed rack and pinion cast iron closers, adjustable to meet maximum opening force requirements of ADA.
- C. Provide heavy duty forged arms with shock absorbing feature at exterior openings.
- D. Provide drop plates, brackets, or adapters for arms as required to suit details.
- E. Mount closers on room side of corridor doors, inside at exterior doors, and stair side of stairway doors.
- F. Provide hand adjustable hold-open arms where required by project manager, not allowed at fire rated openings.
- G. Provide closers meeting the requirements of UBC 7-2 and UL 10C positive pressure tests.
- H. Provide "Quik-Install" mounting brackets to attach the closer.
- I. Provide Sex Nut Bolts at all wood doors.

2.12 OVERHEAD STOPS

A. Acceptable Manufacturers:

Type	Sargent	Rixson
Surface mounted heavy duty overhead stops	590	9-

Concealed mounted heavy duty overhead stop	690	1-
--	-----	----

- B. Provide surface overhead stops at new construction for doors that swing more than 90 degrees before striking wall, and for doors that open against equipment, casework, sidelights, and any other objects that would make wall stops inappropriate.
- C. Provide surface overhead stops for existing applications where wall stops are inappropriate; provide concealed overhead stops at locations where surface overhead stops are not applicable.
- D. Limit the use of concealed overhead stops where applicable and approved by UTHSC-SA facilities.
- E. Provide sex bolt attachments for mineral core door applications.
- F. Floor stops are not permitted.

2.13 WALL STOPS AND HOLDERS

- A. Acceptable Manufacturers and Types:

Type	Rockwood	Trimco
Wall stop - Concave	409	W1274CCS
Heavy duty wall stop	475	1205

- B. Provide concave wall stop at doors with wall
- C. Floor stops are not permitted, use concealed overhead stop where wall stop is not permitted.

2.14 THRESHOLDS

- A. Acceptable Manufacturers:

Type	National Guard	Pemko
Saddle Threshold	425A	171A
Lip Threshold	896A	2005AT

- B. Where thresholds are specified in hardware groups, provide saddle type thresholds unless detailed otherwise.
 1. Refer to drawings for special details. Provide accessories, shims and fasteners.
 2. Where thresholds occur at openings with one or more mullions, they shall be cut for the mullions and extended continuously for the entire opening.
 3. Provide lip thresholds with integral bulb seal at all openings except main entrance and kitchen delivery entrance doors.
 4. Provide a maximum threshold total height of 1/2 inch at ADA compliant openings.

2.15 WEATHERSTRIPPING

- A. Acceptable Manufacturers and Product:

Type	National Guard	Pemko
Door Bottom Sweep	101V	345AV
Bulb Weather stripping	701P	2891APK
Rain Drips	16A	346C

- B. Provide neoprene type sweeps with integral rain drip at exterior doors.
- C. Provide self-tapping fasteners for weather stripping being applied to hollow metal frames.
- D. Provide 1 1/2 inches wide solid aluminum flat stock bar for weather stripping for mounting of applied closer bracket and applied door hardware to frame without interruption of perimeter seals. Provide weather stripping with closed bulb type design.
- E. Provide rain drip at head of exterior door openings and extend 2" past door width.

- F. Install closer arms and exit device brackets after weatherstripping has been installed.

2.16 ASTRAGALS

- A. Acceptable Manufacturers and Product:

Type	National Guard	Pemko
Brush Meeting Stiles Set	A605A	18041CNB
Brush Mortise Door Edge	136P	369AP

- B. Provide surface applied meeting stiles on pull side at pairs of doors that do not have door coordinators or auto flush bolts. Provide at fire and/or smoke rated openings.
- C. Provide door manufactures standard metal edge astragal at doors with door coordinators or auto flush bolts.

2.17 GASKETING

- A. Acceptable Manufacturers: Pemko, Reese Enterprises, and National Guard Products. Refer to drawings for special details. Provide accessories, shims and fasteners.

Type	National Guard	Pemko
Bulb Seal	5050B	S88BL

- B. Provide adhesive applied smoke gasketing at fire rated and smoke rated openings.
- C. Provide gaskets for 20-minute doors and doors designated for smoke and draft control.
- D. Where frame applied intumescent seals are required by the manufacturer, provide gaskets that comply with UBC 7-2 and UL 10C positive pressure tests.

2.18 MAGNETIC HOLDERS

- A. Acceptable Manufacturers and Types:

TYPE	Rixson
Wall mounted electromagnetic hold opens	FM998

- B. Provide wall mounted magnetic holders which are tied into fire alarm panel and released upon loss of power.
1. Verify voltage with Electrical Contractor.
- C. Provide extensions and mounting brackets for complete installation.
- D. Provide electromagnetic hold open with tri-voltage capability; 12VDC/24VDC/120VAC

2.19 ELECTRIFIED ACCESSORIES

- A. Use of all magnetic locks require written approval by UTHSCSA.
- B. For openings that receive hardwire, electrified hardware, the EPT is the preferred means of power transfer.

2.20 FASTENERS

- A. Including, but not limited to, wood or machine screws, bolts, bolts, nuts, anchors, etc. of proper type, material, and finish required for installation of hardware.
- B. Use Phillips head for exposed screws. Do not use aluminum screws to attach hardware.
- C. Provide self-tapping (TEC) screws for attachment of sweeps and stop-applied weather stripping.

2.21 TYPICAL FINISHES AND MATERIALS

- A. Finishes, unless otherwise specified:

1. Continuous Hinges: Outswinging Exterior Doors:
 - a. Clear extruded 6063-T6 aluminum alloy.
2. Butts: Interior Doors
 - a. US26D (BHMA 652) on Steel
3. Flush Bolts:
 - a. US26D (BHMA 626) on Brass or Bronze
4. Exit Devices:
 - a. US32D (BHMA 630) on Stainless Steel
5. Locks and Latches:
 - a. US26D (BHMA 626) on Brass or Bronze
6. Push Plates, Pulls and Push Bars:
 - a. US32D (BHMA 630) on Stainless Steel
7. Coordinators:
 - a. USP (BHMA 600) on Steel
8. Kick Plates, Armor Plates, and Edge Guards:
 - a. US32D (BHMA 630) on Stainless Steel
9. Overhead Stops and Holders:
 - a. US26D (BHMA 626) on Brass or Bronze
10. Closers: Surface mounted.
 - a. Sprayed Aluminum Lacquer.
11. Latch Protectors:
 - a. US32D (BHMA 630) on Stainless Steel
12. Miscellaneous Hardware:
 - a. US26D (BHMA 626) on Brass or Bronze

2.22 OWNER STOCK

- B. Furnish full-size units of door hardware described below, before installation begins, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents. This material is to be verified with owner in keying meeting prior to ordering and turned over to The University for stock.

1. Door Hardware:
 - a. 1 of each type of lockset and latchset per 25 of each function supplied per project.
 - b. 5 door closer bodies per 100 supplied per project.
 - c. 1 exit devices per 50 supplied per project, function and type to be most common supplied on project.

PART 3 EXECUTION

3.1 EXAMINATION

- A. Examine doors and frames, with Installer present, for compliance with requirements for installation tolerances, labeled fire door assembly construction, wall and floor construction, and other conditions affecting performance.
- B. Examine roughing-in for electrical power systems to verify actual locations of wiring connections before electrified door hardware installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Steel Doors and Frames: Comply with DHI A115 series.
- B. Surface-Applied Door Hardware: Drill and tap doors and frames according to SDI 107.
- C. Wood Doors: Comply with DHI A115-W series.

3.3 INSTALLATION

- A. Mounting Heights: Mount door hardware units at heights indicated in following applicable publications, unless specifically indicated or required to comply with governing regulations:
 - 1. Standard Steel Doors and Frames: DHI's "Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames."
 - 2. Custom Steel Doors and Frames: DHI's "Recommended Locations for Builders' Hardware for Custom Steel Doors and Frames."
 - 3. Wood Doors: DHI WDHS.3, "Recommended Locations for Architectural Hardware for Wood Flush Doors."
- B. Install finish hardware in accordance with reviewed hardware schedule and manufacturer's printed instructions. Pre-fit hardware before finish is applied, remove and reinstall after finish is completed. Install hardware so that parts operate smoothly, close tightly and do not rattle.
- C. Installation of hardware shall comply with NFPA 80 and NFPA 101 requirements.
- D. Set units level, plumb and true to line and location. Adjust and reinforce attachment to substrate as necessary for proper installation and operation.
- E. Drill and countersink units which are not factory-prepared for anchorage fasteners. Space fasteners and anchors in accordance with industry standards.
- F. Weather-stripping and Seals:
 - 1. Comply with manufacturer's instructions and recommendations to extent installation requirements are not otherwise indicated.
 - 2. Set interior of thresholds in full bed of sealant and secure with stainless steel screws in expansion shields spaced not over 12 inches on centers. Extend thresholds full width of opening and notch at door stops.
 - 3. Attach weather-strips to head and jambs of hollow metal door frames with oval head stainless steel sheet metal screws. Miter weather-stripping at corners.
 - 4. Attach rain drip to head of hollow metal door frames with oval head stainless steel sheet metal screws spaced not over 6 inches on centers. Extend raindrip full width of frame.
 - 5. Install automatic door bottoms to be mortised (surface at fire rated doors) sill of doors.
- G. Set thresholds for exterior doors in full bed of butyl-rubber or polyisobutylene mastic sealant, forming tight seal between threshold and surface to which set. Securely and permanently anchor thresholds, using countersunk non-ferrous screws to match color of thresholds (stainless steel screws at aluminum thresholds).
- H. Lead Protection: Lead wrap hardware penetrating lead-lined doors. Levers and roses to be lead lined. Apply kick and armor plates with 3M adhesive #1357, as recommended by 3M Co., on lead-lined doors.
- I. Boxed Power Supplies: Locate power supplies as indicated. Verify location with Architect.

3.4 FIELD QUALITY CONTROL

- A. Upon substantial completion, Project Manager is to coordinate walk-through of finish hardware installation with manufacturer's Rep. for accuracy.
- B. After installation has been completed, provide services of qualified hardware consultant to check general punch list created of inaccuracies to determine proper application of finish hardware according to schedule. Also check operation and adjustment of hardware items.
- C. Adjust door control devices to compensate for final operation of heating and ventilating equipment.

3.5 ADJUSTING AND CLEANING

- A. At final completion, hardware shall be left clean and free from disfigurement. Make final adjustment to door closers and other items of hardware. Where hardware is found defective repair or replace or otherwise correct as directed.
- B. Adjust door closers to meet opening force requirements of Uniform Federal Accessibility Standards.

- C. Final Adjustment: Wherever hardware installation is made more than one month prior to acceptance or occupancy of space or area, return to work during week prior to acceptance or occupancy, and make final check and adjustment of hardware items in such space or area. Clean operating items as necessary to restore proper function and finish of hardware and doors.
- D. Instruct Owner's personnel in proper adjustment and maintenance of door hardware and hardware finishes.
- E. Clean adjacent surfaces soiled by hardware installation.

3.6 PROTECTION

- A. Provide for proper protection of items of hardware until Owner accepts Project as complete.

3.7 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate and maintain door hardware and door hardware finishes.

END OF SECTION 08 71 00 00

THIS PAGE INTENTIONALLY LEFT BLANK

Task	Specification	Specification Description
08 71 16 00	08 71 00 00	Door Hardware

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 81 00 00 - GLASS GLAZING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 DEFINITIONS

- A. Manufacturer is used in this Section to refer to a firm that produces primary glass or fabricated glass as defined in the referenced glazing standard.
- B. Deterioration of Coated Glass: Defects developed from normal use that are attributed to the manufacturing process and not to glass breakage and practices for maintaining and cleaning coated glass contrary to manufacturer's directions. Defects include peeling, cracking, and other indications of deterioration in metallic coating.
- C. Deterioration of Laminated Glass: Defects developed from normal use that are attributed to the manufacturing process and not to glass breakage and practices for maintaining and cleaning laminated glass contrary to manufacturer's directions. Defects include edge separation, delamination materially obstructing vision through glass, and blemishes exceeding those allowed by referenced laminated glass standard.
- D. Deterioration of Insulating Glass: Failure of the hermetic seal under normal use due to causes other than glass breakage and practices for maintenance and cleaning insulated glass contrary to manufacturer's directions. Evidence of failure is the obstruction of vision by dust, moisture, or film on the interior surfaces of glass. Improper practices for maintaining and cleaning glass do not comply with the manufacturer's directions.

1.04 QUALITY ASSURANCE

- A. Glazing Publications: Comply with published recommendations of glass product manufacturers and organizations below, except where more stringent requirements are indicated. Refer to these publications for glazing terms not otherwise defined in this Section or in referenced standards.
 - 1. FGMA Publications: "FGMA Glazing Manual."
 - 2. AAMA Publications: AAMA TIR A7 "Sloped Glazing Guidelines" and "Glass Design for Sloped Glazing."
 - 3. LSGA Publications: "LSGA Design Guide."

4. SIGMA Publications: TM 3000 "Vertical Glazing Guidelines" and TB 3001 "Sloped Glazing Guidelines."
 5. For Insulating Glass: Sigma TM-3000 IGMA
 6. For Laminated Glazing: GANA
- B. Safety Glass: Products complying with ANSI Z97.1 and testing requirements of 16 CFR Part 1201 for Category II materials.
1. Subject to compliance with requirements, provide safety glass permanently marked with certification label of Safety Glazing Certification Council (SGCC) or other certification agency acceptable to authorities having jurisdiction.
- C. Fire Resistive Glazing Products for Door Assemblies: Products identical to those tested per ASTM E 152, labeled and listed by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
- D. Fire Resistive Glazing Products for Window Assemblies: Products identical to those tested per ASTM E 163, labeled and listed by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
- E. Insulating Glass Certification Program: Provide insulating glass units permanently marked either on spacers or at least one component lite of units with appropriate certification label of inspecting and testing agency indicated below:
1. Insulating Glass Certification Council (IGCC).
 2. Associated Laboratories, Inc. (ALI).
 3. National Certified Testing Laboratories (NCTL).
- F. Glazier Qualifications: Engage an experienced glazier who has completed glazing similar in material, design, and extent to that indicated for Project with a record of successful in service performance.
- G. Single Source Responsibility for Glass: Obtain glass from one source for each product indicated below:
1. Primary glass of each (ASTM C 1036) type and class indicated.
 2. Heat treated glass of each (ASTM C 1048) condition indicated.
 3. Laminated glass of each (ASTM C 1172) kind indicated.
 4. Insulating glass of each construction indicated.
- H. Single Source Responsibility for Glazing Accessories: Obtain glazing accessories from one source for each product and installation method indicated.
1. Glass Products: Erect mockups with the following kinds of glass to match glazing systems required for Project, including typical lite size, framing systems, and glazing methods:
 - a. Heat strengthened coated glass.
 - b. Fully tempered glass.
 - c. Spandrel glass.
 - d. Laminated glass.

- e. Coated insulating glass.
- 2. Place mockups at the Project Site in location and of size indicated or, if not indicated, as approved by Architect.
- 3. Notify Architect one week in advance of the dates and times when mockups will be erected.
- 4. Obtain Architect's acceptance of mockups before start of final unit of Work.
- 5. Demonstrate the proposed range of aesthetic effects and workmanship.
- 6. Retain and maintain mockups during construction in undisturbed condition as a standard for judging completed unit of Work.
 - a. When directed, demolish and remove mockups from Project Site.
 - b. Accepted mockups in undisturbed condition at time of Substantial Completion may become part of completed unit of Work.
- I. Preconstruction Compatibility and Adhesion Testing: Submit to sealant manufacturers, samples of each glass, gasket, glazing accessory, and glass framing member that will contact or affect glazing sealants for compatibility and adhesion testing as indicated below:
 - 1. Use test methods standard with sealant manufacturer to determine if priming and other specific preparation techniques are required for rapid, optimum glazing sealants adhesion to glass and glazing channel substrates.
 - a. Perform tests under normal environmental conditions during installation.
 - 2. Submit not less than nine pieces of each type and finish of glass framing members and each type, class, kind, condition, and form of glass (monolithic, laminated, insulating units) for adhesion testing, as well as one sample of each glazing accessory (gaskets, setting blocks and spacers) for compatibility testing.
 - 3. Schedule sufficient time to test and analyze results to prevent delay in the Work.
 - 4. Investigate materials failing compatibility or adhesion tests and get sealant manufacturer's written recommendations for corrective measures, including using special primers.
 - 5. Testing is not required when glazing sealant manufacturer can submit required preparation data that is acceptable to Architect and is based on previous testing of current sealant products for adhesion to and compatibility with submitted glazing materials.
- J. Pre-Installation Conference: Conduct conference at the Project Site to comply with requirements of Division 01.

1.05 SUBMITTALS

A. Product Data:

- 1. Submit manufacturer's technical data for each glazing material and fabricated glass product required, including installation and maintenance instructions.

B. Samples:

- 1. Submit, for verification purposes, 12 inch square samples of each type of glass indicated and 12 inch long samples of each color required (except black) for each type of sealant or gasket exposed to view. Install sealant or gasket sample between two strips of material representative of adjoining framing system in color.

C. Record Documents:

1. **Certificate:** Submit certificates from respective manufacturers attesting that glass and glazing materials furnished for Project comply with requirements.
 - a. Separate certification will not be required for glazing materials bearing manufacturer's permanent labels designating type and thickness of glass, provided labels represent a quality control program involving a recognized certification agency or independent testing laboratory acceptable to authorities having jurisdiction.
2. **Compatibility and Adhesion Test Report:** Submit statement from sealant manufacturer indicating that glass and glazing materials have been tested for compatibility and adhesion with glazing sealants and interpreting test results relative to material performance, including recommendations for primers and substrate preparation needed to obtain adhesion.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Protect glazing materials to comply with manufacturer's directions and as needed to prevent damage to glass and glazing materials from condensation, temperature changes, direct exposure to sun, or other causes.
 1. Where insulating glass units will be exposed to substantial altitude changes, comply with insulating glass fabricator's recommendations for venting and sealing to avoid hermetic seal ruptures.

1.07 SYSTEM PERFORMANCE REQUIREMENTS

- A. Provide glazing systems that are produced, fabricated, and installed to withstand normal thermal movement, wind loading, and impact loading (where applicable), without failure including loss or glass breakage attributable to the following: defective manufacture, fabrication, and installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; and other defects in construction.
- B. **Glass Design:** Glass thicknesses indicated on Drawings are for detailing only. Confirm glass thicknesses by analyzing Project loads and in service conditions. Provide glass lites for the various size openings in the thicknesses and strengths (annealed or heat treated) to meet or exceed the following criteria:
 1. Select minimum glass thickness to comply with ASTM E 1300 according to following requirements:
 - a. Design wind loads- Determine design wind loads applicable to project according to ASCE 7: Section 6.5 based on mean roof heights above grade as indicated on drawings.
 2. Tinted and heat absorbing glass thicknesses for each tint indicated are the same throughout Project.
 3. Minimum glass thicknesses of lites, whether composed of annealed or heat treated glass, are selected so the worst case probability of failure does not exceed the following:
 - a. 8 lites per 1000 for lites set vertically or not over 15 degrees off vertical and under wind action. Determine minimum thickness of monolithic annealed glass according to ASTM E 1300. For other than monolithic annealed glass, determine thickness per glass manufacturer's standard method of analysis including applying adjustment factors to ASTM E 1300 based on type of glass.
 - b. 1 lite per 1000 for lites set over 15 degrees off vertical and under action of wind or snow.

- C. Normal thermal movement results from the following maximum change (range) in ambient and surface temperatures acting on glass framing members and glazing components. Base engineering calculation on materials' actual surface temperatures due to both solar heat gain and nighttime sky heat loss.

1. Temperature Change (Range): 120 degrees F (67 degrees C), ambient; 180 degrees F (100 degrees C), material surfaces.

1.08 PROJECT CONDITIONS

- A. Environmental Conditions: Do not proceed with glazing when ambient and substrate temperature conditions are outside the limits permitted by glazing materials manufacturer or when glazing channel substrates are wet from rain, frost, condensation, or other causes.

1. Install liquid sealants at ambient and substrate temperatures above 40 degrees F (4.4 degrees C).

1.09 WARRANTY

- A. Warranties specified in this Section shall not deprive The University of other rights The University may have under other provisions of the Contract Documents and will be in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.

- B. Manufacturer's Warranty on Coated Glass Products: Submit written warranty signed by coated glass manufacturer agreeing to furnish replacements for those coated glass units that deteriorate as defined in "Definitions" article, f.o.b. point of manufacture, freight allowed Project Site, within specified warranty period indicated below. Warranty covers only deterioration due to normal conditions of use and not to handling, installing, and cleaning practices contrary to glass manufacturer's published instructions.

1. Warranty Period: Manufacturer's standard but not less than five (5) years after date of Substantial Completion.

- C. Manufacturer's Warranty on Laminated Glass: Submit written warranty signed by insulating glass manufacturer agreeing to furnish replacements for those laminated glass units that deteriorate as defined in the "Definitions" article, f.o.b. point of manufacture, freight allowed Project Site, within specified warranty period indicated below. Warranty covers only deterioration due to normal conditions of use and not to handling, installing, and cleaning practices contrary to glass manufacturer's published instructions.

1. Warranty Period: Manufacturer's standard but not less than five (5) years after date of Substantial Completion.

- D. Manufacturer's Warranty on Insulating Glass: Submit written warranty signed by manufacturer of insulating glass agreeing to furnish replacements for insulating glass units that deteriorate as defined in "Definitions" article, f.o.b. point of manufacture, freight allowed Project Site, within specified warranty period indicated below. Warranty covers only deterioration due to normal conditions of use and not to handling, installing, protecting, and maintaining practices contrary to glass manufacturer's published instructions.

1. Warranty Period: Manufacturer's standard but not less than ten (10) years after date of Substantial Completion.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 PRIMARY GLASS PRODUCTS

- A. Glass Type "1": Clear float glass conforming to ASTM C 1036, Type I, Class 1, Quality q3; ¼ inch thick.
- B. Glass Type "2": Clear float glass conforming to ASTM C 1036, Type I, Class 1, Quality q3, which has been fully tempered by manufacturer's standard process (after cutting to final size), to achieve a flexural strength of 4 times normal glass strength, in accordance with ASTM C 1048, Condition A; ¼ inch thick.
- C. Glass Type "5": Bronze tinted float glass conforming to ASTM C 1036, Type I, Class 2, Quality q3, which has been fully tempered by manufacturer's standard process (after cutting to final size), to achieve a flexural strength of 4 times normal glass strength, in accordance with ASTM C 1048, Condition A; 1/4 inch thick with a visible light transmittance of 55 percent, Reflectance of 6 percent, and a shading coefficient of 0.73.
- D. Glass Type "6": Laminated glass conforming to ASTM C1172, 9/16 inch nominal overall thickness, consisting of an outboard light of 1/4 inch thick clear float glass laminated with a 0.060 inch thick polyvinyl butyral interlayer to an inboard light of 1/4 inch thick clear float glass.
- E. Glass Type "7": Laminated glass conforming to ASTM C1172, consisting of 2 sheets of clear float glass, 1/8 inch thick, complying with ASTM C 1036, Type I, Class 2, laminated with a 0.030 inch thick polyvinyl butyral interlayer by manufacturer's standard heat-plus-pressure process with dirt, air pockets, and foreign substances excluded.
- F. Bullet Resistant Glass: Laminated, clear float glass, Type I, Class 1, Quality q3, minimum of 1 3/16 inch (30 mm) thickness, conforming to UL Test No. 752, Fifth Edition, "Standard for Bullet Resisting Equipment" for resistance to medium power small arms. Appearance and performance data equivalent to Globe Amerada Glass Company "BR 136" bullet resisting glass.

2.03 PATTERNED GLASS PRODUCTS

- A. Patterned Glass: ASTM C 1036, Type II, Class 1 (clear), Form 3 (patterned), Quality q8 (glazing), Finish f1 (patterned one side), of pattern indicated.
- B. Tempered Patterned Glass: ASTM C 1048, Kind FT (fully tempered), Type II (patterned glass, flat), Class 1 (clear), Form 3 (patterned), Quality q8 (glazing), Finish f1 (patterned one side), of pattern indicated.

2.04 FIRE RESISTIVE GLAZING PRODUCTS

- A. Fire Resistive, Ceramic Glazing Material: Proprietary product in the form of clear flat sheets of 5.0 mm (3/16 inch) nominal thickness, weighing 2.5 psf, permanently labeled with appropriate marks of testing and inspecting agency, acceptable to authorities having jurisdiction, showing product complies with fire resistive installation indicated, and as follows:
 - 1. Polished on both surfaces, transparent with visible light transmission of 76.9 percent.
 - 2. Unpolished on both surfaces, transparent.
 - 3. Product: Subject to compliance with requirements, provide the following product manufactured by Nippon Electric Glass Co., Ltd. and distributed by Technical Glass Products:

- a. Premium FireLite.
- b. Standard FireLite.
4. Fire Resistance: 45 minutes as determined by testing identical products in door and window assemblies per ASTM E 152 and ASTM E 163 by a testing and inspecting agency acceptable to authorities having jurisdiction.
5. Product: Subject to compliance with requirements, provide Pyrovue Commercial by Advanced Glass Systems Corp.

2.05 MIRROR GLASS

- A. Primary Glass: Float glass complying with ASTM C 1036 requirements for Type I (transparent, flat) and for class and quality indicated below:
 1. Clear Float Glass: Quality q2 (mirror), Class 1 (clear).
- B. Tempered Glass: Tempered float glass manufactured by horizontal (roller hearth) process with roll wave distortion parallel with bottom edge of glass as installed, unless otherwise indicated, complying with ASTM C 1048 for Kind FT (fully tempered), Condition A (uncoated surfaces), Type I (transparent, flat), Quality q3 (glazing select), and for class indicated below:
 1. Clear Tempered Float Glass: Class 1 (clear).
- C. Transparent (One Way) Mirror Glass: Clear float glass, ASTM C 1036, Type I, Class 1, Quality q3; 1/4 inch thick, with chrome alloy or similar reflective metallic coating permanently deposited on one face of glass, with sufficient abrasion resistance to permit repeated cleaning with non abrasive compound and soft cotton cloth without significant removal of coating.

2.06 MIRROR GLASS PRODUCTION AND FABRICATION

- A. Glass Coating: Coat second surface of glass with successive layers of chemically deposited silver, electrically or chemically deposited copper, and manufacturer's standard protective organic coating to produce coating system that complies with FS DD M 0041, except with salt spray test period extended to 300 hours and undercutting, discolorations, blackening, and silver impairment at mirror edges not greater than 1/8 inch.
- B. Mirror Edge Treatment: Provide forms of edge treatment indicated below, with edges sealed after treatment to prevent chemical or atmospheric penetration of glass coating:
 1. Flat polished edge.
 2. Rounded polished edge.
 3. Beveled polished edge of width shown.
 4. Perform edge treatment and sealing in factory immediately after cutting to final sizes.

2.07 ELASTOMERIC GLAZING SEALANTS

- A. Provide products of type indicated, complying with the following requirements:
 1. Compatibility: Select glazing sealants and tapes of proven compatibility with other materials they will contact, including glass products, seals of insulating glass units, and glazing channel substrates, under conditions of installation and service, as demonstrated by testing and field experience.

2. Suitability: Comply with sealant and glass manufacturer's recommendations for selecting glazing sealants and tapes that are suitable for applications indicated and conditions existing at time of installation.
3. Colors: Provide color of exposed joint sealants to comply with the following:
 - a. Match colors indicated by reference to manufacturer's standard designations.
 - b. Provide selections made by Architect from manufacturer's full range of standard colors for products of type indicated.
- B. Elastomeric Glazing Sealant Standard: Provide manufacturer's standard chemically curing, elastomeric sealants of base polymer indicated that comply with ASTM C 920 requirements for Type, Grade, Class and Uses.
- C. Glazing Sealant for Fire Resistant Glazing Products: Identical to product used in test assembly to obtain fire resistive rating.

2.08 GLAZING TAPES

- A. Back Bedding Mastic Glazing Tape: Preformed, butyl based elastomeric tape with a solids content of 100 percent, nonstaining and nonmigrating in contact with nonporous surfaces, with or without spacer rod as recommended by tape and glass manufacturers for application indicated, packaged on rolls with a release paper backing, and complying with AAMA 800.
- B. Expanded Cellular Glazing Tape: Closed cell, polyvinyl chloride foam tape, factory coated with adhesive on both surfaces, packaged on rolls with release liner protecting adhesive, and complying with AAMA 800 for product 810.5.
- C. Products: Subject to compliance with requirements, provide one of the following:
 1. Back Bedding Mastic Glazing Tape Without Spacer Rod:
 - a. PTI 303 Glazing Tape (shimless), Protective Treatments, Inc.
 - b. S M 5700 Poly Glaze Tape Sealant, Schnee Morehead, Inc.
 - c. Tremco 440 Tape, Tremco Inc.
 - d. Extru Seal, Pecora Corp.
 - e. PTI 606 Architectural Sealant Tape, Protective Treatments, Inc.
 - f. Dyna Seal, Pecora Corp.
 - g. PTI 626 Architectural Sealant Tape, Protective Treatments, Inc.
 - h. S M 5710 H.P Poly Glaze Tape Sealant, Schnee Morehead, Inc.
 - i. SST 800 Tape, Tremco, Inc.
 2. Back Bedding Mastic Glazing Tape With Spacer Rod:
 - a. PTI 303 Glazing Tape (with shim), Protective Treatments, Inc.
 - b. Pre shimmed Tremco 440 Tape, Tremco, Inc.
 - c. PTI 606 Architectural Sealant Tape, Protective Treatments, Inc.
 3. Expanded Cellular Glazing Tape:

- a. Norseal V 980 Closed Cell Glazing Tape, Norton Company.

2.09 GLAZING GASKETS

- A. Lock Strip Gaskets: Neoprene extrusions in size and shape indicated, fabricated into frames with molded corner units and zipper lock strips, complying with ASTM C 542, black.
- B. Dense Compression Gaskets: Molded or extruded gaskets of material indicated below, complying with standards referenced with name of elastomer indicated below, and of profile and hardness required to maintain watertight seal:
 - 1. Neoprene, ASTM C 864.
 - 2. EPDM, ASTM C 864.
 - 3. Silicone, ASTM C 1115.
 - 4. Thermoplastic polyolefin rubber, ASTM C 1115.
 - 5. Any material indicated above.
- C. Soft Compression Gaskets: Extruded or molded closed cell, integral skinned gaskets of material indicated below, complying with ASTM C 509, Type II, black, and of profile and hardness required to maintain watertight seal:
 - 1. Neoprene.
 - 2. EPDM.
 - 3. Silicone.
 - 4. Thermoplastic polyolefin rubber.
 - 5. Any material indicated above.
- D. Manufacturers: Subject to compliance with requirements, provide products by one of the following companies.
 - 1. Lock Strip Gaskets: Stanlock Div., Griffith Rubber Mills.
 - 2. Preformed Gaskets:
 - a. Advanced Elastomer Systems, L.P.
 - b. Schnee Morehead, Inc.
 - c. Tremco, Inc.

2.10 MISCELLANEOUS GLAZING MATERIALS

- A. Provide products of material, size, and shape complying with referenced glazing standard, requirements of manufacturers of glass and other glazing materials involved for glazing application indicated, and with a proven record of compatibility with surfaces contacted in installation.
- B. Cleaners, Primers and Sealers: Type recommended by sealant or gasket manufacturer.
- C. Setting Blocks: Elastomeric material with a Shore A durometer hardness of 85 plus or minus 5.
- D. Spacers: Elastomeric blocks or continuous extrusions with a Shore A durometer hardness required by glass manufacturer to maintain glass lites in place for installation indicated.

- E. Edge Blocks: Elastomeric material of hardness needed to limit glass lateral movement (side walking).
- F. Plastic Foam Joint Fillers: Preformed, compressible, resilient, nonstaining, nonextruding, nonoutgassing, strips of closed cell plastic foam of density, size, and shape to control sealant depth and otherwise contribute to produce optimum sealant performance.
- G. Perimeter Insulation for Fire Resistive Glazing: Identical to product used in test assembly to obtain fire resistive rating.

2.11 FABRICATION OF GLASS AND OTHER GLAZING PRODUCTS

- A. Fabricate glass and other glazing products in sizes required to glaze openings indicated for Project, with edge and face clearances, edge and surface conditions, and bite complying with recommendations of product manufacturer and referenced glazing standard as required to comply with system performance requirements.
- B. Clean cut or flat grind vertical edges of butt glazed monolithic lites in a manner that produces square edges with slight kerfs at junctions with indoor and outdoor faces.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine glass framing, with glazier present, for compliance with the following:
 - 1. Manufacturing and installation tolerances, including those for size, squareness, offsets at corners.
 - 2. Presence and functioning of weep system.
 - 3. Minimum required face or edge clearances.
 - 4. Effective sealing between joints of glass framing members.
- B. Do not proceed with glazing until unsatisfactory conditions have been corrected.
- C. Clean glazing channels and other framing members receiving glass immediately before glazing. Remove coatings that are not firmly bonded to substrates.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Glazing – General:
 - 1. Comply with combined recommendations of manufacturers of glass, sealants, gaskets, and other glazing materials, except where more stringent requirements are indicated, including those in referenced glazing publications.
 - 2. Glazing channel dimensions as indicated on Drawings provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances. Adjust as required by Project conditions during installation.
 - 3. Protect glass from edge damage during handling and installation as follows:

- a. Use a rolling block in rotating glass units to prevent damage to glass corners. Do not impact glass with metal framing. Use suction cups to shift glass units within openings; do not raise or drift glass with a pry bar. Rotate glass lites with flares or bevels on bottom horizontal edges so edges are located at top of opening, unless otherwise indicated by manufacturer's label.
 - b. Remove damaged glass from Project Site and legally dispose of off Site. Damaged glass is glass with edge damage or other imperfections that, when installed, weaken glass and impair performance and appearance.
 4. Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction sealant substrate testing.
 5. Install elastomeric setting blocks in sill rabbets, sized and located to comply with referenced glazing standard, unless otherwise required by glass manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.
 6. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.
 7. Provide spacers for glass sizes larger than 50 united inches (length plus height) as follows:
 - a. Locate spacers inside, outside, and directly opposite each other. Install correct size and spacing to preserve required face clearances, except where gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and comply with system performance requirements.
 - b. Provide 1/8 inch minimum bite of spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.
 8. Provide edge blocking to comply with requirements of referenced glazing publications, unless otherwise required by glass manufacturer.
 9. Set glass lites in each series with uniform pattern, draw, bow, and similar characteristics.
 10. Where wedge shaped gaskets are driven into one side of channel to pressurize sealant or gasket on opposite side, provide adequate anchorage so gasket cannot walk out when installation is subjected to movement.
 11. Square cut wedge shaped gaskets at corners and install gaskets in manner recommended by gasket manufacturer to prevent corners from pulling away; seal corner joints and butt joints with sealant recommended by gasket manufacturer.
- D. Tape Glazing:
1. Position tapes on fixed stops so that when compressed by glass their exposed edges are flush with or protrude slightly above sightline of stops.
 2. Install tapes continuously but not in one continuous length. Do not stretch tapes to make them fit opening.
 3. Where framing joints are vertical, cover these joints by applying tapes to heads and sills first and then to jambs. Where framing joints are horizontal, cover these joints by applying tapes to jambs and then to heads and sills.
 4. Place joints in tapes at corners of opening with adjoining lengths butted together, not lapped. Seal joints in tapes with compatible sealant approved by tape manufacturer.
 5. Do not remove release paper from tape until just before each lite is installed.

6. Apply heel bead of elastomeric sealant.
7. Center glass lites in openings on setting blocks and press firmly against tape by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings.
8. Apply cap bead of elastomeric sealant over exposed edge of tape.

E. Gasket Glazing (Dry):

1. Fabricate compression gaskets in lengths recommended by gasket manufacturer to fit openings exactly, with stretch allowance during installation.
2. Secure compression gaskets in place with joints located at corners to compress gaskets producing a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended by gasket manufacturer.
3. Install gaskets so they protrude past face of glazing stops.

F. Sealant Glazing (Wet):

1. Install continuous spacers between glass lites and glazing stops to maintain glass face clearances and to prevent sealant from extruding into glass channel weep systems until sealants cure. Secure spacers in place and in position to control depth of installed sealant relative to edge clearance for optimum sealant performance.
2. Force sealants into glazing channels to eliminate voids and to ensure complete wetting or bond of sealant to glass and channel surfaces.
3. Tool exposed surfaces of sealants to provide a substantial wash away from glass. Install pressurized gaskets to protrude slightly out of channel to eliminate dirt and moisture pockets.

G. Lock Strip Gasket Glazing:

1. Comply with ASTM C 716 and gasket manufacturer's printed recommendations. Provide supplementary wet seal and weep system unless otherwise indicated.

3.03 PROTECTION AND CLEANING

- A. Protect exterior glass from breakage immediately after installation by attaching crossed streamers to framing held away from glass. Do not apply markers to glass surface. Remove nonpermanent labels, and clean surfaces.
- B. Protect glass from contact with contaminating substances resulting from construction operations including weld splatter. If, despite such protection, contaminating substances do come into contact with glass, remove them immediately as recommended by glass manufacturer.
- C. Examine glass surfaces adjacent to or below exterior concrete and other masonry surfaces at frequent intervals during construction, but not less than once a month, for build up of dirt, scum, alkali deposits, or stains, and remove as recommended by glass manufacturer.
- D. Remove and replace glass that is broken, chipped, cracked, abraded, or damaged in any way, including natural causes, accidents and vandalism, during construction period.
- E. Wash glass on both faces in each area of Project not more than four (4) days prior to date scheduled for inspections that establish date of Substantial Completion. Wash glass as recommended by glass manufacturer.

SECTION 08 83 00 00 - MIRRORS

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.2 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.3 GENERAL

- A. Description Of Work
 - 1. This specification covers the furnishing and installation of material for mirrors. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the products manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.
- B. Summary
 - 1. Section includes the following types of silvered flat glass mirrors:
 - a. Annealed monolithic glass mirrors.
 - b. Film-backed, Laminated and Tempered glass mirrors qualifying as safety glazing.
- C. Submittals
 - 1. Product Data: For each type of product indicated.
 - a. Mirrors. Include description of materials and process used to produce each type of silvered flat glass mirror specified that indicates sources of glass, glass coating components, edge sealer, and quality-control provisions.
 - 2. Shop Drawings: Include mirror elevations, edge details, mirror hardware, and attachments to other work, thickness and coatings.
 - 3. Samples: For each type of the following products:
 - a. Mirrors: 12 inches (300 mm) square, including edge treatment on two adjoining edges.
 - b. Mirror Clips: Full size.
 - c. Mirror Trim: 12 inches (300 mm) long.
 - 4. Qualification Data: For qualified Installer.
 - 5. Product Certificates: For each type of mirror and mirror mastic, from manufacturer.
 - 6. Preconstruction Test Reports: From mirror manufacturer indicating that mirror mastic was tested for compatibility and adhesion with mirror backing paint **OR** film and substrates on which mirrors are installed.
 - 7. Maintenance Data: For mirrors to include in maintenance manuals.
- D. Quality Assurance

1. Installer Qualifications: A qualified installer who employs glass installers for this Project who are certified under the National Glass Association's Certified Glass Installer Program.
2. Source Limitations for Mirrors: Obtain mirrors from single source from single manufacturer.
3. Source Limitations for Mirror Accessories: Obtain mirror glazing accessories from single source.
4. Glazing Publications: Comply with the following published recommendations:
 - a. GANA's "Glazing Manual" unless more stringent requirements are indicated. Refer to this publication for definitions of glass and glazing terms not otherwise defined in this Section or in referenced standards.
 - b. GANA Mirror Division's "Mirrors, Handle with Extreme Care: Tips for the Professional on the Care and Handling of Mirrors."
5. Safety Glazing Products: For film-backed, laminated and tempered mirrors, provide products complying with testing requirements in 16 CFR 1201 for Category II materials.

E. Delivery, Storage, And Handling

1. Protect mirrors according to mirror manufacturer's written instructions and as needed to prevent damage to mirrors from moisture, condensation, temperature changes, direct exposure to sun, or other causes.
2. Comply with mirror manufacturer's written instructions for shipping, storing, and handling mirrors as needed to prevent deterioration of silvering, damage to edges, and abrasion of glass surfaces and applied coatings. Store indoors.

F. Project Conditions

1. Environmental Limitations: Do not install mirrors until ambient temperature and humidity conditions are maintained at levels indicated for final occupancy.

G. Warranty

1. Special Warranty: Manufacturer's standard form in which mirror manufacturer agrees to replace mirrors that deteriorate within specified warranty period. Deterioration of mirrors is defined as defects developed from normal use that are not attributed to mirror breakage or to maintaining and cleaning mirrors contrary to manufacturer's written instructions. Defects include discoloration, black spots, and clouding of the silver film.
 - a. Warranty Period: Five years from date of Substantial Completion.

1.4 PRODUCTS

A. Silvered Flat Glass Mirrors

1. Glass Mirrors, General: ASTM C 1503; manufactured using copper-free, low-lead mirror coating process.
2. Clear Glass: Mirror Select **OR** Glazing, **as directed**, Quality; ultraclear (low-iron) float glass with a minimum 91 percent visible light transmission, **as directed**.
 - a. Nominal Thickness: 3.0 mm **OR** 4.0 mm **OR** 5.0 mm **OR** 6.0 mm **OR** As indicated, **as directed**.
3. Tempered Clear **OR** Tinted, **as directed**, Glass: Mirror Glazing Quality, for blemish requirements; and comply with ASTM C 1048 for Kind FT, Condition A, tempered float glass before silver coating is applied.
 - a. Nominal Thickness: 3.0 mm **OR** 4.0 mm **OR** 5.0 mm **OR** 6.0 mm **OR** As indicated, **as directed**.
4. Laminated Mirrors: ASTM C 1172, Kind LM.
 - a. Clear Glass for Outer Lite: Mirror Select **OR** Glazing, **as directed**, Quality; ultraclear (low-iron) float glass with a minimum 91 percent visible light transmission, **as directed**.
 - b. Tinted Glass for Outer Lite: Mirror Glazing Quality.
 - 1) Tint Color: Blue **OR** Black **OR** Bronze **OR** Gold **OR** Gray **OR** Green **OR** Peach **OR** Pink, **as directed**.
 - c. Nominal Thickness for Outer Lite: 3.0 mm **OR** 4.0 mm **OR** 5.0 mm **OR** 6.0 mm **OR** As indicated, **as directed**.

- d. Glass for Inner Lite: Annealed float glass; ASTM C 1036, Type I (transparent flat glass), Quality-Q3; Class 1 (clear).
OR
Glass for Inner Lite: Heat-treated float glass; ASTM C 1048 Type I; Quality-Q3; Class I (clear) Kind HS, Condition A.
OR
Glass for Inner Lite: Tempered float glass; ASTM C 1048 Type I; Quality-Q3; Class I (clear), Kind FT, Condition A.
- e. Nominal Thickness for Inner Lite: 3.0 mm **OR** 4.0 mm **OR** 5.0 mm **OR** 6.0 mm **OR** As indicated, **as directed**.
- f. Interlayer: Mirror manufacturer's standard 0.030-inch- (0.76-mm-) thick, clear polyvinyl-butyl interlayer with a proven record of showing no tendency to delaminate from, or cause damage to, silver coating.

B. Miscellaneous Materials

- 1. Setting Blocks: Elastomeric material with a Shore, Type A durometer hardness of 85, plus or minus 5.
- 2. Edge Sealer: Coating compatible with glass coating and approved by mirror manufacturer for use in protecting against silver deterioration at mirrored glass edges.
- 3. Mirror Mastic: An adhesive setting compound, asbestos-free, produced specifically for setting mirrors and certified by both mirror manufacturer and mastic manufacturer as compatible with glass coating and substrates on which mirrors will be installed.
- 4. Film Backing for Safety Mirrors: Film backing and pressure-sensitive adhesive; both compatible with mirror backing paint as certified by mirror manufacturer.

C. Mirror Hardware

- 1. Top and Bottom Aluminum J-Channels: Aluminum extrusions with a return deep enough to produce a glazing channel to accommodate mirrors of thickness indicated and in lengths required to cover bottom and top edges of each mirror in a single piece.
 - a. Bottom Trim: J-channels formed with front leg and back leg not less than 3/8 and 7/8 inch (9.5 and 22 mm) in height, respectively, and a thickness of not less than 0.04 inch (1.0 mm) **OR** 0.05 inch (1.3 mm), **as directed**.
 - b. Top Trim: J-channels formed with front leg and back leg not less than 5/8 and 1 inch (16 and 25 mm) in height, respectively, and a thickness of not less than 0.04 inch (1.0 mm) **OR** 0.062 inch (1.57 mm), **as directed**.
 - c. Finish: Clear **OR** Gold, **as directed**, bright anodized.
- 2. Top Channel/Cleat and Bottom Aluminum J-Channels: Aluminum extrusions with a return deep enough to produce a glazing channel to accommodate mirrors of thickness indicated and in lengths required to cover bottom and top edges of each mirror in a single piece.
 - a. Bottom Trim: J-channels formed with front leg and back leg not less than 5/16 and 3/4 inch (7.9 and 19 mm) in height, respectively.
 - b. Top Trim: Formed with front leg with a height of 5/16 inch (7.9 mm) and back leg designed to fit into the pocket created by wall-mounted aluminum cleat.
 - c. Finish: Clear **OR** Gold, **as directed**, bright anodized.
- 3. Mirror Bottom Clips: As indicated.
- 4. Mirror Top Clips: As indicated.
- 5. Plated Steel Hardware: Formed-steel shapes with plated finish indicated.
 - a. Profile: As indicated.
 - b. Finish: Selected from manufacturer's standards.
- 6. Fasteners: Fabricated of same basic metal and alloy as fastened metal and matching it in finished color and texture where fasteners are exposed.
- 7. Anchors and Inserts: Provide devices as required for mirror hardware installation. Provide toothed or lead-shield expansion-bolt devices for drilled-in-place anchors. Provide galvanized anchors and inserts for applications on inside face of exterior walls and where indicated.

D. Fabrication

1. Mirror Sizes: To suit Project conditions, and before tempering, **as directed**, cut mirrors to final sizes and shapes.
2. Cutouts: Fabricate cutouts before tempering, **as directed**, for notches and holes in mirrors without marring visible surfaces. Locate and size cutouts so they fit closely around penetrations in mirrors.
3. Mirror Edge Treatment: Flat polished **OR** Rounded polished **OR** Flat high-polished **OR** Rounded high-polished **OR** Beveled polished edge of width shown, **as directed**.
 - a. Seal edges of mirrors with edge sealer after edge treatment to prevent chemical or atmospheric penetration of glass coating.
 - b. Require mirror manufacturer to perform edge treatment and sealing in factory immediately after cutting to final sizes.
4. Film-Backed Safety Mirrors: Apply film backing with adhesive coating over mirror backing paint as recommended in writing by film-backing manufacturer to produce a surface free of bubbles, blisters, and other imperfections.

1.5 EXECUTION

A. Examination

1. Examine substrates, over which mirrors are to be mounted, with Installer present, for compliance with installation tolerances, substrate preparation, and other conditions affecting performance of the Work.
2. Verify compatibility with and suitability of substrates, including compatibility of mirror mastic with existing finishes or primers.
3. Proceed with installation only after unsatisfactory conditions have been corrected and surfaces are dry.

B. Preparation

1. Comply with mastic manufacturer's written installation instructions for preparation of substrates, including coating substrates with mastic manufacturer's special bond coating where applicable.

C. Installation

1. General: Install mirrors to comply with mirror manufacturer's written instructions and with referenced GANA publications. Mount mirrors accurately in place in a manner that avoids distorting reflected images.
2. Provide a minimum air space of 1/8 inch (3 mm) between back of mirrors and mounting surface for air circulation between back of mirrors and face of mounting surface.
3. Wall-Mounted Mirrors: Install mirrors with mirror hardware **OR** mastic and mirror hardware, **as directed**. Attach mirror hardware securely to mounting surfaces with mechanical fasteners installed with anchors or inserts as applicable. Install fasteners so heads do not impose point loads on backs of mirrors.
 - a. Top and Bottom Aluminum J-Channels: Provide setting blocks 1/8 inch (3 mm) thick by 4 inches (100 mm) long at quarter points. To prevent trapping water, provide, between setting blocks, two slotted weeps not less than 1/4 inch (6.4 mm) wide by 3/8 inch (9.5 mm) long at bottom channel.
 - b. Top Channel/Cleat and Bottom Aluminum J-Channels: Fasten J-channel directly to wall and attach top trim to continuous cleat fastened directly to wall.
 - c. Mirror Clips: Place a felt or plastic pad between mirror and each clip to prevent spalling of mirror edges. Locate clips where indicated **OR** so they are symmetrically placed and evenly spaced, **as directed**.
 - d. Install mastic as follows:
 - 1) Apply barrier coat to mirror backing where approved in writing by manufacturers of mirrors and backing material.
 - 2) Apply mastic to comply with mastic manufacturer's written instructions for coverage and to allow air circulation between back of mirrors and face of mounting surface.

- 3) After mastic is applied, align mirrors and press into place while maintaining a minimum air space of 1/8 inch (3 mm) between back of mirrors and mounting surface.

D. Cleaning And Protection

1. Protect mirrors from breakage and contaminating substances resulting from construction operations.
2. Do not permit edges of mirrors to be exposed to standing water.
3. Maintain environmental conditions that will prevent mirrors from being exposed to moisture from condensation or other sources for continuous periods of time.
4. Wash exposed surface of mirrors not more than four days before date scheduled for inspections that establish date of Substantial Completion. Wash mirrors as recommended in writing by mirror manufacturer.
5. Remove labels from mirror surface

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 90 00 00 - LOUVERS AND VENTS**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 DEFINITIONS

- A. Louver Terminology: Refer to AMCA Publication 501 85 for definitions of terms for metal louvers not otherwise defined in this section or referenced standards.

1.04 QUALITY ASSURANCE

- A. Single Source Responsibility: Obtain louvers and vents from a single source where alike in one or more respects with regard to type, design, and factory applied color finish.
- B. Qualify welding processes and welding operators in accordance with D1.2 "Structural Welding Code Aluminum" and D1.3 "Structural Welding Code Sheet Steel."
 - 1. Certify that each welder employed in unit of Work of this section has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.
 - 2. Testing for recertification is Contractor's responsibility.
- C. Engineer Qualifications: Professional engineer licensed to practice in jurisdiction where Project is located and experienced in providing engineering services of the kind indicated which has resulted in the successful installation of louvers similar in material, design, and extent to that indicated for this Project.
- D. SMACNA Standard: Comply with SMACNA "Architectural Sheet Metal Manual" recommendations for fabrication, construction details, and installation procedures.
- E. UL and NEMA Compliance: Provide motors and related components for motor operated adjustable louvers which are listed and labeled by UL and comply with applicable NEMA standards.

1.05 SUBMITTALS

- A. General:
 - 1. Where installed products are indicated to comply with certain structural design loadings, include structural computations, material properties, and other information needed for structural analysis which has been prepared by, or under the supervision of, a qualified professional engineer

B. Product Data:

1. Manufacturer's product data for each product.

C. Samples:

1. Samples for initial selection purposes in form of manufacturer's color charts showing full range of colors available for those units with factory applied color finishes.
2. Samples for verification purposes of each type of metal finish required, prepared on six inch square metal samples of same thickness and alloy indicated for final unit of Work. Where finishes involve normal color and texture variations, include sample sets showing full range of variations expected.

D. Shop Drawings:

1. Shop drawings of louver units and accessories. Include plans, elevations, sections, and details showing profiles, angles, spacing of louver blades; unit dimensions related to wall openings and construction; free areas for each size indicated; and profiles of frames at jambs, heads and sills.

E. Record Documents:

1. Product test reports evidencing compliance of units with performance requirements indicated.
2. Product certificates signed by louver manufacturers certifying that their products which comply with Project requirements are licensed to bear AMCA Seal based on tests made in accordance with AMCA Standard 500 and complying with AMCA Certified Ratings Program.
3. Qualification data for firms and persons specified in "Quality Assurance" article to demonstrate their capabilities and experience.

1.06 PERFORMANCE REQUIREMENTS

- A. Structural Performance:** Design, engineer, fabricate, and install exterior metal wall louvers to withstand the effects of loads and stresses from wind and normal thermal movement, without evidencing permanent deformation of louver components including blades, frames, and supports; noise or metal fatigue caused by louver blade rattle or flutter; and permanent damage to fasteners and anchors:

1. Wind Load: Uniform pressure (velocity pressure) required by Code acting inwards or outwards.
2. Normal thermal movement is defined as that resulting from the following maximum change (range) in ambient temperature. Base design calculations on actual surface temperatures of metals due to both solar heat gain and night time sky heat loss.
 - a. Temperature Change (Range): 100 degrees F (55.5 degrees C).

- B. Air Performance, Water Penetration, and Air Leakage Ratings:** Provide louvers complying with performance requirements indicated as demonstrated by testing manufacturers stock units, of height and width indicated, according to Air Movement and Control Association (AMCA) Standard 500.

1.07 PROJECT CONDITIONS

- A. Field Measurements:** Check actual louver openings by accurate field measurements before fabrication; show recorded measurements on final shop drawings. Coordinate fabrication schedule with construction progress to avoid delay of the Work.

1. Where field measurements cannot be made without delaying the Work, guarantee opening dimensions and proceed with fabrication of louvers and vents without field measurements. Coordinate wall construction to ensure that actual opening dimensions correspond to guaranteed dimensions.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. To establish standards of manufacture, operation, performance, and appearance, drawings and specifications are based on products of Construction Specialties, Inc. Provided compliance with requirements, products of the following manufacturers will also be acceptable:
 1. Ruskin Mfg. Div., Phillips Industries, Inc.
 2. Or Approved Equal

2.03 MATERIALS

- A. Galvanized Steel Sheet: ASTM A 526 or A 527, G90 zinc coating, mill phosphatized.
- B. Aluminum Sheet: ASTM B 209, Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer to produce required finish.
- C. Aluminum Extrusions: ASTM B 221, Alloy 6063 T5 or T 52.
- D. Fasteners: Of same basic metal and alloy as fastened metal, unless otherwise indicated. Do not use metals which are corrosive or incompatible with materials joined.
 1. Use types, gages, and lengths to suit unit installation conditions.
 2. Use Phillips flat head machine screws for exposed fasteners, unless otherwise indicated.
- E. Anchors and Inserts: Of type, size, and material required for type of loading and installation indicated. Use nonferrous metal or hot dip galvanized anchors and inserts for exterior installations and elsewhere as required for corrosion resistance. Use toothed steel or expansion bolt devices for drilled in place anchors.
- F. Bituminous Paint: SSPC Paint 12 (cold applied asphalt mastic).
- G. Galvanizing Repair Paint: High zinc dust content paint for regalvanizing welds in galvanized steel, complying with SSPC Paint 20.

2.04 FABRICATION, GENERAL

- A. Fabricate louvers and vents to comply with requirements indicated for design, dimensions, materials, joinery, and performance.
- B. Preassemble louvers in shop to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
- C. Maintain equal louver blade spacing, including separation between blades and frames at head and sill, to produce uniform appearance.

- D. Fabricate frames, including integral sills, to fit in openings of size indicated with allowances made for fabrication and installation tolerances of louvers, adjoining construction, and perimeter sealant joints.
- E. Include supports, anchorages, and accessories required for complete assembly.
- F. Provide vertical mullions of type and at spacings indicated but not further apart than recommended by manufacturer, or 72 inches on center, whichever is less. At horizontal joints between louver units provide horizontal mullions except where continuous vertical assemblies are indicated.
- G. Provide sill extensions and loose sills made of same material as louvers, where indicated, or required for drainage to exterior and to prevent water penetrating to interior.
- H. Join frame members to one another and to fixed louver blades as follows, unless otherwise indicated, or size of louver assembly makes bolted connections between frame members necessary:
 - 1. With fillet welds, concealed from view.

2.05 STORM RESISTANT LOUVERS

- A. Provide extruded aluminum louvers, stationary, storm proof type, with extrusions not less than 0.081 inches thick. Provide 5 inches deep units; Construction Specialties "Model RS 5300" or accepted equivalent.

2.06 LOUVER SCREENS

- A. Provide each exterior louver with louver screens complying with the following requirements:
 - 1. Screen Location for Fixed Louvers: Interior face, unless otherwise indicated.
 - 2. Screening Type: Bird screening, unless otherwise indicated.
- B. Secure screens to louver frames with stainless steel machine screws, spaced at each corner and at 12 inch on center between.
- C. Louver Screen Frames: Fabricate screen frames with mitered corners to louver sizes indicated and to comply with the following requirements:
 - 1. Metal: Same kind and form of metal as indicated for louver frames to which screens are attached.
 - a. Reinforce extruded aluminum screen frames at corners with clips.
 - 2. Finish: Same finish as louver frames to which louver screens are attached.
 - 3. Type: Nonrewireable U shaped frames for permanently securing screen mesh.
- D. Louver Screening for Aluminum Louvers: Fit aluminum louver screen frames with screening covering louver openings and complying with the following requirements:
 - 1. Bird Screening: 1/2 inch square mesh formed with 0.063 inch diameter aluminum wire.

2.07 BLANK OFF PANELS

- A. Fabricate blank off panels from materials and to sizes indicated and to comply with the following requirements:
 - 1. Finish: Match finish applied to louvers with respect to coating type, color and gloss.
 - 2. Attach blank off panels to back of louver frames with clips.

B. Noninsulated Blank Off Panels: Metal sheet complying with the following requirements:

1. Aluminum sheet for aluminum louvers, thickness as follows:
 - a. 0.051 inch, unless otherwise indicated.

2.08 ALUMINUM FINISHES

- A. Comply with NAAMM "Metal Finishes Manual" for recommendations relative to application and designations of finishes.
- B. Finish louvers after assembly.
- C. Finish designations prefixed by "AA" conform to the system established by the Aluminum Association for designating aluminum finishes.
- D. Class I Clear Anodized Finish: AA M12C22A41 (Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class I Architectural: clear film thicker than 0.7 mil) complying with AAMA 607.1.
- E. Conversion Coated Finish: AA C12C42 (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: chemical conversion coating, acid chromate fluoride phosphate pretreatment).
- F. Conversion Coated and Factory Primed Finish: AA C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: chemical conversion coating, acid chromate fluoride phosphate pretreatment; Organic Coating: as specified below).
 1. Organic Coating: Air dried zinc chromate primer with not less than 2.0 mils dry film thickness.
- G. Class I Color Anodized Finish: AA M12C22A42/A44 (Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, Medium Matte; Anodic Coating: Class II Architectural, film thicker than 0.7 mil with integral color or electrolytically deposited color) complying with AAMA 606.1 or AAMA 608.1.
 1. Color: Light bronze.
 2. Color: Medium bronze.
 3. Color: Dark bronze.
 4. Color: Black.
 5. Color: Match Architect's sample.
 6. Color: As selected by Architect from within standard industry colors and color density range.
- H. Baked Enamel Finish: AA C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: chemical conversion coating, acid chromate fluoride phosphate pretreatment; Organic Coating: as specified below). Apply baked enamel in compliance with paint manufacturer's specifications for cleaning, conversion coating, and painting.
 1. Organic Coating: Thermosetting modified acrylic enamel primer/topcoat system complying with AAMA 603.8 except with minimum dry film thickness of 1.5 mils, medium gloss.
 2. Color: As indicated by reference to manufacturer's standard color designations.
 3. Color: Match Architect's samples.
 4. Color: As selected by Architect from manufacturer's standard colors.

- I. High Performance Organic Coating: AA C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: chemical conversion coating, acid chromate fluoride phosphate pretreatment; Organic Coating: as specified below) Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturer's instructions.
 1. Fluorocarbon 2 Coat Coating System: Manufacturer's standard 2 coat thermo cured system, composed of specially formulated inhibitive primer and fluorocarbon color topcoat containing not less than 70 percent polyvinylidene resin by weight; complying with AAMA 605.2.
 2. Fluorocarbon 3 Coat Coating System: Manufacturer's standard 3 coat thermo cured system composed of specially formulated inhibitive primer, fluorocarbon color coat, and clear fluorocarbon topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene resin by weight; complying with AAMA 605.2.
 - a. Color and Gloss: As indicated by reference to manufacturer's standard color and sheen designations.
 - b. Color and Gloss: Match Architect's sample.
 - c. Color and Gloss: As selected by Architect from manufacturer's standard choices for color and gloss.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Coordinate setting drawings, diagrams, templates, instructions and directions for installation of anchorages which are to be embedded in concrete or masonry construction. Coordinate delivery of such items to the Project Site.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Locate and place louver units plumb, level, and in proper alignment with adjacent Work.
- D. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.
- E. Form closely fitted joints with exposed connections accurately located and secured.
- F. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.
- G. Repair finishes damaged by cutting, welding, soldering, and grinding operations require for fitting and jointing. Restore finishes so there is no evidence of corrective Work. Return items which cannot be refinished in field to shop, make required alterations and refinish entire unit, or provide new units.
- H. Protect galvanized and nonferrous metal surfaces from corrosion or galvanic action by application of a heavy coating of bituminous paint on surfaces which will be in contact with concrete, masonry, or dissimilar metals.
- I. Install concealed gaskets, flashings, joint fillers, and insulation, as louver installation progresses where required to make louver joints weathertight. Comply with Division 07 Section "Joint Sealers" for sealants applied during installation of louver.

3.03 ADJUSTING AND PROTECTION

- A. Protect louvers and vents from damage of any kind during construction period including use of temporary protective coverings where needed and approved by louver manufacturer. Remove protective covering at time of Substantial Completion.
- B. Restore louvers and vents damaged during installation and construction period, so that no evidence remains of correction Work. If results of restoration are unsuccessful, as judged by Architect, remove damaged units and replace with new units.
 - 1. Clean and touch up minor abrasions in finishes with air dried coating that matches color and gloss of, and is compatible with, factory applied finish coating.
- C. Test operation of adjustable wall louvers and adjust as needed to produce fully functioning units which comply with requirements.

3.04 CLEANING

- A. Periodically clean exposed surfaces of louvers and vents, which are not protected by temporary covering, to remove fingerprints and soil during construction period; do not let soil accumulate until final cleaning.
- B. Before final inspection, clean exposed surfaces with water and with a mild soap or detergent not harmful to finishes. Rinse thoroughly and dry surface.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 09 21 00 00 - PLASTER & GYPSUM BOARD ASSEMBLIES**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Special Requirements of Regulatory Agencies: Submit certification that system complies with VOC (Volatile Organic Compounds) requirements and regulations of the Environmental Protection Agency (EPA), Occupational Safety and Health Administration (OSHA), State, County, City, and local Air Control District.
- B. Fire Resistance Ratings: Where plaster systems with fire resistance ratings are indicated, provide materials and installations identical to those of applicable assemblies tested per ASTM E 119 by fire testing laboratories acceptable to authorities having jurisdiction.
 - 1. Fire-Resistance Ratings: As indicated by GA File Numbers in GA-600 "Fire Resistance Design Manual" or design designations in UL "Fire Resistance Directory" or in the listing of another testing and inspecting agency acceptable to authorities having jurisdiction.
 - 2. Provide plaster for fire resistance rated systems that has same aggregate as specified for similar nonrated Work, unless specified aggregate has not been tested by accepted fire testing laboratories.
- C. Coordination of Work: Coordinate layout and installation of suspension system components for suspended ceilings with other work supported by or penetrating through ceiling.
- D. Field Constructed Mock Up: Prior to installation of plaster work, fabricate panels for each type of finish and application required to verify selections made under sample submittals and to demonstrate aesthetic effects of application as well as qualities of materials and erection. Build mock ups to comply with the following requirements, using materials indicated for final unit of Work.
 - 1. Locate mock ups on Site in location as approved by Architect.
 - 2. Erect 10 foot by 10 foot by full thickness mock up using materials, including lath and support system, indicated for final work.
 - 3. Demonstrate the proposed range of aesthetic effects including color, texture, and workmanship to be expected in completed work.

4. Obtain Architect's acceptance of mock ups before start of plaster work.
5. Retain and maintain mock ups during construction in undisturbed condition as a standard for judging completed plaster work.

1.04 SUBMITTALS

A. Record Documents:

1. Samples for verification purposes in units at least twelve inches square of each type of finish indicated, in sets for each color, texture, and pattern specified, showing full range of variations expected in these characteristics.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials in original packages, containers, or bundles bearing brand name and identification of manufacturer.
- B. Store materials inside, under cover, and in manner to keep them dry, protected from weather, direct sunlight, surface contamination, aging, corrosion, and damage from construction traffic and other causes.

1.06 PROJECT CONDITIONS

- A. Comply with requirements of referenced plaster application standards and recommendations of plaster manufacturer for environmental conditions before, during, and after application of plaster.
- B. When ambient outdoor temperatures are below 40 degrees F (4.4 degrees C), maintain continuous uniform temperature of not less than 40 degrees F (4.4 degrees C) nor more than 80 degrees F (26 degrees C) for not less than 1 week prior to beginning plaster application, during its application, and until plaster is dry but for not less than one week after application is complete. Distribute heat evenly; prevent concentrated or uneven heat from contacting plaster near heat source.
- C. Ventilate building spaces as required to remove water in excess of that required for hydration of plaster. Begin ventilation immediately after plaster is applied and continue until it sets.
- D. Protect contiguous Work from soiling, spattering, moisture deterioration and other harmful effects that might result from plastering.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 METAL SUPPORTS FOR SUSPENDED AND FURRED CEILINGS

- A. Size metal ceiling supports to comply with the following, unless otherwise indicated.
 1. Gypsum Plaster Installations: ASTM C 841.
 2. Portland Cement Plaster Installation: ASTM C 1063.
- B. Wire for Hangers and Ties: ASTM A 641, Class 1 zinc coating, soft temper.
- C. Rod Hangers: Mild steel, zinc or cadmium coated.

- D. Flat Hangers: Mild steel, zinc or cadmium coated or protected with rust inhibitive paint.
- E. Channels: Cold rolled steel, 0.05980 inch minimum thickness of base metal (uncoated), allowable bending stress of 18,000 psi, protected with rust inhibitive paint or galvanizing complying with ASTM A 525 for G60 coating designation, and as follows:
 - 1. Carrying Channels: 1-1/2 inch deep by 7/16 inch wide flanges, 475 lbs. per 1000 feet painted, 508 lbs. per 1000 feet galvanized.
 - 2. Furring Channels: 3/4 inch deep by 7/16 inch wide flanges, 300 lbs. per 1000 feet painted, 316 lbs. per 1000 feet galvanized.
 - 3. Provide galvanized channels for exterior, and high-humidity interior, installations.
- F. Hanger Anchorage Devices: Screws, cast in place concrete inserts, or other devices appropriate for anchorage to the form of structural framing indicated and whose suitability for use intended has been proven through standard construction practices or certified test data.
 - 1. Size devices to develop full strength of hanger but not less than 3 times calculated hanger loading, except size direct pullout concrete inserts for 5 times calculated hanger loading.

2.03 LATH

- A. Expanded Metal Lath: Fabricate expanded metal lath from uncoated or zinc coated (galvanized) steel sheet to produce lath complying with ASTM C 847 for type, configuration, and other characteristics indicated below, with uncoated steel sheet painted after fabrication into lath.
 - 1. Diamond Mesh Lath: Comply with the following requirements:
 - a. Configuration: Flat, Weight: 3.4 lbs. per sq. yd.
 - b. Configuration: Self furring, Weight: 3.4 lbs. per sq. yd.
 - c. Paper Backing: Where paper backed diamond mesh lath is indicated, provide asphalt impregnated paper factory bonded to back and complying with FS UU B 790, for Type I, Grade D (vapor permeable), Style 2.
 - 2. Rib Lath: Comply with the following requirements:
 - a. Configuration: Rib depth of 3/8 inch, Weight: 3.4 lbs. per sq. yd.
- B. Lath Attachment Devices: Devices of material and type required by referenced standards and recommended by lath manufacturer for secure attachment of lath to framing members and of lath to lath.

2.04 PLASTER ACCESSORIES

- A. Comply with material provisions of ASTM C 841 and ASTM C 1063; coordinate depth of accessories with thicknesses and number of coats required.
- B. Metal Corner Reinforcement: Expanded large mesh diamond mesh lath fabricated from zinc alloy or welded wire mesh fabricated from 0.0475 inch diameter zinc coated (galvanized) wire and specially formed to reinforce external corners of portland cement plaster on exterior exposures while allowing full plaster encasement.
- C. Fabricate metal beads and accessories from not less than 24 gage solid zinc alloy at exterior and "high humidity" interior areas and galvanized steel at other interior areas, except where extruded aluminum trim is shown. Coordinate depth of grounds with thickness and number of plaster coats required.

1. Square Edged Casing Beads: Manufacturer's standard with expanded or short flange to suit application.
 2. Control Joints: Keene Corp. No. 15 roll formed control joints with expanded flanges at flat plaster areas and No. 30 roll formed control joints with expanded flanges at internal corners.
 3. Two Piece Expansion Joints: Keene Corp. No. 40 roll-formed casing beads with modified back flanges providing positive slip joint action and dust barrier, adjustable for joint width variation of 1/8 inch to 5/8 inch.
 4. Cornerite: Manufacturer's standard preformed interior corner reinforcement made from 2.5 lb./sq. yd. diamond mesh lath.
- D. Aluminum Components: Alloy, temper, and finish recommended by manufacturer with not less than the strength and durability properties of aluminum extrusions complying with ASTM B 221 (ASTM B 221M) or alloy and temper 6063-T5.

2.05 2.4 PORTLAND CEMENT PLASTER MATERIALS AND MIXES

A. Base Coat Materials:

1. Portland Cement: ASTM C 150, Type I.
2. Masonry Cement: ASTM C 91, Type N.
3. Lime: ASTM C 206, Type S special finishing hydrate.
4. Sand Aggregate: ASTM C 897.
5. Fiber for Base Coat: Alkaline resistant glass fibers, 1/2" long, free of contaminants, manufactured for use in portland cement plaster. Subject to compliance with requirements, provide "Dur O Fiber AR Glass" manufactured by Dur O Wal, Inc.

B. Finish Coat Materials:

1. Factory Prepared Finish Coat: Manufacturer's standard product requiring addition of water only; white in color unless otherwise indicated. Subject to compliance with requirements, provide "Oriental Exterior Finish Stucco" manufactured by United States Gypsum Company.
2. Portland Cement: ASTM C 150, Type I, white.
3. Lime: ASTM C 206, Type S special finishing hydrate.
4. Aggregate: ASTM C 897, manufactured or natural sand, white, or in color required to match Architect's accepted sample.

- C. Portland Cement Plaster Mixes: Comply with ASTM C 926 for portland cement plaster base and finish coat mixes as applicable to plaster bases, materials, and other requirements indicated. Proportion materials for respective base coats in parts by volume for cementitious materials and in parts by volume per sum of cementitious materials for aggregates to comply with the following requirements for each method of application and plaster base indicated. Adjust mix proportions below within limits specified to attain workability.

1. Scratch Coat: 1 part portland cement, 1 to 2 parts masonry cement, 2-1/2 to 4 parts sand.
2. Brown Coat: 1 part portland cement, 1 to 2 parts masonry cement, 3 to 5 parts sand.

3. Factory Prepared Portland Cement Finish Coat: Add water only; comply with finish coat manufacturer's directions.
4. Finish Coat: 1 part portland cement, 1-1/2 to 2 parts lime, 3 parts sand.
5. Scratch Coat: 1 part portland cement, 0 to 3/4 parts lime, 2-1/2 to 4 parts sand.
6. Brown Coat: 1 part portland cement, 0 to 3/4 parts lime, 3 to 5 parts sand.
7. Finish Coat: 1 part portland cement, 3/4 to 1-1/2 parts lime, 3 parts sand.
8. Scratch Coat: 1 part portland cement, 3/4 to 1-1/2 parts lime, 2-1/2 to 4 parts sand.
9. Brown Coat: 1 part portland cement, 3/4 to 1-1/2 parts lime, 3 to 5 parts sand.
10. Finish Coat: 1 part portland cement, 1 part masonry cement, 3 parts sand.
11. Fiber Content: Add fiber to scratch and brown coats above to comply with fiber manufacturer's directions but not to exceed 2 lbs./cu. ft. of cementitious materials. Reduce aggregate quantities accordingly to maintain workability.

2.06 GYPSUM PLASTER MATERIALS AND MIXES

A. Base Coat Plaster Materials:

1. Gypsum neat plaster complying with ASTM C 28. Subject to compliance with requirements, provide one of the following:
 - a. Red Top Gypsum Plaster; United States Gypsum Co.
 - b. Red Top Two Purpose Plaster; United States Gypsum Co.
 - c. Two Way Hardwall Plaster; Gold Bond Building Products Division, National Gypsum Co.
2. Gypsum wood fibered plaster complying with ASTM C 28. Subject to compliance with requirements, provide one of the following:
 - a. Red Top Wood Fiber Plaster; United States Gypsum Co.
3. Gypsum ready mixed plaster, with mill mixed perlite aggregate, and complying with ASTM C 28. Subject to compliance with requirements, provide one of the following:
 - a. Gypsolite; Gold Bond Building Products Division, National Gypsum Co.
 - b. Structo Lite; United States Gypsum Co.
4. High strength gypsum gauging plaster complying with ASTM C 28 and with a minimum average dry compressive strength of 2,800 psi per ASTM C 472 for a mix of 100 lbs. plaster and 2 cu. ft. of sand. Subject to compliance with requirements, provide one of the following:
 - a. Structo Base: United States Gypsum Co.
5. Aggregate: ASTM C 35, type as indicated below.
 - a. Sand aggregate, unless otherwise indicated.
 - b. Perlite aggregate where indicated.

B. Finish Coat Plaster Materials:

1. Gypsum gauging plaster complying with ASTM C 28. Subject to compliance with requirements, provide one of the following:
 - a. Champion Gauging Plaster; United States Gypsum Co.
 - b. Red Top Gypsum Plaster; United States Gypsum Co.
 - c. Star Gauging Plaster; United States Gypsum Co.
 - d. Super White Gauging Plaster; Gold Bond Building Products Division, National Gypsum Co.
2. Gypsum ready mixed finished plaster, manufacturer's standard mill mixed gauged interior finish. Subject to compliance with requirements, provide one of the following:
 - a. Red Top Finish; United States Gypsum Co.
3. High strength gypsum gauging plaster complying with ASTM C 28, with a minimum average dry compressive strength of 5,000 psi per ASTM C 472 for a neat mix. Subject to compliance with requirements, provide one of the following:
 - a. Structo Base; United States Gypsum Co.
4. Gypsum Keene's cement complying with ASTM C 61. Subject to compliance with requirements, provide one of the following:
 - a. Red Top Keene's Cement; United States Gypsum Co.
5. Gypsum casting and molding plaster complying with ASTM C 59, in color as selected by Architect from manufacturer's standard white and grey colors. Subject to compliance with requirements, provide one of the following:
 - a. Super White Molding Plaster; Gold Bond Building Products Division, National Gypsum Co.
 - b. USG Molding Plaster; United States Gypsum Co.
6. Finishing hydrated lime complying with ASTM C 206, Type S, special finishing hydrate. Subject to compliance with requirements, provide one of the following:
 - a. Ivory Finish Lime; United States Gypsum Co.
 - b. Snowdrift Finish Lime; United States Gypsum Co.
7. Aggregates for Finish Coat Plaster with Floated Finish: ASTM C 35; graded per ASTM C 842, type as indicated below:
 - a. Sand aggregate.
 - b. Perlite aggregate.
 - c. Sand aggregate, except perlite over base coats containing perlite aggregate.
- C. Gypsum Plaster Mixes: Comply with ASTM C 842 and manufacturer's directions for base coat and finish coat proportions and finish coat textures indicated below:
 1. Scratch Coat: Gypsum wood fibered plaster, neat or with job mixed sand.
 2. Brown Coat: Gypsum neat plaster with job mixed sand.
 3. Finish Coat: Trowel finish gypsum ready mix finish plaster; neat.

4. Scratch Coat: Gypsum wood fibered plaster, neat or with job mixed sand.
5. Brown Coat: Gypsum wood fibered plaster with job mixed sand.
6. Finish Coat: Float finished gypsum gauging plaster; 1 part plaster, 2 parts lime, 8 parts sand.
7. Scratch Coat: Gypsum wood fibered plaster, neat or with job mixed sand.
8. Brown Coat: Gypsum neat plaster with job mixed perlite, or ready mix plaster with mill mixed perlite.
9. Finish Coat: Trowel finished gypsum gauging plaster; 1 part plaster and 2 parts lime.
 - a. Over lightweight aggregate base coats, add 1/2 cu. ft. of perlite fines or 50 lbs. of No. 1 white silica sand per 100 lbs. of plaster.
10. Scratch and Brown Coat: High strength gypsum gauging plaster with job mixed sand.
11. Finish Coat: Trowel finished high strength gypsum gauging plaster; 1 part plaster to 1 part lime.
12. Scratch and Brown Coat: Gypsum neat plaster with job mixed sand.
13. Finish Coat: Trowel finished gypsum Keene's cement; 4 parts plaster to 1 part lime.
14. Finish Coat: Float finished gypsum Keene's cement; 2 parts plaster, 1 part lime, 8 parts sand.

2.07 MISCELLANEOUS MATERIALS

- A. Water for Mixing and Finishing Plaster: Drinkable and free of substances capable of affecting plaster set or of damaging plaster, lath, or accessories.
- B. Bonding Compound for Gypsum Plaster: ASTM C 631.
- C. Bonding Agent for Portland Cement Plaster: ASTM C 932.
- D. Acoustical Sealant: ASTM C 919, nonoxidizing, skinning paintable types for exposed applications; nondrying, nonhardening, nonstaining, nonbleeding, gunnable type sealant complying with requirement specified in Division 7 Section "Joint Sealers" for concealed applications.
- E. Sound Attenuation Blankets: Unfaced mineral fiber blanket insulation produced by combining mineral fibers of type described below with thermosetting resins to comply with ASTM C 665 for Type I (without membrane facing); of widths to fill completely void formed by framing members.
- F. Flexible Flashing: Provide flexible flashing at perimeter of openings and penetrations as indicated. Provide flashing material designed specifically for use as wall flashing, consisting of a rubberized asphalt compound bonded to a polyethylene film with the following properties:
 1. Thickness: 40 Mils
 2. Color: Gray-Black
 3. Roll Width: 18 inches and 36 inches.
 4. Product: "Perm-A-Barrier Wall Flashing" by W. R. Grace & Co.

2.08 MIXING

- A. Mechanically mix cementitious and aggregate materials for plasters to comply with applicable referenced application standard and with recommendations of plaster manufacturer.

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

3.02 INSTALLATION OF LATHING AND FURRING, GENERAL

- A. Interior Lathing and Furring Installation Standard: Install lathing and furring materials indicated for gypsum plaster to comply with ASTM C 841.
- B. Portland Cement Plaster Lathing and Furring Installation Standard: Install lathing and furring materials indicated for portland cement plaster to comply with ASTM C 1063.
- C. Install supplementary framing, blocking, and bracing at terminations in the Work and for support of fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, and similar Work to comply with details indicated or, if not otherwise indicated, to comply with applicable published recommendations of gypsum plaster manufacturer or, if not available, of "Gypsum Construction Handbook" published by United States Gypsum Co.
- D. Isolation: Where lathing and metal support system abuts building structure horizontally and where partition/wall Work abuts overhead structure, isolate the Work from structural movement sufficiently to prevent transfer of loading into the Work from the building structure. Install slip or cushion type joints to absorb deflections but maintain lateral support.
 - 1. Frame both sides of control and expansion joints independently, and do not bridge joints with furring and lathing or accessories.
- E. Install flexible flashing at locations indicated, following manufacturer's recommendations and details appropriate to the Project conditions.
 - 1. Properly prepare substrate to ensure adhesion of flashing sheet.
 - 2. Apply manufacturer's recommended primer to substrate and allow to dry for a minimum of 20 minutes prior to flashing application.
 - 3. Overlap adjoining pieces 1 inches to 2 inches and roll all overlaps with a steel roller.
 - 4. Apply a bead of mastic/sealant at top edge termination and at overlaps.

3.03 INSTALLATION OF CEILING SUSPENSION SYSTEMS

- A. Preparation and Coordination: Coordinate installation of ceiling suspension system with installation of overhead structural systems to ensure that inserts and other structural anchorage provisions have been installed to receive ceiling hangers in a manner that will develop their full strength and at spacings required to support ceiling.
 - 1. Furnish concrete inserts, and other devices indicated, to other trades for installations well in advance of time needed for coordination with other Work.
- B. Hanger Installation: Attach hangers to structure above ceiling to comply with ML/SFA "Specifications for Metal Lathing and Furring" and with referenced standards.
 - 1. Do not attach hangers to metal deck tabs.

- C. Install ceiling suspension system components of sizes and spacings indicated but not in smaller sizes or greater spacings than those required by referenced lathing and furring installation standards.
1. Wire Hangers: Space 8 gage (0.16 inch diameter) wire hangers not over 4' 0" on center parallel with and not over 3' 0" perpendicular to direction of carrying channels, unless otherwise indicated, and within 6 inches of carrying channel ends.
 2. Carrying Channels: Space carrying channels not over 3' 0" on center with 4' 0" on center hanger spacing.
 3. Furring Channels to Receive Metal Lath: Space furring channels not over 16 inches on center for 3.4 lb. diamond mesh lath, 19 inches on center for 3.4 lb. flat rib lath, or 24 inches on center for 3.4 lb., 3/8 inch rib lath.
 4. Furring Channels to Receive Gypsum Lath: Space furring channels not over 16 inches on center for 3/8 inch thick, clip attached gypsum lath, unless closer spacing indicated or required for fire resistance rated assembly.

3.04 METAL LATHING

- A. Install expanded metal lath for the following applications where plaster base coats are required. Provide appropriate type, configuration, and weight of metal lath selected from materials indicated that comply with referenced lathing installation standards.
1. Suspended and furred ceilings using 3.4 lbs. per sq. yd. minimum weight diamond mesh lath.
 2. Vertical metal framing and furring.
 3. Ceramic tile setting beds using 3.4 lbs. per sq. yd. minimum weight diamond mesh lath.
 4. Exterior sheathed wall surfaces using 3.4 lbs. per sq. yd. minimum weight self furring diamond mesh lath:

3.05 INSTALLATION OF PLASTERING ACCESSORIES

- A. Comply with referenced lathing and furring installation standards for provision and location of plaster accessories of type indicated. Miter or cope accessories at corners; install with tight joints and in alignment. Attach accessories securely to plaster bases to hold accessories in place and alignment during plastering.
- B. Accessories for Gypsum Plaster: Provide the following types to comply with requirements indicated for location:
1. Corner Beads: Install at external corners.
 2. Casing Beads: Install at terminations of plaster Work, except where plaster passes behind and is concealed by other Work and where metal screeds, bases, or metal frames and act casing beads.
 3. Control Joints: Install at locations indicated, or if not indicated, at locations complying with the following criteria and accepted by Architect.
 - a. Where a control joint occurs in surface of construction directly behind plaster membrane.
 - b. Plaster Partitions: 30' feet on center
 - c. Ceilings without Perimeter Relief: 30 feet on center
 - d. Ceilings with Perimeter Relief: 50 feet on center

- C. Accessories for Portland Cement Plaster: Provide the following types to comply with requirements indicated for location:
1. Corner Bead: Install at external corners.
 2. Cornerite: Install at interior corners to comply with referenced standards.
 3. Casing Beads: Install at terminations of plaster Work unless otherwise indicated. At small penetrations, such as columns and pipes, set casing beads $\frac{3}{4}$ inches from penetrating object.
 4. Control Joints: Install control joints at locations indicated, or if not indicated, at locations complying with the following criteria and accepted by Architect.
 - a. Where a control joint occurs in surface of construction directly behind plaster membrane.
 - b. Where distance between control joints in plastered surface exceeds 10 feet in either direction.
 - c. Where area within portland cement panels exceed 100 sq. ft.
 - d. Where portland cement plaster panel sizes or dimensions change. Extend joints full width or height of plaster membrane.
 5. Expansion Joints: Install expansion joints at locations indicated or, if not indicated, at locations complying with the following criteria and approved by Architect.
 - a. Where an expansion or control joint occurs in surface of construction directly behind plaster membrane.
 - b. Horizontally, within 4 inches of a floor line directly behind plaster Work.
 - c. Vertically, at all column lines directly behind plaster Work.
 - d. Changes from insulated to uninsulated back up construction.
 - e. Changes in type of back up construction.
 - f. Set beads $\frac{1}{4}$ inches apart for interior Work and $\frac{1}{2}$ inches apart for exterior Work.

3.06 PLASTER APPLICATION, GENERAL

- A. Prepare monolithic surfaces for bonded base coats and use bonding compound or agent to comply with requirements of referenced plaster application standards for conditioning of monolithic surfaces.
- B. Tolerances: Do not deviate more than $\frac{1}{8}$ inch in 10' 0" from a true plane in finished plaster surfaces, as measured by a 10' 0" straightedge placed at any location on surface.
- C. Grout hollow metal frames, bases, and similar Work occurring in gypsum plastered areas, with base coat plaster material and prior to lathing where necessary. Except where full grouting is indicated or required for fire resistance rating, grout at least 6 inches at each jamb anchor clip.
- D. Sequence plaster application with the installation and protection of other Work so that neither will be damaged by the installation of the other.
- E. Plaster flush with metal frames and other built in metal items or accessories that act as a plaster ground, unless otherwise indicated. Where plaster is not terminated at metal by casing beads, cut base coat free from metal before plaster sets and groove finish coat at the junctures with metal.
- F. Apply thicknesses and number of coats of plaster as indicated or as required by referenced standards.

- G. Concealed Plaster: Where plaster application will be concealed by wood paneling, above suspended ceilings and similar locations, finish coat may be omitted; where concealed behind cabinets and similar furnishings and equipment, apply finish coat; where used as a base for adhesive application of tile and similar finishes, omit finish coat and coordinate thickness with overall dimension as shown and comply with tolerances specified.

3.07 GYPSUM PLASTER APPLICATION

- A. Interior Gypsum Plaster Application Standard: Apply gypsum plaster materials, composition, mixes, and finishes indicated to comply with ASTM C 842.
 - 1. Use three coat work, $\frac{3}{4}$ inch thickness, over metal lath bases.
 - 2. Use two coat work, $\frac{5}{8}$ inch thickness, directly on unit masonry.
 - 3. Finish Coat: Troweled finish for gypsum finish coat plasters to produce a smooth dense finish, unless otherwise indicated.
 - 4. Finish Coat: Floated finish for gypsum plaster finish coats; match Architect's sample for texture and color.
- B. Ornamental Plaster Applications: Run or cast the Work in place (or precast at Contractor's option) in accordance with the profile and relief requirements shown or accepted by models or mock ups (if any). At corners of running moldings and cornices, miter the Work to produce symmetric treatment running both ways from each corner.

3.08 PORTLAND CEMENT PLASTER APPLICATION

- A. Apply portland cement plaster materials, compositions, and mixes to comply with ASTM C 926.
 - 1. Use three coat work, $\frac{7}{8}$ inch thickness, over metal lath bases.
 - 2. Use two coat work, $\frac{5}{8}$ inch thickness, directly on unit masonry.
 - 3. Finish Coat: Floated finish unless otherwise indicated; match Architect's sample for texture and color.
 - 4. Finish Coat: Dash finish, machine applied to match Architect's accepted sample.
- B. Moist cure portland cement plaster base and finish coats to comply with ASTM C 926, including recommendations for time between coats and curing in "Annex A2 Design Considerations."

3.09 CUTTING AND PATCHING

- A. Cut, patch, point up, and repair plaster as necessary to accommodate other Work and to restore cracks, dents, and imperfections. Repair or replace Work to eliminate blisters, buckles, excessive crazing and check cracking, dry outs, efflorescence, sweat outs, and similar defects and where bond to the substrate has failed.
- B. Sand smooth troweled finishes lightly to remove trowel marks and arrises.

3.10 CLEANING AND PROTECTION

- A. Remove temporary protection and enclosure of other Work. Promptly remove plaster from door frames, windows, and other surfaces that are not to be plastered. Repair floors, walls, and other surfaces that have been stained, marred, or otherwise damaged during the plastering Work. When plastering Work is completed, remove unused materials, containers, and equipment and clean floors of plaster debris.

- B. Provide final protection and maintain conditions, in a manner suitable to Installer that ensure plaster Work's being without damage or deterioration at time of Substantial Completion.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 09 22 00 00 - SUPPORTS FOR PLASTER AND GYPSUM BOARD

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Fire Resistance Ratings: Where indicated, provide materials and construction which are identical to those of assemblies whose fire resistance rating has been determined per ASTM E 119 by a testing and inspecting organization acceptable to authorities having jurisdiction.
 - 1. Provide fire resistance rated assemblies identical to those indicated by reference to GA File No's. in GA 600 "Fire Resistance Design Manual" or to design designations in U.L. "Fire Resistance Directory" or in listing of other testing and agencies acceptable to authorities having jurisdiction.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Submit product data consisting of manufacturer's product Specifications and installation instructions for each product, including data showing compliance with the requirements.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products which may be incorporated in the Work include:
 - 1. Alabama Metal Industries (AMICO)
 - 2. Dale/Incor Inc.
 - 3. Delta Metal Products

4. Dietrich Industries Inc.
5. Marino Industries Corp.
6. Unimast Co.

2.03 STEEL FRAMING FOR WALLS AND PARTITIONS

- A. Design Criteria: Design metal stud partitions to have deflection not to exceed $l/240$ under a 5 psf lateral load. Where height of stud required exceeds the deflection criteria shown in manufacturer's printed engineering charts, provide heavier gauge studs, or closer spacing, as required for actual span conditions.
- B. Steel Studs and Runners: ASTM C 645, with flange edges of studs bent back 90 degrees and doubled over to form $3/16$ inch minimum lip (return) and complying with the following requirements for minimum thickness and depth:
 1. Thickness: 0.0329 inch (20 gauge), unless otherwise indicated.
 2. Thickness: 0.0179 inch (25 gauge) where indicated.
 3. Thickness: 0.0270 inch (22 gauge) where indicated.
 4. Thickness: As indicated.
 5. Depth: 3-5/8 inches, unless otherwise indicated.
 6. Depth: 6 inches where indicated.
 7. Depth: 4 inches where indicated.
 8. Depth: 2-1/2 inches where indicated.
 9. Depth: 1-5/8 inches where indicated.
 10. Depth: As indicated.
- C. Steel Rigid Furring Channels: ASTM C 645, hat shaped, depth and minimum thickness of base (uncoated) metal as follows:
 1. Depth: 7/8 inch.
 2. Depth: 1-1/2 inch.
 3. Thickness: 0.0329 inch (20 gauge), unless otherwise indicated.
 4. Thickness: 0.0179 inch (25 gauge) where indicated.
 5. Thickness: 0.0270 inch (22 gauge) where indicated.
 6. Thickness: As indicated.
- D. Furring Brackets: Serrated arm type, adjustable, fabricated from corrosion resistant steel sheet complying with ASTM C 645, minimum thickness of base (uncoated) metal of 0.0329 inch, designed for screw attachment to steel studs and steel rigid furring channels used for furring.
- E. Steel Resilient Furring Channels: Manufacturer's standard product designed to reduce sound transmission, complying with ASTM C 645 for base metal, finish and widths of face and fastening flange, fabricated to form 1/2 inch deep channel of the following configuration:

1. Single Leg Configuration: Assymetric shaped channel with face connected to a single flange by a single slotted leg (web).
 2. Double Leg Configuration: Hat shaped channel, with 1-1/2 inch wide face connected to flanges by double slotted or expanded metal legs (webs).
 3. Configuration: Either one indicated above.
- F. Z Furring Members: Manufacturer's standard zee shaped furring members with slotted or nonslotted web, fabricated from hot dip galvanized steel sheet complying with ASTM A 525, Coating Designation G60; with a minimum base metal (uncoated) thickness of 0.0179 inch, face flange of 1-1/4 inch, wall attachment flange of 7/8 inch, and of depth required to fit insulation thickness indicated.
- G. Fasteners: Provide fasteners of type, material, size, corrosion resistance, holding power and other properties required to fasten steel framing and furring members securely to substrates involved; complying with the recommendations of gypsum drywall manufacturers for applications indicated.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

3.02 INSTALLATION OF STEEL FRAMING, GENERAL

- A. Steel Framing Installation Standard: Install steel framing to comply with ASTM C 754 and with ASTM C 840 requirements that apply to framing installation.
 1. Steel Stud Systems to Receive Metal Lath: Comply with requirements of ML/SFA 920, "Guide" "Specifications for Metal Lathing and Furring" applicable to each installation condition and type of metal stud system indicated.
- B. Install supplementary framing, blocking and bracing at terminations in the Work and for support of fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, and similar construction to comply with details indicated and with recommendations of gypsum board manufacturer, or if none available, with "Gypsum Construction Handbook" published by United States Gypsum Co.
- C. Isolate steel framing from building structure to prevent transfer of loading imposed by structural movement, at locations indicated below to comply with details shown on Drawings:
 1. Where edges of suspended ceilings abut building structure horizontally at ceiling perimeters or penetration of structural elements.
 2. Where partition and wall framing abuts overhead structure.
 - a. Provide slip or cushioned type joints as detailed to attain lateral support and avoid axial loading.
- D. Do not bridge building expansion and control joints with steel framing or furring members; independently frame both sides of joints with framing or furring members or as indicated.

3.03 INSTALLATION OF STEEL FRAMING FOR FURRED CEILINGS AND SOFFITS

- A. Screw furring members to wood framing.

- B. Secure hangers to structural support by connecting directly to structure where possible, otherwise connect to cast in concrete inserts or other anchorage devices or fasteners as indicated.
- C. Do not connect or suspend steel framing from ducts, pipes or conduit.
- D. Keep hangers and braces two inches clear of ducts, pipes and conduits.
- E. Sway brace suspended steel framing with hangers used for support.
- F. Install suspended steel framing components in sizes and at spacings indicated but not less than that required by referenced steel framing installation standard.
- G. For exterior soffits provide cross bracing and additional framing indicated or required to resist wind uplift.

3.04 INSTALLATION OF STEEL FRAMING FOR WALLS AND PARTITIONS

- A. Install runners (tracks) at floors, ceilings and structural walls and columns where gypsum drywall stud system abuts other construction.
 - 1. Where studs are installed directly against exterior walls, install asphalt felt strips between studs and wall.
- B. Installation Tolerances: Install each steel framing and furring member so that fastening surface do not vary more than 1/8 inch from plane of faces of adjacent framing.
- C. Extend partition framing full height to structural supports or substrates above suspended ceilings, except where partitions are indicated to terminate at suspended ceilings. Continue framing over frames for doors and openings and frame around ducts penetrating partitions above ceiling to provide support for gypsum board.
- D. Terminate partition framing at suspended ceilings where indicated.
- E. Install steel studs and furring in sizes and at spacings indicated but not less than that required by referenced steel framing installation standard.
 - 1. For single layer construction: Unless otherwise indicated, 16 inches on center.
- F. Install steel studs so that flanges point in the same direction and gypsum boards can be installed in the direction opposite to that of the flange.
- G. Frame door openings to comply with details indicated, with GA 219 and with applicable published recommendations of gypsum board manufacturer. Attach vertical studs at jambs with screws either directly to frames or to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs.
- H. Frame openings other than door openings to comply with details indicated, or if none indicated, in same manner as required for door openings; and install framing below sills of openings to match framing required above door heads.

END OF SECTION 09 22 00 00

Task	Specification	Specification Description
09 22 13 00	09 21 00 00	Plaster & Gypsum Board Assemblies
09 22 13 00	09 22 00 00	Supports For Plaster And Gypsum Board

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 09 29 00 00 - GYPSUM BOARD**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 DEFINITIONS

- A. Gypsum Board Construction Terminology: Refer to ASTM C 11 and GA 505 for definitions of terms for gypsum board construction not otherwise defined in this section or other referenced standards.

1.04 QUALITY ASSURANCE

- A. Fire Resistance Ratings: Where indicated, provide materials and construction which are identical to those of assemblies whose fire resistance rating has been determined per ASTM E 119 by a testing and inspecting organization acceptable to authorities having jurisdiction.
 - 1. Provide fire resistance rated assemblies identical to those indicated by reference to GA File No's. in GA 600 "Fire Resistance Design Manual" or to design designations in U.L. "Fire Resistance Directory" or in listing of other testing and agencies acceptable to authorities having jurisdiction.
- B. Perform gypsum board Work in accordance with recommendations of ASTM C 754 and GA 216 unless otherwise indicated or required by project conditions.
- C. Keep a copy of GA 216 and GA 600 in field office for duration of project.
- D. Single Source Responsibility: Obtain each type of gypsum board and related joint treatment materials from a single manufacturer.

1.05 SUBMITTALS

- A. Product Data:
 - 1. Submit product data indicating compliance with all specified requirements.
- B. Record Documents:
 - 1. Submit the following in accordance with Conditions of Contract and Division 01 Specification Sections.

2. Design Data: Submit copies of each UL design selected for each required fire resistance rating for gypsum drywall assemblies including installer certification that each UL design selected will provide the scheduled fire resistance rating in accordance with local Codes.
3. Submit certification and test results that clearly state and indicate that each individual element and component of fire rated gypsum drywall assemblies are approved and appropriately rated for specific rated assembly for which it is to be used, and that the use of such individual element will in no way jeopardize the required rating of the assembly.
4. Submit Shop Drawings including complete details indicating location of all control and expansion joints in walls and ceilings.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials in original packages, containers or bundles bearing brand name and identification of manufacturer or supplier.
- B. Store materials inside under cover and keep them dry and protected against damage from weather, direct sunlight, surface contamination, corrosion, construction traffic and other causes. Neatly stack gypsum boards flat to prevent sagging.
- C. Handle gypsum boards to prevent damage to edges, ends, and surfaces. Do not bend or otherwise damage metal corner beads and trim.

1.07 SEQUENCING AND SCHEDULING

- A. Sequence installation of gypsum sheathing board with installation of exterior cladding to comply with requirements indicated below:
 1. Do not leave gypsum sheathing board exposed to the weather after application for longer than one month.
 2. Do not leave gypsum sheathing board exposed to weather after its application for more than one month or, if protected as indicated below, for more than 6 months:
 - a. Protect cutouts, corners and joints in the sheathing by filling them with a flexible sealant at the time sheathing is applied.
 - b. As an alternate to sealant application, cover exposed exterior surface of sheathing with building paper or air infiltration barrier. Anchor covering with metal lath securely fastened through sheathing to framing. Apply covering immediately after sheathing is installed.

1.08 PROJECT CONDITIONS

- A. Environmental Conditions, General: Establish and maintain environmental conditions for application and finishing gypsum board to comply with ASTM C 840 and with gypsum board manufacturer's recommendations.
- B. Minimum Room Temperatures: For nonadhesive attachment of gypsum board to framing, maintain not less than 40 degrees F (4 degrees C). For adhesive attachment and finishing of gypsum board maintain not less than 50 degrees F (10 degrees C) for 48 hours prior to application and continuously thereafter until drying is complete.
- C. Ventilate building spaces to remove water not required for drying joint treatment materials. Avoid drafts during dry, hot weather to prevent materials from drying too rapidly.

1.09 ASSEMBLY PERFORMANCE REQUIREMENTS

- A. Sound Transmission Characteristics: For gypsum board assemblies indicated to have STC ratings, provide materials and construction identical to those of assemblies whose STC ratings were determined per ASTM E 90 and classified per ASTM E 413 by a qualified independent testing agency.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products which may be incorporated in the Work include the following:
 - 1. Grid Suspension Systems:
 - a. Armstrong World Industries
 - b. Chicago Metallic Corp.
 - c. Worthington Steel Co.
 - d. USG Interiors
 - 2. Gypsum Boards and Related Products:
 - a. Domtar Gypsum Co.
 - b. Georgia Pacific Corp.
 - c. Gold Bond Building Products Div., National Gypsum Co.
 - d. United States Gypsum Co.

2.03 STEEL FRAMING COMPONENTS FOR SUSPENDED AND FURRED CEILINGS

- A. General: Provide components which comply with ASTM C 754 for materials and sizes, unless otherwise indicated.
- B. Concrete Inserts: Inserts designed for attachment to concrete forms and for embedment in concrete, fabricated from corrosion resistant materials, with holes or loops for attachment of hanger wires and capability to sustain, without failure, a load equal to 5 times that imposed by ceiling construction, as determined from testing per ASTM E 488, conducted by an independent testing laboratory.
- C. Wire for Hangers and Ties: ASTM A 641, Class 1 zinc coating, soft temper.
- D. Hanger Rods: Mild steel, zinc coated or protected with rust inhibitive paint.
- E. Flat Hangers: Mild steel, zinc coated or protected with rust inhibitive paint.
- F. Angle Type Hangers: Angles with legs not less than 7/8 inch wide, formed from 0.0635 inch thick galvanized steel sheet complying with ASTM A 446, Coating Designation G90, with bolted connections and 5/16 inch diameter bolts.

- G. Channels: Cold rolled steel, 0.0598 inch minimum thickness of base (uncoated) metal and 7/16 inch wide flanges, protected with rust inhibitive paint, and as follows:
 - 1. Carrying Channels: 2 inches deep, 590 lbs per 1000 feet, unless otherwise indicated.
 - 2. Carrying Channels: 1-1/2 inch deep, 475 lbs per 1000 feet, unless otherwise indicated.
 - 3. Furring Channels: 3/4 inch deep, 300 lbs per 1000 feet, unless otherwise indicated.
- H. Grid Suspension System: ASTM C 645, manufacturer's standard grid suspension system composed of main beams and cross furring members which interlock to form a modular supporting network.
 - 1. Non Fire Rated Direct Hung Suspended Drywall Furring System: ASTM C 63, heavy-duty, double web steel main and cross runners with 1-3/8 inch wide capped flange face for screw attachment, and channel type wall track at perimeter; Chicago Metallic "640 Furring System".

2.04 GYPSUM BOARD

- A. Provide gypsum board of types indicated in maximum lengths available to minimize end to end joints.
 - 1. Provide gypsum board in thicknesses indicated, or if not otherwise indicated, in 5/8 inch thicknesses to comply with ASTM C 840 for application system and support spacing indicated.
- B. Gypsum Wallboard: ASTM C 36, "Regular" for vertical surfaces, "Sag-Resistant" for ceilings, and as follows:
 - 1. Type: Type X where required for fire-resistant rated assemblies.
 - 2. Type: Foil backed where indicated.
 - 3. Edges: Tapered.
 - 4. Thickness: 5/8 inch, unless otherwise indicated.
 - 5. Subject to compliance with requirements, products which may be incorporated in the Work where "Regular" gypsum wallboard is indicated include:
 - a. "Gyprock Regular"; Domtar Gypsum Co.
 - b. "GP Gypsum Board"; Georgia Pacific Corp.
 - c. "Regular Gypsum Board"; Gold Bond Building Products Div., National Gypsum Co.
 - d. "SHEETROCK Brand Gypsum Panels"; United States Gypsum Co.
 - 6. Subject to compliance with requirements, products which may be incorporated in the Work where "Type X" gypsum wallboard is indicated include:
 - a. "Gyprock Fireguard 'C' Gypsum Board"; Domtar Gypsum Co.
 - b. "Firestop Type C"; Georgia Pacific Corp.
 - c. "Fire Shield G"; Gold Bond Building Products Div., National Gypsum Co.
 - d. "SHEETROCK Brand FIRECODE 'C' Gypsum Panels"; United States Gypsum Co.
- C. Gypsum Backing Board for Multi Layer Applications: ASTM C 442 or, where backing board is not available from manufacturer, gypsum wallboard, ASTM C 36, and as follows:

1. Type: Type X for fire resistance rated assemblies.
 2. Edges: Manufacturer's standard.
- D. Water Resistant Gypsum Backing Board: ASTM C 630, and as follows:
1. Type: Regular, unless otherwise indicated.
 2. Type: Type X for fire resistance rated assemblies.
 3. Thickness: 5/8 inch, unless otherwise indicated.

2.05 SHAFT-WALL SYSTEM DESCRIPTION

- A. Performance Requirements, General: Provide gypsum board shaft wall systems complying with performance requirements specified, as demonstrated by pretesting manufacturer's corresponding stock systems.
- B. Fire Resistance Ratings: Where indicated, provide materials and construction which are identical to those of assemblies, including those incorporating elevator door and other framing, whose fire resistance has been determined per ASTM E 119 by a testing and inspecting organization acceptable to authorities having jurisdiction.
1. Provide fire resistance rated assemblies identical to those indicated by reference to GA File No.'s in GA 600 "Fire Resistance Design Manual" or to design designations in UL "Fire Resistance Directory" or in listings of other testing and inspecting agencies acceptable to authorities having jurisdiction.
- C. Steel Framing: ASTM C 645, of profile, size, and base metal thickness required to produce assemblies complying with structural performance requirements, with sectional properties computed to conform with AISI "Specification for Design of Cold Formed Steel Structural Members."
- D. Gypsum Shaftwall Board: ASTM C 442, Type X liner panel or coreboard designed for shaft wall construction, with moisture resistant paper facings.
- E. Structural Performance Characteristics: Provide gypsum board shaft wall systems engineered to withstand the following lateral design loadings (air pressures), applied transiently and cyclically, for maximum heights of partitions required, within the following deflection limits, verified by pretesting for deflection characteristics:
1. Lateral Loading: 5 per square foot
 2. Lateral Loading: 7.5 per square foot
 3. Lateral Loading: 10 per square foot
 4. Lateral Loading: 15 per square foot
 5. Lateral Loading: As indicated but not less than 10 per square foot
 6. Deflection Limit: 1/120 of partition height
 7. Deflection Limit: 1/240 of partition height
 8. Deflection Limit: 1/360 of partition height
 9. Deflection Limit: As indicated but not more than 1/240 of partition height
- F. Sound Attenuation Performance: Provide gypsum board shaft wall systems designed and pretested to achieve the following minimum ratings for sound transmission class (STC) per ASTM E 90.

1. STC Rating: 35
2. STC Rating: 39
3. STC Rating: 47
4. STC Rating: 50
5. STC Rating: As indicated but not less than 35

G. Cavity Shaft Wall Systems: Provide assemblies consisting of gypsum shaft wall boards inserted between U or J shaped metal floor and ceiling tracks; with specially shaped studs engaged in tracks and fitted between shaftwall boards; and gypsum boards on finished side or sides applied to studs in number of layers, thicknesses and arrangement indicated.

1. Shaftwall Board Thickness: As indicated.
2. Stud Shape: I, C H or double E
3. Stud Thickness: 0.0179 inch min. thickness of base metal unless otherwise indicated or required.
4. Stud Depth: As indicated.
5. Room Side Finish: As indicated.
6. Shaft Side Finish: One layer of gypsum board; provide only where finish is indicated on shaft side as well as room side, otherwise leave exposed.
7. Cavity Insulation: Provide sound attenuation blankets in cavity formed by studs between shaftwall board and room side finish.

2.06 GYPSUM SHEATHING AT EIFS SYSTEMS

A. Glass Mat Gypsum Board: Gypsum board designed as an exterior substrate for a weather barrier, consisting of a noncombustible water resistant core, essentially gypsum, surfaced with glass mats on face and back, partially or completely embedded in core, and with unsurfaced square edges. Comply with ASTM C 1177 and requirements indicated below:

1. Type: Regular unless Type X is required by Project conditions.
2. Thickness: 1/2 inch unless otherwise indicated.
3. Size: 4 feet by 8 feet

B. Product: Dens Glass Gold Exterior Sheathing, Georgia Pacific Corp.

2.07 GYPSUM SHEATHING AT ALL OTHER LOCATIONS

A. Gypsum Sheathing Board with Water Resistant Core: Gypsum sheathing board consisting of noncombustible gypsum core incorporating a water resistant material, surfaced on face, back and long edges with water repellent paper; complying with ASTM C 79 and requirements indicated below:

1. Type: Regular (not Type X)
2. Edge and End Configuration: V shaped tongue and groove long edges, square ends.
3. Thickness: 1/2 inch
4. Size: 2 feet by 8 feet

- B. Subject to compliance with requirements, gypsum sheathing boards which may be incorporated in the Work include, but are not limited to, the following:
 - 1. "Gyproc Gypsum Sheathing"; Domtar Gypsum Co.
 - 2. "G P Gypsum Sheathing"; Georgia Pacific Corp.
 - 3. "Gold Bond Gypsum Sheathing"; Gold Bond Building Products Div., National Gypsum Co.
 - 4. USG Gypsum Sheathing; United States Gypsum Co.
- C. Sheathing Tape: Tape specifically designed and manufactured to seal joints in gypsum sheathing against water and air infiltration, formulated with an adhesive that permanently bonds to gypsum sheathing substrates, and as indicated below:
 - 1. Polyethylene backed SBS modified sheathing joint tape, 0.0020 inch thick membrane, 4 inch wide: Protecto Flash Building Tape by Protecto Wrap Company, Denver, Colorado.
 - 2. Linerless polypropylene sheathing tape, 0.0027 inch thick, 2-1/2 inches wide, composed of oriented polypropylene backing coated with permanent acrylic adhesive formulated to adhere to gypsum sheathing surfaces: No. 8086 Contractor Sheathing Tape, 3M Contractor Products.
 - 3. Polyethylene tape, 0.025 inch thick, 3 inches wide, composed of polyethylene backing coated with synthetic rubber based adhesive: POLYKEN 612 Seam Seal Tape, Polyken Technologies.

2.08 TRIM ACCESSORIES

- A. Cornerbead and Edge Trim for Interior Installation: Provide corner beads, edge trim and control joints which comply with ASTM C 1047 and requirements indicated below:
 - 1. Material: Formed metal, plastic or metal combined with paper, with metal complying with the following requirement:
 - a. Sheet steel zinc coated by hot dip process.
 - b. Sheet steel coated with zinc by hot dip or electrolytic processes, or with aluminum.
 - 2. One Piece Control Joint: Formed with vee shaped slot per Fig. 1 in ASTM C 1047, with slot opening covered with removable strip.
- B. Aluminum Edge Trim: Where indicated, provide manufacturer's standard extruded aluminum edge trim of profile shown or referenced by manufacturer's standard product designation, fabricated from aluminum alloy 6063 T5 complying with ASTM B 221, with clear anodized finish.
 - 1. Manufacturer: Subject to compliance with requirements, provide aluminum accessories of one of the following:
 - a. Fry Reglet Corp.
 - b. Gordon, Inc.
 - c. MM Systems, Inc.
- C. Metal Cornerbead and Edge Trim for Exterior Ceilings: Comply with ASTM C 1047, formed from rolled zinc.

2.09 SHEATHING ACCESSORY MATERIALS

- A. Air Infiltration Barrier: As follows:

1. Asphalt saturated organic felt complying with ASTM D 226, Type I (No. 15 asphalt felt), unperforated.
2. Plastic Sheet as indicated below:
 - a. Polyethylene sheet formed by spinning continuous strands of fine high density polyethylene interconnected fibers and bonding them together by heat and pressure; and as follows:
 - 1) Thickness: 0.0061 inch thick
 - 2) Basic Weight: 8.81 lb per 1000 sq. ft. per ASTM D 646
 - 3) Roll Widths and Lengths: 3 feet by 165 feet, 9 feet by 195 feet
 - 4) Moisture Vapor Transmission Rate: 795.38 grams/sq. meter/24 hours per ASTM E 96, Procedure A.
 - 5) Surface Burning Characteristics: Flame spread: 5; smoke developed: 10; per ASTM E 84.
 - 6) Product: Subject to compliance with requirements, provide "Tyvek Housewrap" by Textile Fibers Department, Du Pont Company.
 - b. Nonwoven polymeric sheet with reinforced edges and center nailing strips for tear resistance, and as follows:
 - 1) Thickness: 0.006 inch
 - 2) Basic Weight: 9.37 lb per 1000 sq. feet per ASTM D 646
 - 3) Roll Widths and Lengths: 3 feet, 4' 6" feet, 8 feet, and 9 feet widths, 195 feet long.
 - 4) Moisture Vapor Transmission Rate: 393.40 grams/sq. meter/24 hours per ASTM E 96, Procedure A.
 - 5) Air Leakage Rate: 0.60 CFM at pressure differential of 1.56 psf, 1.12 CFM at pressure differential when tested as part of a fiber board sheathed wall assembly per ASTM E 283.
 - 6) Surface Burning Characteristics: Flame spread of 0, smoke developed 45, per ASTM E 84.
 - 7) Product: Subject to compliance with requirements, provide "Barricade Building Wrap" by Simplex Products Division, Anthony Industries, Inc.
- B. Fasteners: Type S steel drill screws, 1 inch long, with corrosion resistant finish in form of cadmium plating or proprietary coating, and as follows:
 1. For attachment of sheathing to light gage steel framing of less than 0.033 of an inch in thickness, provide steel drill screws complying with ASTM C 1002.
 2. For attachment of sheathing to steel framing from 0.033 to 0.112 of an inch in thickness, provide steel drill screws complying with ASTM C 954.
- C. Sealant: Solvent release curing joint sealant compatible with joint substrates formed by gypsum sheathing and other related materials and complying with requirements of Division 07 Section "Joint Sealers."

2.10 GYPSUM BOARD JOINT TREATMENT MATERIALS

- A. Provide materials complying with ASTM C 475, ASTM C 840, and recommendations of manufacturer of both gypsum board and joint treatment materials for the application indicated.

2.11 MISCELLANEOUS MATERIALS

- A. Provide auxiliary materials for gypsum drywall construction which comply with referenced standards and the recommendations of the manufacturer of the gypsum board.
- B. Laminating Adhesive: Special adhesive or joint compound recommended for laminating gypsum boards.
- C. Spot Grout: ASTM C 475, setting type joint compound of type recommended for spot grouting hollow metal door frames.
- D. Fastening Adhesive for Wood: ASTM C 557
- E. Fastening Adhesive for Metal: Special adhesive recommended for laminating gypsum boards to steel framing.
- F. Gypsum Board Screws: ASTM C 1002
- G. Gypsum Board Nails: ASTM C 514
- H. Asphalt Felt: ASTM D 226, Type I (No. 15)
- I. Concealed Acoustical Sealant: Nondrying, nonhardening, nonskinning, nonstaining, nonbleeding, gunnable sealant complying with requirement specified in Division 07 section "Joint Sealers."
- J. Sound Attenuation Blankets: Unfaced mineral fiber blanket insulation produced by combining mineral fibers of type described below with thermosetting resins to comply with ASTM C 665 for Type I (blankets without membrane facing); and as follows:
 - 1. Mineral Fiber Type: Fibers manufactured from glass or slag.
 - a. Owens Corning Fiberglas "Firecore 60 Sound Attenuation Batts"
 - b. U. S. Gypsum Co. "Thermafiber Sound Attenuation Fire Blankets".
 - 2. Provide blankets in thicknesses shown or, if not shown, in manufacturer's standard nominal thickness corresponding to the wall stud width.
- K. Sound Pads: Flat sheets of heavy, mastic, flexible, non-hardening material such as "Sound Pad #68" manufactured by L. H. Dottie Company.
- L. Security Mesh: ¾ inch x 16 gage, flatten.
- M. Vapor Retarder: Two outer layers of polyethylene film and one inner layer of nylon reinforcing, with an overall thickness of 6.0 to 8.0 mils.
- N. Fire-Retardant, Reinforced-Polyethylene Vapor Retarders: Two outer layers of polyethylene film laminated to an inner reinforcing layer consisting of either a nonwoven grid of nylon cord or polyester scrim and weighing not less than 26 lb/1000 sq. ft. (13 kg/100 sq.m), with maximum permeance rating of 0.0403 perm (2.3 ng/PA x s x sq. m) and flame-spread and smoke-developed indicates of not more than 5 and 75, respectively.
 - 1. Subject to compliance with requirements, products that may be incorporated in the Work include:
 - 2. Reinforced Polyethylene Vapor Retarder: "Griffolyn T 65," Griffolyn Div., Reef Industries, Inc.

3. Fire-Retardant, Reinforced-Polyethylene Vapor Retarders: Griffolyn T-55 FR; Reef Industries, Inc. Griffolyn Div.
- O. Tape for Vapor Retarder: Pressure sensitive tape of type recommended by vapor retarder manufacturer for sealing joints and penetrations in vapor retarder.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine substrates to which drywall construction attaches or abuts, preset hollow metal frames, cast in anchors, and structural framing, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of drywall construction. Do not proceed with installation until unsatisfactory conditions have been corrected.
- B. Ceiling Anchorages: Coordinate installation of ceiling suspension system with installation of overhead structural systems to ensure that inserts and other structural anchorage provisions have been installed to receive ceiling anchors in a manner that will develop their full strength and at spacing required to support ceiling.
 1. Furnish concrete inserts and other devices indicated, to other trades for installation well in advance of time needed for coordination with other construction.
- C. Before sprayed on fireproofing is applied, attach offset anchor plates or ceiling runners (tracks) to surfaces indicated to receive sprayed on fireproofing. Where offset anchor plates are required provide continuous units fastened to building structure not more than 24 inches on center and to ceiling runners.
- D. After sprayed on fireproofing has been applied, remove only as much fireproofing as needed to complete installation of drywall construction. Protect fireproofing that remains from damage.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

3.03 INSTALLATION OF STEEL FRAMING FOR SUSPENDED CEILINGS

- A. Install suspended steel framing components in sizes and at spacings indicated but not less than that required by referenced steel framing installation standard.
- B. Suspend ceiling hangers from building structural members and as follows:
 1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or ceiling suspension system. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
 2. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with the location of hangers required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards.

3. Secure wire hangers by looping and wire tying, either directly to structures or to inserts, eyescrews, or other devices and fasteners that are secure and appropriate for substrate, and in a manner that will not cause them to deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.
 4. Secure flat, angle, channel, and rod hangers to structure, including intermediate framing members, by attaching to inserts, eyescrews, or other devices and fasteners that are secure and appropriate for structure as well as for type of hanger involved, and in a manner that will not cause them to deteriorate or fail due to age, corrosion, or elevated temperatures.
 5. Do not support ceilings directly from permanent metal forms. Furnish cast in place hanger inserts that extend through forms.
 6. Do not attach hangers to steel deck tabs.
 7. Do not attach hangers to steel roof deck. Attach hangers to structural members.
 8. Do not connect or suspend steel framing from ducts, pipes or conduit.
- C. Sway brace suspended steel framing with hangers used for support.
- D. Installation Tolerances: Install steel framing components for suspended ceilings so that cross furring members or grid suspension members are level to within 1/8 inch in 12 feet as measured both lengthwise on each member and transversely between parallel members.
- E. Wire tie or clip furring members to main runners and to other structural supports as indicated.
- F. Grid Suspension System: Attach perimeter wall track or angle where grid suspension system meets vertical surfaces. Mechanically join main beam and cross furring members to each other and butt cut to fit into wall track.

3.04 APPLICATION AND FINISHING OF GYPSUM BOARD, GENERAL

- A. Gypsum Board Application and Finishing Standard: Install and finish gypsum board to comply with ASTM C 840 and GA 216.
- B. Install polyethylene vapor retarder on interior of framing members of exterior insulated walls to comply with the following requirements:
1. Extend vapor retarder to extremities of exterior insulated walls and to cover miscellaneous voids in insulated substrates, including those which have been stuffed with loose thermal insulation.
 2. Seal vertical joints in vapor retarders over framing by lapping not less than 2 wall studs. Fasten vapor retarders to framing at top, end, and bottom edges, at perimeter of wall openings, and at lap joints; space fasteners 16 inches on center.
 3. Seal joints in vapor retarder caused by pipes, conduits, electrical boxes and similar items penetrating vapor retarders with cloth or aluminized tape which bonds permanently to vapor retarder.
 4. Repair tears or punctures in vapor retarder immediately before concealment by application of gypsum board or other construction.
- C. Install sound attenuation blankets where indicated, prior to gypsum board unless readily installed after board has been installed.
1. Install sound pad sheets on the back of any device or accessory that is mounted in a drywall partition shown on Drawings to have an STC rating. Devices and accessories include: electrical receptacles, electrical outlet boxes, toilet accessories, and medical gas outlets.

- D. Locate exposed end butt joints as far from center of walls and ceilings as possible, and stagger not less than 24 inches in alternate courses of board.
- E. Install ceiling boards across framing in the manner which minimizes the number of end butt joints, and which avoids end joints in the central area of each ceiling. Stagger end joints at least 24 inches.
- F. Install wall/partition boards in manner which minimizes the number of end butt joints or avoids them entirely where possible. At stairwells and similar high walls, install boards horizontally with end joints staggered over studs.
- G. Install exposed gypsum board with face side out. Do not install imperfect, damaged or damp boards. Butt boards together for a light contact at edges and ends with not more than 1/16 inch open space between boards. Do not force into place.
- H. Locate either edge or end joints over supports, except in horizontal applications where intermediate supports or gypsum board back blocking is provided behind end joints. Position boards so that like edges abut, tapered edges against tapered edges and mill cut or field cut ends against mill cut or field cut ends. Do not place tapered edges against cut edges or ends. Stagger vertical joints over different studs on opposite sides of partitions.
- I. Attach gypsum board to steel studs so that leading edge or end of each board is attached to open (unsupported) edge of stud flange first.
- J. Attach gypsum board to supplementary framing and blocking provided for additional support at openings and cutouts.
- K. Spot grout hollow metal door frames for solid core wood doors, hollow metal doors and doors over 32 inches wide. Apply spot grout at each jamb anchor clip just before inserting board into frame.
- L. Form control joints and expansion joints at locations indicated, with space between edges of boards, prepared to receive trim accessories.
- M. Cover both faces of steel stud partition framing with gypsum board in concealed spaces (above ceilings, etc.), except in chase walls which are braced internally.
 - 1. Except where concealed application is indicated or required for sound, fire, air or smoke ratings, coverage may be accomplished with scraps of not less than 8 sq. ft. area, and may be limited to not less than 75 percent of full coverage.
 - 2. Fit gypsum board around ducts, pipes, and conduits.
 - 3. Where partitions intersect open concrete coffers, cut gypsum board to fit profile of coffers and allow 1/4 to 1/2 inch wide joint for sealant.
- N. Isolate perimeter of non load bearing drywall partitions at structural abutments. Provide 1/4 inch to 1/2 inch space and trim edge with "U" bead edge trim. Seal joints with acoustical sealant.
- O. Where sound rated drywall construction is indicated, seal construction at perimeters, control and expansion joints, openings and penetrations with a continuous bead of acoustical sealant including a bead at both faces of partitions. Comply with ASTM C 919 and manufacturer's recommendations for location of edge trim, and close off sound flanking paths around or through construction, including sealing of partitions above acoustical ceilings.
 - 1. For double layer partition systems, construction above acoustical ceilings may be installed with base layer only.
- P. Space fasteners in gypsum boards in accordance with referenced gypsum board application and finishing standard and manufacturer's recommendations.

3.05 METHODS OF GYPSUM BOARD APPLICATION

- A. Single Layer Application: Install gypsum wallboard as follows:
 - 1. On ceilings apply gypsum board prior to wall/partition board application to the greatest extent possible.
 - 2. On partitions/walls apply gypsum board vertically (parallel to framing), unless otherwise indicated, and provide sheet lengths which will minimize end joints.
 - 3. On Z furring members apply gypsum board vertically (parallel to framing) with no end joints. Locate edge joints over furring members.
- B. Wall Tile Base: Where drywall is base for thin set ceramic tile and similar rigid applied wall finishes, install gypsum backing board.
 - 1. In "dry" areas install gypsum backing board or wallboard with tapered edges taped and finished to produce a flat surface.
- C. At showers, tubs and similar "wet areas" install glass mesh mortar units and treat joints to comply with ANSI A108.11 and manufacturer's recommendations for type of application indicated.
- D. Double Layer Application: Install gypsum backing board for base layer and gypsum wallboard for face layer.
 - 1. On ceilings apply base layer prior to application of base layer on walls/partitions; apply face layers in same sequence. Offset joints between layers at least 10 inches. Apply base layers at right angles to supports unless otherwise indicated.
 - 2. On partitions/walls apply base layer and face layers vertically (parallel to framing) with joints of base layer over supports and face layer joints offset at least 10 inches with base layer joints.
 - 3. On Z furring members apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.
- E. Acoustical Tile Base: Where drywall is base for adhesively applied acoustical tile, install gypsum backing board.
 - 1. Provide either V joint type backing board or tape and finish joints to produce a flat surface.
- F. Single Layer Fastening Methods: Apply gypsum boards to supports as follows:
 - 1. Fasten with screws.
 - 2. Fasten to steel framing with adhesive and supplementary screws.
 - 3. Fasten to wood supports with single nailing.
 - 4. Fasten to wood supports with double nailing.
 - 5. Fasten to wood supports with adhesive and supplementary nails or screws.
- G. Double Layer Fastening Methods: Apply base layer of gypsum board and face layer to base layer as follows:
 - 1. Fasten both base layers and face layers separately to supports with screws.
 - 2. Fasten base layers with screws and face layer with adhesive and supplementary fasteners.

3. Fasten base layers to wood supports with nails and face layer with adhesive and supplementary fasteners.
- H. Direct Bonding to Substrate: Where gypsum board is indicated to be directly adhered to a substrate (other than studs, joists, furring members or base layer of gypsum board), comply with gypsum board manufacturer's recommendations, and temporarily brace or fasten gypsum board until fastening adhesive has set.
- I. Exterior Soffits and Ceilings: Apply exterior gypsum soffit board perpendicular to supports, with end joints staggered over supports. Install with 1/4 inch open space where boards abut other construction.
 1. Fasten with cadmium plated screws, or with galvanized or aluminum nails where supports are nailable.

3.06 INSTALLATION OF DRYWALL TRIM ACCESSORIES

- A. General: Where feasible, use the same fasteners to anchor trim accessory flanges as required to fasten gypsum board to the supports. Otherwise, fasten flanges to comply with manufacturer's recommendations.
- B. Install corner beads at external corners.
- C. Install metal edge trim whenever edge of gypsum board would otherwise be exposed or semi exposed, and except where plastic trim is indicated. Provide type with face flange to receive joint compound except where "U" bead (semi finishing type) is indicated.
- D. Install U bead where indicated, and where exterior gypsum board edges are not covered by applied moldings or indicated to receive edge trim with face flanges covered with joint compound.
- E. Install plastic edge trim where indicated on wall panels at juncture with ceilings.
- F. Install control joints at locations indicated, or if not indicated, at spacings and locations required by referenced gypsum board application and finish standard, and approved by the Architect for visual effect.
 1. Extend control joints for full height and width of gypsum board installation. Do not stop joints short of termination of gypsum board.
- G. Install H molding in exterior gypsum drywall construction where control joints are indicated.

3.07 FINISHING OF DRYWALL

- A. General: Apply joint treatment at gypsum board joints (both directions); flanges of corner bead, edge trim, and control joints; penetrations; fastener heads, surface defects and elsewhere as required to prepare Work for decoration.
- B. Prefill open joints and rounded or beveled edges, if any, using setting type joint compound.
- C. Apply joint tape at joints between gypsum boards, except where trim accessories are indicated.
- D. Levels of Gypsum Board Finish: Provide the following levels of gypsum board finish per GA 214.
 1. Level 1 for ceiling plenum areas, concealed areas, and where indicated, unless a higher level of finish is required for fire resistive rated assemblies and sound rated assemblies.
 2. Level 2 where water resistant gypsum backing board panels form substrates for tile, and where indicated.

3. Level 3 for gypsum board surfaces indicated to receive medium or heavy textured finishes before painting.
 4. Level 4 for gypsum board surfaces indicated to receive light textured finishes, wallcoverings, and flat paints over light textures.
 5. Level 5 for gypsum board surfaces indicated to receive gloss and semigloss enamels, nontextured flat paints, and where indicated.
- E. Finish exterior gypsum soffit board by using setting type joint compounds to prefill joints, embed tape, and to apply first, fill (second) and finish (third) coats; smooth each coat before joint compound hardens to minimize need for sanding; sand between coats and after finish coat.
- F. Base for Acoustical Tile: Where gypsum board is indicated as a base for adhesively applied acoustical tile, install tape and 2 coat compound treatment, without sanding.
- G. Water Resistant Gypsum Backing Board Base for Ceramic Tile: Comply with ASTM C 840 and manufacturer's recommendations for treatment of joints behind tile.
- H. Water Resistant Backing Board Base for Ceramic Tile: Finish joints between water resistant backing board with tape and setting type joint compound to comply with gypsum board manufacturer's recommendations and installation standards referenced in Division 9 Section "Tile."
- I. Partial Finishing: Omit third coat and sanding on concealed drywall construction which is indicated for drywall finishing or which requires finishing to achieve fire resistance rating, sound rating or to act as air or smoke barrier.
- J. At all corridor partitions, smoke-stop partitions, horizontal exit enclosures, and fire walls, permanently mark both sides of wall construction above ceilings to identify wall construction.
1. Label each wall with the words "(number) HOUR (FIRE) (SMOKE) Barrier - Do Not Penetrate".
 2. Use stencils and paint letters at least 3 inches high in red ink or sign paint.
 3. Apply to partition between 12 inches and 24 inches above ceiling line, located on surfaces that will not be concealed from view by subsequent construction.
 4. For walls in excess of 20 feet long, message repeated every 20 feet unless otherwise required by applicable code. For walls less than 20 feet in length, label each wall.
 5. Use vertical bold black lines with arrows designating areas of individual walls that have different ratings.

3.08 INSTALLATION OF GYPSUM BOARD SHAFT WALL SYSTEMS

- A. General: Install gypsum board shaft wall systems to comply with performance and other requirements indicated as well as with manufacturer's installation instructions and the following:
1. ASTM C 754 for installation of steel framing.
- B. Do not bridge building expansion joints with shaft wall system, frame both sides of joints with furring and other support as indicated.
- C. Install supplementary framing, blocking and bracing to support gravity and pullout loads of fixtures, equipment, services, heavy trim, furnishings and similar Work which cannot be adequately supported directly by regular framing of gypsum board shaft wall system.
1. Support elevator hoistway door frames independently of shaft wall framing system, or reinforce system in accordance with system manufacturer's instructions.

2. Where handrails are indicated for direct attachment to gypsum board shaft wall system, provide not less than a 0.0341 inch thick by 4 inch wide galvanized steel reinforcement strip, accurately positioned and secured behind not less than one gypsum board face layer of 1/2 inch or 5/8 inch thickness.
- D. Coordinate gypsum board shaft wall construction with sprayed on fireproofing of the structure, so that both remain complete and undamaged. Patch or replace sprayed on fireproofing removed or damaged during the installation of the shaft wall system.
- E. Integrate stair hanger rods with gypsum board shaft wall system where indicated (and where possible); by locating cavity of system as required to enclose rods.
- F. At penetrations in shaft wall, maintain fire resistance rating of entire shaft wall assembly by installing supplementary fire protection behind boxes containing wiring devices, elevator call buttons, elevator floor indicators, and similar items.
- G. Isolate shaft wall system from transfer of structural loading to system, both horizontally and vertically. Provide slip or cushioned type joints to attain lateral support and avoid axial loading. Comply with details shown and with manufacturer's instructions.
- H. Seal gypsum board shaft walls at perimeter of each section which abuts other Work and at joints and penetrations within each section. Install acoustical sealant to withstand dislocation by air pressure differential between shaft and external spaces; comply with manufacturer's instructions and ASTM C 919.
- I. In elevator shafts where gypsum board shaft wall system cannot be positioned within 2 inches of shaft face of structural beams, floor edges and similar projections into shaft, install 1/2 inch or 5/8 inch thick gypsum board cants covering tops of projections as follows:
 1. Slope cant panels not more than 15 degrees from vertical. Set base edge of panels in gypsum board adhesive and secure top edges to shaft walls at 24 inches on center with screws fastened to shaft wall framing.
 2. Where cants exceed 2 inches, support gypsum board with steel studs spaced 24 inches on center; extend studs from top of projection to shaft wall framing behind cant.

3.09 SHEATHING INSTALLATION

- A. General: Except as otherwise indicated, comply with manufacturer's instructions, GA 253, and the following for the installation of gypsum sheathing.
 1. Cut boards at penetrations, edges and other obstructions of the Work; fit tight against abutting Work, except provide 3/8 inch setback where non loadbearing Work abuts structural elements at head and jams.
 2. Coordinate installation of sheathing with installation of flashing and joint sealers so that these combined materials are installed in the sequence and manner which prevents exterior moisture from passing through completed exterior wall assembly to the interior.
 3. Apply fasteners so that screw heads bear tightly against face of gypsum sheathing boards but do not cut into face paper.
 4. Do not bridge building expansion joints with gypsum sheathing; cut and space edges to match spacing of structural support elements.

- B. Horizontal Installation: Install 2 feet wide gypsum sheathing boards horizontally with V grooved edge down and tongue edge up. Interlock tongue with groove to bring long edges in contact with edges of adjacent boards without forcing. Abut ends of boards over centers of stud flanges and stagger end joints of adjacent boards not less than one stud spacing, two where possible. Screw attach boards at perimeter and within field of board to each steel stud as follows:
 - 1. Fasteners spaced approximately 8 inches on center and set back 3/8 inch minimum from edges and ends of boards.
 - 2. For sheathing under stucco cladding, boards may be initially tacked in place with screws if overlying self furring metal lath is screw attached through gypsum sheathing to studs immediately after installation of sheathing.
- C. Air Infiltration Barrier Application: Cover gypsum board sheathing with air infiltration barrier as follows:
 - 1. Cut back air infiltration barrier 1/2 inch on each side of break in supporting members at control joint locations.
 - 2. Apply asphalt saturated organic felt horizontally with 2 inch overlap and 6 inch endlap; fasten to sheathing with corrosion resistant staples.
 - 3. Apply plastic sheet to comply with manufacturer's printed directions.
 - 4. Apply air infiltration barrier to cover upstanding flashing with 4 inch overlap.

3.10 APPLICATION OF TEXTURE FINISH

- A. Surface Preparation and Primer: Prepare and prime drywall and other surfaces in strict accordance with texture finish manufacturer's instructions. Apply primer to all surfaces to achieve texture finish.
- B. Finish Application: Mix and apply finish to drywall and other surfaces indicated to receive finish in strict accordance with manufacturer's instructions to produce a uniform texture matching Architect's sample without starved spots or other evidence of thin application, and free of application patterns.
- C. Remove any texture droppings or overspray from door frames, windows and other adjoining construction.

3.11 PROTECTION

- A. Provide final protection and maintain conditions, in a manner suitable to Installer, which ensures gypsum drywall construction being without damage or deterioration at time of Substantial Completion.

END OF SECTION 09 29 00 0028 10 0029 00

THIS PAGE INTENTIONALLY LEFT BLANK

Task	Specification	Specification Description

09 30 16 00	09 31 00 00	Thin-set Tiling

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 09 31 00 00 - THIN-SET TILING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Single Source Responsibility for Tile: Obtain each color, grade, finish, type, composition, and variety of tile from a single source with resources to provide products of consistent quality in appearance and physical properties without delaying progress of the Work.
- B. Single Source Responsibility for Setting and Grouting Materials: Obtain ingredients of a uniform quality from one manufacturer for each cementitious and admixture component and from one source or producer for each aggregate.
- C. Installer Qualifications: Engage an experienced Installer who has successfully completed tile installations similar in material, design, and extent to that indicated for Project.
- D. Preinstallation Conference: Conduct conference at Project Site to comply with requirements of Division 01.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Submit manufacturer's product data and installation instructions for all manufactured products and materials.
- B. Record Documents:
 - 1. Submit plans of all areas to receive tile Work showing location of expansion and control joints, layout of tile units, and other conditions affecting the Work.
 - a. Include details showing setting methods, expansion joint constructions, and relationships to adjacent substrates.
 - b. Locate precisely each joint and crack in tile substrates by measuring, record measurements on shop Drawings, and coordinate them with tile joint locations, in consultation with Architect.

2. Submit samples for initial selection purposes of each tile type and grout in form of manufacturer's color charts consisting of actual units or sections of units showing full range of colors, textures, and patterns available for each type of finish indicated.
 - a. Where finish involves normal color and texture variations, include sample sets composed of two or more units showing full range of variations expected.
 - b. Include similar samples of material for joints and accessories involving color selection.
3. Submit samples for verification purposes of each type, class, and color/ pattern of tile required, not less than 18 inches square on plywood or hardboard backing, and grouted as required. Architect's review will be for color, pattern and texture only. Compliance with all other requirements is the exclusive responsibility of the Contractor.
 - a. Prepare and submit new samples, if requested, until appearance is acceptable to the Architect.
4. Provide manufacturer's Master Grade Certificate bearing TCA Certification mark and stating type, grade and location of material for all tile specified to be "Standard Grade".
5. Provide guarantee on waterproofing membrane stating that the waterproofing membrane will not leak, cause delamination of tile installation, or otherwise fail to perform as protective waterproofing for a period of five (5) years from the Date of Substantial Completion.

1.05 PERFORMANCE REQUIREMENTS

- A. Static Coefficient of Friction: For tile installed on walkway surfaces, provide products with the following values as determined by testing identical products per ASTM C 1028:
 1. Level Surfaces: Minimum 0.6
 2. Step Treads: Minimum 0.6
 3. Ramp Surfaces: Minimum 0.8
- B. Load-Bearing Performance: For ceramic tile installed on walkway surfaces, provide installations rated for the following load-bearing performance level based on testing assemblies according to ASTM C 627 that are representative of those indicated for this Project.
 1. Extra Heavy: Passes cycles 1 through 14
 2. Heavy: Passes cycles 1 through 12
 3. Moderate: Passes cycles 1 through 10
 4. Light: Passes cycles 1 through 6
 5. Residential: Passes cycles 1 through 3

1.06 MOCK-UP INSTALLATION

- A. Prior to beginning tile installation, arrange for a meeting, on-site, with the Architect to review proposed tile layout in each area scheduled to receive tile.
 1. Arrange for a "mock-up" installation of tile at certain areas as directed to establish acceptable appearance standards.

2. In general, mock-up areas will be limited approximately 40 square feet each and will be located at intersections of floor and wall, at corners of rooms.
- 1.07 DELIVERY, STORAGE, AND HANDLING
- A. Deliver and store packaged materials in original containers with seals unbroken and labels intact until time of use. Comply with requirement of ANSI A137.1 for labeling sealed tile packages.
 - B. Prevent damage or contamination to materials by water, freezing, foreign matter, and other causes.
 - C. Handle tile with temporary protective coating on exposed surfaces to prevent coated surfaces from contacting backs or edges of other units. If despite these precautions coating does contact bonding surfaces of tile, remove coating from bonding surfaces before setting tile.
- 1.08 PROJECT CONDITIONS
- A. Maintain environmental conditions and protect Work during and after installation to comply with referenced standards and manufacturer's printed recommendations.
 - B. Vent temporary heaters to exterior to prevent damage to tile Work from carbon dioxide buildup.
 - C. Maintain temperatures at 50 degrees F (10 degrees C) or more in tiled areas during installation and for seven (7) days after completion, unless higher temperatures are required by referenced installation standard or manufacturer's instructions.
- 1.09 EXTRA MATERIALS
- A. Deliver extra materials to Owner. Furnish extra materials that match products installed as described below, packaged with protective covering for storage and identified with labels clearly describing contents.
 1. Tile and Trim Units: Furnish quantity of full size units equal to 3 percent of amount installed, for each type, composition, color, pattern, and size.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. The notes and schedules on the Drawings establish manufacturer and model/design of tile products required for the Project. Provide the products listed unless Architect approves products of other manufacturer specifically for this Project.

2.03 TILE SCHEDULE

- A. Provide tile from the following manufacturer or as approved by architect:
 1. Dal-Tile
 2. Other approved equal

2.04 PRODUCTS, GENERAL

- A. ANSI Standard for Ceramic Tile: Comply with ANSI A137.1 "American National Standard Specifications for Ceramic Tile" for types, compositions, and grades of tile indicated.

1. Furnish tile complying with "Standard Grade" requirements unless otherwise indicated.
- B. ANSI Standard for Tile Installation Materials: Comply with ANSI standard referenced with products and materials indicated for setting and grouting.
- C. Colors, Textures, and Patterns: Where manufacturer's standard products are indicated for tile, grout, and other products requiring selection of colors, surface textures, patterns, and other appearance characteristics, provide specific products or materials complying with the following requirements:
 1. Match Architect's sample.
 2. Match color, texture, and pattern indicated by reference to manufacturer's standard designations for these characteristics.
 3. Provide selections made by Architect from manufacturer's full range of standard colors, textures, and patterns for products of type indicated.
 4. Provide tile trim and accessories that match color and finish of adjoining flat tile.
- D. Factory Blending: For tile exhibiting color variations within the ranges selected during sample submittals, blend tile in factory and package accordingly so that tile units taken from one package show the same range in colors as those taken from other packages and match approved samples.
 1. Trim and Special Shapes: Rounded external corners, and trim shapes at head, jamb, and sills of opening, of same material and finish as tile, and as follows:
 - a. Base: At tiled walls, integral cove base; at vinyl fabric covered walls, integral cove, field tile and surface bullnose to form a base 5 inches high.
 - b. Base: At tiled floor and walls, integral cove base; at vinyl composition tile floors and tiled walls, straight field tile base; at vinyl composition tile floors and vinyl wallcovering, straight field tile and surface bullnose to form a base 4 inches high.
 - c. External Corners: Surface bullnose shapes.
 - d. Internal Corners: Field butted square, except use square corner-combination angle and stretcher type cap.
 2. At locations indicated, provide tile manufacturer's abrasive grit surfaced tile for slip-resistant finish.
- E. Mounting: Where factory mounted tile is required, provide back or edge mounted tile assemblies as standard with manufacturer unless another mounting method is indicated.
 1. Where tile is indicated for installation in swimming pools, on exteriors or in wet areas, do not use back or edge mounted tile assemblies unless tile manufacturer specifies that this type of mounting is suitable for these kinds of uses and has been successfully used on other projects.
 - a. Internal Corners: Field butted square corners, except use coved base and cap angle pieces designed to member with stretcher shapes.
 - b. Tapered Transition Tile: Shape designed to effect transition between thickness of tile floor and adjoining floor finishes of different thickness, tapered to provide a reduction in thickness from 1/2 inch to 1/4 inch across nominal 4 INCH dimension.
- F. For glazed wall tile, provide "Standard Grade" units, complying with ANSI A137.1. Provide 6" x 6" cushion edge units (except where square edge units are indicated), trim and special shapes as indicated and required.

- G. Accessories for Glazed Wall Tile: Provide vitreous china accessories of type and size indicated and in color and finish to match adjoining glazed wall tile.

1. One soap holder for each shower and tub indicated.
2. One roll paper holder at each water closet.

2.05 QUARRY TILE

- A. For quarry tile, provide "Standard Grade" units complying with ANSI A137.1. As indicated on drawings.

1. Color and Texture: As selected by Architect from standard quarry tile colors equivalent to American Olean Tile Company or Dal Tile Corp., as accepted by Architect.
2. At locations indicated, provide tile manufacturer's abrasive grit surfaced tile for slip-resistant finish.
3. Protect quarry tile against damage from furan grout by coating exposed faces with wax coating to produce a thin continuous film. Use wax which is compatible with grout and which is removable by a steaming method approved by tile and grout manufacturer. Apply wax in manner to avoid coating edges or backs and handle coated tile to prevent waxed surfaces from contacting backs or edges of other units.

2.06 STONE THRESHOLDS

- A. Provide stone that is uniform in color and finish, fabricated to sizes and profiles indicated or required to provide transition between tile surfaces and adjoining finished floor surfaces.

1. Fabricate thresholds to heights indicated, but not more than 1/2 inch (12.7 mm) above adjoining finished floor surfaces, with transition edges beveled on a slope of no greater than 1:2.

- B. Marble Thresholds: Provide marble thresholds complying with ASTM C 503 requirements for exterior use and for abrasion resistance where exposed to foot traffic, a minimum hardness of 10 per ASTM C 241.

1. Match Architect's sample for color and finish.
2. Provide white, honed "Carrera" marble complying with MIA Group "A" requirements for soundness.

- C. Slate Thresholds: Provide nonfading slate thresholds with honed finish complying with ASTM C 629 requirements for interior use and for abrasion resistance.

1. Match Architect's sample for color.

2.07 WATERPROOFING FOR THINSET TILE INSTALLATIONS

- A. Polyethylene Sheet Waterproofing: Manufacturer's standard proprietary product consisting of composite sheets, 60 inches wide by a nominal thickness of 0.030, composed of an inner layer of chlorinated polyethylene sheet faced on both sides with laminated high strength nonwoven polyester material, designed for embedding in latex portland cement mortar, and as substrate for latex portland cement mortar setting bed.

1. "Nobleseal TS"; Noble Co. (distributed by H.B. Fuller Co.)

- B. Liquid Applied Membrane: Cold applied rubberized elastomeric membrane incorporating a reinforcing fabric, nominally 20 mils thick, designed specifically for use as a waterproof membrane under tile installations.

1. "Laticrete 9235" by Laticrete International Inc., Bethany, Connecticut.

2. Provide manufacturer's recommended sealants and other accessories required for a complete installation.

2.08 MORTAR SETTING BED MATERIALS

- A. Provide portland cement mortar as specified in the ANSI A 108 Series, Materials, and Installation Specifications with a Portland Cement mortar/sand mix in 1:6 proportion.
- B. For "Thin Set/Dry Set" mortar bed setting, provide factory sanded Portland Cement mix with manufacturer's standard acrylic latex additive conforming to ANSI A 118.4.
 1. American Olean "759 Thinset Mortar with AO Acrylic Thin Set Additive".
 2. Laticrete "Floor 'N Wall Thin Set Mortar".
 3. Mapei "Kerabond Premium".
 4. C Cure Chemical Co. "Permabond with C Cure Latex Admixture".

2.09 ADHESIVE SETTING MATERIALS

- A. For wall tile adhesive, provide factory mixed organic adhesive complying with ANSI A 136.1, Type I, with manufacturer's certification of conformance.
 1. American Olean "AO 1700 Adhesive".
 2. Laticrete "No. 15 Multi-Mastic".
 3. Mapei "Ultra/Mastic 1".
 4. C Cure Chemical Co. "Permabond 1002".

2.10 JOINT GROUT

- A. For mosaic tile and glazed tile grout, provide manufactured joint grout conforming to ANSI A 118.6.
 1. American Olean "Wall and Floor Grout".
 2. Laticrete "Floor Grout" or "Wall Grout".
 3. Mapei "Keracolor".
 4. C Cure "MP Grout".
- B. For epoxy grout, provide two-component epoxy grout conforming to ANSI 118.3.
 1. American Olean "AO 6000 AAR II HT Epoxy Mortar and Grout".
 2. Mapei "Kerapoxy".
 3. C Cure "Epoxy 100".
- C. For furan grout for quarry tile, provide furan grout conforming to ASTM C 658, 2 component polyfurfuryl alcohol based resin and hardeners; L & M Furan produced by L & M Surco Manufacturing Company, Inc.

2.11 MISCELLANEOUS MATERIALS

- A. Metal Edge Strips: Zinc alloy or stainless steel terrazzo strips, 1/8 inch wide at top edge with integral provision for anchorage to mortar bed or substrate unless otherwise indicated.
- B. Crack Isolation Membrane: Where thin-set tile will be installed over existing cracks in the substrate, provide an isolation membrane specifically manufactured for the purpose by one of the following:
 - 1. "Laticrete 9235" by Laticrete International Inc.
 - 2. "Crack Isolation Sheet CIS" by The Noble Company.
- C. Temporary Protective Coating: Provide product indicated below that is formulated to protect exposed surfaces of tile against adherence of mortar and grout, is compatible with tile and mortar/grout products, and is easily removable after grouting is completed without damaging grout or tile.
 - 1. Petroleum paraffin wax, fully refined, tasteless, odorless, containing at least 0.5 percent oil with a melting point of 120 degrees F (49 degrees C) to 140 degrees F (60 degrees C) per ASTM D 87.
 - 2. Grout release in form of manufacturer's standard proprietary liquid coating that is specially formulated and recommended for use as a temporary protective coating for tile.

2.12 MIXING MORTARS AND GROUT

- A. Mix mortars and grouts to comply with requirements of referenced standards and manufacturers including those for accurate proportioning of materials, water, or additive content; type of mixing equipment, selection of mixer speeds, mixing containers, mixing time, and other procedures needed to produce mortars and grouts of uniform quality with optimum performance characteristics for application indicated.

PART 3 - EXECUTION**3.01 PREPARATION**

- A. Examine substrates and areas where tile will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.
 - 1. Verify that substrates for setting tile are firm, dry, clean, and free from oil or waxy films and curing compounds.
 - 2. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of Work, and similar items located in or behind tile has been completed before installing tile.
- B. Do not proceed with installation until unsatisfactory conditions have been corrected.
- C. Blending: For tile exhibiting color variations within the ranges selected during sample submittals, verify that tile has been blended in factory and packaged accordingly so that tile units taken from one package show the same range in colors as those taken from other packages and match approved samples. If not factory blended, either return to manufacturer or blend tiles at the Project Site before installing.
- D. Field Applied Temporary Protective Coating: Where indicated under tile type or needed to prevent adhesion or staining of exposed tile surfaces by grout, protect exposed surfaces of tile against adherence of mortar and grout by precoating them with a continuous film of temporary protective coating indicated below, taking care not to coat unexposed tile surfaces:
 - 1. Petroleum paraffin wax, applied hot.

2. Grout release.
3. Petroleum paraffin wax or grout release.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. ANSI Tile Installation Standard: Comply with parts of ANSI 108 series of tile installation standards included under "American National Standard Specifications for the Installation of Ceramic Tile" that apply to type of setting and grouting materials and methods indicated.
 1. Dry Set or latex cement set wall and floor tile: ANSI A 108.5.
 2. Organic adhesive set wall and floor tile: ANSI A 108.4.
 3. Tile set in portland cement mortar bed: ANSI A 108.1.
 4. Tile set in chemical resistant epoxy mortar and grout: ANSI A 108.6.
 5. Tile set in chemical resistant furan mortar and grout: ANSI A 108.8.
- D. TCA Installation Guidelines: TCA "Handbook for Ceramic Tile Installation"; comply with TCA installation methods indicated.
- E. Extend tile Work into recesses and under or behind equipment and fixtures to form a complete covering without interruptions except as otherwise shown. Terminate Work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.
- F. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Carefully grind cut edges of tile abutting trim, finish, or built in items for straight aligned joints. Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so that plates, collars, or covers overlap tile.
- G. Carefully lay out tile in an endeavor to center the tiles to space them evenly, and to avoid cutting them. If cutting is necessary, cutting shall be done by saw cut or drilling only, no tile cutters or snipped edges allowed; all cut ends shall be rubbed smooth and even. Lay out tile so that no tile less than 1/2 size occurs. For height stated in feet and inches, maintain full courses to produce nearest attainable heights without cutting tile. Align joints in wall tile vertically and horizontally. No staggering of joints will be permitted. All cutting and drilling shall be done without marring surfaces and shall be done neatly to fit closely around pipes, fixtures, and fittings so that cover plates will overlap cuts.
- H. Unless otherwise shown, lay tile in grid pattern. Align joints when adjoining tiles on floor, base, walls, and trim are same size. Lay out tile Work and center tile fields in both directions in each space or on each wall area. Adjust to minimize tile cutting. Provide uniform joint widths unless otherwise shown.
 1. Confirm locations of joints in substrate will align with planned expansion joints in tile Work. Adjust layout of tile if necessary to align expansion joints with substrate conditions.
 2. For tile mounted in sheets, make joints between tile sheets same width as joints within tile sheets so that extent of each sheet is not apparent in finished Work.
- I. Lay out tile wainscots to next full tile beyond dimensions indicated.

J. Expansion Joints: Locate expansion joints and other sealant filled joints, including control, Contraction, and isolation joints, where indicated during installation of setting materials, mortar beds, and tile. Do not saw cut joints after installation of tiles.

1. Locate joints in tile surfaces directly above joints in concrete substrates.
2. Prepare joints and apply sealants to comply with requirements of Division 07 Section "Joint Sealers."

K. Grout tile to comply with the requirements of the following installation standards:

1. For ceramic tile grouts (sand portland cement, dry set, commercial portland cement, and latex portland cement grouts), comply with ANSI A108.10.
2. For chemical resistant epoxy grouts, comply with ANSI A108.6.
3. For chemical resistant furan grouts, comply with ANSI A108.8.

3.03 WATERPROOFING FOR THINSET TILE INSTALLATIONS

- A. Install waterproofing in compliance with waterproofing manufacturer's instructions to produce a waterproof membrane of uniform thickness bonded securely to substrate.
- B. Do not install tile over waterproofing until waterproofing has cured and been tested to determine that it is watertight.

3.04 FLOOR INSTALLATION METHODS

A. Thick Set Setting Bed:

1. Mortar Bed: 1-1/4 inch to 2 inch thick latex-portland cement mortar.
2. Bond Coat: Portland cement paste on plastic mortar bed or latex-portland cement mortar on cured mortar bed (Contractor's option).
3. On Grade: TCA F112.
4. Above Grade: TCA F111.
5. Over Waterproof Membrane: TCA F121.
6. With Epoxy Mortar and Bond Coat: TCA F132.

B. Medium Set Setting Bed; Tiles 8" x 8" and Larger:

1. Bond Coat: 3/8 inch to 3/4 inch thick medium bed dry set latex-portland cement mortar.
2. Typical: TCA F113, except for bond coat thickness.
3. Over Waterproof Membrane: TCA F122, except for bond coat thickness.

C. Thin Set Setting Bed; Tiles 6" x 6" and Smaller:

1. Bond Coat: 3/32 inch minimum thick dry set latex-portland cement mortar.
2. Typical: TCA F113.
3. Over Waterproof Membrane: TCA F122.
4. With Epoxy Mortar and Grout: TCA F131.

- D. Set marble thresholds in thin set mortar setting beds; point threshold base flush with adjoining tile floors. Comply with TCA Method TH821.

3.05 WALL TILE INSTALLATION METHODS

- A. Install types of tile designated for wall application to comply with requirements indicated below for setting bed methods, TCA installation methods related to subsurface wall conditions, and grout types:
- B. Over gypsum board, use organic adhesive in accordance with TCA Method W242.
- C. Over glass mesh mortar units, at typical locations, use latex portland cement mortar in accordance with TCA Method W244.
 - 1. At Bath Tubs; TCA B412.
 - 2. At Showers; TCA B415.
- D. Over masonry or concrete use latex portland cement mortar; TCA W202.

3.06 GROUT

- A. Wall Joints (less than 1/8 inches wide): Unsanded Grout.
- B. Floor and Wall Joints (1/8 inch to 5/8 inch wide): Sanded Grout.
- C. Floor Joints in Showers, and all Quarry Tile Joints (1/16 inch to 3/8 inch wide): Epoxy Grout.

3.07 EXPANSION JOINT INSTALLATION

- A. At all floor tile installations, provide expansion joints at perimeter of area to be tiled, at all penetrations in tile Work, and 12 feet 0 inches on center both ways as recommended in the TCA "Handbook for Ceramic Tile Installation" unless closer spacing is indicated or required by Project conditions. Install removable strips of the same depth as the finished tile system including setting bed. Remove strips after grouting and curing operations.
 - 1. Install joints in accordance with TCA Method EJ711.

3.08 CLEANING AND PROTECTION

- A. Upon completion of placement and grouting, clean all ceramic tile surfaces so they are free of foreign matter.
 - 1. Remove latex portland cement grout residue from tile as soon as possible.
 - 2. Unglazed tile may be cleaned with acid solutions only when permitted by tile and grout manufacturer's printed instructions, but no sooner than fourteen (14) calendar days after installation. Protect metal surfaces, cast iron, and vitreous plumbing fixtures from effects of acid cleaning. Flush surface with clean water before and after cleaning.
 - 3. Remove temporary protective coating by method recommended by coating manufacturer that is acceptable to brick and grout manufacturer. Trap and remove coating to prevent it from clogging drains.
- B. Leave finished installation clean and free of cracked, chipped, broken, unbonded, and otherwise defective tile Work.
- C. Provide final protection and maintain conditions in a manner acceptable to manufacturer and installer that ensures tile is without damage or deterioration at time of Substantial Completion.

1. When recommended by tile manufacturer, apply a protective coat of neutral protective cleaner to completed tile walls and floors. Protect installed tile Work with kraft paper or other heavy covering during construction period to prevent staining, damage, and wear.
 2. Prohibit foot and wheel traffic from tiled floors for at least seven (7) calendar days after grouting is completed.
- D. Before final inspection, remove protective coverings and rinse neutral cleaner from tile surfaces.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 09 51 13 00 - ACOUSTICAL PANEL CEILINGS**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Installer Qualifications: Engage an experienced Installer who has successfully completed acoustical ceilings similar in material, design, and extent to those indicated for Project.
- B. Fire Performance Characteristics: Provide acoustical ceilings that are identical to those tested for the following fire performance characteristics, per ASTM test method indicated below, by UL or other testing and inspecting organizations acceptable to authorities having jurisdiction. Identify acoustical ceiling components with appropriate markings of applicable testing and inspecting organization.
 - 1. Surface Burning Characteristics: As follows, tested per ASTM E 84 and complying with ASTM E 1264 for Class A products.
 - a. Flame Spread: 25 or less.
 - b. Smoke Developed: 50 or less.
 - 2. Fire Resistance Ratings: As indicated by reference to design designations in UL "Fire Resistance Directory," for types of assemblies in which acoustical ceilings function as a fire protective membrane and tested per ASTM E 119.
 - a. Protect lighting fixtures and air ducts to comply with requirements indicated for rated assembly.
- C. Single Source Responsibility for Ceiling Units: Obtain each type of acoustical ceiling unit from a single source with resources to provide products of consistent quality in appearance and physical properties without delaying progress of the Work.
- D. Single Source Responsibility for Suspension System: Obtain each type of suspension system from a single source with resources to provide products of consistent quality in appearance and physical properties without delaying progress of the Work.

- E. Coordination of Work: Coordinate layout and installation of acoustical ceiling units and suspension system components with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire suppression system components (if any), and partition system (if any).
- F. Preinstallation Conference: Conduct conference at Project Site.

1.04 SUBMITTALS

A. Coordination Drawings:

- 1. Reflected ceiling plans drawn accurately to scale and coordinating penetrations and ceiling mounted items. Show the following:
 - a. Ceiling suspension members.
 - b. Method of attaching hangers to building structure.
 - c. Ceiling mounted items including light fixtures; air outlets and inlets; speakers; sprinkler heads; and special moldings at walls, column penetrations, and other junctures with adjoining construction.

B. Samples:

- 1. Samples for verification purposes of each type of exposed finish required, prepared on samples of size indicated below and of same thickness and material indicated for final unit of Work. Where finishes involve normal color and texture variations, include sample sets showing full range of variations expected.
 - a. 6" X 6" samples of each unit pattern and color required.
 - b. Set of 12 inch long samples of exposed suspension system members, including moldings, for each color and system type required.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver acoustical ceiling units to Project Site in original, unopened packages and store them in a fully enclosed space where they will be protected against damage from moisture, direct sunlight, surface contamination, and other causes.
- B. Before installing acoustical ceiling units, permit them to reach room temperature and stabilized moisture content.
- C. Handle acoustical ceiling units carefully to avoid chipping edges or damaging units in any way.

1.06 PROJECT CONDITIONS

- A. Space Enclosure: Do not install interior acoustical ceilings until space is enclosed and weatherproof, wet Work in space is completed and nominally dry, Work above ceilings is complete, and ambient conditions of temperature and humidity will be continuously maintained at values near those indicated for final occupancy.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 METAL SUSPENSION SYSTEMS, GENERAL

- A. Standard for Metal Suspension Systems: Provide manufacturer's standard metal suspension systems of types, structural classifications, and finishes indicated that comply with applicable ASTM C 635 requirements.
- B. Finishes and Colors: Provide manufacturer's standard factory applied finish for type of system indicated.
 - 1. High Humidity Finish: Comply with ASTM C 635 requirements for "Coating Classification for Severe Environment Performance" where high humidity finishes are indicated.
- C. Attachment Devices: Size for 5 times design load indicated in ASTM C 635, Table 1, Direct Hung unless otherwise indicated.
 - 1. Cast In Place and Postinstalled Anchors in Concrete: Anchors of type indicated below, fabricated from corrosion resistant materials, with holes or loops for attachment of hangers of type indicated and with capability to sustain, without failure, a load equal to 5 times that imposed by ceiling construction, as determined by testing per ASTM E 488, conducted by a qualified independent testing laboratory.
 - a. Cast in place anchors.
 - b. Chemical anchors.
 - c. Expansion anchors.
 - d. Undercut anchors.
 - 2. Powder Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion resistant materials, with clips or other accessory devices for attachment of hangers of type indicated, and with capability to sustain, without failure, a load equal to 10 times that imposed by ceiling construction, as determined by testing per ASTM E 1190, conducted by a qualified testing laboratory.
- D. Wire for Hangers and Ties: ASTM A 641, Class 1 zinc coating, soft temper.
 - 1. Gage: Provide wire sized so that stress at 3 times hanger design load (ASTM C 635, Table 1, Direct Hung), will be less than yield stress of wire, but provide not less than 0.106 inch diameter (12 gage).
- E. Hanger Rods: Mild steel, zinc coated, or protected with rust inhibitive paint.
- F. Flat Hangers: Mild steel, zinc coated, or protected with rust inhibitive paint.
- G. Angle Hangers: Angles with legs not less than 7/8 inch wide, formed with 0.0365 inch thick galvanized steel sheet complying with ASTM A 446, Coating Designation G90, with bolted connections and 5/16 inch diameter bolts.
- H. Edge Moldings and Trim: Metal or extruded aluminum of types and profiles indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations that fit type of edge detail and suspension system indicated. Provide trim with hemmed edges.

1. For lay in panels with reveal edge details, provide stepped edge molding that forms reveal of same depth and width as that formed between edge of panel and flange at exposed suspension member.
2. For circular penetrations of ceiling, provide edge moldings fabricated to diameter required to fit penetration exactly.
3. For narrow faced suspension systems, provide suspension system manufacturer's standard edge moldings that match width and configuration of exposed runners.

2.03 EXPOSED GRID SYSTEM

- A. Provide double web main and cross runners, 1-1/2 inch deep nominally, with painted aluminum cap.
- B. For direct hung system, provide "intermediate duty" structural classification per ASTM C 635.
- C. Exposed grid system for Shall be one of the following unless noted on drawings:

CEILING ANGLE WHITE 7/8" X 7/8" X 12'
 DONN # M7
 TEE CEILING GRID CROSS 48" X 1-1/2"
 DONN #DX-422
 TEE CROSS DONN DX 524 56" X 1-1/2"

TEE MAIN CEILING GRID 6" CENTERS X 12'
 DONN DX-24

2.04 ACOUSTIC UNIT MATERIALS

- A. Provide units of configuration indicated which are prepared for mounting method designated and which comply with ASTM E 1264 requirements, including those indicated by reference to type, form, pattern, grade (NRC as applicable), light reflectance coefficient (LR), edge detail, and joint detail (if any).
- B. Acoustic units are specified below by manufacturer and design to establish standards of appearance and performance. Equivalent products of other manufacturers may be incorporated into the Work if accepted by the Architect.
- C. Provide the following lay-in acoustic panels where indicated. Units shall be one of the following, unless noted otherwise on drawings:

CEILING TILE 24" X 24" X 5/8" ARMSTRONG
 756A
 CEILING TILE 24" X 24" X 3/4" ARMSTRONG

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine substrates and structural framing to which ceiling system attaches or abuts, with Installer present, for compliance with requirements specified in this and other sections that affect installation and anchorage of ceiling system. Do not proceed with installation until unsatisfactory conditions have been corrected.
- B. Coordination: Furnish layouts for preset inserts, clips, and other ceiling anchors whose installation is specified in other sections.
 - 1. Furnish concrete inserts and similar devices to other trades for installation well in advance of time needed for coordination of other Work.
- C. Measure each ceiling area and establish layout of acoustical units to balance border widths at opposite edges of each ceiling. Avoid use of less than half width units at borders, and comply with reflected ceiling plans.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install acoustical ceiling systems to comply with installation standard referenced below, per manufacturer's instructions and CISCA "Ceiling Systems Handbook."
 - 1. Standard for Installation of Ceiling Suspension Systems: Comply with ASTM C 636.
 - 2. Standards for Installation of Ceiling Suspension Systems Requiring Seismic Restraint: Comply with ASTM C 636 and ASTM E 580.

3. CISCAs Recommendations for Acoustical Ceilings: Comply with CISCAs "Recommendations for Direct-Hung Acoustical Tile and Lay-in Panel Ceilings--Seismic Zones 0-2."
 4. CISCAs Guidelines for Systems Requiring Seismic Restraint: Comply with CISCAs "Guidelines for Seismic Restraint of Direct-Hung Suspended Ceiling Assemblies--Seismic Zones 3 & 4."
 5. U.B.C.s "Metal Suspension Systems for Acoustical Tile and for Lay-in Panel Ceilings": U.B.C. Standard 25-2.
- D. Arrange acoustical units and orient directionally patterned units (if any) in manner shown by reflected ceiling plans.
1. Install units with pattern running in one direction.
 2. Install units with pattern running in alternating directions to form checkerboard layout.
- E. Suspend ceiling hangers from building structural members and as follows:
1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or ceiling suspension system. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
 2. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with the location of hangers at spacings required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards.
 3. Secure wire hangers by looping and wire tying, either directly to structures or to inserts, eyescrews, or other devices that are secure and appropriate for substrate, and in a manner that will not cause them to deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.
 4. Secure flat, angle, channel, and rod hangers to structure, including intermediate framing members, by attaching to inserts, eyescrews, or other devices that are secure and appropriate for structure to which hangers are attached as well as for type of hanger involved, and in a manner that will not cause them to deteriorate or fail due to age, corrosion, or elevated temperatures.
 5. Do not support ceilings directly from permanent metal forms; furnish cast in place hanger inserts that extend through forms.
 6. Do not attach hangers to steel deck tabs.
 7. Do not attach hangers to steel roof deck. Attach hangers to structural members.
 8. Space hangers not more than 4' 0" on center along each member supported directly from hangers, unless otherwise shown, and provide hangers not more than 8 inches from ends of each member.
- F. Install edge moldings of type indicated at perimeter of acoustical ceiling area and where necessary to conceal edges of acoustical units.
1. Screw attach moldings to substrate at intervals not over 16 inches on center and not more than 3 inches from ends, leveling with ceiling suspension system to tolerance of 1/8 inch in 12' 0". Miter corners accurately and connect securely.
 2. When using pop rivets use white color.

- G. Install suspension system runners so they are squared and securely interlocked with one another. Remove and replace dented, bent, or kinked members.
- H. Install acoustical panels with undamaged edges and fitted accurately into suspension system runners and edge moldings. Scribe and cut panels at borders and penetrations to provide a neat, precise fit.
- I. Install acoustical units in coordination with suspension system, with edges concealed by support of suspension members. Scribe and cut panels to fit accurately at borders and at penetrations.
 - 1. For square-edged panels, install panels with edges fully hidden from view by flanges of suspension system runners and moldings.
 - 2. For reveal-edged panels on suspension system runners, install panels with bottom of reveal in firm contact with top surface of runner flanges.
 - 3. For reveal-edged panels on suspension system members with box-shaped flanges, install panels with reveal surfaces in firm contact with suspension system surfaces and panel faces flush with bottom face of runners.
 - 4. Paint cut panel edges remaining exposed after installation; match color of exposed panel surfacing using coating recommended in writing for this purpose by acoustical panel manufacturer.
 - 5. Install hold down clips in areas indicated and in areas where required by governing regulations or for fire resistance ratings; space as recommended by panel manufacturer, unless otherwise indicated or required.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 09 61 36 00 - STATIC-CONTROL FLOOR COVERINGS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for static-control resilient floor coverings. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Static-dissipative, solid vinyl floor tile, rubber floor tile, vinyl composition floor tile, vinyl sheet floor covering, and rubber sheet floor covering.
 - b. Conductive, solid vinyl floor tile, rubber floor tile, vinyl sheet floor covering, and rubber sheet floor covering.

C. Performance Requirements

1. Static-Dissipative Properties: Provide floor coverings with static-control properties indicated as determined by testing identical products per test method indicated by an independent testing and inspecting agency.
 - a. Electrical Resistance: Test per ASTM F 150 with 100-V applied voltage **OR** ESD-STM-7.1, **as directed**.
 - 1) Average greater than 1 megohm and less than or equal to 1000 megohms when test specimens are tested surface to ground.
 - 2) Average no less than 1 megohm and less than or equal to 1000 megohms when installed floor coverings are tested surface to ground.
 - b. Static Generation: Less than 300 V when tested per AATCC-134 at 20 percent relative humidity with conductive footwear.
 - c. Static Decay: 5000 to 0 V in less than 0.25 seconds when tested per FED-STD-101C/4046.1.
2. Conductive Properties: Provide floor coverings with static-control properties indicated as determined by testing identical products per test method indicated by an independent testing and inspecting agency.
 - a. Electrical Resistance: Test per ASTM F 150 with 500-V applied voltage **OR** ESD-STM-7.1 **OR** NFPA 99, Annex E **OR** UL 779, **as directed**.
 - 1) Average greater than 25,000 ohms and less than 1 megohm when test specimens and installed floor coverings are tested surface to surface (point to point).
 - 2) Average no less than 25,000 ohms with no single measurement less than 10,000 ohms when installed floor coverings are tested surface to ground.
 - b. Static Generation: Less than 100 V when tested per AATCC-134 at 20 percent relative humidity with conductive footwear.
 - c. Static Decay: 5000 to 0 V in less than 0.03 **OR** 0.01, **as directed**, seconds when tested per FED-STD-101C/4046.1.

D. Submittals

1. Product Data: For each type of product indicated.
2. LEED Submittal:
 - a. Product Data for Credit EQ 4.1: For static-control adhesive and chemical-bonding compound, including printed statement of VOC content.
3. Shop Drawings: For each type of floor covering. Include floor covering layouts, edges, columns, doorways, enclosing partitions, built-in furniture, cabinets, and cutouts.
4. Samples: For each type of floor covering indicated and of size indicated below:
 - a. Floor Tile: Full-size **OR** 6-by-9-inch (150-by-230-mm), **as directed**, units.

- b. Sheet Floor Covering: 6-by-9-inch (150-by-230-mm) sections of floor covering.
- c. Heat-Welding Bead: Include manufacturer's standard-size Samples, but not less than 9 inches (230 mm) long, of each color required.
- 5. Seam Samples: For seamless-installation technique indicated and for each floor covering product, color, and pattern required; with seam running lengthwise and in center of 6-by-9-inch (152-by-230-mm) Sample applied to a rigid backing and prepared by Installer for this Project.
- 6. Product test reports.
- 7. Field quality-control reports.
- 8. Maintenance data.

E. Quality Assurance

- 1. Fire-Test-Response Characteristics: As determined by testing identical products according to ASTM E 648 or NFPA 253 by a qualified testing agency.
 - a. Critical Radiant Flux Classification: Class I, not less than 0.45 W/sq. cm.
- 2. Preinstallation Conference: Conduct conference at Project site.

F. Delivery, Storage, And Handling

- 1. Store floor coverings and installation materials in dry spaces protected from the weather, with ambient temperatures maintained within range recommended by manufacturer but not less than 50 deg F (10 deg C) or more than 90 deg F (32 deg C).
 - a. Floor Tile: Store on flat surfaces.
 - b. Sheet Floor Covering: Store rolls upright.

G. Project Conditions

- 1. Maintain ambient temperatures within range recommended by manufacturer, but not less than 70 deg F (21 deg C) or more than 85 deg F (29 deg C), in spaces to receive floor coverings during the following time periods:
 - a. 48 hours before installation.
 - b. During installation.
 - c. 48 hours after installation.
- 2. Until Substantial Completion, maintain ambient temperatures within range recommended by manufacturer, but not less than 55 deg F (13 deg C) or more than 95 deg F (35 deg C).
- 3. Close spaces to traffic during floor covering installation.
- 4. Close spaces to traffic for 48 hours after floor covering installation.
- 5. Install floor coverings after other finishing operations, including painting, have been completed.

1.2 PRODUCTS

A. Acceptable Manufacturer

- 1. Roppe
 - a. *Roppe ROP605 or ROP604 ESD adhesive must be used with Roppe ESD Conductive Static Control Solid Vinyl Tile & Roppe ESD Static Dissipative Control Solid Vinyl Tile. Roppe vinyl welding beads, 160" in diameter, are available in matching colors.

B. Static-Dissipative Resilient Floor Coverings

- 1. Static-Dissipative, Solid Vinyl Floor Tile: ASTM F 1700, Class I (monolithic), Type A (smooth surface).
 - a. Thickness: In manufacturer's standard thickness, but not less than 0.08 inch (2.0 mm).
 - b. Size: 12 by 12 inches (305 by 305 mm) **OR** 24 by 24 inches (610 by 610 mm) **OR** 36 by 36 inches (914 by 914 mm), **as directed**.
 - c. Seaming Method: Heat welded **OR** Chemically bonded **OR** Standard, **as directed**.
 - d. Colors and Patterns: As selected from full range of industry colors.
- 2. Static-Dissipative Rubber Floor Tile: ASTM F 1344; except in manufacturer's standard hardness when tested per ASTM D 2240 using Shore, Type A durometer.
 - a. Raised-Disc Floor Tile: Class I-A (homogenous rubber, solid color):

- 1) Size: 39.4 by 39.4 inches (1000 by 1000 mm).
- 2) Seaming Method: Chemically bonded **OR** Standard, **as directed**.
- 3) Colors and Patterns: As selected from full range of industry colors.
- b. Hammered-Surface Textured Floor Tile: Class I-B (homogenous rubber, through-mottled pattern).
 - 1) Thickness: Not less than 0.09 inch (2.2 mm) **OR** 0.14 inch (3.5 mm), **as directed**.
 - 2) Size: 19.7 by 19.7 inches (500 by 500 mm); not less than 0.09 inch (2.2 mm) **OR** 39.4 by 39.4 inches (1000 by 1000 mm); not less than 0.14 inch (3.5 mm), **as directed**.
 - 3) Seaming Method: Chemically bonded **OR** Standard, **as directed**.
 - 4) Colors and Patterns: As selected from full range of industry colors.
- c. [Smooth] [Textured]-Surface Floor Tile: Class I-B (homogenous rubber, through-mottled pattern).
 - 1) Thickness: Not less than 0.08 inch (2.0 mm) **OR** 0.14 inch (3.5 mm), **as directed**.
 - 2) Size: 24 by 24 inches (610 by 610 mm) **OR** 39.4 by 39.4 inches (1000 by 1000 mm), **as directed**.
 - 3) Seaming Method: Heat welded **OR** Standard, **as directed**.
 - 4) Colors and Patterns: As selected from full range of industry colors.
3. Static-Dissipative, Recycled Rubber Floor Tile: Manufactured from postconsumer rubber.
 - a. Thickness: Not less than 0.16 inch (4.0 mm) **OR** 0.75 inch (19 mm), **as directed**.
 - b. Size: 18 by 18 inches (450 by 450 mm) **OR** 36 by 36 inches (914 by 914 mm), **as directed**.
 - c. Colors and Patterns: As selected from full range of industry colors.
4. Static-Dissipative, Vinyl Composition Floor Tile: ASTM F 1066 (vinyl composition floor tile, nonasbestos formulated), Class 2 (through-pattern tile).
 - a. Thickness: Not less than 0.125 inch (3.2 mm).
 - b. Size: 12 by 12 inches (305 by 305 mm).
 - c. Colors and Patterns: As selected from full range of industry colors.
5. Static-Dissipative, Vinyl Sheet Floor Covering: ASTM F 1913 (unbacked) or ASTM F 1303, Type II, Grade I, Class B (nonfoamed plastic backing).
 - a. Thickness: Not less than 0.08 inch (2.0 mm).
 - b. Size: Manufacturer's standard roll width and length.
 - c. Seaming Method: Heat welded **OR** Standard, **as directed**.
 - d. Colors and Patterns: As selected from full range of industry colors.
6. Static-Dissipative, Rubber Sheet Floor Covering: ASTM F 1859, Type I (homogenous).
 - a. Wear Surface: Smooth **OR** Slightly textured, **as directed**.
 - b. Thickness: Not less than 0.08 inch (2.0 mm) **OR** 0.14 inch (3.5 mm), **as directed**.
 - c. Size: Manufacturer's standard roll width and length.
 - d. Seaming Method: Heat welded **OR** Standard, **as directed**.
 - e. Colors and Patterns: As selected from full range of industry colors.
- C. Conductive Resilient Floor Coverings
 1. Conductive, Solid Vinyl Floor Tile: ASTM F 1700, Class I (monolithic), Type A (smooth surface).
 - a. Thickness: In manufacturer's standard thickness, but not less than 0.08 inch (2.0 mm).
 - b. Size: 12 by 12 inches (305 by 305 mm) **OR** 24 by 24 inches (610 by 610 mm) **OR** 36 by 36 inches (914 by 914 mm), **as directed**.
 - c. Seaming Method: Heat welded **OR** Chemically bonded **OR** Standard, **as directed**.
 - d. Colors and Patterns: As selected from full range of industry colors.
 2. Conductive Rubber Floor Tile: ASTM F 1344, Class II-B (laminated rubber, mottled wear layer).
 - a. Wear Surface: Smooth.
 - b. Thickness: 0.10-inch (2.5-mm).
 - c. Size: 24 by 24 inches (610 by 610 mm).
 - d. Seaming Method: Heat welded **OR** Standard, **as directed**.
 - e. Colors and Patterns: As selected from full range of industry colors.
 3. Conductive, Vinyl Sheet Floor Covering: ASTM F 1303, Type II, Grade I, Class B (nonfoamed plastic backing).
 - a. Thickness: Manufacturer's standard thickness, but not less than 0.08 inch (2.0 mm).

- b. Size: Manufacturer's standard roll width and length.
- c. Seaming Method: Heat welded **OR** Standard, **as directed**.
- d. Colors and Patterns: As selected from full range of industry colors.
- 4. Conductive, Rubber Sheet Floor Covering: ASTM F 1344, Class II-B (laminated rubber, mottled wear layer).
 - a. Wear Surface: Smooth.
 - b. Thickness: Manufacturer's standard thickness, but not less than 0.10-inch (2.5-mm).
 - c. Size: Manufacturer's standard roll width and length.
 - d. Seaming Method: Heat welded **OR** Standard, **as directed**.
 - e. Colors and Patterns: As selected from full range of industry colors.

D. Installation Materials

- 1. Trowelable Leveling and Patching Compounds: Latex-modified, portland cement or blended hydraulic-cement-based formulation provided or approved by manufacturer for applications indicated.
- 2. Static-Control Adhesive: Provided or approved by manufacturer; type that maintains electrical continuity of floor covering system to ground connection.
- 3. Use adhesives that comply with the following limits for VOC content when calculated according to 40 CFR, Subpart D (EPA Method 24):
 - a. VCT and Asphalt Tile Adhesives: Not more than 50 g/L.
 - b. Rubber Floor Adhesives: Not more than 60 g/L.
- 4. Grounding Strips: Provided or approved by manufacturer; type and size that maintains electrical continuity of floor covering system to ground connection.
- 5. Seamless-Installation Accessories:
 - a. Heat-Welding Bead: Solid-strand product of manufacturer for heat welding seams.
 - 1) Color: As selected from manufacturer's full range to contrast with floor covering **OR** Match floor covering, **as directed**.
 - b. Chemical-Bonding Compound: Product of manufacturer for chemically bonding seams.
 - 1) Use chemical-bonding compound that has a VOC content of 350 **OR** 510, **as directed**, g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- 6. Integral-Flash-Cove Base Accessories:
 - a. Cove Strip: 1-inch (25-mm) radius support strip provided or approved by manufacturer.
 - b. Cap Strip: Square metal, vinyl, or rubber cap **OR** Tapered vinyl cap, **as directed**, provided or approved by manufacturer.
 - c. Corners: Metal inside and outside corners and end stops provided or approved by floor covering manufacturer.
- 7. Maintenance Floor Tiles: Special floor tiles inscribed "Conductive floor. Do not wax."
- 8. Floor Polish: Provide protective, static-control liquid floor polish products as recommended by floor covering manufacturer.

1.3 EXECUTION

A. Preparation

- 1. Prepare substrates according to manufacturer's written instructions[and with oversight by manufacturer's representative] to ensure adhesion of floor coverings and electrical continuity of floor covering systems.
- 2. Concrete Substrates: Prepare according to ASTM F 710.
 - a. Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
 - b. Remove substrate coatings and other substances that are incompatible with floor covering adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
 - c. Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer. Proceed with installation only after substrates pass testing.
 - d. Moisture Testing: Perform tests recommended by manufacturer and as follows. Proceed with installation only after substrates pass testing.

- 1) Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. (1.36 kg of water/92.9 sq. m) in 24 hours.
- 2) Perform relative humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have maximum 75 percent relative humidity level measurement.
3. Access Flooring Panels: Remove protective film of oil or other coating using method recommended by access flooring manufacturer.
4. Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound and remove bumps and ridges to produce a uniform and smooth substrate.
5. Do not install floor coverings until they are same temperature as space where they are to be installed.
 - a. Move floor coverings and installation materials into spaces where they will be installed at least 48 hours in advance of installation.
6. Sweep and vacuum clean substrates to be covered by floor coverings immediately before installation.

B. Installation, General

1. Install static-control resilient floor covering according to manufacturer's written instructions and with oversight by manufacturer's representative.
2. Embed grounding strips in static-control adhesive. Extend grounding strips beyond perimeter of static-control resilient floor covering surfaces to ground connections.
3. Scribe, cut, and fit floor coverings to butt neatly and tightly to vertical surfaces and permanent fixtures including built-in furniture, cabinets, pipes, outlets, and door frames.
4. Extend floor coverings into toe spaces, door reveals, closets, and similar openings. Extend floor covering to center of door openings.
5. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on floor coverings as marked on substrates. Use chalk or other nonpermanent, nonstaining marking device.
6. Install floor coverings on covers for telephone and electrical ducts, and similar items in installation areas. Maintain overall continuity of color and pattern with pieces of floor coverings installed on covers. Tightly adhere floor covering edges to substrates that abut covers and to cover perimeters.
7. Adhere floor coverings to substrates using a full spread of static-control adhesive applied to substrate to produce a completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.
8. Seamless Installation:
 - a. Heat-Welded Seams: Comply with ASTM F 1516. Rout joints and heat weld with welding bead to permanently fuse sections into a seamless floor covering. Prepare, weld, and finish seams to produce surfaces flush with adjoining floor covering surfaces.
 - b. Chemically Bonded Seams: Bond seams with chemical-bonding compound to permanently fuse sections into a seamless floor covering. Prepare seams and apply compound to produce tightly fitted seams without gaps, overlays, or excess bonding compound on floor covering surfaces.
9. Integral-Flash-Cove Base: Cove floor coverings 6 inches (152 mm) **OR** dimension indicated, **as directed**, up vertical surfaces. Support floor coverings at horizontal and vertical junction with cove strip. Butt at top against cap strip.
 - a. Install metal corners at inside and outside corners.

C. Floor Tile Installation

1. Comply with manufacturer's written instructions for installing floor tile.
2. Lay out floor tiles from center marks established with principal walls, discounting minor offsets, so floor tiles at opposite edges of room are of equal width. Adjust as necessary to avoid using cut widths that equal less than one-half floor tile at perimeter.
 - a. Lay floor tiles square with room axis **OR** at a 45-degree angle with room axis **OR** in pattern indicated, **as directed**.

3. Match floor tiles for color and pattern by selecting floor tiles from cartons in same sequence as manufactured and packaged, if so numbered. Discard broken, cracked, chipped, or deformed floor tiles.
 - a. Lay static-dissipative, vinyl composition floor tiles with grain running in one direction **OR** with grain direction alternating in adjacent floor tiles (basket-weave pattern) **OR** in pattern of colors and sizes indicated, **as directed**.
4. In each space where conductive, solid vinyl floor tile is installed, install maintenance floor tile identifying conductive floor tile in location approved by Architect.

D. Sheet Floor Covering Installation

1. Comply with manufacturer's written instructions for installing sheet floor coverings.
2. Unroll sheet floor coverings and allow them to stabilize before cutting and fitting.
3. Lay out sheet floor coverings as follows:
 - a. Maintain uniformity of sheet floor covering direction.
 - b. Minimize number of seams and place them in inconspicuous and low-traffic areas, at least 6 inches (152 mm) away from parallel joints in floor covering substrates.
 - c. Match edges of floor coverings for color shading at seams.
 - d. Avoid cross seams.

E. Field Quality Control

1. Testing: Engage a qualified testing agency to test electrical resistance of static-control resilient floor covering systems for compliance with requirements.
 - a. Arrange for testing after installation static-control adhesives have fully cured and floor covering systems have stabilized to ambient conditions and after ground connections are completed.
 - b. Arrange for testing of floor coverings before **OR** after **OR** before and after, **as directed**, performing floor polish procedures.
2. Static-control resilient floor coverings will be considered defective if they do not pass tests and inspections.
3. Prepare test and inspection reports.

F. Cleaning And Protection

1. Comply with manufacturer's written instructions for cleaning and protection of floor coverings.
2. Perform the following operations immediately after completing floor covering installation:
 - a. Remove static-control adhesive and other blemishes from exposed surfaces.
 - b. Sweep and vacuum surfaces thoroughly.
 - c. Damp-mop surfaces to remove marks and soil.
3. Protect floor coverings from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period.
 - a. Do not wax static-control resilient floor coverings.
 - b. If recommended in writing by manufacturer, apply protective static-control floor polish formulated to maintain or enhance floor covering's electrical properties to floor covering surfaces that are free from soil, static-control adhesive, and surface blemishes.
 - 1) Verify that both floor polish and its application method are approved by manufacturer and that floor polish will not leave an insulating film that reduces floor coverings' effectiveness for static control.
4. Cover floor coverings until Substantial Completion.

END OF SECTION 09 61 36 00

SECTION 09 63 43 00 - RESINOUS FLOORING**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for resinous flooring. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Decorative resinous flooring systems.
 - b. Industrial resinous flooring systems.
 - c. High-performance resinous flooring systems.

C. Submittals

1. Product Data: For each type of product indicated. Include manufacturer's technical data, application instructions, and recommendations for each resinous flooring component required.
2. LEED Submittal:
 - a. Product Data for Credit EQ 4.2: For resinous flooring systems, documentation including printed statement of VOC content and chemical components.
3. Samples: For each resinous flooring system required, 6 inches (150 mm) square, applied to a rigid backing by Installer for this Project.
4. Product Schedule: For resinous flooring. Use same designations indicated on Drawings.
5. Installer Certificates: Signed by manufacturer certifying that installers comply with specified requirements.
6. Material Certificates: For each resinous flooring component, from manufacturer.
7. Material Test Reports: For each resinous flooring system.
8. Maintenance Data: For resinous flooring to include in maintenance manuals.

D. Quality Assurance

1. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of flooring systems required for this Project.
 - a. Engage an installer who is certified in writing by resinous flooring manufacturer as qualified to apply resinous flooring systems indicated.
2. Source Limitations: Obtain primary resinous flooring materials, including primers, resins, hardening agents, grouting coats, and topcoats, from single source from single manufacturer. Provide secondary materials, including patching and fill material, joint sealant, and repair materials, of type and from source recommended by manufacturer of primary materials.
3. Preinstallation Conference: Conduct conference at Project site.

E. Delivery, Storage, And Handling

1. Deliver materials in original packages and containers, with seals unbroken, bearing manufacturer's labels indicating brand name and directions for storage and mixing with other components.

F. Project Conditions

1. Environmental Limitations: Comply with resinous flooring manufacturer's written instructions for substrate temperature, ambient temperature, moisture, ventilation, and other conditions affecting resinous flooring application.
2. Lighting: Provide permanent lighting or, if permanent lighting is not in place, simulate permanent lighting conditions during resinous flooring application.

3. Close spaces to traffic during resinous flooring application and for not less than 24 hours after application unless manufacturer recommends a longer period.

1.2 PRODUCTS

A. Approved Manufacturers:

1. Sika Flooring
2. HP Spartcote
3. StoneHard
4. Or Approved Equal

B. Materials

1. VOC Content of Resinous Flooring: Provide resinous flooring systems, for use inside the weatherproofing system, that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
 - a. Resinous Flooring: 100 g/L.

C. Decorative Resinous Flooring

1. Resinous Flooring: Abrasion-, impact- and chemical-resistant, decorative-aggregate-filled, epoxy-resin-based, monolithic floor surfacing designed to produce a seamless floor and integral cove base, **as directed**.
2. System Characteristics:
 - a. Color and Pattern: As selected from manufacturer's full range **OR** As indicated by product designation, **as directed**.
 - b. Wearing Surface: Textured for slip resistance **OR** Orange-peel texture **OR** Smooth **OR** Manufacturer's standard wearing surface, **as directed**.
 - c. Overall System Thickness: 1/16 inch (1.6 mm) **OR** 1/8 inch (3.2 mm) **OR** 3/16 inch (4.8 mm) **OR** 1/4 inch (6.4 mm), **as directed**.
 - d. Federal Agency Approvals: USDA **OR** FDA, **as directed**, approved for food-processing environments.
3. Body Coats:
 - a. Resin: Epoxy.
 - b. Formulation Description: 100 percent solids **OR** High solids **OR** Water based, **as directed**.
 - c. Application Method: Self-leveling slurry with broadcast aggregates **OR** Self-leveling slurry **OR** Troweled or screeded, **as directed**.
 - 1) Thickness of Coats: 1/16 inch (1.6 mm) **OR** 1/8 inch (3.2 mm) **OR** 3/16 inch (4.8 mm) **OR** 1/4 inch (6.4 mm), **as directed**.
 - 2) Number of Coats: One **OR** Two, **as directed**.
 - d. Aggregates: Manufacturer's standard **OR** Colored quartz (ceramic-coated silica) **OR** Vinyl flakes **OR** Granite **OR** Natural silica, **as directed**.
4. Topcoat: Sealing or finish coats.
 - a. Resin: Epoxy **OR** Urethane **OR** Vinyl ester, **as directed**.
 - b. Formulation Description: 100 percent solids **OR** High solids **OR** Water based, **as directed**.
 - c. Type: Clear **OR** Pigmented, **as directed**.
 - d. Finish: Matte **OR** Gloss, **as directed**.
 - e. Number of Coats: One **OR** Two, **as directed**.
5. System Physical Properties: Provide resinous flooring system with the following minimum physical property requirements when tested according to test methods indicated:
 - a. Compressive Strength: per ASTM C 579.
 - b. Tensile Strength: per ASTM C 307.
 - c. Flexural Modulus of Elasticity: per ASTM C 580.
 - d. Water Absorption: per ASTM C 413.
 - e. Coefficient of Thermal Expansion: per ASTM C 531.
 - f. Indentation: per MIL-D-3134.
 - g. Impact Resistance: No chipping, cracking, or delamination and not more than 1/16-inch (1.6-mm) permanent indentation per MIL-D-3134.

- h. Resistance to Elevated Temperature: No slip or flow of more than 1/16 inch (1.6 mm) per MIL-D-3134.
- i. Abrasion Resistance: maximum weight loss per ASTM D 4060.
- j. Flammability: Self-extinguishing per ASTM D 635.
- k. Critical Radiant Flux: 0.45 W/sq. cm **OR** 0.22 W/sq. cm, **as directed**, or greater per NFPA 253.
- l. Hardness: Shore D per ASTM D 2240.
- m. Bond Strength: 100 percent concrete failure per ACI 503R.
- 6. System Chemical Resistance: Test specimens of cured resinous flooring system are unaffected when tested according to ASTM D 1308 for 50 percent immersion **OR** ASTM D 543, Procedure A, for immersion **OR** ASTM C 267 for immersion, **as directed**, in reagents **as directed** for no fewer than seven days:
- D. Industrial Resinous Flooring
 - 1. Resinous Flooring: Abrasion-, impact- and chemical-resistant, industrial-aggregate-filled, resin-based, monolithic floor surfacing designed to produce a seamless floor and integral cove base, **as directed**.
 - 2. System Characteristics:
 - a. Color and Pattern: As selected from manufacturer's full range **OR** As indicated by product designation, **as directed**.
 - b. Wearing Surface: Textured for slip resistance **OR** Orange-peel texture **OR** Smooth **OR** Manufacturer's standard wearing surface, **as directed**.
 - c. Overall System Thickness: 1/16 inch (1.6 mm) **OR** 1/8 inch (3.2 mm) **OR** 3/16 inch (4.8 mm) **OR** 1/4 inch (6.4 mm), **as directed**.
 - d. Federal Agency Approvals: USDA **OR** FDA, **as directed**, approved for food-processing environments.
 - 3. Body Coats:
 - a. Resin: Epoxy **OR** Urethane **OR** Vinyl ester, **as directed**.
 - b. Formulation Description: 100 percent solids **OR** High solids **OR** Water based, **as directed**.
 - c. Application Method: Self-leveling slurry with broadcast aggregates **OR** Self-leveling slurry **OR** Troweled or screeded, **as directed**.
 - 1) Thickness of Coats: 1/16 inch (1.6 mm) **OR** 1/8 inch (3.2 mm) **OR** 3/16 inch (4.8 mm) **OR** 1/4 inch (6.4 mm), **as directed**.
 - 2) Number of Coats: One **OR** Two, **as directed**.
 - d. Aggregates: Manufacturer's standard **OR** Colored quartz (ceramic-coated silica) **OR** Vinyl flakes **OR** Granite **OR** Natural silica, **as directed**.
 - 4. Topcoat: Sealing or finish coats.
 - a. Resin: Epoxy **OR** Urethane **OR** Vinyl ester, **as directed**.
 - b. Formulation Description: 100 percent solids **OR** High solids **OR** Water based, **as directed**.
 - c. Type: Clear **OR** Pigmented, **as directed**.
 - d. Finish: Matte **OR** Gloss, **as directed**.
 - e. Number of Coats: One **OR** Two, **as directed**.
 - 5. System Physical Properties: Provide resinous flooring system with the following minimum physical property requirements when tested according to test methods indicated:
 - a. Compressive Strength: per ASTM C 579.
 - b. Tensile Strength: per ASTM C 307.
 - c. Flexural Modulus of Elasticity: per ASTM C 580.
 - d. Water Absorption: per ASTM C 413.
 - e. Coefficient of Thermal Expansion: per ASTM C 531.
 - f. Indentation: percent maximum per MIL-D-3134.
 - g. Impact Resistance: No chipping, cracking, or delamination and not more than 1/16-inch (1.6-mm) permanent indentation per MIL-D-3134.
 - h. Resistance to Elevated Temperature: No slip or flow of more than 1/16 inch (1.6 mm) per MIL-D-3134.
 - i. Abrasion Resistance: maximum weight loss per ASTM D 4060.
 - j. Flammability: Self-extinguishing per ASTM D 635.

- k. Critical Radiant Flux: 0.45 W/sq. cm **OR** 0.22 W/sq. cm, **as directed**, or greater per NFPA 253.
- l. Hardness: Shore D per ASTM D 2240.
- m. Bond Strength: 100 percent concrete failure per ACI 503R.
- 6. System Chemical Resistance: Test specimens of cured resinous flooring system are unaffected when tested according to ASTM D 1308 for 50 percent immersion **OR** ASTM D 543, Procedure A, for immersion **OR** ASTM C 267 for immersion, **as directed**, in reagents **as directed** for no fewer than seven days:

E. High-Performance Resinous Flooring

- 1. Resinous Flooring: Abrasion-, impact- and chemical-resistant, high-performance-aggregate-filled, resin-based, monolithic floor surfacing designed to produce a seamless floor and integral cove base, **as directed**.
- 2. System Characteristics:
 - a. Color and Pattern: As selected from manufacturer's full range **OR** As indicated by product designation, **as directed**.
 - b. Wearing Surface: Textured for slip resistance **OR** Orange-peel texture **OR** Smooth **OR** Manufacturer's standard wearing surface, **as directed**.
 - c. Overall System Thickness: 1/16 inch (1.6 mm) **OR** 1/8 inch (3.2 mm) **OR** 3/16 inch (4.8 mm) **OR** 1/4 inch (6.4 mm), **as directed**.
 - d. Federal Agency Approvals: USDA **OR** FDA, **as directed**, approved for food-processing environments.
- 3. Body Coats:
 - a. Resin: Epoxy **OR** Epoxy novolac **OR** Urethane **OR** Vinyl ester **OR** Methyl methacrylate, **as directed**.
 - b. Formulation Description: 100 percent solids **OR** High solids **OR** Water based, **as directed**.
 - c. Application Method: Self-leveling slurry with broadcast aggregates **OR** Self-leveling slurry **OR** Troweled or screeded, **as directed**.
 - 1) Thickness of Coats: 1/16 inch (1.6 mm) **OR** 1/8 inch (3.2 mm) **OR** 3/16 inch (4.8 mm) **OR** 1/4 inch (6.4 mm), **as directed**.
 - 2) Number of Coats: One **OR** Two, **as directed**.
 - d. Aggregates: Manufacturer's standard **OR** Colored quartz (ceramic-coated silica) **OR** Vinyl flakes **OR** Granite **OR** Natural silica, **as directed**.
- 4. Topcoat: Sealing or finish coats.
 - a. Resin: Epoxy **OR** Epoxy novolac **OR** Urethane **OR** Vinyl ester **OR** Methyl methacrylate, **as directed**.
 - b. Formulation Description: 100 percent solids **OR** High solids **OR** Water based, **as directed**.
 - c. Type: Clear **OR** Pigmented, **as directed**.
 - d. Finish: Matte **OR** Gloss, **as directed**.
 - e. Number of Coats: One **OR** Two, **as directed**.
- 5. System Physical Properties: Provide resinous flooring system with the following minimum physical property requirements when tested according to test methods indicated:
 - a. Compressive Strength: per ASTM C 579.
 - b. Tensile Strength: per ASTM C 307.
 - c. Flexural Modulus of Elasticity: per ASTM C 580.
 - d. Water Absorption: per ASTM C 413.
 - e. Coefficient of Thermal Expansion: per ASTM C 531.
 - f. Indentation: percent maximum per MIL-D-3134.
 - g. Impact Resistance: No chipping, cracking, or delamination and not more than 1/16-inch (1.6-mm) permanent indentation per MIL-D-3134.
 - h. Resistance to Elevated Temperature: No slip or flow of more than 1/16 inch (1.6 mm) per MIL-D-3134.
 - i. Abrasion Resistance: maximum weight loss per ASTM D 4060.
 - j. Flammability: Self-extinguishing per ASTM D 635.
 - k. Critical Radiant Flux: 0.45 W/sq. cm **OR** 0.22 W/sq. cm, **as directed**, or greater per NFPA 253.
 - l. Hardness: Shore D per ASTM D 2240.

- m. Bond Strength: 100 percent concrete failure per ACI 503R.
6. System Chemical Resistance: Test specimens of cured resinous flooring system are unaffected when tested according to ASTM D 1308 for 50 percent immersion **OR** ASTM D 543, Procedure A, for immersion **OR** ASTM C 267 for immersion, **as directed**, in reagents **as directed** for no fewer than seven days:

F. Accessories

1. Primer: Type recommended by manufacturer for substrate and body coats indicated.
 - a. Formulation Description: 100 percent solids **OR** High solids **OR** Water based, **as directed**.
2. Waterproofing Membrane: Type recommended by manufacturer for substrate and primer and body coats indicated.
 - a. Formulation Description: 100 percent solids **OR** High solids, **as directed**.
3. Reinforcing Membrane: Flexible resin formulation that is recommended by manufacturer for substrate and primer and body coats indicated and that prevents substrate cracks from reflecting through resinous flooring.
 - a. Formulation Description: 100 percent solids **OR** High solids, **as directed**.
 - 1) Provide fiberglass scrim embedded in reinforcing membrane.
4. Patching and Fill Material: Resinous product of or approved by resinous flooring manufacturer and recommended by manufacturer for application indicated.

1.3 EXECUTION

A. Preparation

1. General: Prepare and clean substrates according to resinous flooring manufacturer's written instructions for substrate indicated. Provide clean, dry substrate for resinous flooring application.
2. Concrete Substrates: Provide sound concrete surfaces free of laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants incompatible with resinous flooring.
 - a. Roughen concrete substrates as follows:
 - 1) Shot-blast surfaces with an apparatus that abrades the concrete surface, contains the dispensed shot within the apparatus, and recirculates the shot by vacuum pickup.
OR
Comply with ASTM C 811 requirements unless manufacturer's written instructions are more stringent.
 - b. Repair damaged and deteriorated concrete according to resinous flooring manufacturer's written instructions.
 - c. Verify that concrete substrates are dry and moisture-vapor emissions are within acceptable levels according to manufacturer's written instructions.
 - 1) Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with application of resinous flooring only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. (1.36 kg of water/92.9 sq. m) of slab area in 24 hours.
 - 2) Perform plastic sheet test, ASTM D 4263. Proceed with application only after testing indicates absence of moisture in substrates.
 - 3) Perform relative humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have a maximum 75 percent relative humidity level measurement.
 - d. Alkalinity and Adhesion Testing: Verify that concrete substrates have pH within acceptable range. Perform tests recommended by manufacturer. Proceed with application only after substrates pass testing.
3. Resinous Materials: Mix components and prepare materials according to resinous flooring manufacturer's written instructions.
4. Use patching and fill material to fill holes and depressions in substrates according to manufacturer's written instructions.

5. Treat control joints and other nonmoving substrate cracks to prevent cracks from reflecting through resinous flooring according to manufacturer's written instructions.

B. Application

1. General: Apply components of resinous flooring system according to manufacturer's written instructions to produce a uniform, monolithic wearing surface of thickness indicated.
 - a. Coordinate application of components to provide optimum adhesion of resinous flooring system to substrate, and optimum intercoat adhesion.
 - b. Cure resinous flooring components according to manufacturer's written instructions. Prevent contamination during application and curing processes.
 - c. At substrate expansion and isolation joints, comply with resinous flooring manufacturer's written instructions.
2. Apply primer over prepared substrate at manufacturer's recommended spreading rate.
3. Apply waterproofing membrane, where indicated, in manufacturer's recommended thickness.
 - a. Apply waterproofing membrane to integral cove base substrates.
4. Apply reinforcing membrane to substrate cracks **OR** entire substrate surface, **as directed**.
5. Integral Cove Base: Apply cove base mix to wall surfaces before applying flooring. Apply according to manufacturer's written instructions and details including those for taping, mixing, priming, troweling, sanding, and topcoating of cove base. Round internal and external corners.
 - a. Integral Cove Base: 4 inches (100 mm) high.
6. Apply self-leveling slurry body coats in thickness indicated for flooring system.
 - a. Broadcast aggregates at rate recommended by manufacturer and, after resin is cured, remove excess aggregates to provide surface texture indicated.
7. Apply troweled or screeded body coats in thickness indicated for flooring system. Hand or power trowel and grout to fill voids. When cured, remove trowel marks and roughness using method recommended by manufacturer.
8. Apply grout coat, of type recommended by resinous flooring manufacturer, to fill voids in surface of final body coat and to produce wearing surface indicated.
9. Apply topcoats in number indicated for flooring system and at spreading rates recommended in writing by manufacturer.

C. Field Quality Control

1. Core Sampling: At the direction of Owner and at locations designated by Owner, take one core sample per 1000 sq. ft. (92.9 sq. m) of resinous flooring, or portion of, to verify thickness. For each sample that fails to comply with requirements, take two additional samples. Repair damage caused by coring and correct deficiencies.
2. Material Sampling: Owner may at any time and any number of times during resinous flooring application require material samples for testing for compliance with requirements.
 - a. Owner will engage an independent testing agency to take samples of materials being used. Material samples will be taken, identified, sealed, and certified in presence of Contractor.
 - b. Testing agency will test samples for compliance with requirements, using applicable referenced testing procedures or, if not referenced, using testing procedures listed in manufacturer's product data.
 - c. If test results show applied materials do not comply with specified requirements, pay for testing, remove noncomplying materials, prepare surfaces coated with unacceptable materials, and reapply flooring materials to comply with requirements.

D. Protection

1. Protect resinous flooring from damage and wear during the remainder of construction period. Use protective methods and materials, including temporary covering, recommended in writing by resinous flooring manufacturer.

END OF SECTION 09 63 43 0062 00 00

SECTION 09 65 13 00 - RESILIENT BASE AND ACCESSORIES**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Single Source Responsibility for Products: Obtain each type and color of product specified from a single source with resources to provide products of consistent quality in appearance and physical properties without delaying progress of the Work.
- B. Special Requirements of Regulatory Agencies: Submit certification that system complies with VOC (Volatile Organic Compounds) requirements and regulations of the Environmental Protection Agency (EPA), Occupational Safety and Health Administration (OSHA), State, County, City, and local Air Control District.
- C. Mockups: Provide resilient products with mockups specified in other sections.
- D. Fire Test Response Characteristics: As determined by test in identical products according to ASTM E648 or NFPA 253 by a qualified testing agency.
 - 1. Critical Radiant Flux Classifications: Class 1, > 0.45 w/sg.cm.

1.04 SUBMITTALS

- A. Samples:
 - 1. Samples for initial selection purposes of manufacturer's standard sample sets in form of pieces cut from each type of product specified showing full range of colors and patterns available.
 - 2. Samples for verification purposes in manufacturer's standard sizes, but not less than 12 inches long, of each different color and pattern of product specified.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver products to Project Site in original manufacturer's unopened cartons and containers, each bearing names of product and manufacturer, Project identification, and shipping and handling instructions.

- B. Store products in dry spaces protected from the weather with ambient temperatures maintained within the range recommended by manufacturer but not less than 50 degrees F (10 degrees C) or more than 90 degrees F (32 degrees C).
- C. Unboxed wall base, corners, and adhesive area to be moved into the installation space at least 48 hours before installation and are to be maintained between 65 degrees F and 85 degrees F.

1.06 PROJECT CONDITIONS

- A. Maintain a temperature between 65 degrees F and 85 degrees F in spaces to receive products specified in this Section for at least 48 hours prior to installation, during installation, and thereafter.
- B. A bond test should be performed at least 72 hours prior to the schedule installation to ensure the surface is suitable.
- C. Close spaces to traffic during installation of products specified in this Section.

1.07 SEQUENCING AND SCHEDULING

- A. Sequence installing products specified in this Section with other construction to minimize possibility of damage and soiling during remainder of construction period.

1.08 WARRANTY

- A. Wall base products will be warranted for a period of one (1) year from the date of installation with three (3) limited wear warranty

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. The notes and schedules on the Drawings establish manufacturer and model/design required for the Project. Provide the products listed below unless Architect approves products of other manufacturer specifically for this Project.

2.02 MANUFACTURERS

- A. To establish standards of manufacture, operation, performance, and appearance, drawings and specifications are based on the specific manufacturer's products and color/patterns shown on the Drawings. If accepted in advance by the Architect, and provided compliance with requirements, products of the following manufacturers may also be acceptable:
 - 1. Roppe
 - a. Pinnacle Rubber Base

- 1) Flooring accessories shown in the finish schedule or listed herein as Cove Base or Wall Base shall be 1/8" (3.175mm) thick Type TS, Thermoset Vulcanized Pinnacle EXTRUDED RUBBER WALL BASE as manufactured by Roppe Corporation, Fostoria, Ohio. It shall be constructed of first quality materials, properly vulcanized, and shall be smooth and free from imperfections which detract from its appearance. The base shall conform fully to all the requirements of Standard Specification F-1861, Type TS (Thermoset Vulcanized Rubber), Group 1 (solid). All Wall Base shall be of the type (Straight, Style A, or Cove, Style B), with a nominal height of 4" {101.6mm}, in nominal lengths of (48" {1.22m}), in the color stated, and 1/8" (3.175mm) nominal thickness, unless noted otherwise.
- 2) Sanitary Wall Base shall be 4" (101.6mm) high with a 2" (50.8mm) Sanitary Toe. The toe shall be 1/8" (3.175mm) nominal thick. The length shall be (48" {1.22m}) nominal long and in the color selected

b. Pinnacle Plus Rubber Base

- 1) Flooring accessories shown in the finish schedule or listed herein as Cove Base or Wall Base shall be 1/8" (3.175mm) thick Type TS, Thermoset Vulcanized Pinnacle Plus EXTRUDED RUBBER WALL BASE as manufactured by Roppe Corporation, Fostoria, Ohio. It shall be constructed of first quality materials, properly vulcanized, and shall be smooth and free from imperfections which detract from its appearance. The base shall conform fully to all the requirements of Standard Specification F-1861, Type TS (Thermoset Vulcanized Rubber), Group 1 (solid). All Wall Base shall be of the style (style B, Base Shoe or Cove), with a height of 4" (101.6mm) nominal, in the color stated, and 1/8" (3.175mm) nominal thickness.

2.03 RESILIENT WALL BASE

- A. Provide the following resilient base materials at locations indicated on plans.
- B. Lengths: **4 foot lengths, NO COILS**
- C. Exterior Corners: Factory molded outside corners required.
- D. Interior Corners: Premolded or formed on job

2.04 ACCESSORIES

- A. Provide reducer strips, transition strips, and other accessories required in the Work from the same manufacturer as the resilient wall base. The following accessories are products of Roppe Corporation and are listed to establish configuration, size, and shape of items only.
 1. Where scheduled in colors matching base, provide accessories from the same color run to assure acceptable match.
- B. Accessories:
 1. Carpet to O Reducer Strip: Type 160
 2. Reducer: Type 172
 3. Transition Strip; Carpet Reducer 159
 4. Transition Strip; Ceramic to Wood: Type 182
- C. Provide accessories in proper thickness to accommodate adjacent flooring materials.

2.05 RESILIENT STAIR ACCESSORIES

- A. Products of style suitable for use indicated, provided by same manufacturer as resilient base. Color and pattern to be selected by Architect from manufacturer's full range of colors and patterns produced from rubber stair accessories, including:
 - 1. Stair Treads: [Type 1 design (smooth)] [Type 2 design (designed)] [Type 4 design (grooved lead antimony or aluminum/oxide silicone carbide filled channels)] products complying with the following requirements.
 - 2. Risers: [Smooth flat risers with cove toe, 1/8 inch thick by 7 inches high by length to match that of treads.] [Smooth flat risers without cove toe, 1/8 inch thick by height and length to cover risers.] Stringers: Material matching risers, of height and length after cutting to fit risers and treads to cover stair stringers.

2.06 INSTALLATION ACCESSORIES

- A. Concrete Slab Primer: Nonstaining type as recommended by flooring manufacturer.
- B. Trowelable Underlayments and Patching Compounds: Latex modified, portland cement based formulation provided or approved by flooring manufacturer for applications indicated.
- C. Stair Tread Nose Filler: Two part epoxy compound recommended by resilient tread manufacturer to fill nosing substrates not conforming to tread contours.
- D. Adhesives: Water resistant type recommended by manufacturer to suit resilient flooring product and substrate conditions indicated.

PART 3 - EXECUTION**3.01 PREPARATION**

- A. Examine areas where installation of products specified in this Section will occur, with Installer present, to verify that substrates and conditions are satisfactory for installation and comply with manufacturer's requirements and those specified in this Section.
- B. Comply with manufacturer's installation specifications for preparing substrates indicated to receive products indicated.
- C. Use trowelable leveling and patching compounds per manufacturer's directions to fill cracks, holes, and depressions in substrates.
- D. Use stair tread nose filler per tread manufacturer's directions to fill nosing substrates not conforming to tread contours.
- E. Remove coatings, including curing compounds, and other substances that are incompatible with flooring adhesives and that contain soap, wax, oil, or silicone, by using a terrazzo or concrete grinder, a drum sander, or a polishing machine equipped with a heavy duty wire brush.
- F. Broom or vacuum clean substrates to be covered immediately before installing products specified in this Section. Following cleaning, examine substrates for moisture, alkaline salts, carbonation, or dust.
- G. Apply concrete slab primer, if recommended by flooring manufacturer, prior to applying adhesive. Apply according to manufacturer's directions.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install products specified in this Section using methods indicated according to manufacturer's installation directions.
- D. Apply resilient wall base to walls, columns, pilasters, casework, and other permanent fixtures in rooms and areas where base is required. Install wall base in lengths as long as practicable. Tightly adhere wall base to substrate throughout length of each piece, with base in continuous contact with horizontal and vertical substrates.
 - 1. On masonry surfaces or other similar irregular substrates, fill voids along top edge of resilient wall base with manufacturer's recommended adhesive filler material.
 - 2. Install inside and exterior corners before installing straight pieces.
 - 3. Form inside corners on job from straight pieces of maximum lengths possible by cutting an inverted V shaped notch in toe of wall base at the point where corner is formed. Shave back of base where necessary to produce snug fit to substrate.
 - 4. Install Roppe (or approved equal). Factory Molded Outside Rubber Corners on all Projects awarded on or after April 1, 2013, at all outside corners of wall base whenever the wall exceeds the length of the returns on the base.
- E. Place resilient accessories so they are butted to adjacent materials of type indicated and bond to substrates with adhesive. Install reducer strips at edges of flooring that otherwise would be exposed.
- F. Apply resilient accessories to stairs as indicated and according to manufacturer's installation instructions.

3.03 CLEANING AND PROTECTION

- A. Perform the following operations immediately after completing installation:
 - 1. Remove visible adhesive and other surface blemishes using cleaner recommended by manufacturers of resilient product involved.
 - 2. Apply protective floor polish to resilient accessories that are free from soil, visible adhesive, and surface blemishes.
 - a. Use commercially available cross linked, acrylic product acceptable to resilient accessory manufacturer.
 - b. Coordinate selection of floor polish with Owner's maintenance service.
- B. Protect flooring against mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period. Use protection methods indicated or recommended by manufacturer of resilient product involved.
- C. Clean products specified in this Section not more than four (4) days prior to dates scheduled for inspections intended to establish date of Substantial Completion in each area of Project. Clean products using method recommended by manufacturer.
 - 1. Strip protective floor polish that was applied after completing installation, prior to cleaning.

2. Reapply floor polish after cleaning.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 09 65 16 00 - RESILIENT SHEET FLOORING**PART 1 GENERAL****1.01 SUMMARY**

- A. Section Includes: Toli Sheet vinyl floor coverings.
- B. Related Documents: Specifications throughout Divisions of the Project Manual are directly applicable to this section and this section is directly applicable to them.

1.02 REFERENCES**A. ASTM International:**

1. ASTM E648 Standard Test Method for Critical Radiant Flux of Floor-Covering Systems Using a Radiant Heat Energy Source.
2. ASTM E662 Standard Test Method for Specific Optical Density of Smoke Generated by Solid Materials.
3. ASTM F710 Standard Practice for Preparing Concrete Floors to Receive Resilient Flooring.
4. ASTM F970 Standard Test Method for Static Load Limit.
5. ASTM F1303 Standard Specification for Sheet Vinyl Floor Covering with Backing.
6. ASTM F1914 Standard Test Method for Short-Term Indentation and Residual Indentation of Resilient Floor Covering.

B. National Fire Protection Association (NFPA):

1. NFPA 253 Standard Method of Test for Critical Radiant Flux for Floor Covering Systems Using a Radiant Energy Source.
2. NFPA 258 Research Test Method for Determining Smoke Generation of Solid Materials.

1.04 SUBMITTALS

- A. General: Submit listed submittals in accordance with General Conditions of the Contract and Division 1 Submittal Procedures Section.
- B. Product Data: Submit product data, including manufacturer's SPEC-DATA® sheet, for specified products.
- C. Samples: Submit selection and verification samples of finishes, colors and textures (24" X 23" square sample)
- D. Shop drawings indicating resilient sheet flooring type, layout, pattern direction, edge transitions, columns, doorways, partitions, build-in furniture, cabinets, cutouts, expansion and control joints, and attachment requirements.

1.05 QUALITY ASSURANCE

A. Regulatory Requirements and Approvals, as directed.

1.06 DELIVERY, STORAGE & HANDLING

A. Delivery: Deliver materials in manufacturer's original, unopened, undamaged containers with identification labels intact.

B. Storage and Protection: Store materials protected from exposure to harmful environmental conditions and at temperature and humidity conditions recommended by the manufacturer.

1.06 WARRANTY

A. Floor products will be warranted to be free from defects in material and workmanship for ten (10) years from date of invoice to original end users

PART 2 PRODUCTS

2.01 SHEET VINYL FLOOR COVERING

A. Manufacturer: TOLI International, a Division of CBC (America) Corp., 55 Mall Drive, Commack, NY 11725; Telephone: (800) 446-5476; Technical Support: (888) TRY-TOLI; Fax: (631) 864-8151; E-mail: support@toli.com; website: www.toli.com or approved equal.

2.02 MATERIALS

A. Mature Collection, or as noted on drawings

1. Classification: ASTM F1303, Type I, Grade 1, embossed, clear, semi-rigid PVC commercial grade wearlayer over photographic print film design.
2. Size: 6 foot x 66 foot (1.8 x 20 m) rolls.
3. Gauge: 0.080 inch (2.03 mm).
4. Backing: ASTM F1303, Class B, 3-ply fused backing system consisting of fiberglass inner layer, PVC backing layer, with 45% recycled material, and polyester scrim backing.
5. Recovery from Long-Term Indentation (ASTM F970): 2500 psi (17,225 kPa).
6. Pass when tested in accordance with ASTM F1914.
7. Pattern and Color: As selected by the Architect from the manufacturer's standard patterns and colors in the Mature Woods and Mature Opus and lines.

B. Adhesive: CBC 5000 Premium Resilient Flooring Adhesive or CBC 950, as recommended by the manufacturer.

C. Installation Accessories

1. Concrete Slab Leveling and Patching Compound: Non-staining type as recommended by flooring manufacturer.

2. Adhesives (Acrylic): Solvent-free, ion odor, acrylic based, high tack type adhesive as recommended by manufacturer to suit sheet vinyl floor covering products and substrate conditions indicated. Or adhesives- heavy duty Epoxy: 2-part solvent-free, low odor, flooring epoxy adhesive as recommended by manufacturer.
3. Seam Seal: Formulation provided or approved by floor covering manufacturer for products indicated
 - a. Heat Welding- color to be selected by Architect
 - b. Cold Welding
4. Floor Finish System: Provide protective liquid floor polish product systems as recommended by flooring manufacturer.

PART 3 EXECUTION

3.01 MANUFACTURER'S INSTRUCTIONS

- A. Compliance: Comply with manufacturer's product data, including product technical bulletins, product catalog installation instructions and product carton instructions for installation.

3.02 EXAMINATION

- A. Site Verification of Conditions: Verify that substrate conditions, which have been previously installed under other sections, are acceptable for product installation in accordance with manufacturer's instructions. Slab substrates to be dry and free of curing compounds, sealers, hardeners, and other material whose presence would interfere with the hardening of adhesives. Determine adhesion and dryness characteristics by performing bond and moisture test as recommended by manufacturer

3.03 PREPARATION

- A. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.04 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install products specified in this Section using methods indicated according to manufacturer's installation directions.
- D. Apply resilient wall base to walls, columns, pilasters, casework, and other permanent fixtures in rooms and areas where base is required. Install wall base in lengths as long as practicable. Tightly adhere wall base to substrate throughout length of each piece, with base in continuous contact with horizontal and vertical substrates.
- E. On masonry surfaces or other similar irregular substrates, fill voids along top edge of resilient wall base with manufacturer's recommended adhesive filler material.
- F. Install inside and exterior corners before installing straight pieces.

- G. Form inside corners on job from straight pieces of maximum lengths possible by cutting an inverted V shaped notch in toe of wall base at the point where corner is formed. Shave back of base where necessary to produce snug fit to substrate.
- H. Form outside corners on job from straight pieces of maximum lengths possible by shaving back of base at point where bending will occur. Remove a strip perpendicular to length of base and only deep enough to produce a snug fit without bends whitening or removal of more than half the thickness of wall base.
- I. Place resilient accessories so they are butted to adjacent materials of type indicated and bond to substrates with adhesive. Install reducer strips at edges of flooring that otherwise would be exposed.
- J. Apply resilient accessories to stairs as indicated and according to manufacturer's installation instructions.

3.05 CLEANING AND PROTECTION

- A. Perform the following operations immediately after completing installation:
 - 1. Remove visible adhesive and other surface blemishes using cleaner recommended by manufacturers of resilient product involved.
 - 2. Sweep or vacuum floor thoroughly.
 - 3. Do not wash floor until after time period recommended by manufacturer.
 - 4. Damp mop resilient accessories to remove black marks and soil.
 - 5. Apply protective floor polish to resilient accessories that are free from soil, visible adhesive, and surface blemishes.
 - a. Use commercially available cross linked, acrylic product acceptable to resilient accessory manufacturer.
 - b. Coordinate selection of floor polish with Owner's maintenance service.
- B. Protect flooring against mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period. Use protection methods indicated or recommended by manufacturer of resilient product involved.
- C. Clean products specified in this Section not more than four (4) days prior to dates scheduled for inspections intended to establish date of Substantial Completion in each area of Project. Clean products using method recommended by manufacturer.

- 10. ASTM F1515 Standard Test Method for Measuring Light Stability of Resilient Vinyl Flooring by Color Change.
- 11. ASTM F1700 Standard Specification for Solid Vinyl Floor Tile
- 12. ASTM F1914 Standard Test Method for Short-Term Indentation and Residual Indentation of Resilient Floor Covering.

B. National Fire Protection Association (NFPA):

- 1. NFPA 253 Standard Method of Test for Critical Radiant Flux for Floor Covering Systems Using a Radiant Heat Energy Source.
- 2. NFPA 258 Research Test Method for Determining Smoke Generation of Solid Materials.

1.03 SUBMITTALS

- A. General: Submit listed submittals in accordance with General Conditions of the Contract and Section 01 33 00 -

May 2013

Resilient Tile Flooring

- B. Product Data: Submit manufacturer's printed product data for specified products.
- C. C. Samples: Submit selection and verification samples of finishes, colors and textures.

1.04 QUALITY ASSURANCE

- A. Regulatory Requirements: In accordance with Section 01 40 00 - Quality Requirements.

1.05 DELIVERY, STORAGE & HANDLING

- A. Delivery: Deliver materials in manufacturer's original, unopened, undamaged containers with identification labels intact.
- B. Storage and Protection: Store materials protected from exposure to harmful environmental conditions and at temperature and humidity conditions recommended by the manufacturer.

1.06 WARRANTY

- A. Floor product will be warranted to be free from manufacturing defects for five (5) years from date of substantial completion.

PART 2 PRODUCTS

2.01 RESILIENT TILE MODULAR FLOORING

- A. Manufacturer: Armstrong- Standard Excelon Imperial Texture, or approved equal
 - 1. Contact: P.O. Box 3001, Lancaster, PA 17604, 1.877.ARMSTRONG, www.armstrong.com
- B. Armstrong Standard Excelon:
 - 1. Size: 12 inches x 12 inches (305 mm x 305 mm).
 - 2. Gauge: 1/8 inch (3.2 mm).
 - 3. Recovery from Long-Term Indentation (ASTM F970): 125 PSI.
 - 4. Pattern and Color: As selected by the Architect from the manufacturer's standard patterns and colors.
- C. Latex Patching Compound: ASTM F710.
- D. Adhesive: As recommended by manufacturer.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Site Verification of Conditions: Verify that substrate conditions, for substrates that have been previously installed under other sections, are acceptable for product installation in accordance with manufacturer's instructions.

3.02 PREPARATION

- A. Prepare surfaces using methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.03 INSTALLATION

- A. Compliance: Comply with manufacturer's product data for installation, including product technical bulletins, product catalog installation instructions and product carton instructions.

3.04 PROTECTION

- A. Protect installed products until completion of project.
- B. Repair or replace damaged products prior to substantial completion.

SECTION 09 68 00 00 - CARPETING**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for carpet. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Tufted carpet.
 - b. Carpet cushion.

C. Submittals

1. Product Data: For each product indicated.
2. Shop Drawings: Show the following:
 - a. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in carpet.
 - b. Existing flooring materials to be removed.
 - c. Existing flooring materials to remain.
 - d. Carpet type, color, and dye lot.
 - e. Locations where dye lot changes occur.
 - f. Seam locations, types, and methods.
 - g. Type of subfloor.
 - h. Type of installation.
 - i. Pattern type, repeat size, location, direction, and starting point.
 - j. Pile direction.
 - k. Type, color, and location of insets and borders.
 - l. Type, color, and location of edge, transition, and other accessory strips.
 - m. Transition details to other flooring materials.
 - n. Type of carpet cushion.
3. Samples: For each of the following products and for each color and texture required. Label each Sample with manufacturer's name, material description, color, pattern, and designation indicated on Drawings and in schedules.
 - a. Carpet: 12-inch- (300-mm-) square Sample.
 - b. Exposed Edge, Transition, and other Accessory Stripping: 12-inch- (300-mm-) long Samples.
 - c. Carpet Cushion: 6-inch- (150-mm-) square Sample.
 - d. Carpet Seam: 6-inch (150-mm) Sample.
 - e. Mitered Carpet Border Seam: 12-inch- (300-mm-) square Sample. Show carpet pattern alignment.
4. LEED Submittals:
 - a. Product Data for Credit EQ 4.3:
 - 1) For carpet, documentation indicating compliance with testing and product requirements of Carpet and Rug Institute's "Green Label Plus" program.
 - 2) For carpet cushion, documentation indicating compliance with testing and product requirements of Carpet and Rug Institute's "Green Label" program.
 - 3) For installation adhesive, including printed statement of VOC content.
5. Product Schedule: For carpet and carpet cushion. Use same designations indicated on Drawings.
6. Maintenance data.

- D. Quality Assurance
 - 1. Installer Qualifications: An experienced installer who is certified by the Floor Covering Installation Board or who can demonstrate compliance with its certification program requirements.
 - 2. Fire-Test-Response Characteristics: Provide products with the critical radiant flux classification indicated in Part 1.2, as determined by testing identical products per ASTM E 648 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
 - 3. Preinstallation Conference: Conduct conference at Project site.
- E. Delivery, Storage, And Handling
 - 1. Comply with CRI 104, Section 5, "Storage and Handling."
- F. Project Conditions
 - 1. Comply with CRI 104, Section 7.2, "Site Conditions; Temperature and Humidity" and Section 7.12, "Ventilation."
 - 2. Environmental Limitations: Do not install carpet and carpet cushion until wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
 - 3. Do not install carpet and carpet cushion over concrete slabs until slabs have cured, are sufficiently dry to bond with adhesive, and have pH range recommended by carpet manufacturer.
 - 4. Where demountable partitions or other items are indicated for installation on top of carpet, install carpet before installing these items.
- G. Warranty
 - 1. Special Warranty for Carpet: Manufacturer's standard form in which manufacturer agrees to repair or replace components of carpet installation that fail in materials or workmanship within specified warranty period.
 - a. Warranty does not include deterioration or failure of carpet due to unusual traffic, failure of substrate, vandalism, or abuse.
 - b. Failures include, but are not limited to, more than 10 percent loss of face fiber, edge raveling, snags, runs, loss of tuft bind strength, excess static discharge, and delamination.
 - c. Warranty Period: 10 years from date of Substantial Completion.
 - 2. Special Warranty for Carpet Cushion: Manufacturer's standard form in which manufacturer agrees to repair or replace components of carpet cushion installation that fail in materials or workmanship within specified warranty period.
 - a. Warranty includes consequent removal and replacement of carpet and accessories.
 - b. Warranty does not include deterioration or failure of carpet cushion due to unusual traffic, failure of substrate, vandalism, or abuse.
 - c. Failure includes, but is not limited to, permanent indentation or compression.
 - d. Warranty Period: 10 years from date of Substantial Completion.

1.2 PRODUCTS

- A. Patcraft "Homeroom II" or Shaw "Constellation or Shaw "Unity" or Approved Equal
- B. Tufted Carpet
 - 1. Fiber Content: 100 percent nylon 6
 - 2. Pile Characteristic: Multilevel-loop pile.
 - 3. Yarn Twist: as approved by The University.
 - 4. Yarn Count: as approved by The University.
 - 5. Density: as approved by The University.
 - 6. Pile Thickness: finished carpet per ASTM D 6859.
 - 7. Stitches: as approved by The University.
 - 8. Gage: as approved by The University.
 - 9. Face Weight: as approved by The University.
 - 10. Total Weight: for finished carpet.

11. Primary Backing: EcoWorx.
12. Secondary Backing: Manufacturer's standard material.
13. Backcoating: Manufacturer's standard material
14. Width: 12 feet (3.7 m)
15. Applied Soil-Resistance Treatment: Manufacturer's standard material.
16. Antimicrobial Treatment: Manufacturer's standard material.
17. Performance Characteristics: As follows:
 - a. Critical Radiant Flux Classification: Not less than 0.45 W/sq. cm
 - b. Dry Breaking Strength: Not less than 100 lbf (445 N) per ASTM D 2646.
 - c. Tuft Bind: Not less than 8 lbf (36 N) **OR** per ASTM D 1335.
 - d. Delamination: Not less than 2.5 lbf/in. (12 N/mm) **OR** 3.5 lbf/in. (15 N/mm) **OR** 4 lbf/in. (18 N/mm), **as directed**, per ASTM D 3936.
 - e. Resistance to Insects: Comply with AATCC 24.
 - f. Noise Reduction Coefficient (NRC): per ASTM C 423.
 - g. Colorfastness to Crocking: Not less than 4, wet and dry, per AATCC 165.
 - h. Colorfastness to Light: Not less than 4 after 60, AFU (AATCC fading units) per AATCC 16, Option E.
 - i. Antimicrobial Activity: Not less than 2-mm halo of inhibition for gram-positive bacteria; not less than 1-mm halo of inhibition for gram-negative bacteria; no fungal growth; per AATCC 174.
 - j. Electrostatic Propensity: Less than 3.5, kV per AATCC 134.
 - k. Environmental Requirements: Provide carpet that complies with testing and product requirements of Carpet and Rug Institute's "Green Label Plus" program.

C. Installation Accessories

1. Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided or recommended by carpet manufacturer.
2. Adhesives: Water-resistant, mildew-resistant, nonstaining type to suit products and subfloor conditions indicated, that complies with flammability requirements for installed carpet and is recommended or provided by carpet and carpet cushion manufacturers.
 - a. VOC Limits: Provide adhesives with VOC content not more than 50g/L when calculated according to 40 CFR 59, Subpart D (EPA method 24).
3. Tackless Carpet Stripping: Water-resistant plywood, in strips as required to match cushion thickness and that comply with CRI 104, Section 12.2.
4. Seam Adhesive: Hot-melt adhesive tape or similar product recommended by carpet manufacturer for sealing and taping seams and butting cut edges at backing to form secure seams and to prevent pile loss at seams.
5. Metal Edge Strips: Extruded aluminum with mill finish of width shown, of height required to protect exposed edge of carpet, and of maximum lengths to minimize running joints.

1.3 EXECUTION

A. Preparation

1. General: Comply with CRI 104, Section 7.3, "Site Conditions; Floor Preparation," and with carpet manufacturer's written installation instructions for preparing substrates.
2. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, depressions, and protrusions in substrates. Fill or level cracks, holes and depressions 1/8 inch (3 mm) wide or wider, and protrusions more than 1/32 inch (0.8 mm), unless more stringent requirements are required by manufacturer's written instructions.
3. Remove coatings, including curing compounds, and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, without using solvents. Use mechanical methods recommended in writing by carpet manufacturer.
4. Broom and vacuum clean substrates to be covered immediately before installing carpet.

B. Installation

1. Comply with CRI 104 carpet cushion manufacturers', written installation instructions for the following:
 - a. Direct-Glue-Down Installation: Comply with CRI 104, Section 9, "Direct Glue-Down Installation."
 - b. Double-Glue-Down Installation: Comply with CRI 104, Section 10, "Double Glue-Down Installation."
 - c. Carpet with Attached-Cushion Installation: Comply with CRI 104, Section 11, "Attached-Cushion Installations."
 - d. Preapplied Adhesive Installation: Comply with CRI 104, Section 11.4, "Pre-Applied Adhesive Systems (Peel and Stick)."
 - e. Hook-and-Loop Installation: Comply with CRI 104, Section 11.5, "Hook and Loop Technology."
 - f. Stretch-in Installation: Comply with CRI 104, Section 12, "Stretch-in Installation."
 - g. Stair Installation: Comply with CRI 104, Section 13, "Carpet on Stairs" for glue-down, installation.
2. Comply with carpet manufacturer's written recommendations and Shop Drawings for seam locations and direction of carpet; maintain uniformity of carpet direction and lay of pile. At doorways, center seams under the door in closed position.
 - a. Bevel adjoining border edges at seams with hand shears **OR** Level adjoining border edges, **as directed**.
3. Do not bridge building expansion joints with carpet.
4. Cut and fit carpet to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet manufacturer.
5. Extend carpet into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.
6. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use nonpermanent, nonstaining marking device.
7. Install pattern parallel to walls and borders to comply with CRI 104, Section 15, "Patterned Carpet Installations" and with carpet manufacturer's written recommendations.
8. Comply with carpet cushion manufacturer's written recommendations. Install carpet cushion seams at 90-degree angle with carpet seams.

C. Cleaning And Protecting

1. Perform the following operations immediately after installing carpet:
 - a. Remove excess adhesive, seam sealer, and other surface blemishes using cleaner recommended by carpet manufacturer.
 - b. Remove yarns that protrude from carpet surface.
 - c. Vacuum carpet using commercial machine with face-beater element.
2. Protect installed carpet to comply with CRI 104, Section 16, "Protection of Indoor Installations."
3. Protect carpet against damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated or recommended in writing by carpet manufacturer and carpet cushion and adhesive manufacturers.

SECTION 09 68 13 00 - CARPET TILE**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for carpet tile. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes carpet tile.

C. Submittals

1. Product Data: For each product indicated.
2. Shop Drawings: Show the following:
 - a. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in carpet tiles.
 - b. Existing flooring materials to be removed.
 - c. Existing flooring materials to remain.
 - d. Carpet tile type, color, and dye lot.
 - e. Type of subfloor.
 - f. Type of installation.
 - g. Pattern of installation.
 - h. Pattern type, location, and direction.
 - i. Pile direction.
 - j. Type, color, and location of insets and borders.
 - k. Type, color, and location of edge, transition, and other accessory strips.
 - l. Transition details to other flooring materials.
3. Samples: For each of the following products and for each color and texture required. Label each Sample with manufacturer's name, material description, color, pattern, and designation indicated on Drawings and in schedules.
 - a. Carpet Tile: Full-size Sample.
 - b. Exposed Edge, Transition, and other Accessory Stripping: 12-inch- (300-mm-) long Samples.
4. LEED Submittal:
 - a. Product Data for Credit EQ 4.3:
 - 1) For carpet tile, documentation indicating compliance with testing and product requirements of Carpet and Rug Institute's "Green Label Plus" program.
 - 2) For installation adhesive, including printed statement of VOC content.
5. Product Schedule: For carpet tile. Use same designations indicated on Drawings.
6. Maintenance data.

D. Quality Assurance

1. Installer Qualifications: An experienced installer who is certified by the Floor Covering Installation Board or who can demonstrate compliance with its certification program requirements.
2. Fire-Test-Response Characteristics: Provide products with the critical radiant flux classification indicated in Part 2, as determined by testing identical products per ASTM E 648 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
3. Preinstallation Conference: Conduct conference at Project site.

E. Delivery, Storage, And Handling

1. Comply with CRI 104, Section 5, "Storage and Handling."

F. Project Conditions

1. Comply with CRI 104, Section 7.2, "Site Conditions; Temperature and Humidity" and Section 7.12, "Ventilation."
2. Environmental Limitations: Do not install carpet tiles until wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
3. Do not install carpet tiles over concrete slabs until slabs have cured and are sufficiently dry to bond with adhesive and concrete slabs have pH range recommended by carpet tile manufacturer.
4. Where demountable partitions or other items are indicated for installation on top of carpet tiles, install carpet tiles before installing these items.

G. Warranty

1. Special Warranty for Carpet Tiles: Manufacturer's standard form in which manufacturer agrees to repair or replace components of carpet tile installation that fail in materials or workmanship within specified warranty period.
 - a. Warranty does not include deterioration or failure of carpet tile due to unusual traffic, failure of substrate, vandalism, or abuse.
 - b. Failures include, but are not limited to, more than 10 percent loss of face fiber, edge raveling, snags, runs, loss of tuft bind strength, dimensional stability, excess static discharge, and delamination.
 - c. Warranty Period: 10 years from date of Substantial Completion.

1.2 PRODUCTS**A. Patcraft "Homeroom II" or Shaw "Constellation" or Shaw "Unity", or approved equal.****B. Carpet Tile**

1. Fiber Content: 100 percent nylon 6,
2. Fiber Type:
3. Pile Characteristic: Multi Level-loop
4. Yarn Twist: As Approved by University.
5. Yarn Count: As Approved by University.
6. Density: As Approved by University.
7. Pile Thickness: finished carpet tile per ASTM D 6859.
8. Stitches: As Approved by University.
9. Gage: As Approved by University.
10. Surface Pile Weight: As Approved by University.
11. Total Weight: for finished carpet tile.
12. Primary Backing/Backcoating: Ecworx
13. Secondary Backing: Manufacturer's standard material.
14. Backing System: Ecworx
15. Size: 24 by 24 inches (610 by 610 mm)
16. Applied Soil-Resistance Treatment: Manufacturer's standard material.
17. Antimicrobial Treatment: Manufacturer's standard material.
18. Performance Characteristics: As follows:
 - a. Critical Radiant Flux Classification: Not less than 0.45 W/sq. cm
 - b. Dry Breaking Strength: Not less than 100 lbf (445 N) per ASTM D 2646.
 - c. Tuft Bind: Not less than 8 lbf (36 N), per ASTM D 1335.
 - d. Delamination: Not less than 4 lbf/in. (18 N/mm), per ASTM D 3936.
 - e. Dimensional Tolerance: Within 1/32 inch (0.8 mm) of specified size dimensions, as determined by physical measurement.
 - f. Dimensional Stability: 0.2 percent or less per ISO 2551 (Aachen Test).
 - g. Resistance to Insects: Comply with AATCC 24.
 - h. Noise Reduction Coefficient (NRC): **<Insert NRC>** per ASTM C 423.
 - i. Colorfastness to Crocking: Not less than 4, wet and dry, per AATCC 165.

- j. Colorfastness to Light: Not less than 4 after 60, AFU (AATCC fading units) per AATCC 16, Option E.
- k. Antimicrobial Activity: Not less than 2-mm halo of inhibition for gram-positive bacteria; not less than 1-mm halo of inhibition for gram-negative bacteria; no fungal growth; per AATCC 174.
- l. Electrostatic Propensity: Less than 3.5 kV per AATCC 134.
- m. Environmental Requirements: Provide carpet tile that complies with testing and product requirements of Carpet and Rug Institute's "Green Label Plus" program.

C. Installation Accessories

- 1. Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided or recommended by carpet tile manufacturer.
- 2. Adhesives: Water-resistant, mildew-resistant, nonstaining, pressure-sensitive type to suit products and subfloor conditions indicated, that complies with flammability requirements for installed carpet tile and is recommended by carpet tile manufacturer for releasable installation.
 - a. VOC Limits: Provide adhesives with VOC content not more than 50 g/L when calculated according to 40 CFR 59, Subpart D (EPA method 24).

1.3 EXECUTION

A. Preparation

- 1. General: Comply with CRI 104, Section 6.2, "Site Conditions; Floor Preparation," and with carpet tile manufacturer's written installation instructions for preparing substrates indicated to receive carpet tile installation.
- 2. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, depressions, and protrusions in substrates. Fill or level cracks, holes and depressions 1/8 inch (3 mm) wide or wider and protrusions more than 1/32 inch (0.8 mm), unless more stringent requirements are required by manufacturer's written instructions.
- 3. Remove coatings, including curing compounds, and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, without using solvents. Use mechanical methods recommended in writing by carpet tile manufacturer.
- 4. Clean metal substrates of grease, oil, soil and rust, and prime if directed by adhesive manufacturer. Rough sand painted metal surfaces and remove loose paint. Sand aluminum surfaces, to remove metal oxides, immediately before applying adhesive.
- 5. Broom and vacuum clean substrates to be covered immediately before installing carpet tile.

B. Installation

- 1. General: Comply with CRI 104, Section 14, "Carpet Modules," and with carpet tile manufacturer's written installation instructions.
- 2. Installation Method: As recommended in writing by carpet tile manufacturer install every tile with full-spread, releasable, pressure-sensitive adhesive
- 3. Maintain dye lot integrity. Do not mix dye lots in same area.
- 4. Cut and fit carpet tile to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet tile manufacturer.
- 5. Extend carpet tile into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.
- 6. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use nonpermanent, nonstaining marking device.
- 7. Install pattern parallel to walls and borders.
- 8. Stagger joints of carpet tiles so carpet tile grid is offset from access flooring panel grid. Do not fill seams of access flooring panels with carpet adhesive; keep seams free of adhesive.

C. Cleaning And Protection

1. Perform the following operations immediately after installing carpet tile:
 - a. Remove excess adhesive, seam sealer, and other surface blemishes using cleaner recommended by carpet tile manufacturer.
 - b. Remove yarns that protrude from carpet tile surface.
 - c. Vacuum carpet tile using commercial machine with face-beater element.
2. Protect installed carpet tile to comply with CRI 104, Section 16, "Protection of Indoor Installations."
3. Protect carpet tile against damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated or recommended in writing by carpet tile manufacturer.

SECTION 09 69 13 00 - ACCESS FLOORING RIGID-GRID

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 DEFINITIONS

- A. Access flooring is a complete portable assembly of modular floor panels on an elevated support system (understructure), forming an accessible under floor cavity to accommodate electrical and mechanical services.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: Engage an experienced Installer who is approved by the access flooring manufacturer for installation of the types of access flooring required for this Project.
- B. Testing Laboratory Qualifications: To qualify for acceptance, an independent testing laboratory must demonstrate to Architect's satisfaction, based on evaluation of laboratory submitted criteria conforming to ASTM E 699, that it has the experience and capability to conduct satisfactorily the testing indicated without delaying the progress of the Work.
- C. NFPA Standard: Provide access flooring complying with NFPA 75 requirements for raised flooring.
- D. Single Source Responsibility: Obtain access flooring from one source from a single manufacturer.
- E. Coordination of Work: Coordinate location of mechanical and electrical Work in underfloor cavity to prevent interference with access flooring pedestals.
- F. Pre Installation Conference: Conduct conference at Project Site.

1.05 SUBMITTALS

- A. Product Data:
 - 1. Product data for each type of access flooring.
- B. Samples:

1. Samples for initial selection purposes in form of manufacturer's color charts consisting of actual units or sections of units showing full range of colors, textures, and patterns available for each type of floor covering and exposed finish indicated.
2. Samples for verification purposes in full size units of each type of floor covering and exposed finish indicated.
 - a. In addition, submit one complete full size floor panel, pedestal and grid unit for each type of access floor required.

C. Shop Drawings:

1. Shop drawings indicating complete layout of access flooring based on field verified dimensions; include dimensional relationships to adjoining Work installation tolerances. Include details, with descriptive notes indicating materials, finishes, fasteners, typical and special edge conditions, accessories, understructure, and other data to permit a full evaluation of entire access flooring system.

D. Record Documents:

1. Qualification data for firms and persons specified in "Quality Assurance" article to demonstrate their capabilities and experience. Include list of completed projects with project name, addresses, names of Architects and Owners, plus other information specified.
2. Product test reports from qualified independent testing laboratory evidencing compliance of access flooring with performance requirements, based on comprehensive testing performed by qualified independent testing laboratory or by access flooring manufacturer and witnessed by qualified independent testing laboratory.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver access flooring components in original, unopened packages, clearly labeled with manufacturer's name and item description.
- B. Handle and store packages containing access flooring in a manner which avoids overloading building structure.

1.07 EXTRA MATERIALS

- A. Deliver extra materials to Owner. Furnish extra materials described below matching products installed, packaged with protective covering for storage and identified with labels clearly describing contents:
 1. Standard Field Panels and Understructure: Furnish quantity of standard field panels and understructure components to support them equal to 2 percent of the amount installed.

1.08 PROJECT CONDITIONS

- A. Environmental Conditions: Do not proceed with installation of access flooring until installation area is enclosed and has an ambient temperature of between 40 degrees F (4.4 degrees C) and 90 degrees F (32.2 degrees C), and a relative humidity of not more than 70 percent.
- B. Field Measurements: Check actual locations of walls and other construction to which access flooring must fit, by accurate field measurements before preparation of shop drawings; show recorded measurements on final shop drawings. Coordinate fabrication schedule with construction progress to avoid delay of Work.

1. Where field measurements cannot be made without delaying the Work, guarantee dimensions and proceed with preparation of shop drawings for access flooring without field measurements. Coordinate construction to ensure that actual dimensions correspond to guaranteed dimensions.

1.09 SEQUENCING AND SCHEDULING

- A. Mark pedestal locations by use of 10 feet by 10 feet grid on concrete subfloor so that mechanical and electrical Work can take place without interfering with pedestals.
- B. Do not proceed with installation of access flooring until after substantial completion of other performable construction within affected spaces.

1.10 SYSTEM PERFORMANCE REQUIREMENTS

- A. Performance Requirements, General: Design, engineer, fabricate, and install access flooring to comply with performance requirements specified, as demonstrated by testing of manufacturer's corresponding stock systems per test methods specified or, if not specified, manufacturer's standard method.
- B. Structural Performance per CISCA/AF: Provide access flooring capable of supporting the following loads, within limits and under conditions indicated, as demonstrated by testing according to applicable procedure in Ceilings & Interior Systems Construction Association (CISCA) "Recommended Test Procedures for Access Floors" referenced elsewhere in this section as CISCA/AF:
 1. Concentrated-Load Performance: Capability of floor panels, including those with cutouts, to support concentrated design loads of the following magnitude, with a top-surface deflection under load and a permanent set not to exceed, respectively, 0.10 and 0.010 inch (2.54 and 0.25 mm), according to CISCA A/F Section I.
 - a. 1000 lbf (4448 N).
 2. Ultimate-Load Performance: Capability of access flooring systems to support a minimum ultimate concentrated load equal to the value obtained by multiplying the specified concentrated floor panel design load by the factor indicated below, without failing, according to CISCA A/F Section II. Failure is defined as the point at which the access flooring system will not take any additional load.
 3. Factor: 2.5
- C. Rolling-Load Performance: Capability of access flooring system to withstand rolling loads of the following magnitude applied to panels, with a combination of local and overall deformation not to exceed 0.040 inch (1.02 mm) after exposure to rolling load over CISCA A/F path A or B, whichever path produces the greatest top-surface deformation, according to CISCA A/F Section III.
 1. CISCA A/F Wheel 1 rolling load indicated below:
 - a. 1000 lbf (4448 N).
 2. Stringer Concentrated-Load Performance: Capability of stringers, without panels in place, to support a concentrated load of 200 lbf (890 N) at center of span with a permanent set not to exceed 0.010 inch (0.25 mm), as determined per CISCA A/F Section IV.
 3. Pedestal Axial-Load Performance: Capability of pedestal assemblies, without panels or other supports in place, to withstand the following axial load per pedestal, according to CISCA A/F Section V.
 - a. 5000 LBF (22.24 kN).

4. Pedestal Overturning-Moment Performance: Capability of pedestal assemblies, without panels or other supports in place, to withstand the following overturning moment per pedestal, according to CISCA A/F Section VI.
 - a. 1000 lbf x inches (113 N x m).
- D. Seismic Loads: Provide access flooring system capable of withstanding stresses produced by lateral forces of magnitude indicated.
 1. Calculate lateral forces (F_p) in accordance with the formula $F_p = ZIC_pW_p$ in which the values for the following are based on requirements of ANSI A58.1 for seismic zone in which project occurs.
 - a. Z = Seismic Coefficient.
 - b. I = Occupancy Importance Factor.
 - c. C_p = Horizontal Force Factor.
 - d. W_p = Area of a single standard field panel in sq. ft. x [(25 percent of Uniform Live Load in lbf/sq. ft.) + (Dead Load consisting of weight of access floor in lbf/sq. ft. + partition load in lbf/sq. ft.)].
- E. Electrical Resistance of System: Provide access flooring system with the following electrical resistance characteristics:
 1. Static control floor covering resistance of not less than 150,000 ohms, or more than 20,000 megohms, measured across surface of floor covering through panel to understructure by test method for conductive flooring specified in Chapter 3 of NFPA 99.
 2. Static conductive floor covering resistance of not less than 25,000 ohms, nor more than 1,000,000 ohms, measured across surface of floor covering through panel to understructure, by test method for conductive flooring specified in Chapter 3 of NFPA 99.
 3. Panel to understructure resistance of not more than 10 ohms.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering access flooring which may be incorporated in the Work include:
 1. Cementitious Filled Formed Steel Panel Systems:
 - a. USG Interiors, Inc., Access Floor Division
 - b. Or Approved Equal

2.03 FLOOR PANELS

- A. Provide manufacturer's standard modular field panels of size and construction indicated, that are interchangeable with other standard field panels, easily placed and removed without disturbing adjacent panels or understructure by one person using a portable lifting device, free of exposed metal edges in installed position with floor covering in place.
- B. Nominal Panel Size: 24 inches by 24 inches.
- C. Fabrication Tolerances: Fabricate panels to the following tolerances with squareness tolerances expressed as the difference between diagonal measurements from corner to corner:
 - 1. Size and Squareness: Plus or minus 0.015 inch of required size, with a squareness tolerance of plus or minus 0.015 inch, unless tolerances are otherwise indicated for a specific panel type.
 - 2. Flatness: Plus or minus 0.020 inch measured on a diagonal on top of panel.
 - 3. Size and Squareness of Bolted Down Reinforced Lightweight Concrete Panels: Plus or minus 0.015 inch of required size, with a squareness tolerance of plus or minus 0.035 inch.
- D. Cementitious Filled Formed Steel Panels: Fabricate panels with flat cold rolled steel top sheet and die formed and stiffened cold rolled steel bottom pan and with lightweight cementitious core; top and bottom sheets joined together by resistance welding to form an enclosed assembly.
 - 1. Protect metal surfaces against corrosion with manufacturer's standard factory applied finish.
 - 2. For bolted down panels, fabricate units with holes drilled in corners to align precisely with threaded holes in pedestal heads and to accept countersunk screws with heads flush with top of panel.

2.04 FLOOR PANEL COVERING

- A. Cover tops of floor panels to comply with requirements indicated for color, pattern, and material.
- B. Colors and Patterns: Provide floor covering materials in colors and patterns as indicated below:
 - 1. Match Architect's sample.
 - 2. Match color and pattern indicated by reference to manufacturers standard designations for these characteristics.
 - 3. Provide selections made by Architect from manufacturer's full range of standard colors and patterns.
- C. Plastic Laminate: NEMA LD 3, High Wear Type, of grade indicated below; fabricated in one piece to cover each panel face within perimeter plastic edging or with integral trim serving as edging.
 - 1. Grade HW 62 (0.062 inch thick).
 - 2. Grade HW 120 (0.120 inch thick).
- D. Vinyl Composition Tile: FS SS T 312, Type IV, Composition 1 (asbestos free); fabricated in 4 equal sized units from 12 inches x 12 inches x 1/8 inch tiles to cover panel face within perimeter plastic edging.
- E. Static Conductive Vinyl Tile: FS SS T 312, Type III; fabricated in one piece to cover each panel face within perimeter plastic edging, unless otherwise indicated, with static generation of less than 100 volts with conductive footwear at 20 percent relative humidity per AATCC 134 and static decay of 5,000 volts to zero in less than 0.03 seconds per Fed. Test Method 101C/4046, Method 4046, at 15 percent relative humidity.

F. Carpet: Provide carpet complying with following requirements:

1. Pile Filament/Fiber: Two ply, 100 percent soil hiding, antimicrobial, stain repellant bulked continuous filament solution dyed nylon containing conductive mono filament.
2. Static Generation: Less than 1.8 KV at 20 percent relative humidity, per AATCC 134 using step and scuff tests with neolite and chrome tanned leather soles.
3. Carpet Construction: Tufted level loop.
4. Gage and Stitches: 1/10 inch x 9.2.
5. Pile Thickness (Height): 0.17 inch.
6. Pile Face Weight: Not less than 28 oz. per sq. yd.
7. Total Weight: Not less than 58 oz. per sq. yd.
8. Backing: Unitary backing consisting of woven propylene back coated with carbon loaded latex.
9. Installation: Die cut and adhesively bonded in factory to panel face; edge condition as follows:
 - a. Trim edge.
10. Flammability: Passes "pill test" of ASTM D 2859.
11. Critical Radiant Flux Rating: Minimum of 0.45 watts/sq. cm. per ASTM E 648.

G. Edging: Manufacturer's standard form of edge trim, either integral with floor covering or applied. For applied edge trim, use method standard with manufacturer involving either mechanical or adhesive attachment or both of edge trim to perimeter of each panel. Select size and profile of applied edge trim to suit floor covering selected.

2.05 UNDERSTRUCTURE

- A. Pedestals: Provide manufacturer's standard pedestal assembly including base, column with provisions for height adjustment, and head (cap); made either of steel or aluminum or a combination of both.
1. Base: Square or circular base with not less than 16 sq. inches of bearing area.
 2. Provide vibration proof mechanism for making and holding fine adjustments in height for leveling purposes over a range of not less than 2 inches. Include means of locking leveling mechanism at a selected height, which requires deliberate action to change height setting and prevents vibratory displacement.
 3. Fabricate units of sufficient height to provide required underfloor clearance.
 4. Head: Of type designed to support understructure system indicated.
- B. Stringer Systems: Manufacturer's standard modular steel stringer system, designed and fabricated to interlock with pedestal head and to form a grid pattern with members under each edge of each floor panel and with a pedestal under each corner of each floor panel. Protect steel components against corrosion with manufacturer's standard galvanized or paint finish.
1. Bolted Stringers: System of main and cross stringers connected to pedestals with threaded fasteners accessible from above.

- a. Provide continuous gasket at contact surfaces between panel and stringers to deaden sound, to form an effective plenum seal, and where required, to maintain panel alignment and position.
- b. Provide stringers which support each edge of each panel where required to meet design load criteria.

2.06 ACCESSORIES

- A. Colors and Finishes: For exposed accessories available in more than one standard color or finish, provide color or finish complying with the following requirements:
 1. Provide selections made by Architect from manufacturer's full range of standard colors and finishes for products and materials indicated.
- B. Cutouts: Fabricate cutouts in floor panels to accommodate cable penetrations and service outlets, if any. Comply with requirements indicated for size, shape, number, and location. Provide reinforcement or additional support, if needed, to make panels with cutouts comply with standard performance requirements.
 1. Fit cutouts with manufacturer's standard grommets in sizes indicated or, where size of cutouts exceed maximum grommet size available, trim edge of cutouts with manufacturer's standard plastic molding having tapered top flange.
 - a. Furnish removable twist close covers.
 2. Provide foam rubber pads for sealing annular space formed in cutouts by cables and trim edge of cutout with molding having flange and ledge for capturing and supporting pads.
- C. Service Outlets: Manufacturer's standard UL listed and labeled assemblies, for recessed mounting flush with top of floor panels, designed and fabricated to accommodate power, communication, and signal cables, and complying with following requirements:
 1. Structural Performance: Cover capable of supporting a 1,000 lbf concentrated load.
 2. Cover and Box Type: Hinged cover with opening for passage of cables when cover is closed and including frame and steel box or formed steel plate for mounting of electrical receptacles.
 3. Cover and Box Type: Grommet with twist close cover and including steel junction box for mounting of electrical receptacle with provision for passage or housing of telephone amphenol connectors and signal cables.
 4. Location: Locate outlets in center of panel quadrant.
 5. Receptacles and Wiring: Equip each service outlet with power receptacles to comply with requirements indicated below.
 - a. Type of Receptacle: Heavy duty duplex, 2 pole, 3 wire grounding, 20 amperes, 125 volts, NEMA configuration 5 20R unless otherwise indicated.
 - b. Number of Receptacles for Outlet: Two (2).
 - c. Wiring Method: Factory wired for hard wiring in field with armored cable of length indicated, containing 3 insulated No. 12 AWG solid copper conductors, terminated with 6 inch long pigtail.
- D. Perforated Panels: Manufacturer's standard load bearing perforated metal panels interchangeable with standard field panels and complying with the following requirements:

1. Air Distribution Characteristics of Units without Dampers: Capable of delivering 770 CFM at 0.10 inch static pressure.
 2. Air Distribution Characteristics of Units with Dampers: Where indicated, provide units with air volume control dampers, adjustable from top surface and capable of delivering 525 CFM at 0.10 inch static pressure with damper full open.
 3. Structural Performance: Capable of supporting a 1,000 lbf concentrated load.
 4. Floor Covering: Same as standard field panel.
- E. Aluminum Floor Grilles: Manufacturer's standard load bearing extruded aluminum grilles complying with the following requirements:
1. Air Distribution Characteristics of Units without Dampers: Capable of delivering 290 CFM at 0.10 inch static pressure.
 2. Air Distribution Characteristics of Units with Dampers: Where indicated, provide units with air volume control dampers, adjustable from top surface and capable of delivering 290 CFM at 0.10 inch static pressure with damper full open.
 3. Structural Performance: Capable of supporting a 1,000 lbf concentrated load.
 4. Isolate grille from metal to metal contact with panel and understructure.
- F. Die Cast Aluminum Floor Grates: Manufacturer's standard load bearing die cast aluminum grates complying with the following requirements:
1. Air Distribution Characteristics of Units without Dampers: Capable of delivering 3725 CFM at 0.10 inch static pressure.
 2. Air Distribution Characteristics of Units with Dampers: Where indicated, provide units with air volume control dampers, adjustable from top surface and capable of delivering 1975 CFM at 0.10 inch static pressure with damper full open.
 3. Structural Performance: Capable of supporting a 1,000 lbf concentrated load.
- G. Plenum Dividers: Manufacturer's standard metal plenum divider, located where indicated to divide underfloor plenum.
- H. Vertical Closures (Fascia): Where underfloor cavity is not enclosed by abutting walls, columns, beams, or downturned slabs, provide manufacturer's standard metal closure plates with factory applied finish.
- I. Ramps: Manufacturer's standard ramp construction of width and slope indicated, but not steeper than 1 in 12, with non slip raised disc rubber or vinyl floor covering, and of same materials, performance, and construction requirements as the access flooring.
- J. Steps: Provide steps of size and arrangement indicated with floor covering to match access flooring. Apply non slip aluminum nosings to treads unless otherwise indicated.
- K. Railings: Manufacturer's standard satin finish extruded aluminum post and rail type railings, at ramps and open sided perimeter of access flooring where indicated. Include handrail, intermediate rails, posts, brackets, end caps, wall returns, wall and floor flanges, plates, and anchorages where required. Provide railings that comply with code required structural performance requirements for railings.
- L. Panel Lifting Device: Manufacturer's standard portable lifting device of type and number required for lifting panels with floor covering provided.

1. Provide 1 lifting device of each type required for each room in which access flooring is installed.
- M. Vinyl Base: Vinyl wall base complying with FS SS W 40, Type II, with matching end stops and preformed or molded corner units, with topset cove, and of height and thickness indicated.
- N. Perimeter Support: Where indicated, provide manufacturer's standard aluminum extrusion to support panel edge and form transition between access flooring and adjoining floor covering at same level as access flooring.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Pre Installation Adhesive Subfloor Field Test: Prior to proceeding with installation of pedestals, field test their adhesion to subfloor surfaces as follows:
 1. In areas representative of each subfloor surface condition, set typical pedestal assemblies in same adhesive and methods required for completed Work.
 2. Allow test installation to cure for 14 days, with a pressure of 25 lbf applied vertically to pedestals during this period.
 3. After curing, apply lateral loads against a straight steel extension bar inserted 2 inches into pedestal stems. Measure with spring scale the force needed to cause adhesive failure between pedestal base and subfloor.
 4. Do not proceed with installation until tests evidence compliance with indicated requirement for pedestal's capability to resist overturning bending movement.
- B. Locate each pedestal and complete any necessary subfloor preparation, and vacuum clean the subfloor of all dust, dirt, and construction debris before starting installation.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install access floor system and accessories under supervision of the access flooring manufacturer's authorized representative to ensure rigid, firm installation free of vibration, rocking, rattles, squeaks, and other unacceptable performance.
- D. Set pedestals in adhesive as recommended by the access flooring manufacturer to provide full bearing of the pedestal base on the subfloor.
- E. Layout floor panel installation to keep the number of cut panels at the floor perimeter to a minimum. Scribe panel assemblies at perimeter to provide a close fit with no voids greater than 1/8 inch where panels abut vertical surfaces.
 1. To prevent dusting, seal cut edges of the panel with sealer recommended by panel manufacturer.
- F. Secure grid members to pedestal heads in accordance with access flooring manufacturer's instructions.
- G. Accurately scribe and fit plenum dividers to subfloor and seal with mastic to ensure maintenance of plenum effect.

- H. Accurately scribe and fit vertical closures to subfloor and adjacent finish floor. Set in mastic and seal if required for plenum effect.
- I. Thoroughly clean up dust, dirt, and construction debris caused by floor installation, including vacuuming the subfloor area, as installation of floor panels proceeds. Extend cleaning under installed panels as far as possible.
- J. Cutting and trimming or other dirt or debris producing operations will not be permitted in the rooms where the floor is being installed.
- K. Perform cutting and trimming or other dirt or debris producing operations as remotely as possible from installation area and in manner to prevent contamination of subfloor surfaces under sections of access floor which already have been installed.
- L. Level installed access floor to within 0.10 inch of true level over the entire area and within 0.0625 inch in any 10 foot distance.

3.03 ADJUSTING, CLEANING, AND PROTECTION

- A. After completion of installation, vacuum clean the entire floor surface and cover with continuous sheets of reinforced paper or plastic. Maintain and repair damages to protective covering until time of Substantial Completion.
- B. Replace access floor panels which are chipped, broken, stained, scratched, or otherwise damaged, or do not conform to specified requirements.

END OF SECTION 09 69 13 0069 10 0069 00

Task	Specification	Specification Description
09 69 53 00	09 69 13 00	Access Flooring Rigid-Grid
09 82 00 00	07 95 13 00	Expansion Joint Cover Assemblies
09 91 13 00	09 91 23 00	Painting - Interior

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 09 91 23 00 - PAINTING - INTERIOR**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 DEFINITIONS

- A. "Paint" includes coating systems materials; primers, emulsions, enamels, stains, sealers and fillers, and other applied materials whether used as prime, intermediate, or finish coats.
 - 1. Substrate" as used herein means the surface to which paint is to be applied. In the case of previously painted existing surfaces, substrate means the surface to which the existing paint was applied.

1.04 QUALITY ASSURANCE

- A. Single Source Responsibility: Provide primers and undercoat paint produced by the same manufacturer as the finish coats.
- B. Coordination of Work: Review other sections in which primers are provided to ensure compatibility of the total systems for various substrates. On request, furnish information on characteristics of finish materials to ensure use of compatible primers.
- C. Notify the Architect of problems anticipated using the materials specified.
- D. Material Quality: Provide the manufacturer's best quality trade sale paint material of the various coating types specified. Paint material containers not displaying manufacturer's product identification will not be acceptable.
 - 1. Proprietary names used to designate colors or materials are not intended to imply that products named are required or to exclude equal products of other manufacturers.
 - 2. Federal Specifications establish a minimum quality level for paint materials, except where other product identification is used. Provide written certification from the manufacturer that materials provided meet or exceed these criteria.
 - 3. Products that comply with qualitative requirements of applicable Federal Specifications, yet differ in quantitative requirements, may be considered for use when acceptable to the Architect. Furnish material data and manufacturer's certificate of performance to Architect for proposed substitutions.

E. Odor Eliminating Additive: At all locations scheduled to receive solvent or alkyd-based coatings, provide an odor-eliminating additive to minimize the presence of odor from wet and drying paint films.

1. Provide additive recommended and approved by the primer/finish coat manufacturer for use with their paint. Benjamin Moore does not recommend an "odor eliminator additive" for Benjamin Moore Paints.
2. Provided compliance with above requirements, "Bio Zapp Paint Odor Eliminator" by Bio Zapp Laboratories, (800/776-7721) is acceptable.

1.05 SUBMITTALS

A. Samples:

1. Samples for initial color selection in the form of manufacturer's color charts.
2. Samples for verification purposes:
 - a. Provide samples of each color and material to be applied, with texture to simulate actual conditions, on representative samples of the actual substrate.
 - b. Resubmit until required sheen, color, and texture are achieved.
 - c. Provide a list of material and application for each coat of each sample. Label each sample as to location and application.
 - d. Submit samples on the following substrates for the Architect's review of color and texture only:
 - 1) Concrete: Provide two 4 inch square samples for each color and finish, or provide field sample as determined by architect.
 - 2) Concrete Masonry: Provide two 4 by 8 inch samples of masonry, with mortar joint in the center, for each finish and color, or provide field sample as determined by architect.
 - 3) Painted Wood: Provide two 12 by 12 inch samples of each color and material on hardboard.
 - 4) Stained or Natural Wood: Provide two 4 by 8 inch samples of natural and stained wood finish on actual wood surfaces.
 - 5) Ferrous Metal: Provide two 4 inch square samples of flat metal and two 8 inch long samples of solid metal for each color and finish, or provide field sample as determined by architect.
 - 6) Drywall: Provide two 12 by 12-inch samples of each color and finish.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to the Project Site in the manufacturer's original, unopened packages and containers bearing manufacturer's name and label and the following information:
1. Product name or title of material.
 2. Product description (generic classification or binder type).
 3. Federal Specification number, if applicable.
 4. Manufacturer's stock number and date of manufacture.

5. Contents by volume, for pigment and vehicle constituents, and VOC content.
 6. Thinning instructions.
 7. Application instructions.
 8. Color name and number.
- B. Store materials not in use in tightly covered containers in a well ventilated area at a minimum ambient temperature of 45 degrees F (7 degrees C). Maintain containers used in storage in a clean condition, free of foreign materials and residue.
1. Protect from freezing. Keep storage area neat and orderly. Remove oily rags and waste daily. Take necessary measures to ensure that workers and Work areas are protected from fire and health hazards resulting from handling, mixing, and application.

1.07 PROJECT CONDITIONS

- A. Apply water based paints only when the temperature of surfaces to be painted and surrounding air temperatures are between 50 degrees F (10 degrees C) and 90 degrees F (32 degrees C).
- B. Apply solvent thinned paints only when the temperature of surfaces to be painted and surrounding air temperatures are between 45 degrees F (7 degrees C) and 95 degrees F (35 degrees C).
- C. Do not apply paint in snow, rain, fog, or mist, when the relative humidity exceeds 85 percent, at temperatures less than 5 degrees F (3 degrees C) above the dew point, or to damp or wet surfaces.
 1. Painting may continue during inclement weather if surfaces and areas to be painted are enclosed and heated within temperature limits specified by the manufacturer during application and drying periods.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 PAINTING MANUFACTURES

A. Sherwin-Williams

1. Website: www.sherwin-williams.com
2. Address: 3453 Fredericksburg Rd, San Antonio, TX 78201-3848

B. Or Approved Equal

2.03 PAINT SCHEDULE

- A. Provide the following paint systems for the various substrates, as indicated. Provide only the listed prime and finish coat materials unless otherwise recommended in writing by the paint manufacturer for each specific substrate.
- B. Where specific finish paint material is not indicated, refer to notes and finish schedules for finish paint material and gloss levels for each surface to be painted.

2.04 EXTERIOR PAINT SCHEDULE

- A. Ferrous Metal; two (2) finish coats of water borne <semigloss><gloss> acrylic enamel over primer:
 - 1. Rust Inhibiting Primer:
 - a. SW Primer Rust Inhibitive
 - 2. Finish Coat:
 - a. SW Semi-gloss Enamel
- B. Galvanized Metal; two (2) finish coats of water borne <semigloss><gloss> acrylic enamel over primer:
- C. Traffic & Zone Products
 - 1. Sherwin Williams SETFAST[®] Solvent Based Acrylic Zone Marking Paint:
 - a. TM5632 White
 - b. TM5645 Lead Free Yellow.

2.05 INTERIOR PAINTING SCHEDULE

- A. Gypsum Board, Plasterboard, ect; two (2) finish coats over primer.
 - 1. Latex Systems
 - a. Eg-Shell Finish
- B. Masonary (CMU, Etc.); Latex system, two (2) finish coats over primer- gloss to be selected by Architect.
- C. Steel Columns, joist, beams, doors, etc; Latex system, two (2) finish coats over primer- gloss to be selected by Architect.
- D. Aluminum & Galvanized Metal; Latex system, two (2) finish coats over primer- gloss to be selected by Architect.
- E. Wood Walls, Doors, Trim, Etc; Latex system, two (2) finish coats over primer- gloss to be selected by Architect.
- F. Concrete (Pre-cast, unglazed brick, cement board, etc): Latex system, two (2) finish coats over primer- gloss to be selected by Architect.
- G. Concrete Floors- Two (2) coats SW Sher-Crete flexible Concrete waterproof, A5 series or Pro Industrial Systems as per recommendation.
- H. Wood Interior Systems (Vertical)- Transparent
 - 1. Water Reducible Polyurethane
 - a. Transparent Finish
 - 1) First Coat: S-W Wood Classic Waterborne Polyurethane Varnish, A68 Series
 - 2) Second Coat: S-W Wood Classic Waterborne Polyurethane Varnish, A68 Series (400-500 sq ft/gal)

2. Alkyd System
 - a. Transparent Finish
 - 1) First Coat: S-W Wood Classic Fast Dry Oil Bases Varnish, A66-300 Series
 - 2) Second Coat: S-W Wood Classic Fast Dry Oil Bases Varnish, A66-300 Series ((350-400 sq ft/gal)
 3. Polyurethane System
 - a. Transparent Finish
 - 1) First Coat: S-W Wood Classic Polyurethane Varnish, A67 Series
 - 2) Second Coat: S-W Wood Classic Polyurethane Varnish, A68 Series (400-500 sq ft/gal)
- I. Wood Interior Systems (vertical)- Semi Transparent
1. Water Reducible Polyurethane (topcoat)
 - a. Semi-Transparent Stain
 - 1) First Coat: S-W Wood Classic Oil Stain A49 Series (450-500 sq ft/ga;)
 - 2) Second Coat: S-W Wood Classic Waterborne Polyurethane Varnish, A68 Series
 - 3) Third Coat: S-W Wood Classic Waterborne Polyurethane Varnish, A68 Series (400-500 sq ft/gal)
 2. Alkyd (topcoat)
 - a. Semi-Transparent Stain
 - 1) First Coat: S-W Wood Classics Oil Stain, A49 Series (450-500 sq ft/gal)
 - 2) Second Coat: S-W Wood Classic Oil Base Varnish, A66-300 Series
 - 3) Third Coat: S-W Wood Classic Oil Base Varnish, A66-300 Series (350-400 sq ft/gal)
 3. Polyurethane (topcoat)
 - a. Semi-Transparent Stain
 - 1) First Coat: S-W Wood Classics Oil Stain, A49 Series (450-500 sq ft/gal)
 - 2) First Coat: S-W Wood Classic Polyurethane Varnish, A67 Series
 - 3) Second Coat: S-W Wood Classic Polyurethane Varnish, A68 Series (400-500 sq ft/gal)

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine substrates and conditions under which painting will be performed for compliance with requirements for application of paint. Do not begin paint application until unsatisfactory conditions have been corrected.

1. Start of painting will be construed as the Applicator's acceptance of surfaces and conditions within a particular area.
- B. General Procedures: Remove hardware and hardware accessories, plates, machined surfaces, lighting fixtures, and similar items in place that are not to be painted, or provide surface applied protection prior to surface preparation and painting. Remove these items if necessary for complete painting of the items and adjacent surfaces. Following completion of painting operations in each space or area, have items reinstalled by workers skilled in the trades involved.
 1. Clean surfaces before applying paint or surface treatments. Remove oil and grease prior to cleaning. Schedule cleaning and painting so that dust and other contaminants from the cleaning process will not fall on wet, newly painted surfaces.
- C. Surface Preparation: Clean and prepare surfaces to be painted in accordance with the manufacturer's instructions for each particular substrate condition and as specified.
 1. Provide barrier coats over incompatible primers and existing surfaces, or remove and reprime. Notify Architect in writing of problems anticipated with using the specified finish coat material with substrates primed by others.
 2. Cementitious Materials: Prepare concrete, concrete masonry block, cement plaster, and mineral fiber reinforced cement panel surfaces to be painted. Remove efflorescence, chalk, dust, dirt, grease, oils, and release agents. Roughen as required to remove glaze. If hardeners or sealers have been used to improve curing, use mechanical methods of surface preparation.
 - a. Use abrasive blast cleaning methods if recommended by the paint manufacturer.
 - b. Determine alkalinity and moisture content of surfaces by performing appropriate tests. If surfaces are sufficiently alkaline to cause blistering and burning of finish paint, correct this condition before application. Do not paint surfaces where moisture content exceeds that permitted in manufacturer's printed directions.
 - c. Clean concrete floors to be painted with a 5 percent solution of muriatic acid or other etching cleaner. Flush the floor with clean water to remove acid, neutralize with ammonia, and rinse; allow to dry and vacuum before painting.
 3. Wood: Clean surfaces of dirt, oil, and other foreign substances with scrapers, mineral spirits, and sandpaper, as required. Sand surfaces exposed to view smooth and dust off.
 - a. Scrape and clean small, dry, seasoned knots and apply a thin coat of white shellac or other recommended knot sealer before application of primer. After priming, fill holes and imperfections in finish surfaces with putty or plastic wood filler. Sand smooth when dried.
 - b. Prime, stain, or seal wood to be painted immediately upon delivery. Prime edges, ends, faces, undersides, and backsides of wood, including cabinets, counters, cases, and paneling.
 - c. When transparent finish is required, backprime with spar varnish.
 - d. Backprime paneling on interior partitions where masonry, plaster, or other wet wall construction occurs on backside.
 - e. Seal tops, bottoms, and cutouts of unprimed wood doors with a heavy coat of varnish or sealer immediately upon delivery.
 4. Ferrous Metals: Clean nongalvanized ferrous metal surfaces that have not been shop coated; remove oil, grease, dirt, loose mill scale, and other foreign substances. Use solvent or mechanical cleaning methods that comply with recommendations of the Steel Structures Painting Council.

- a. Blast steel surfaces clean as recommended by the paint system manufacturer and in accordance with requirements of SSPC specification SSPC SP 10.
 - b. Touch up bare areas and shop applied prime coats that have been damaged. Wire brush, clean with solvents recommended by the paint manufacturer, and touch up with the same primer as the shop coat.
 5. Galvanized Surfaces: Clean galvanized surfaces with non petroleum based solvents so that the surface is free of oil and surface contaminants. Remove pretreatment from galvanized sheet metal fabricated from coil stock by mechanical methods.
 6. Wood-Interior: All surfaces must be sanded smooth, with the grain, never across it. Surface blemishes must be corrected and area cleaned of dust before coating. Patching compounds will generally be visible through clear coatings.
- D. Materials Preparation: Carefully mix and prepare paint materials in accordance with manufacturer's directions.
1. Maintain containers used in mixing and application of paint in a clean condition, free of foreign materials and residue.
 2. Stir material before application to produce a mixture of uniform density; stir as required during application. Do not stir surface film into material. Remove film and, if necessary, strain material before using.
 3. Use only thinners approved by the paint manufacturer, and only within recommended limits.
- E. Tinting: Tint each undercoat a lighter shade to facilitate identification of each coat where multiple coats of the same material are applied. Tint undercoats to match the color of the finish coat, but provide sufficient differences in shade of undercoats to distinguish each separate coat.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

3.03 APPLICATION

- A. Apply paint in accordance with manufacturer's directions. Use applicators and techniques best suited for substrate and type of material being applied.
- B. Paint exposed surfaces whether or not colors are designated in "schedules," except where a surface or material is specifically indicated not to be painted or is to remain natural. Where an item or surface is not specifically mentioned, paint the same as similar adjacent materials or surfaces. If color or finish is not designated, the Architect will select from standard colors or finishes available.
 1. Painting includes field painting exposed bare and covered pipes and ducts (including color coding), hangers, exposed steel and iron Work, primed surfaces of mechanical, electrical, and all other equipment, and prefinished surfaces of certain equipment including, but not limited to; electrical panel covers, equipment supports, and equipment exposed to view on the roof.
- C. At "unoccupied" interior areas, painting is not required on prefinished items or finished metal surfaces.
 1. Do not paint over Underwriter's Laboratories, Factory Mutual or other code required labels or equipment name, identification, performance rating, or nomenclature plates.

- D. Do not paint over dirt, rust, scale, grease, moisture, scuffed surfaces, or conditions detrimental to formation of a durable paint film.
1. Paint colors, surface treatments, and finishes are indicated in "schedules."
 2. Provide finish coats that are compatible with primers used.
 3. The number of coats and film thickness required is the same regardless of the application method. Do not apply succeeding coats until the previous coat has cured as recommended by the manufacturer. Sand between applications where sanding is required to produce an even smooth surface in accordance with the manufacturer's directions.
 4. Apply additional coats when undercoats, stains, or other conditions show through final coat of paint until paint film is of uniform finish, color, and appearance. Give special attention to ensure that surfaces, including edges, corners, crevices, welds, and exposed fasteners, receive a dry film thickness equivalent to that of flat surfaces.
 5. The term "exposed surfaces" includes areas visible when permanent or built in fixtures, convactor covers, covers for finned tube radiation, grilles, and similar components are in place. Extend coatings in these areas as required to maintain the system integrity and provide desired protection.
 6. Paint surfaces behind movable equipment and furniture same as similar exposed surfaces. Paint surfaces behind permanently fixed equipment or furniture with prime coat only before final installation of equipment.
 7. Paint interior surfaces of ducts, where visible through registers or grilles, with a flat, nonspecular black paint.
 8. Paint back sides of access panels and removable or hinged covers to match exposed surfaces.
 9. Finish interior of wall and base cabinets and similar field finished casework to match exterior.
 10. Finish exterior doors on tops, bottoms, and side edges same as exterior faces.
 11. Sand lightly between each succeeding enamel or varnish coat.
 12. Omit primer on metal surfaces that have been shop primed and touch up painted.
- E. Scheduling Painting: Apply first coat to surfaces that have been cleaned, pretreated, or otherwise prepared for painting as soon as practicable after preparation and before subsequent surface deterioration.
1. Allow sufficient time between successive coats to permit proper drying. Do not recoat until paint has dried to where it feels firm, and does not deform or feel sticky under moderate thumb pressure and where application of another coat of paint does not cause lifting or loss of adhesion of the undercoat.
- F. Minimum Coating Thickness: Apply materials at not less than the manufacturer's recommended spreading rate. Provide a total dry film thickness of the entire system as recommended by the manufacturer.
- G. Mechanical and Electrical Work: Painting mechanical and electrical Work is limited to items exposed in mechanical equipment rooms and in occupied spaces.
- H. Block Fillers: Apply block fillers to concrete masonry block at a rate to ensure complete coverage with pores filled.

1. Prime Coats: Before application of finish coats, apply a prime coat of material as recommended by the manufacturer to material that is required to be painted or finished and has not been prime coated by others. Recoat primed and sealed surfaces where evidence of suction spots or unsealed areas in first coat appears, to assure a finish coat with no burn through or other defects due to insufficient sealing.
- I. Stipple Enamel Finish: Roll and redistribute paint to an even and fine texture. Leave no evidence of rolling such as laps, irregularity in texture, skid marks, or other surface imperfections.
- J. Pigmented (Opaque) Finishes: Completely cover to provide an opaque, smooth surface of uniform finish, color, appearance, and coverage. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections will not be acceptable.
- K. Transparent (Clear) Finishes: Use multiple coats to produce a glass smooth surface film of even luster. Provide a finish free of laps, cloudiness, color irregularity, runs, brush marks, orange peel, nail holes, or other surface imperfections.
 1. Provide satin finish for final coats.
- L. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish, or repaint Work not in compliance with specified requirements.

3.04 FIELD QUALITY CONTROL

- A. The University reserves the right to invoke the following test procedure at any time and as often as The University deems necessary during the period when paint is being applied:
 1. The University will engage the services of an independent testing laboratory to sample the paint material being used. Samples of material delivered to the project will be taken, identified, sealed, and certified in the presence of the Contractor.
 2. The testing laboratory will perform appropriate tests for the following characteristics as required by The University:
 - a. Quantitative materials analysis
 - b. Abrasion resistance
 - c. Apparent reflectivity
 - d. Flexibility
 - e. Wash ability
 - f. Absorption
 - g. Accelerated weathering
 - h. Dry opacity
 - i. Accelerated yellowness
 - j. Recoating
 - k. Skinning
 - l. Color retention
 - m. Alkali and mildew resistance

3. If test results show material being used does not comply with specified requirements, the Contractor may be directed to stop painting, remove noncomplying paint, pay for testing, repaint surfaces coated with rejected paint, and remove rejected paint from previously painted surfaces if, upon repainting with specified paint, the two coatings are noncompatible.

3.05 CLEANING

- A. At the end of each workday, remove empty cans, rags, rubbish, and other discarded paint materials from the Project Site.
- B. Upon completion of painting, clean glass and paint spattered surfaces. Remove spattered paint by washing and scraping, using care not to scratch or damage adjacent finished surfaces.

3.06 PROTECTION

- A. Protect Work of other trades, whether to be painted or not, against damage by painting. Correct damage by cleaning, repairing or replacing, and repainting, as acceptable to Architect.
- B. Provide "wet paint" signs to protect newly painted finishes. Remove temporary protective wrappings provided by others for protection of their Work after completion of painting operations.
 1. At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces.

END OF SECTION 09 91 23 00

Task	Specification	Specification Description
09 91 43 00	03 01 30 71	Rehabilitation of Cast-in-Place Concrete
09 93 00 00	09 96 00 00	High-Performance Coatings

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 09 96 00 00 - HIGH-PERFORMANCE COATINGS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for high performance coatings. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes surface preparation and application of high-performance coating systems on the following substrates:
 - a. Exterior Substrates:
 - 1) Concrete, vertical and horizontal surfaces.
 - 2) Clay masonry.
 - 3) Concrete masonry units (CMU).
 - 4) Steel.
 - 5) Galvanized metal.
 - 6) Aluminum (not anodized or otherwise coated).
 - 7) Wood.
 - b. Interior Substrates:
 - 1) Concrete, vertical and horizontal surfaces.
 - 2) Clay masonry.
 - 3) Concrete masonry units (CMU).
 - 4) Steel.
 - 5) Galvanized metal.
 - 6) Aluminum (not anodized or otherwise coated).
 - 7) Wood.
 - 8) Gypsum board.

C. Submittals

1. Product Data: For each type of product indicated.
2. Samples: For each type of finish-coat product indicated.
3. Product List: For each product indicated. Cross-reference products to coating system and locations of application areas. Use same designations indicated on Drawings and in schedules.
4. LEED Submittals:
 - a. Product Data for Credit EQ 4.2: For coatings, including printed statement of VOC content and chemical components.

D. Quality Assurance

1. Master Painters Institute (MPI) Standards:
 - a. Products: Complying with MPI standards indicated and listed in "MPI Approved Products List."
 - b. Preparation and Workmanship: Comply with requirements in "MPI Architectural Painting Specification Manual" **OR** "MPI Maintenance Repainting Manual," **as directed**, for products and coating systems indicated.

E. Delivery, Storage, And Handling

1. Store materials not in use in tightly covered containers in well-ventilated areas with ambient temperatures continuously maintained at not less than 45 deg F (7 deg C).
 - a. Maintain containers in clean condition, free of foreign materials and residue.
 - b. Remove rags and waste from storage areas daily.

F. Project Conditions

1. Apply coatings only when temperature of surfaces to be coated and surrounding air temperatures are between 50 and 95 deg F (10 and 35 deg C).
2. Do not apply coatings in snow, rain, fog, or mist; when relative humidity exceeds 85 percent; at temperatures less than 5 deg F (3 deg C) above the dew point; or to damp or wet surfaces.

1.2 PRODUCTS**A. High-Performance Coatings, General**

1. Material Compatibility:
 - a. Provide materials for use within each coating system that are compatible with one another and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.
 - b. Provide products of same manufacturer for each coat in a coating system.
2. VOC Content of Field-Applied Interior Paints and Coatings: Provide products that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
 - a. Flat Paints, Coatings, and Primers: VOC content of not more than 50 g/L.
 - b. Nonflat Paints, Coatings, and Primers: VOC content of not more than 150 g/L.
 - c. Anticorrosive and Anti-Rust Paints Applied to Ferrous Metals: VOC content of not more than 250 g/L.
 - d. Clear Wood Finishes, Varnishes: VOC not more than 350 g/L.
 - e. Clear Wood Finishes, Lacquers: VOC not more than 550 g/L.
 - f. Floor Coatings: VOC not more than 100 g/L.
 - g. Shellacs, Clear: VOC not more than 730 g/L.
 - h. Shellacs, Pigmented: VOC not more than 550 g/L.
 - i. Stains: VOC content of not more than 250 g/L.
 - j. Flat Interior Topcoat Paints: VOC content of not more than 50 g/L.
 - k. Nonflat Interior Topcoat Paints: VOC content of not more than 150 g/L.
 - l. Anti-Corrosive and Anti-Rust Paints Applied to Ferrous Metals: VOC not more than 250 g/L.
 - m. Clear Wood Finishes, Varnishes: VOC not more than 350 g/L.
 - n. Clear Wood Finishes, Lacquers: VOC not more than 550 g/L.
 - o. Floor Coatings: VOC not more than 100 g/L.
 - p. Shellacs, Clear: VOC not more than 730 g/L.
 - q. Shellacs, Pigmented: VOC not more than 550 g/L.
 - r. Stains: VOC not more than 250 g/L.
 - s. Primers, Sealers, and Undercoaters: VOC content of not more than 200 g/L.
 - t. Zinc-Rich Industrial Maintenance Primers: VOC content of not more than 340 g/L.
 - u. Pre-Treatment Wash Primers: VOC content of not more than 420 g/L.
3. Chemical Components of Field-Applied Interior Paints and Coatings: Provide topcoat paints and anti-corrosive and anti-rust paints applied to ferrous metals that comply with the following chemical restrictions; these requirements do not apply to paints and coatings that are applied in a fabrication or finishing shop:
 - a. Aromatic Compounds: Paints and coatings shall not contain more than 1.0 percent by weight of total aromatic compounds (hydrocarbon compounds containing 1 or more benzene rings).
 - b. Restricted Components: Paints and coatings shall not contain any of the following:
 - 1) Acrolein.
 - 2) Acrylonitrile.
 - 3) Antimony.
 - 4) Benzene.
 - 5) Butyl benzyl phthalate.
 - 6) Cadmium.
 - 7) Di (2-ethylhexyl) phthalate.
 - 8) Di-n-butyl phthalate.

- 9) Di-n-octyl phthalate.
 - 10) 1,2-dichlorobenzene.
 - 11) Diethyl phthalate.
 - 12) Dimethyl phthalate.
 - 13) Ethylbenzene.
 - 14) Formaldehyde.
 - 15) Hexavalent chromium.
 - 16) Isophorone.
 - 17) Lead.
 - 18) Mercury.
 - 19) Methyl ethyl ketone.
 - 20) Methyl isobutyl ketone.
 - 21) Methylene chloride.
 - 22) Naphthalene.
 - 23) Toluene (methylbenzene).
 - 24) 1,1,1-trichloroethane.
 - 25) Vinyl chloride.
4. Colors: As selected from manufacturer's full range **OR** Match samples **OR** As indicated in color schedule, **as directed**.
- B. Block Fillers
1. Interior/Exterior Latex Block Filler: MPI#4.
 - a. VOC Content: Minimum E Range of E2 **OR** E3, **as directed**.
 2. Epoxy Block Filler: MPI #116.
 - a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
- C. Interior Primers/Sealers
1. Interior Latex Primer/Sealer: MPI #50.
 - a. Environmental Characteristics:
 - 1) VOC Content:
 - a) Minimum E Range of E2 **OR** E3, **as directed**.
 - b) Meets or exceeds LEED requirements for VOC content.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 2 **OR** 3, **as directed**.
 2. Interior Alkyd Primer/Sealer: MPI #45.
 - a. VOC Content: Minimum E Range of E1 **OR** E2, **as directed**.
 3. Interior Latex-Based Wood Primer: MPI #39.
 - a. Environmental Characteristics:
 - 1) VOC Content:
 - a) Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
 - b) Meets or exceeds LEED requirements for VOC content.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 1 **OR** 2 **OR** 3, **as directed**.
 4. Wood-Knot Sealer: White shellac or other sealer recommended in writing by manufacturer for this purpose.
- D. Metal Primers
1. Inorganic Zinc Primer: MPI #19.
 - a. VOC Content: Minimum E Range of 0 **OR** E1 **OR** E2 **OR** E3, **as directed**.
 2. Epoxy Zinc Primer: MPI #20.
 - a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
 3. Rust-Inhibitive Primer (Water Based): MPI #107.
 - a. Environmental Characteristics:
 - 1) VOC Content:
 - a) Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
 - b) Meets or exceeds LEED requirements for VOC content.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 1 **OR** 2 **OR** 3, **as directed**.

4. Cold-Curing Epoxy Primer: MPI #101.
 - a. VOC Content: Minimum E Range of E1 **OR** E3, **as directed**.
5. Alkyd Anticorrosive Metal Primer: MPI #79.
 - a. VOC Content: Minimum E Range of E1 **OR** E2, **as directed**.
6. Quick-Dry Alkyd Metal Primer: MPI #76.
 - a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
7. Cementitious Galvanized-Metal Primer: MPI #26.
 - a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
8. Waterborne Galvanized-Metal Primer: MPI #134.
 - a. Environmental Characteristics:
 - 1) VOC Content:
 - a) Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
 - b) Meets or exceeds LEED requirements for VOC content.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 1 **OR** 2 **OR** 3, **as directed**.
9. Quick-Drying Primer for Aluminum: MPI #95.
 - a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
10. Vinyl Wash Primer: MPI #80.
 - a. VOC Content: Minimum E Range of E2 **OR** E3, **as directed**.

E. Water-Based, Light-Industrial Coatings

1. Gloss, Water-Based, Light-Industrial Coating: MPI #110-G6.
 - a. Environmental Characteristics:
 - 1) VOC Content: Minimum E Range of E2.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 2.
2. Semigloss, Water-Based, Light-Industrial Coating: MPI #110-G5.
 - a. Environmental Characteristics:
 - 1) VOC Content:
 - a) Minimum E Range of E2 **OR** E3, **as directed**.
 - b) Meets or exceeds LEED requirements for VOC content.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 2 **OR** 3, **as directed**.
3. Eggshell, Water-Based, Light-Industrial Coating: MPI #110-G3.
 - a. Environmental Characteristics:
 - 1) VOC Content:
 - a) Minimum E Range of E2 **OR** E3, **as directed**.
 - b) Meets or exceeds LEED requirements for VOC content.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 2 **OR** 3, **as directed**.

F. Epoxy Coatings

1. Epoxy, Cold-Cured, Gloss: MPI #77.
 - a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
2. Water-Based Epoxy (Interior and Exterior): MPI #115.
 - a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
3. High-Build Epoxy Marine Coating, Low Gloss: MPI #108.
 - a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
4. Epoxy Deck Coating: MPI #82.
 - a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
5. Water-Based Epoxy Floor Paint: MPI #93.
 - a. Environmental Characteristics:
 - 1) VOC Content:
 - a) Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
 - b) Meets or exceeds LEED requirements for VOC content.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 1 **OR** 2 **OR** 3, **as directed**.

G. Polyurethane Coatings

1. Polyurethane, Two-Component, Pigmented, Gloss: MPI #72.

- a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
 2. Two-Component, Aliphatic Polyurethane, Clear: MPI #78.
 - a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
 3. Polyurethane, Moisture Cured, Clear, Gloss: MPI #31.
 - a. VOC Content: Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
 4. Polyurethane, Moisture Cured, Clear, Flat: MPI #71.
 - a. VOC Content: Minimum E Range of E2.
- H. Interior High-Performance Architectural Latex Coatings
1. High-Performance Architectural Latex, Velvet Finish: MPI #138, Gloss Level 2.
 - a. Environmental Characteristics:
 - 1) VOC Content:
 - a) Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
 - b) Meets or exceeds LEED requirements for VOC content.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 4 **OR** 5 **OR** 6, **as directed**.
 2. High-Performance Architectural Latex, Eggshell Finish: MPI #139, Gloss Level 3.
 - a. Environmental Characteristics:
 - 1) VOC Content:
 - a) Minimum E Range of E2 **OR** E3, **as directed**.
 - b) Meets or exceeds LEED requirements for VOC content.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 5 **OR** 6, **as directed**.
 3. High-Performance Architectural Latex, Satin Finish: MPI #140, Gloss Level 4.
 - a. Environmental Characteristics:
 - 1) VOC Content:
 - a) Minimum E Range of E1 **OR** E3, **as directed**.
 - b) Meets or exceeds LEED requirements for VOC content.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 4.5 **OR** 6.5, **as directed**.
 4. High-Performance Architectural Latex, Semigloss Finish: MPI #141, Gloss Level 5.
 - a. Environmental Characteristics:
 - 1) VOC Content:
 - a) Minimum E Range of E1 **OR** E2 **OR** E3, **as directed**.
 - b) Meets or exceeds LEED requirements for VOC content.
 - 2) Environmental Performance Rating (EPR): Minimum EPR 5 **OR** 6 **OR** 7, **as directed**.
- I. Wood Stains
1. Exterior Semitransparent Stain (Solvent Based): MPI #13.
 - a. VOC Content: Minimum E Range of E1 **OR** E2, **as directed**.
 2. Interior Wood Stain, Semitransparent (Solvent Based): MPI #90.
 - a. VOC Content: Minimum E Range of E1 **OR** E2, **as directed**.

1.3 EXECUTION

A. Preparation

1. Comply with manufacturer's written instructions and recommendations in "MPI Architectural Painting Specification Manual" applicable to substrates indicated.
2. Remove plates, machined surfaces, and similar items already in place that are not to be coated. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and coating.
 - a. After completing coating operations, reinstall items that were removed; use workers skilled in the trades involved.
3. Clean substrates of substances that could impair bond of coatings, including dirt, oil, grease, and incompatible paints and encapsulants.

- a. Remove incompatible primers and reprime substrate with compatible primers as required to produce coating systems indicated.
4. Concrete Substrates: Remove release agents, curing compounds, efflorescence, and chalk. Do not coat surfaces if moisture content or alkalinity of surfaces to be coated exceeds that permitted in manufacturer's written instructions.
 - a. Clean surfaces with pressurized water. Use pressure range of 1500 to 4000 psi (10 350 to 27 580 kPa) at 6 to 12 inches (150 to 300 mm) **OR** 4000 to 10,000 psi (27 580 to 68 950 kPa), **as directed**.
OR
Abrasive blast clean surfaces to comply with SSPC-SP 7/NACE No. 4, "Brush-Off Blast Cleaning."
5. Clay Masonry Substrates: Remove efflorescence and chalk. Do not coat surfaces if moisture content or alkalinity of surfaces to be coated exceeds that permitted in manufacturer's written instructions.
 - a. Clean surfaces with pressurized water. Use pressure range of 100 to 600 psi (690 to 4140 kPa) **OR** 1500 to 4000 psi (10 350 to 27 580 kPa), **as directed**, at 6 to 12 inches (150 to 300 mm).
6. CMU Substrates: Remove efflorescence and chalk. Do not coat surfaces if moisture content or alkalinity of surfaces to be coated exceeds that permitted in manufacturer's written instructions.
7. Steel Substrates (for field applied primers): Remove rust and loose mill scale.
 - a. Clean using methods recommended in writing by coating manufacturer.

Blast clean according to SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning **OR** SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning **OR** SSPC-SP 7/NACE No. 4, "Brush-Off Blast Cleaning **OR** SSPC-SP 10/NACE No. 2, "Near-White Blast Cleaning," **as directed**.
8. Galvanized-Metal Substrates: Remove grease and oil residue from galvanized sheet metal fabricated from coil stock by mechanical methods to produce clean, lightly etched surfaces that promote adhesion of subsequently applied coatings.
9. Aluminum Substrates: Remove surface oxidation.
10. Wood Substrates:
 - a. Scrape and clean small, dry, seasoned knots, and apply a thin coat of knot sealer before applying primer.
 - b. Sand surfaces that will be exposed to view and dust off.
 - c. Prime edges, ends, faces, undersides, and back sides of wood.
 - d. After priming, fill holes and imperfections in the finish surfaces with putty or plastic wood filler. Sand smooth when dried.

B. Application

1. Apply high-performance coatings according to manufacturer's written instructions.
 - a. Use applicators and techniques suited for coating and substrate indicated.
 - b. Coat surfaces behind movable equipment and furniture same as similar exposed surfaces. Before final installation, coat surfaces behind permanently fixed equipment or furniture with prime coat only.
 - c. Coat back sides of access panels, removable or hinged covers, and similar hinged items to match exposed surfaces.
2. Tint each undercoat a lighter shade to facilitate identification of each coat if multiple coats of the same material are to be applied. Tint undercoats to match color of finish coat, but provide sufficient difference in shade of undercoats to distinguish each separate coat.
3. If undercoats or other conditions show through final coat, apply additional coats until cured film has a uniform coating finish, color, and appearance.
4. Apply coatings to produce surface films without cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections. Produce sharp glass lines and color breaks.

C. Field Quality Control

1. Owner reserves the right to invoke the following procedure at any time and as often as Owner deems necessary during the period when coatings are being applied:

- a. Owner will engage the services of a qualified testing agency to sample coating material being used. Samples of material delivered to Project site will be taken, identified, sealed, and certified in presence of Contractor.
 - b. Testing agency will perform tests for compliance with specified requirements.
 - c. Owner may direct Contractor to stop applying coatings if test results show materials being used do not comply with specified requirements. Contractor shall remove noncomplying coating materials from Project site, pay for testing, and recoat surfaces coated with rejected materials. Contractor will be required to remove rejected materials from previously coated surfaces if, on recoating with complying materials, the two coatings are incompatible.
- D. Cleaning And Protection
1. At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.
 2. After completing coating application, clean spattered surfaces. Remove spattered coatings by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.
 3. Protect work of other trades against damage from coating operation. Correct damage by cleaning, repairing, replacing, and recoating, as approved by The University, and leave in an undamaged condition.
 4. At completion of construction activities of other trades, touch up and restore damaged or defaced coated surfaces.
- E. Exterior High-Performance Coating Schedule
1. Coating systems in this Article are based on "MPI Architectural Painting Specification Manual." For renovation projects, consult "MPI Maintenance Repainting Manual" and revise coating systems accordingly.
 2. Concrete Substrates, Vertical Surfaces:
 - a. Water-Based, Light-Industrial Coating System (System below corresponds to MPI EXT 3.1C):
 - 1) Prime Coat: Water-based, light-industrial coating, MPI #110, gloss matching topcoat.
 - 2) Intermediate Coat: Not required **OR** Water-based, light-industrial coating, MPI #110, gloss matching topcoat, **as directed**.
 - 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
 - b. Epoxy Coating System (System below corresponds to MPI EXT 3.1D):
 - 1) Prime Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 2) Intermediate Coat: Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - c. Water-Based Epoxy Coating System (System below corresponds to MPI EXT 3.1E):
 - 1) Prime Coat: Water-based epoxy (interior and exterior), MPI #115.
 - 2) Intermediate Coat: Not required **OR** Water-based epoxy (interior and exterior), MPI #115, **as directed**.
 - 3) Topcoat: Water-based epoxy (interior and exterior), MPI #115.
 3. Concrete Substrates, Horizontal Surfaces (System below corresponds to MPI EXT 3.2C):
 - a. Epoxy Slip-Resistant Deck Coating System:
 - 1) Topcoat: Epoxy deck coating, MPI #82.
 4. Clay-Masonry Substrates (System below corresponds to MPI EXT 4.1C):
 - a. Water-Based, Light-Industrial Coating System:
 - 1) Prime Coat: Water-based, light-industrial coating, MPI #110, gloss matching topcoat.
 - 2) Intermediate Coat: Not required **OR** Water-based, light-industrial coating, MPI #110, gloss matching topcoat, **as directed**.
 - 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.

- b. Epoxy Coating System (System below corresponds to MPI EXT 4.1D) (MPI recommends this system for smooth brick.):
 - 1) Prime Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 2) Intermediate Coat : Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - c. Water-Based Epoxy Coating System (System below corresponds to MPI EXT 4.1E) (MPI recommends this system for smooth brick.):
 - 1) Prime Coat: Water-based epoxy (interior and exterior), MPI #115.
 - 2) Intermediate Coat: Not required **OR** Water-based epoxy (interior and exterior), MPI #115, **as directed**.
 - 3) Topcoat: Water-based epoxy (interior and exterior), MPI #115.
 - d. Polyurethane, Pigmented, Over Epoxy Coating System (System below corresponds to MPI EXT 4.1J):
 - 1) Prime Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 2) Intermediate Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 3) Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
5. CMU Substrates:
- a. Water-Based, Light-Industrial Coating System (System below corresponds to MPI EXT 4.2C):
 - 1) Prime Coat: Interior/exterior latex block filler, MPI #4.
 - 2) Intermediate Coat: Not required **OR** Water-based, light-industrial coating, MPI #110, gloss matching topcoat, **as directed**.
 - 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
 - b. Epoxy Coating System (System below corresponds to MPI EXT 4.2E):
 - 1) Block Filler: Epoxy block filler, MPI #116.
 - 2) Intermediate Coat: Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - c. Water-Based Epoxy Coating System (System below corresponds to MPI EXT 4.2F):
 - 1) Block Filler: Epoxy block filler, MPI #116.
 - 2) Intermediate Coat: Not required **OR** Water-based epoxy (interior and exterior), MPI #115, **as directed**.
 - 3) Topcoat: Water-based epoxy (interior and exterior), MPI #115.
 - d. Polyurethane, Pigmented, Over High-Build Epoxy Coating System (System below corresponds to MPI EXT 4.2G):
 - 1) Block Filler: Epoxy block filler, MPI #116.
 - 2) Intermediate Coat: High-build epoxy marine coating, low gloss, MPI #108.
 - 3) Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
6. Steel Substrates:
- a. Water-Based, Light-Industrial Coating System (System below corresponds to MPI EXT 5.1B, MPI EXT 5.1C, MPI EXT 5.1M and MPI EXT 5.1N, depending on primer selected):
 - 1) Prime Coat: Inorganic zinc primer, MPI #19 **OR** Alkyd anticorrosive metal primer, MPI #79 **OR** Rust-inhibitive primer, (water based), MPI #107 **OR** Cold-curing epoxy primer, MPI #101, **as directed**, primer.
 - 2) Intermediate Coat: Water-based, light-industrial coating, MPI #110, gloss matching topcoat (intermediate coat is required for coating systems except MPI Custom Grade system using inorganic zinc primer).
 - 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
 - b. High-Build Epoxy Coating System (System below corresponds to MPI EXT 5.1F):
 - 1) Prime Coat: Cold-curing epoxy primer, MPI #101.
 - 2) Intermediate Coat: High-build epoxy marine coating, low gloss, MPI #108.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - c. Water-Based Epoxy Coating System (System below corresponds to MPI EXT 5.1E):

- 1) Prime Coat: Rust-inhibitive primer, (water based), MPI #107.
- 2) Intermediate Coat: Water-based epoxy (interior and exterior), MPI #115.
- 3) Topcoat: Water-based epoxy (interior and exterior), MPI #115.
- d. Polyurethane, Pigmented, Over Epoxy Coating System (System below corresponds to MPI EXT 5.1H):
 - 1) Prime Coat: Cold-curing epoxy primer, MPI #101.
 - 2) Intermediate Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 3) First Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 4) Second Topcoat (for Premium Grade system): Polyurethane, two-component, pigmented, gloss, MPI #72.
- e. Polyurethane, Pigmented, Over Epoxy Coating System (System below corresponds to MPI EXT 5.1P)
 - 1) Prime Coat: Epoxy zinc primer, MPI#20.
 - 2) Intermediate Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 3) First Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 4) Second Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
- f. Polyurethane, Pigmented, Over High-Build Epoxy Coating System (System below corresponds to MPI EXT 5.1G):
 - 1) Prime Coat: Epoxy zinc primer, MPI#20.
 - 2) Intermediate Coat: High-build epoxy marine coating, low gloss, MPI #108.
 - 3) First Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 4) Second Topcoat (for Premium Grade system): Polyurethane, two-component, pigmented, gloss, MPI #72.
- g. Polyurethane, Pigmented, Over High-Build Epoxy Coating System (System below corresponds to MPI EXT 5.1J):
 - 1) Prime Coat: Cold-curing epoxy primer, MPI #101.
 - 2) Intermediate Coat: High-build epoxy marine coating, low gloss, MPI #108.
 - 3) First Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 4) Second Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
- h. Polyurethane, Pigmented, Over High-Build Epoxy Coating System (System below corresponds to MPI EXT 5.1L):
 - 1) Prime Coat: Inorganic zinc primer, MPI #19.
 - 2) Intermediate Coat: High-build epoxy marine coating, low gloss, MPI #108.
 - 3) First Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 4) Second Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
7. Galvanized-Metal Substrates:
 - a. Water-Based, Light-Industrial Coating System (System below corresponds to MPI EXT 5.3G and MPI EXT 5.3J, depending on primer selected):
 - 1) Prime Coat: Cementitious galvanized-metal primer, MPI #26 **OR** Waterborne galvanized-metal primer, MPI #134, **as directed**.
 - 2) Intermediate Coat (for Premium Grade system): Not required **OR** Water-based, light-industrial coating, MPI #110, gloss matching topcoat, **as directed**.
 - 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
 - b. Epoxy Coating System (System below corresponds to MPI EXT 5.3C) (MPI recommends this system for high-contact and -traffic areas.):
 - 1) Prime Coat: Cold-curing epoxy primer, MPI #101.
 - 2) Intermediate Coat (for Premium Grade system): Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - c. Polyurethane, Pigmented Coating System (System below corresponds to MPI EXT 5.3D) (MPI recommends these systems for high-contact and -traffic areas.):
 - 1) Prime Coat: Vinyl wash primer, MPI #80.
 - 2) Intermediate Coat: Not required **OR** Cold-curing epoxy primer, MPI #101, **as directed**.
 - 3) First Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 4) Second Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.

- d. Polyurethane, Pigmented Coating System (System below corresponds to MPI EXT 5.3L):
 - 1) Prime Coat: Cold-curing epoxy primer, MPI #101.
 - 2) Intermediate Coat: Not required **OR** Polyurethane, two-component, pigmented, gloss, MPI #72, **as directed**.
 - 3) First Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 4) Second Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
8. Aluminum (Not Anodized or Otherwise Coated) Substrates:
 - a. Water-Based, Light-Industrial Coating System (System below corresponds to MPI EXT 5.4G):
 - 1) Prime Coat: Quick-drying primer for aluminum, MPI #95.
 - 2) Intermediate Coat: Not required **OR** Water-based, light-industrial coating, MPI #110, gloss matching topcoat, **as directed**.
 - 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
 - b. Epoxy Coating System (System below corresponds to MPI EXT 5.4E):
 - 1) Prime Coat: Vinyl wash primer, MPI #80.
 - 2) Intermediate Coat (for Premium Grade system): Epoxy, cold-cured, gloss, MPI #77.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - c. Polyurethane, Pigmented Coating System (System below corresponds to MPI EXT 5.4B) (MPI recommends these systems for high-contact and -traffic areas.):
 - 1) Prime Coat: Vinyl wash primer, MPI #80.
 - 2) Intermediate Coat: Cold-curing epoxy primer, MPI #101.
 - 3) First Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 4) Second Topcoat (for Premium Grade system): Polyurethane, two-component, pigmented, gloss, MPI #72.
9. Wood Substrates:
 - a. Pigmented Polyurethane Coating System (System below corresponds to MPI EXT 6.1J, MPI EXT 6.2J, and MPI EXT 6.3H):
 - 1) Prime Coat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 2) Intermediate Coat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 3) Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - b. Polyurethane, Clear, Two-Component Coating System (System below corresponds to MPI EXT 6.1E for use on glue-laminated beams and columns):
 - 1) Stain Coat: Exterior semitransparent stain (solvent based), MPI #13.
 - 2) Intermediate Coat: Two-component, aliphatic polyurethane, clear, MPI #78.
 - 3) First Topcoat: Two-component, aliphatic polyurethane, clear, MPI #78.
 - 4) Second Topcoat (for Premium Grade systems): Two-component, aliphatic polyurethane, clear, MPI #78.

F. Interior High-Performance Coating Schedule

1. Coating systems in this Article are based on "MPI Architectural Painting Specification Manual." For renovation projects, consult "MPI Maintenance Repainting Manual" and revise coating systems accordingly.
2. Concrete Substrates, Vertical Surfaces (System below corresponds to MPI INT 3.1C):
 - a. High-Performance Architectural Latex Coating System:
 - 1) Prime Coat: Interior latex primer/sealer, MPI #50.
 - 2) Intermediate Coat: Not required **OR** High-performance architectural latex matching topcoat, **as directed**.
 - 3) Topcoat: High-performance architectural latex, velvet finish, MPI #138, Gloss Level 2 **OR** eggshell finish, MPI #139, Gloss Level 3 **OR** satin finish, MPI #140, Gloss Level 4 **OR** semigloss finish, MPI #141, Gloss Level 5, **as directed**.
 - b. Water-Based, Light-Industrial Coating System (System below corresponds to MPI INT 3.1L):
 - 1) Prime Coat: Water-based, light-industrial coating, MPI #110, gloss matching topcoat.
 - 2) Intermediate Coat: Not required **OR** Water-based, light-industrial coating, MPI #110, gloss matching topcoat, **as directed**.

- 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
- c. Epoxy Coating System (System below corresponds to MPI INT 3.1F.) (MPI recommends this system for smooth concrete.):
 - 1) Prime Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 2) Intermediate Coat: Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
- d. Water-Based Epoxy Coating System (System below corresponds to MPI INT 3.1G) (MPI recommends this system for smooth concrete.):
 - 1) Prime Coat: Water-based epoxy (interior and exterior), MPI #115.
 - 2) Intermediate Coat: Not required **OR** Water-based epoxy (interior and exterior), MPI #115, **as directed**.
 - 3) Topcoat: Water-based epoxy (interior and exterior), MPI #115.
3. Concrete Substrates, Horizontal Surfaces.
 - a. Epoxy Coating System (System below corresponds to MPI INT 3.2C):
 - 1) Prime Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 2) Intermediate Coat: Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - b. Water-Based Epoxy Floor Paint Coating System (System below corresponds to MPI INT 3.2L).
 - 1) Prime Coat: Water-based epoxy floor paint, MPI #93.
 - 2) Intermediate Coat: Not required **OR** Water-based epoxy floor paint, MPI #93, **as directed**.
 - 3) Topcoat: Water-based epoxy floor paint, MPI #93.
 - c. Polyurethane, Pigmented Coating System (System below corresponds to MPI INT 3.2D):
 - 1) Prime Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 2) Intermediate Coat: Not required **OR** Polyurethane, two-component, pigmented, gloss, MPI #72, **as directed**.
 - 3) Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - d. Polyurethane, Clear, Two-Component Coating System (System below corresponds to MPI INT 3.2K):
 - 1) Prime Coat: Two-component, aliphatic polyurethane, clear, MPI #78.
 - 2) Intermediate Coat: Not required **OR** Two-component, aliphatic polyurethane, clear, MPI #78, **as directed**.
 - 3) Topcoat: Two-component, aliphatic polyurethane, clear, MPI #78.
4. Clay-Masonry Substrates:
 - a. High-Performance Architectural Latex Coating System (System below corresponds to MPI INT 4.1L):
 - 1) Prime Coat: High-performance architectural latex matching topcoat.
 - 2) Intermediate Coat: Not required **OR** High-performance architectural latex matching topcoat, **as directed**.
 - 3) Topcoat: High-performance architectural latex, velvet finish, MPI #138, Gloss Level 2 **OR** eggshell finish, MPI #139, Gloss Level 3 **OR** satin finish, MPI #140, Gloss Level 4 **OR** semigloss finish, MPI #141, Gloss Level 5, **as directed**.
 - b. Water-Based, Light-Industrial Coating System (System below corresponds to MPI INT 4.1C):
 - 1) Prime Coat: Water-based, light-industrial coating, MPI #110, gloss matching topcoat.
 - 2) Intermediate Coat: Not required **OR** Water-based, light-industrial coating, MPI #110, gloss matching topcoat, **as directed**.
 - 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
 - c. Epoxy Coating System (System below corresponds to MPI INT 4.1F) (MPI recommends this system for smooth brick.):
 - 1) Prime Coat: Epoxy, cold-cured, gloss, MPI #77.

- 2) Intermediate Coat: Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - d. Water-Based Epoxy Coating System (System below corresponds to MPI INT 4.1G) (MPI recommends this system for smooth brick.):
 - 1) Prime Coat: Water-based epoxy (interior and exterior), MPI #115.
 - 2) Intermediate Coat: Not required **OR** Water-based epoxy (interior and exterior), MPI #115, **as directed**.
 - 3) Topcoat: Water-based epoxy (interior and exterior), MPI #115.
 - e. Polyurethane, Clear, Two-Component Coating System (System below corresponds to MPI INT 4.1K):
 - 1) Prime Coat: Two-component, aliphatic polyurethane, clear, MPI #78.
 - 2) Intermediate Coat: Not required **OR** Two-component, aliphatic polyurethane, clear, MPI #78, **as directed**.
 - 3) Topcoat: Two-component, aliphatic polyurethane, clear, MPI #78.
5. CMU Substrates:
- a. High-Performance Architectural Latex Coating System (System below corresponds to MPI INT 4.2D):
 - 1) Prime Coat: Interior/exterior latex block filler, MPI #4.
 - 2) Intermediate Coat: Not required **OR** High-performance architectural latex matching topcoat, **as directed**.
 - 3) Topcoat: High-performance architectural latex, velvet finish, MPI #138, Gloss Level 2 **OR** eggshell finish, MPI #139, Gloss Level 3 **OR** satin finish, MPI #140, Gloss Level 4 **OR** semigloss finish, MPI #141, Gloss Level 5, **as directed**.
 - b. Water-Based, Light-Industrial Coating System (System below corresponds to MPI INT 4.2K):
 - 1) Prime Coat: Interior/exterior latex block filler, MPI #4.
 - 2) Intermediate Coat: Not required **OR** Water-based, light-industrial coating, MPI #110, gloss matching topcoat, **as directed**.
 - 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
 - c. Epoxy Coating System (System below corresponds to MPI INT 4.2F and MPI INT 4.2G, depending on primer selected) (MPI recommends these systems for dry environments.):
 - 1) Prime Coat: Interior/exterior latex block filler, MPI #4 **OR** Epoxy block filler, MPI #116, **as directed**.
 - 2) Intermediate Coat: Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - d. Water-Based Epoxy Coating System (System below corresponds to MPI INT 4.2J) (MPI recommends this system for wet environments.):
 - 1) Prime Coat: Interior/exterior latex block filler, MPI #4.
 - 2) Intermediate Coat: Not required **OR** Water-based epoxy (interior and exterior), MPI #115, **as directed**.
 - 3) Topcoat: Water-based epoxy (interior and exterior), MPI #115.
6. Steel Substrates:
- a. High-Performance Architectural Latex Coating System (System below corresponds to MPI INT 5.1R):
 - 1) Prime Coat: Alkyd anticorrosive metal primer, MPI #79 **OR** Quick-dry alkyd metal primer, MPI #76, **as directed**.
 - 2) Intermediate Coat: Not required **OR** High-performance architectural latex matching topcoat, **as directed**.
 - 3) Topcoat: High-performance architectural latex, velvet finish, MPI #138, Gloss Level 2 **OR** eggshell finish, MPI #139, Gloss Level 3 **OR** satin finish, MPI #140, Gloss Level 4 **OR** semigloss finish, MPI #141, Gloss Level 5, **as directed**.
 - b. Water-Based, Light-Industrial Coating System (System below corresponds to MPI INT 5.1B and MPI INT 5.1N, depending on primer selected.):

- 1) Prime Coat: Rust-inhibitive primer (water based), MPI #107 **OR** Cold-curing epoxy primer, MPI #101, **as directed**.
- 2) Intermediate Coat: Not required **OR** Water-based, light-industrial coating, MPI #110, gloss matching topcoat, **as directed**.
- 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
- c. High-Build Epoxy Coating System - Premium Grade (System below corresponds to MPI INT 5.1P):
 - 1) Prime Coat: Epoxy zinc primer, MPI#20.
 - 2) Intermediate Coat: High-build epoxy marine coating, low gloss, MPI #108.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
- d. High-Build Epoxy Coating System – Custom Grade (System below corresponds to MPI INT 5.1P):
 - 1) Prime Coat: Epoxy zinc primer, MPI#20.
 - 2) Topcoat: High-build epoxy marine coating, low gloss, MPI #108.
- e. Epoxy Coating System (System below corresponds to MPI INT 5.1L):
 - 1) Prime Coat: Cold-curing epoxy primer, MPI #101.
 - 2) Intermediate Coat: Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
- f. Water-Based Epoxy Coating System (System below corresponds to MPI INT 5.1K):
 - 1) Prime Coat: Rust-inhibitive primer (water based), MPI #107.
 - 2) Intermediate Coat: Water-based epoxy (interior and exterior), MPI #115.
 - 3) Topcoat: Water-based epoxy (interior and exterior), MPI #115.
- g. Polyurethane, Pigmented Coating System (System below corresponds to MPI INT 5.1F):
 - 1) Prime Coat: Cold-curing epoxy primer, MPI #101.
 - 2) Intermediate Coat: Not required **OR** Polyurethane, two-component, pigmented, gloss, MPI #72, **as directed**.
 - 3) Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
- h. Polyurethane, Pigmented Coating System (System below corresponds to MPI INT 5.1H):
 - 1) Prime Coat: Inorganic zinc primer, MPI #19.
 - 2) Intermediate Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 3) Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
- i. Polyurethane, Pigmented Coating System (System below corresponds to MPI INT 5.1J):
 - 1) Prime Coat: Epoxy zinc primer, MPI#20.
 - 2) Intermediate Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 3) Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
- j. Polyurethane, Pigmented, Over High-Build Epoxy Coating System (System below corresponds to MPI INT 5.1G):
 - 1) Prime Coat: Cold-curing epoxy primer, MPI #101.
 - 2) Intermediate Coat: High-build epoxy marine coating, low gloss, MPI #108.
 - 3) Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
7. Galvanized-Metal Substrates:
 - a. High-Performance Architectural Latex Coating System (System below corresponds to MPI INT 5.3M):
 - 1) Prime Coat: Waterborne galvanized-metal primer, MPI #134.
 - 2) Intermediate Coat: Not required **OR** High-performance architectural latex matching topcoat, **as directed**.
 - 3) Topcoat: High-performance architectural latex, velvet finish, MPI #138, Gloss Level 2 **OR** eggshell finish, MPI #139, Gloss Level 3 **OR** satin finish, MPI #140, Gloss Level 4 **OR** semigloss finish, MPI #141, Gloss Level 5, **as directed**.
 - b. Water-Based, Light-Industrial Coating System (System below corresponds to MPI INT 5.3B and MPI INT 5.3K, depending on primer selected.):
 - 1) Prime Coat: Cementitious galvanized-metal primer, MPI #26 **OR** Waterborne galvanized-metal primer, MPI #134, **as directed**.
 - 2) Intermediate Coat: Not required **OR** Water-based, light-industrial coating, MPI #110, gloss matching topcoat, **as directed**.

- 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
- c. Epoxy Coating System (System below corresponds to MPI INT 5.3D):
 - 1) Prime Coat: Cold-curing epoxy primer, MPI #101.
 - 2) Intermediate Coat: Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
8. Aluminum (Not Anodized or Otherwise Coated) Substrates (System below corresponds to MPI INT 5.4F):
 - a. High-Performance Architectural Latex Coating System:
 - 1) Prime Coat: Quick-drying primer for aluminum, MPI #95.
 - 2) Intermediate Coat: Not required **OR** High-performance architectural latex, matching topcoat, **as directed**.
 - 3) Topcoat: High-performance architectural latex, velvet finish, MPI #138, Gloss Level 2 **OR** eggshell finish, MPI #139, Gloss Level 3 **OR** satin finish, MPI #140, Gloss Level 4 **OR** semigloss finish, MPI #141, Gloss Level 5, **as directed**.
 - b. Water-Based, Light-Industrial Coating System (System below corresponds to MPI INT 5.4E):
 - 1) Prime Coat: Quick-drying primer for aluminum, MPI #95.
 - 2) Intermediate Coat: Not required **OR** Water-based, light-industrial coating, MPI #110, gloss matching topcoat, **as directed**.
 - 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
 - c. Epoxy Coating System (System below corresponds to MPI INT 5.4B):
 - 1) Prime Coat: Vinyl wash primer, MPI #80.
 - 2) Intermediate Coat: Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - d. Polyurethane, Pigmented Coating System (System below corresponds to MPI INT 5.4C):
 - 1) Prime Coat: Vinyl wash primer, MPI #80.
 - 2) Intermediate Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 3) Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.
9. Wood Substrates:
 - a. High-Performance Architectural Latex Coating System (System below corresponds to MPI INT 6.1N, MPI INT 6.3A, and MPI INT 6.4S):
 - 1) Prime Coat: Interior latex-based wood primer, MPI #39.
 - 2) Intermediate Coat: High-performance architectural latex matching topcoat.
 - 3) Topcoat: High-performance architectural latex, velvet finish, MPI #138, Gloss Level 2 **OR** eggshell finish, MPI #139, Gloss Level 3 **OR** satin finish, MPI #140, Gloss Level 4 **OR** semigloss finish, MPI #141, Gloss Level 5, **as directed**.
 - b. Water-Based, Light-Industrial Coating System (System below corresponds to MPI INT 6.3P and MPI INT 6.4N):
 - 1) Prime Coat: Interior alkyd primer/sealer, MPI #45.
 - 2) Intermediate Coat: Water-based, light-industrial coating, MPI #110, gloss matching topcoat.
 - 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
 - c. Epoxy Coating System (System below corresponds to MPI INT 6.1L and MPI INT 6.3L):
 - 1) Prime Coat: Epoxy, cold-cured, gloss, MPI #77.
 - 2) Intermediate Coat: Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - d. Pigmented Polyurethane Coating System (System below corresponds to MPI INT 6.1E):
 - 1) Prime Coat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 2) Intermediate Coat: Polyurethane, two-component, pigmented, gloss, MPI #72.
 - 3) Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.

- e. Polyurethane, Clear, Moisture-Cured Coating System (System below corresponds to MPI INT 6.1S, MPI INT 6.2N, MPI INT 6.3Y, and MPI INT 6.4V):
 - 1) Stain Coat: Interior wood stain, semitransparent (solvent based), MPI #90.
 - 2) Intermediate Coat: Polyurethane, moisture cured, clear, flat, MPI #71 **OR** Polyurethane, moisture cured, clear, gloss, MPI #31, **as directed**.
 - 3) First Topcoat: Polyurethane, moisture cured, clear, flat, MPI #71 **OR** Polyurethane, moisture cured, clear, gloss, MPI #31, **as directed**.
 - 4) Second Topcoat: Not required **OR** Polyurethane, moisture cured, clear, flat, MPI #71 **OR** Polyurethane, moisture cured, clear, gloss, MPI #31, **as directed**.
 - f. Polyurethane, Clear, Moisture-Cured Coating System (System below corresponds to MPI INT 6.3X):
 - 1) Intermediate Coat: Polyurethane, moisture cured, clear, flat, MPI #71 **OR** Polyurethane, moisture cured, clear, gloss, MPI #31, **as directed**.
 - 2) First Topcoat: Polyurethane, moisture cured, clear, flat, MPI #71 **OR** Polyurethane, moisture cured, clear, gloss, MPI #31, **as directed**.
 - 3) Second Topcoat: Not required **OR** Polyurethane, moisture cured, clear, flat, MPI #71 **OR** Polyurethane, moisture cured, clear, gloss, MPI #31, **as directed**.
 - g. Polyurethane, Clear, Two-Component Coating System (System below corresponds to MPI INT 6.3Z):
 - 1) Stain Coat: Exterior semitransparent stain (solvent based), MPI #13.
 - 2) Intermediate Coat: Not required **OR** Two-component, aliphatic polyurethane, clear, MPI #78, **as directed**.
 - 3) Topcoat: Two-component, aliphatic polyurethane, clear, MPI #78.
10. Gypsum Board Substrates:
- a. High-Performance Architectural Latex Coating System (System below corresponds to MPI INT 9.2B):
 - 1) Prime Coat: Interior latex primer/sealer, MPI #50.
 - 2) Intermediate Coat: High-performance architectural latex matching topcoat.
 - 3) Topcoat: High-performance architectural latex, velvet finish, MPI #138, Gloss Level 2 **OR** eggshell finish, MPI #139, Gloss Level 3 **OR** satin finish, MPI #140, Gloss Level 4 **OR** semigloss finish, MPI #141, Gloss Level 5, **as directed**.
 - b. Water-Based, Light-Industrial Coating System (System below corresponds to MPI INT 9.2L):
 - 1) Prime Coat: Interior latex primer/sealer, MPI #50.
 - 2) Intermediate Coat: Water-based, light-industrial coating, MPI #110, gloss matching topcoat.
 - 3) Topcoat: Water-based, light-industrial coating, MPI #110-G6, gloss **OR** 5, semigloss **OR** 3, eggshell, **as directed**.
 - c. Epoxy Coating System (System below corresponds to MPI INT 9.2E):
 - 1) Prime Coat: Interior latex primer/sealer, MPI #50.
 - 2) Intermediate Coat: Not required **OR** Epoxy, cold-cured, gloss, MPI #77, **as directed**.
 - 3) Topcoat: Epoxy, cold-cured, gloss, MPI #77.
 - d. Water-Based Epoxy Coating System (System below corresponds to MPI INT 9.2F):
 - 1) Prime Coat: Interior latex primer/sealer, MPI #50.
 - 2) Intermediate Coat: Not required **OR** Water-based epoxy (interior and exterior), MPI #115, **as directed**.
 - 3) Topcoat: Water-based epoxy (interior and exterior), MPI #115.

SECTION 10 11 00 00 - VISUAL DISPLAY UNITS**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Installer Qualifications: Engage an experienced Installer who is an authorized representative of the manufacturer for both installation and maintenance of the type of sliding markerboard units required for this Project.
 - 1. Maintenance Proximity: Not more than four hours normal travel time from the Installer's place of business to the Project Site.
- B. Fire Performance Characteristics: Provide vinyl fabric faced tackboards with surface burning characteristics indicated below, as determined by testing assembled materials composed of facings and backings identical to those required in this section, in accordance with ASTM E 84, by a testing organization acceptable to authorities having jurisdiction.
 - 1. Flame Spread: 25 or less
 - 2. Smoke Developed: 10 or less
- C. Design Criteria:
 - 1. The Drawings indicate sizes, profiles, and dimensional requirements of visual display boards and are based on the specific type and model indicated.
 - 2. Other visual display boards having equal performance characteristics with deviations from indicated dimensions and profiles may be considered, provided that deviations in dimensions and profiles are minor and do not change the design concept or intended performance as judged by the Architect. The burden of proof of equality is on the proposer.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Include motor capacities, and individual panel weights for sliding markerboard or markerboard units. Include manufacturer's data substantiating that tackboard materials comply with requirements indicated.

2. In lieu of laboratory test reports, when permitted by the Architect, submit the manufacturer's certification that tackboard materials furnished comply with requirements specified for flame spread ratings.

B. Samples:

1. Samples for initial selection of color, pattern, and texture:
 - a. Porcelain Enamel Markerboard: Manufacturer's color charts consisting of actual sections of porcelain enamel finish showing the full range of colors available for each type of markerboard required.
 - b. Vinyl fabric faced Cork Tackboards: Manufacturer's color charts consisting of actual sections of vinyl fabric, showing the full range of colors, textures, and patterns available for each type of vinyl fabric faced cork tackboard indicated.
 - c. Aluminum Trim and Accessories: .
2. Samples for verification of color, pattern, and texture selected, and compliance with requirements indicated.
 - a. Markerboards, and Tackboards: Sample panels not less than 8-1/2 inches by 11 inches for each type of markerboard and tackboard indicated. Include a sample panel for each color, texture, and pattern required.
 - b. Aluminum Trim and Accessories: Samples of each finish type and color, on 6 inch long sections of extrusions and not less than 4 inch squares of sheet or plate. Where finishes involve normal color and texture variations, include sets showing the full range of variations expected.

C. Shop Drawings:

1. Shop Drawings: Provide shop drawings for each type of markerboard and tackboard required. Include sections of typical trim members and dimensioned elevations. Show anchors, grounds, reinforcement, accessories, layout, and installation details.

1.05 WARRANTY

- A. Porcelain Enamel Markerboard Warranty: Furnish the manufacturer's written warranty, agreeing to replace porcelain enamel markerboards that do not retain their original writing and erasing qualities, become slick and shiny, or exhibit crazing, cracking, or flaking, provided the manufacturer's instructions with regard to handling, installation, protection, and maintenance have been followed.
 1. Warranty Period: 50 years.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products may be incorporated in the Work include, but are not limited to, the following:

1. Porcelain Enamel Markerboards:
 - a. Claridge Products and Equipment, Inc.
 - b. Or Approved equal
2. Tackboards:
 - a. Claridge Products and Equipment, Inc.
 - b. Or approved Equal

2.03 MATERIALS

- A. Porcelain Enamel Markerboards: Provide balanced, high pressure laminated porcelain enamel markerboards of 3 ply construction consisting of face sheet, core material, and backing.
1. Face Sheet: Provide face sheet of 24 gage enameling grade steel especially processed for temperatures used in coating porcelain on steel. Coat the exposed face and exposed edges with a 3 coat process consisting of primer, ground coat, and color cover coat, and the concealed face with a 2 coat process consisting of primer and ground coat. Fuse cover and ground coats to steel at the manufacturer's standard firing temperatures, but not less than 1200 degrees F (649 degrees C).
 - a. Cover Coat: Provide the manufacturer's standard light colored special writing surface with gloss finish intended for use with liquid felt tipped markers.
 2. Core: Provide the manufacturer's standard 3/8 inch thick particleboard core material complying with the requirements of ANSI A208.1, Grade 1 M 1.
 3. Core: Provide the manufacturer's standard 1/4 inch thick tempered hardboard core material.
 4. Core: Provide the manufacturer's standard 3/8 inch heavy kraft paper honeycomb core material.
 5. Backing Sheet: Provide the manufacturer's standard 26 gage galvanized steel sheet backing.
 6. Laminating Adhesive: Provide the manufacturer's standard moisture resistant thermoplastic type adhesive.

2.04 ACCESSORIES

- A. Metal Trim and Accessories: Fabricate frames and trim of not less than 0.062 inch thick aluminum alloy, size and shape as indicated, to suit type of installation. Provide straight, single length units wherever possible; keep joints to a minimum. Miter corners to a neat, hairline closure.
1. Where the size of boards or other conditions exist that require support in addition to the normal trim, provide structural supports or modify the trim as indicated or as selected by the Architect from the manufacturer's standard structural support accessories to suit the condition indicated.
 2. Field Applied Trim: Provide the manufacturer's standard snap on trim, with no visible screws or exposed joints.
 3. Chalktray: Furnish manufacturer's standard continuous box type aluminum chalktray with slanted front and cast aluminum end closures for each markerboard.
 - a. Provide one box, 4 colors minimum, of liquid felt tip markers for each individual markerboard installed.
 4. Map Rail: Furnish map rail at the top of each unit, complete with the following accessories:

- a. Display Rail: Provide continuous cork display rail approximately 1 or 2 inches wide, as indicated, integral with the map rail.
- b. End Stops: Provide one end stop at each end of the map rail.
- c. Map Hooks: Provide 2 map hooks with flexible metal clips for each 4 feet of map rail or fraction thereof.

2.05 FABRICATION

- A. Porcelain Enamel Markerboards: Laminate facing sheet and backing sheet to core material under pressure with manufacturer's recommended flexible, waterproof adhesive.
- B. Assembly: Provide factory assembled markerboard and tackboard units, except where field assembled units are required.
 1. Make joints only where total length exceeds maximum manufactured length. Fabricate with the minimum number of joints, balanced around the center of the board, as acceptable to the Architect.
 2. Provide the manufacturer's standard vertical joint system between abutting sections of markerboard.
 3. Provide manufacturer's standard mullion trim at joints between markerboard and tackboard.
- C. Unit Sizes: Provide markerboard and tackboard units in lengths shown on Drawings and, unless otherwise indicated, in a constant 42 inch height.

2.06 FINISHES

- A. Comply with NAAMM "Metal Finishes Manual" for recommendations relative to application and designations of finishes.
- B. Finish designations prefixed by "AA" conform to the system established by the Aluminum Association for designating aluminum finishes.
- C. Class II Clear Anodized Finish: AA M12C22A31 (Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class II Architectural, clear film thicker than 0.4 mil).
- D. Class II Color Anodized Finish: AA M12C22A32/A34 (Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class II Architectural, film thicker than 0.4 mil with integral color or electrolytically deposited color).
 1. Color: Light bronze
 2. Color: Medium bronze
 3. Color: Dark bronze
 4. Color: Black
 5. Color: Match Architect's sample.
 6. Color: As selected by Architect from within standard industry colors and color density range.

- E. Baked Enamel Finish: AA C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: chemical conversion coating, acid chromate fluoride phosphate pretreatment; Organic Coating: as specified below). Apply baked enamel in compliance with paint manufacturer's specifications for cleaning, conversion coating, and painting.
 - 1. Organic Coating: Thermosetting modified acrylic enamel primer/topcoat system complying with AAMA 603.8 except with minimum dry film thickness of 1.5 mils, medium gloss.
 - 2. Color: As indicated by reference to manufacturer's standard color designations.
 - 3. Color: Match Architect's sample.
 - 4. Color: As selected by Architect from manufacturer's standard colors.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Deliver factory built markerboard and tackboard units completely assembled in one piece without joints, wherever possible. Where dimensions exceed panel size, provide 2 or more pieces of equal length as acceptable to the Architect. When overall dimensions require delivery in separate units, prefabricate components at the factory, disassemble for delivery, and make final joints at the site. Use splines at joints to maintain surface alignment.
- D. Install units in locations and at mounting heights indicated and in accordance with the manufacturer's instructions. Keep perimeter lines straight, plumb, and level. Provide grounds, clips, backing materials, adhesives, brackets, anchors, trim, and accessories necessary for a complete installation.
- E. Coordinate job site assembled units with grounds, trim, and accessories. Join parts with a neat, precision fit.

3.02 ADJUST AND CLEAN

- A. Verify that accessories required for each unit have been properly installed and that operating units function properly.
- B. Clean units in accordance with the manufacturer's instructions. Break in markerboards only as recommended by the manufacturer.

SECTION 10 21 13 13 - TOILET COMPARTMENTS - METAL**1.1 GENERAL****A. Description Of Work:**

1. This specification covers the furnishing and installation of materials for toilet compartments. Product shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary**1. Section Includes:**

- a. Steel toilet compartments configured as toilet enclosures, entrance screens, and urinal screens.
- b. Stainless-steel toilet compartments configured as toilet enclosures, entrance screens, and urinal screens.
- c. Plastic-laminate-faced toilet compartments configured as toilet enclosures, entrance screens, and urinal screens.
- d. Phenolic-core toilet compartments configured as toilet enclosures, entrance screens, and urinal screens.
- e. Solid-polymer toilet compartments configured as toilet enclosures, entrance screens, and urinal screens.

C. Submittals

1. Product Data: For each type of product indicated.
2. LEED Submittals:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2, **as directed**: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating costs for each product having recycled content.
 - b. Product Data for Credit EQ 4.4: For particleboard, documentation indicating that product contains no urea formaldehyde.
3. Shop Drawings: For toilet compartments. Include plans, elevations, sections, details, and attachments to other work.
4. Samples for each exposed product and for each color and texture specified.
5. Product certificates.
6. Maintenance data.

D. Quality Assurance

1. Comply with requirements in GSA's CID-A-A-60003, "Partitions, Toilets, Complete", **as directed**.
2. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84, or another standard acceptable to authorities having jurisdiction, by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - a. Flame-Spread Index: 25 **OR** 75 **OR** 200, **as directed**, or less.
 - b. Smoke-Developed Index: 450 or less.
3. Regulatory Requirements: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA) and Architectural Barriers Act (ABA) Accessibility Guidelines for Buildings and Facilities" and ICC/ANSI A117.1 for toilet compartments designated as accessible.

1.2 PRODUCTS**A. Materials**

1. Aluminum Castings: ASTM B 26/B 26M.
2. Aluminum Extrusions: ASTM B 221 (ASTM B 221M).
3. Brass Castings: ASTM B 584.
4. Brass Extrusions: ASTM B 455.
5. Steel Sheet: Commercial steel sheet for exposed applications; mill phosphatized and selected for smoothness.
 - a. Electrolytically Zinc Coated: ASTM A 879/A 879M, 01Z (03G).
 - b. Hot-Dip Galvanized: ASTM A 653/A 653M, either hot-dip galvanized or galvanized.
6. Stainless-Steel Sheet: ASTM A 666, Type 304, stretcher-leveled standard of flatness.
7. Stainless-Steel Castings: ASTM A 743/A 743M.
8. Zamac: ASTM B 86, commercial zinc-alloy die castings.
9. Particleboard: ANSI A208.1, Grade M-2 with 45-lb (20.4-kg) density, made with binder containing no urea formaldehyde.
10. Plastic Laminate: NEMA LD 3, general-purpose HGS grade, 0.048-inch (1.2-mm) nominal thickness.

B. Steel Units

1. Toilet-Enclosure Style: Overhead braced **OR** Floor anchored **OR** Ceiling hung **OR** Floor and ceiling anchored, **as directed**.
2. Entrance-Screen Style: Overhead braced **OR** Floor anchored **OR** Ceiling hung **OR** Floor and ceiling anchored, **as directed**.
3. Urinal-Screen Style: Wall hung, flat panel **OR** Wall hung with integral flanges **OR** Wall hung, wedge shaped **OR** Floor anchored **OR** Overhead braced **OR** Post to ceiling, **as directed**.
4. Door, Panel, and Pilaster Construction: Seamless, metal facing sheets pressure laminated to core material; with continuous, interlocking molding strip or lapped-and-formed edge closures; corners secured by welding or clips and exposed welds ground smooth. Provide with no-sightline system, **as directed**. Exposed surfaces shall be free of pitting, seam marks, roller marks, stains, discolorations, telegraphing of core material, or other imperfections.
 - a. Core Material: Manufacturer's standard sound-deadening honeycomb of resin-impregnated kraft paper in thickness required to provide finished thickness of 1 inch (25 mm) for doors and panels and 1-1/4 inches (32 mm) for pilasters.
 - b. Grab-Bar Reinforcement: Provide concealed internal reinforcement for grab bars mounted on units.
 - c. Tapping Reinforcement: Provide concealed reinforcement for tapping (threading) at locations where machine screws are used for attaching items to units.
5. Urinal-Screen Construction:
 - a. Flat-Panel Urinal Screen: Matching panel construction.
 - b. Integral-Flange, Wall-Hung Urinal Screen: Similar to panel construction, with integral full-height flanges for wall attachment, and maximum 1-1/4 inches (32 mm) thick.
 - c. Wedge-Shaped, Wall-Hung Urinal Screen: Similar to panels, V-shaped, fabricated for concealed wall attachment, and maximum 6 inches (152 mm) wide at wall and minimum 1 inch (25 mm) wide at protruding end.
6. Facing Sheets and Closures: Electrolytically coated steel **OR** Hot-dip galvanized-steel **OR** Electrolytically coated or hot-dip galvanized-steel, **as directed**, sheet with nominal base-metal (uncoated) thicknesses as follows:
 - a. Pilasters, Braced at Both Ends (for overhead-braced and floor-and-ceiling-anchored mounting styles): Manufacturer's standard thickness, but not less than 0.036 inch (0.91 mm).
 - b. Pilasters, Unbraced at One End (for floor-anchored and ceiling-hung mounting styles): Manufacturer's standard thickness, but not less than 0.048 inch (1.21 mm).
 - c. Panels: Manufacturer's standard thickness, but not less than 0.030 inch (0.76 mm) **OR** 0.036 inch (0.91 mm), **as directed**.
 - d. Doors: Manufacturer's standard thickness, but not less than 0.030 inch (0.76 mm).
 - e. Flat-Panel Urinal Screens: Thickness matching the panels.
 - f. Integral-Flange, Wall-Hung Urinal Screens (for government-style metal screens): Manufacturer's standard thickness, but not less than 0.030 inch (0.76 mm).

- g. Wedge-Shaped, Wall-Hung Urinal Screens: Manufacturer's standard thickness, but not less than 0.036 inch (0.91 mm).
 7. Pilaster Shoes and Sleeves (Caps): Stainless-steel sheet, not less than 0.031-inch (0.79-mm) nominal thickness and 3 inches (76 mm) high, finished to match hardware.
 8. Urinal-Screen Post (for floor-anchored, overhead-braced, and post-to-ceiling urinal screens): Manufacturer's standard post design of material matching the thickness and construction of pilasters **OR** 1-3/4-inch- (44-mm-) square, aluminum tube with satin finish, **as directed**; with shoe and sleeve (cap), **as directed**, matching that on the pilaster.
 9. Brackets (Fittings):
 - a. Stirrup Type: Ear or U-brackets; chrome-plated zamac **OR** clear-anodized aluminum **OR** stainless steel **OR** chrome-plated brass, **as directed**.
 - b. Full-Height (Continuous) Type: Manufacturer's standard design; stainless steel **OR** aluminum, **as directed**.
 10. Steel-Sheet Finish: Immediately after cleaning and pretreating, apply manufacturer's standard baked-on finish, including thermosetting, electrostatically applied, and powder coatings. Comply with coating manufacturer's written instructions for applying and baking. Apply one color **OR** two colors, **as directed**, in each room.
 - a. Color: As selected from manufacturer's full range.
- C. Stainless-Steel Units
1. Toilet-Enclosure Style: Overhead braced **OR** Floor anchored **OR** Ceiling hung **OR** Floor and ceiling anchored, **as directed**.
 2. Entrance-Screen Style: Overhead braced **OR** Floor anchored **OR** Ceiling hung **OR** Floor and ceiling anchored, **as directed**.
 3. Urinal-Screen Style: Wall hung flat panel **OR** Wall hung with integral flanges **OR** Wall hung, wedge shaped **OR** Floor anchored **OR** Overhead braced **OR** Post to ceiling, **as directed**.
 4. Door, Panel, and Pilaster Construction: Seamless, metal facing sheets pressure laminated to core material; with continuous, interlocking molding strip or lapped-and-formed edge closures; corners secured by welding or clips and exposed welds ground smooth. Provide with no-sightline system, **as directed**. Exposed surfaces shall be free of pitting, seam marks, roller marks, stains, discolorations, telegraphing of core material, or other imperfections.
 - a. Core Material: Manufacturer's standard sound-deadening honeycomb of resin-impregnated kraft paper in thickness required to provide finished thickness of 1 inch (25 mm) for doors and panels and 1-1/4 inches (32 mm) for pilasters.
 - b. Grab-Bar Reinforcement: Provide concealed internal reinforcement for grab bars mounted on units.
 - c. Tapping Reinforcement: Provide concealed reinforcement for tapping (threading) at locations where machine screws are used for attaching items to units.
 5. Urinal-Screen Construction:
 - a. Flat-Panel Urinal Screen: Matching panel construction.
 - b. Integral-Flange, Wall-Hung Urinal Screen (for government-style metal screens): Similar to panel construction, with integral full-height flanges for wall attachment, and maximum 1-1/4 inches (32 mm) thick.
 - c. Wedge-Shaped, Wall-Hung Urinal Screen: Similar to panels, V-shaped, fabricated for concealed wall attachment, and maximum 6 inches (152 mm) wide at wall and minimum 1 inch (25 mm) wide at protruding end.
 6. Facing Sheets and Closures: Stainless-steel sheet of nominal thicknesses as follows:
 - a. Pilasters, Braced at Both Ends (for overhead-braced and floor-and-ceiling-anchored mounting styles): Manufacturer's standard thickness, but not less than 0.038 inch (0.95 mm).
 - b. Pilasters, Unbraced at One End (for floor-anchored and ceiling-hung mounting styles): Manufacturer's standard thickness, but not less than 0.050 inch (1.27 mm).
 - c. Panels: Manufacturer's standard thickness, but not less than 0.031 inch (0.79 mm) **OR** 0.038 inch (0.95 mm), **as directed**.
 - d. Doors: Manufacturer's standard thickness, but not less than 0.031 inch (0.79 mm).
 - e. Flat-Panel Urinal Screens: Thickness matching the panels.

- f. Integral-Flange, Wall-Hung Urinal Screens (for government-style metal screens: Manufacturer's standard thickness, but not less than 0.031 inch (0.79 mm).
 - g. Wedge-Shaped, Wall-Hung Urinal Screens: Manufacturer's standard thickness, but not less than 0.038 inch (0.95 mm).
 7. Pilaster Shoes and Sleeves (Caps): Stainless-steel sheet, not less than 0.031-inch (0.79-mm) nominal thickness and 3 inches (76 mm) high, finished to match hardware.
 8. Urinal-Screen Post (for floor-anchored, overhead-braced, and post-to-ceiling urinal screens): Manufacturer's standard post design of material matching the thickness and construction of pilasters **OR** 1-3/4-inch- (44-mm-) square, aluminum tube with satin finish, **as directed**; with shoe and sleeve (cap) matching that on the pilaster.
 9. Brackets (Fittings):
 - a. Stirrup Type: Ear or U-brackets; chrome-plated zamac **OR** clear-anodized aluminum **OR** stainless steel **OR** chrome-plated brass, **as directed**.
 - b. Full-Height (Continuous) Type: Manufacturer's standard design; stainless steel **OR** aluminum, **as directed**.
 10. Stainless-Steel Finish: No. 4 bright, directional polish **OR** Manufacturer's standard textured finish, **as directed**, on exposed faces. Protect exposed surfaces from damage by application of strippable, temporary protective covering before shipment.
- D. Plastic-Laminate-Faced Units
1. Toilet-Enclosure Style: Overhead braced **OR** Floor anchored **OR** Ceiling hung **OR** Floor and ceiling anchored, **as directed**.
 2. Entrance-Screen Style: Overhead braced **OR** Floor anchored **OR** Ceiling hung **OR** Floor and ceiling anchored, **as directed**.
 3. Urinal-Screen Style: Wall hung **OR** Floor anchored **OR** Overhead braced **OR** Post to ceiling, **as directed**.
 4. Door, Panel, Screen, and Pilaster Construction: One-piece, plastic-laminate facing sheets pressure laminated to core material without splices or joints in facings or cores; with laminate **OR** stainless-steel edge trim 0.050 inch (1.27 mm) thick, **as directed**, applied to edges before faces to seal edges and prevent laminate from being pried loose. Seal exposed core material at cutouts to protect core from moisture. Provide with no-sightline system, **as directed**.
 - a. Core Material: Particleboard.
 - b. Doors and Panels: Finished to not less than 7/8 inch (22 mm) **OR** 1 inch (25 mm), **as directed**, thick.
 - c. Pilasters: Provide construction to comply with one of the following, **as directed**:
 - 1) Finished to not less than 1-1/4 inches (32 mm) thick and with internal, nominal 0.134-inch- (3.42-mm-) thick, steel-sheet reinforcement, **as directed**.
 - 2) Finished to 1-1/4 inches (32 mm) thick and with manufacturer's standard steel-sheet core laminated to both sides of honeycomb of resin-impregnated kraft paper in lieu of particleboard core.
 - 3) Finished to not less than 1 inch (25 mm) thick and with internal, nominal 0.120-inch- (3.04-mm-) thick, steel-sheet reinforcement.
 5. Pilaster Shoes and Sleeves (Caps): Formed from stainless-steel sheet, not less than 0.031-inch (0.79-mm) nominal thickness and 3 inches (76 mm) high, finished to match hardware.
 6. Urinal-Screen Post (for floor-anchored, overhead-braced, and post-to-ceiling urinal screens): Manufacturer's standard post design of material matching the thickness and construction of pilasters **OR** 1-3/4-inch- (44-mm-) square, aluminum tube with satin finish **OR** 1-1/4-inch- (32-mm-) square, stainless-steel tube 0.050 inch (1.27 mm) thick with satin finish, **as directed**; with shoe and sleeve (cap) matching that on the pilaster.
 7. Brackets (Fittings):
 - a. Stirrup Type: Ear or U-brackets, chrome-plated zamac **OR** clear-anodized aluminum **OR** stainless steel **OR** chrome-plated brass, **as directed**.
 - b. Full-Height (Continuous) Type: Manufacturer's standard design; stainless steel **OR** aluminum, **as directed**.
 8. Plastic-Laminate Finish: One color and pattern **OR** Two colors and patterns, **as directed**, in each room.
 - a. Color and Pattern: As selected from manufacturer's full range.

E. Phenolic-Core Units

1. Toilet-Enclosure Style: Overhead braced **OR** Floor anchored **OR** Ceiling hung **OR** Floor and ceiling anchored, **as directed**.
2. Entrance-Screen Style: Overhead braced **OR** Floor anchored **OR** Ceiling hung **OR** Floor and ceiling anchored, **as directed**.
3. Urinal-Screen Style: Wall hung **OR** Floor anchored **OR** Overhead braced **OR** Post to ceiling, **as directed**.
4. Door, Panel, Screen, and Pilaster Construction: Solid phenolic-core panel material with melamine facing on both sides fused to substrate during panel manufacture (not separately laminated), and with eased and polished edges and no-sightline system, **as directed**. Provide minimum 3/4-inch- (19-mm-) thick doors and pilasters and minimum 1/2-inch- (13-mm-) thick panels.
5. Pilaster Shoes and Sleeves (Caps): Fabricated from stainless-steel sheet, not less than 0.031-inch (0.79-mm) nominal thickness and 3 inches (76 mm) high, finished to match hardware.
6. Urinal-Screen Post (for floor-anchored, overhead-braced, and post-to-ceiling urinal screens): Manufacturer's standard post design of monolithic phenolic urinal screen cut out at bottom to form a post **OR** material matching the thickness and construction of pilasters **OR** 1-3/4-inch- (44-mm-) square, aluminum tube with satin finish, **as directed**; with shoe and sleeve (cap) matching that on the pilaster.
7. Brackets (Fittings):
 - a. Stirrup Type: Ear or U-brackets, chrome-plated zamac **OR** clear-anodized aluminum **OR** stainless steel **OR** chrome-plated brass, **as directed**.
 - b. Full-Height (Continuous) Type: Manufacturer's standard design; stainless steel **OR** aluminum, **as directed**.
8. Phenolic-Panel Finish:
 - a. **Arborite** Laboratory Grade, Matte finish unless noted differently on the drawings. Thickness as indicated on drawings

F. Solid-Polymer Units

1. Toilet-Enclosure Style: Overhead braced **OR** Floor anchored **OR** Ceiling hung **OR** Floor and ceiling anchored, **as directed**.
2. Entrance-Screen Style: Overhead braced **OR** Floor anchored **OR** Ceiling hung **OR** Floor and ceiling anchored, **as directed**.
3. Urinal-Screen Style: Wall hung **OR** Floor anchored **OR** Overhead braced **OR** Post to ceiling, **as directed**.
4. Door, Panel, Screen, and Pilaster Construction: Solid, high-density polyethylene (HDPE) **OR** polypropylene (PP), **as directed**, panel material, not less than 1 inch (25 mm) thick, seamless, with eased edges, no-sightline system, **as directed**, and with homogenous color and pattern throughout thickness of material.
 - a. Integral Hinges: Configure doors and pilasters to receive integral hinges.
 - b. Heat-Sink Strip: Manufacturer's standard continuous, extruded-aluminum **OR** stainless-steel, **as directed**, strip fastened to exposed bottom edges of solid-polymer components to prevent burning.
 - c. Color and Pattern: One color and pattern **OR** Two colors and patterns, **as directed**, in each room as indicated by manufacturer's designations **OR** as selected from manufacturer's full range, **as directed**.
5. Pilaster Shoes and Sleeves (Caps): Manufacturer's standard design; polymer **OR** stainless steel, **as directed**.
 - a. Polymer Color and Pattern: Matching pilaster **OR** Contrasting with pilaster, as indicated by manufacturer's designations **OR** Contrasting with pilaster, as selected from manufacturer's full range, **as directed**.
6. Urinal-Screen Post (for floor-anchored, overhead-braced, and post-to-ceiling urinal screens): Manufacturer's standard post design of material matching the thickness and construction of pilasters **OR** 1-3/4-inch- (44-mm-) square, aluminum tube with satin finish, **as directed**; with shoe and sleeve (cap) matching that on the pilaster.
7. Brackets (Fittings):

- a. Stirrup Type: Ear or U-brackets, chrome-plated zamac **OR** clear-anodized aluminum **OR** stainless steel **OR** chrome-plated brass, **as directed**.
- b. Full-Height (Continuous) Type: Manufacturer's standard design; polymer or extruded aluminum **OR** polymer **OR** extruded aluminum **OR** stainless steel, **as directed**.
 - 1) Polymer Color and Pattern: Matching panel **OR** Contrasting with panel, as indicated by manufacturer's designations **OR** Contrasting with panel, as selected from manufacturer's full range, **as directed**.
- 8. Overhead Cross Bracing for Ceiling-Hung Units: As recommended by manufacturer and fabricated from solid polymer.

G. Accessories

- 1. Hardware and Accessories: Manufacturer's standard design, heavy-duty operating hardware and accessories.
 - a. Material: Chrome-plated zamac **OR** Clear-anodized aluminum **OR** Stainless steel **OR** Chrome-plated brass, **as directed**.
 - b. Hinges: Manufacturer's standard paired, self-closing type that can be adjusted to hold doors open at any angle up to 90 degrees **OR** continuous, cam type that swings to a closed or partially open position **OR** continuous, spring-loaded type **OR** integral hinge for solid-polymer doors, **as directed**.
 - c. Latch and Keeper: Manufacturer's standard recessed **OR** surface-mounted, **as directed**, latch unit designed for emergency access and with combination rubber-faced door strike and keeper. Provide units that comply with regulatory requirements for accessibility at compartments designated as accessible.
 - d. Coat Hook: Manufacturer's standard combination hook and rubber-tipped bumper, sized to prevent in-swinging door from hitting compartment-mounted accessories.
 - e. Door Bumper: Manufacturer's standard rubber-tipped bumper at out-swinging doors and entrance-screen doors, **as directed**.
 - f. Door Pull: Manufacturer's standard unit at out-swinging doors that complies with regulatory requirements for accessibility. Provide units on both sides of doors at compartments designated as accessible.
- 2. Overhead Bracing (for overhead-braced units): Manufacturer's standard continuous, extruded-aluminum head rail with antigrip profile and in manufacturer's standard finish.
- 3. Anchorages and Fasteners: Manufacturer's standard exposed fasteners of stainless steel or chrome-plated steel or brass, finished to match the items they are securing, with theft-resistant-type heads. Provide sex-type bolts for through-bolt applications. For concealed anchors, use stainless steel, hot-dip galvanized steel, or other rust-resistant, protective-coated steel.

H. Fabrication

- 1. Overhead-Braced Units: Provide manufacturer's standard corrosion-resistant supports, leveling mechanism, and anchors at pilasters to suit floor conditions. Provide shoes at pilasters to conceal supports and leveling mechanism.
- 2. Floor-Anchored Units: Provide manufacturer's standard corrosion-resistant anchoring assemblies with leveling adjustment nuts at pilasters for structural connection to floor. Provide shoes at pilasters to conceal anchorage.
- 3. Ceiling-Hung Units: Provide manufacturer's standard corrosion-resistant anchoring assemblies with leveling adjustment nuts at pilasters for connection to structural support above finished ceiling. Provide assemblies that support pilasters from structure without transmitting load to finished ceiling. Provide sleeves (caps) at tops of pilasters to conceal anchorage.
- 4. Floor-and-Ceiling-Anchored Units: Provide manufacturer's standard corrosion-resistant anchoring assemblies with leveling adjustment at tops and bottoms of pilasters. Provide shoes and sleeves (caps) at pilasters to conceal anchorage.
- 5. Urinal-Screen Posts: Provide manufacturer's standard corrosion-resistant anchoring assemblies with leveling adjustment at tops and bottoms, **as directed**, of posts. Provide shoes and sleeves (caps) at posts to conceal anchorage.
- 6. Door Size and Swings: Unless otherwise indicated, provide 24-inch- (610-mm-) wide, in-swinging doors for standard toilet compartments and 36-inch- (914-mm-) wide, out-swinging doors with a minimum 32-inch- (813-mm-) wide, clear opening for compartments designated as accessible.

1.3 EXECUTION

A. Installation

1. General: Comply with manufacturer's written installation instructions. Install units rigid, straight, level, and plumb. Secure units in position with manufacturer's recommended anchoring devices.
 - a. Maximum Clearances:
 - 1) Pilasters and Panels: 1/2 inch (13 mm).
 - 2) Panels and Walls: 1 inch (25 mm).
 - b. Stirrup Brackets: Secure panels to walls and to pilasters with no fewer than two brackets attached **OR** three brackets attached at midpoint and, **as directed**, near top and bottom of panel.
 - 1) Locate wall brackets so holes for wall anchors occur in masonry or tile joints.
 - 2) Align brackets at pilasters with brackets at walls.
2. Overhead-Braced Units: Secure pilasters to floor and level, plumb, and tighten. Set pilasters with anchors penetrating not less than 1-3/4 inches (44 mm) into structural floor unless otherwise indicated in manufacturer's written instructions. Secure continuous head rail to each pilaster with no fewer than two fasteners. Hang doors to align tops of doors with tops of panels, and adjust so tops of doors are parallel with overhead brace when doors are in closed position.
3. Floor-Anchored Units: Set pilasters with anchors penetrating not less than 2 inches (51 mm) into structural floor unless otherwise indicated in manufacturer's written instructions. Level, plumb, and tighten pilasters. Hang doors and adjust so tops of doors are level with tops of pilasters when doors are in closed position.
4. Ceiling-Hung Units: Secure pilasters to supporting structure and level, plumb, and tighten. Hang doors and adjust so bottoms of doors are level with bottoms of pilasters when doors are in closed position.
5. Floor-and-Ceiling-Anchored Units: Secure pilasters to supporting construction and level, plumb, and tighten. Hang doors and adjust so doors are level and aligned with panels when doors are in closed position.
6. Urinal Screens: Attach with anchoring devices to suit supporting structure. Set units level and plumb, rigid, and secured to resist lateral impact.

B. Adjusting

1. Hardware Adjustment: Adjust and lubricate hardware according to hardware manufacturer's written instructions for proper operation. Set hinges on in-swinging doors to hold doors open approximately 30 degrees from closed position when unlatched. Set hinges on out-swinging doors and doors in entrance screens to return doors to fully closed position.

SECTION 10 21 23 13 - CUBICLE CURTAINS

Office Source

Tami Corbin

Voice 210 212-7742

Fax 210 212-8845

Mobile 210 563-5975

Specifications:

- All Fantagraph fabric will be inherently flame resistant. Flame certificates available upon request.
- Fullness to be a minimum of 10-15% in addition to cubicle track length.
- Grommets are to be rust proof, nickel plated brass, set 6-12" on center.
- When a specific curtain width is required, curtains must be ordered as flat finished width.
- Curtains are manufactured to a length with a tolerance of plus or minus 1".
- Care and location labels are sewn into the reverse side of right hem, approximately 6" above bottom hem.
- Typically cubicles finish 12" above floor.
- Mesh is to be open ½" on diagonal.

- Vertically Seamed
 - Hems are to be doubled folded, 1-1/8" and sewn with double needle lock stitch.
 - Seams are to be double flap folded ½" and sewn with a double needle lock stitch.
 - Curtains to be ordered in 18" increments as the cut width.
 - Curtain will finish approximately 4% less than specified size, due to allowance for hems and seams.
 - Mesh to have 1" non-woven tape inserted into side hems as reinforcement.
 - Sapor II mesh will finish at approximately 19-1/2".

- Integral Mesh
 - Curtains have a maximum finished length of 92"-94".
 - Curtains have 1-1/2" header containing grommets spaced 6-12" on center.
 - Curtain fabric and mesh are knitted as one piece of fabric.
 - 20" mesh typical, plus or minus 1" for industry tolerance. This method ensures the construction of a totally seamless cubicle curtain.
 - Integral mesh cannot be shortened. Mesh must remain intact.
 - Fabric is railroaded, so there are no vertical seams.
 - Curtains can be ordered in 12" increments.
-

SECTION 10 22 39 00 - FOLDING PANEL PARTITIONS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Single Source Responsibility: Obtain folding panel partitions and mounting hardware from one source from a single manufacturer.
- B. Testing Laboratory Qualifications: To qualify for acceptance, an independent testing laboratory must demonstrate to Architect's satisfaction, based on evaluation of laboratory submitted criteria conforming to ASTM E 699, that it has the experience and capability to conduct satisfactorily the testing indicated.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Product data on physical characteristics, durability, resistance to fading, and flame spread characteristics for each type of folding panel partition and accessory specified.
- B. Samples:
 - 1. Samples for initial selection purposes in form of manufacturer's standard color charts showing full range of colors, textures, and patterns available for each type of material exposed to view.
 - 2. Samples for verification purposes of each type of material exposed to view. Include samples of each panel facing material selected.
- C. Shop Drawings:
 - 1. Shop Drawings showing location and extent of folding panel partitions. Include plans, elevations, large scale details of anchorages, and accessory items. Indicate unit conditions at openings, typical and special details, and location and installation requirements for hardware and operators. Indicate direction of travel and static and dynamic loading on the building structure.
 - 2. Template drawings prepared by manufacturer showing location of items supported or anchored by permanent construction.

3. Wiring diagrams that detail power and control wiring. Differentiate between manufacturer installed and field installed wiring. Include motor size and voltage.

D. Record Documents:

1. Product certificates signed by manufacturers of folding panel partitions certifying that their products comply with specified requirements.
2. Acoustical Certification from an independent testing agency stating that product and materials furnished comply with specified requirements. Include certified laboratory testing data indicating that panels and materials meet specified test requirements. Include STC and NRC ratings and square foot weight of panel.

E. Operation and Maintenance Data:

1. Maintenance data for electric operating devices for inclusion in Operating and Maintenance Manual.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to Project Site in original factory wrappings and containers, clearly labeled with identification of manufacturer, brand name, quality or grade, fire performance characteristics, and lot number.
- B. Store panels only on edge, blocked off ground to prevent sagging and warping, in original undamaged packages and containers, inside well ventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity.
- C. Comply with instructions and recommendations of manufacturer for special delivery, storage, and handling requirements.

1.06 SYSTEM PERFORMANCE REQUIREMENTS

- A. Fire Performance Characteristics: Provide folding panel partitions with surface burning characteristics indicated below, as determined by testing assembled materials composed of surface coverings, backings, and other construction identical to those required in this section, per ASTM E 84, by a testing organization acceptable to authorities having jurisdiction.
 1. Flame Spread: 25 or less
 2. Smoke Developed: 450 or less
- B. Acoustical Performance: Provide folding panel partitions tested by independent testing laboratory acceptable to authorities having jurisdiction, for the following acoustic properties, according to the test method indicated:
 1. Sound Transmission Requirements: Folding panel partition assembly tested in a full scale opening (14 feet by 9 feet) for laboratory sound transmission loss performance in accordance with ASTM E 90, determined by ASTM E 413 and rated for a STC plus or minus 1 as indicated:

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. **Door to be Modernfold Inc. or approved equal, or as called out in drawings, finish as called out in drawings.**
- B. Provided compliance with requirements, products of the following manufacturers will also be acceptable:
 - 1. Hufcor, Inc. (Hough Mfg. Corp.)
 - 2. Panelfold, Inc.

2.03 SUSPENSION SYSTEMS

- A. Carriers: Four wheel at lead post and two wheel at intermediate spacing as required for size and weight of partition for ease of operation.
- B. Suspension Tracks: Heavy duty steel or aluminum, with overhead supports of adjustable steel hanger rods; heavy duty, ball bearing, trolley system supports specifically designed for use with size and type folding panel partition assembly indicated. Track deflection independent of structural support system no more than 1/360th of opening width.

2.04 POSTS AND SEALS

- A. Lead posts and jamb posts formed to provide rigidity for partition and light seal at adjacent construction.
 - 1. Post Type: Floating or attached multiple meeting post with 2, 3, or 4 way meeting arrangements.
 - 2. Post Type: Intermediate post, one side.
 - 3. Post Type: Intermediate post, both sides.
- B. Sound Seals: Perimeter sweep strips for each side, top, and bottom; providing continuous contact with head and sill surfaces for positive light and sound seal. Include manufacturer's standard male and female sound and light seal at lead post and jamb.
- C. Vertical Seals: Deep nesting, interlocking astragals with continuous vinyl acoustical seal.
- D. Horizontal Top Seals: Continuous contact extruded vinyl or mechanical retractable vinyl faced seal exerting positive pressure on track when extended.
- E. Horizontal Bottom Seals: Retractable seal exerting positive pressure downward assuring horizontal and vertical sealing and resisting panel movement. Minimum clearance between retracted seal and floor finish shall be 1 inch.
 - 1. Extension/retraction of bottom seals automatically actuated by movement of partition.
 - 2. Bottom seal shall be continuous contact extruded vinyl.
- F. Final Closure: Positive mechanical closure expanding from panel edge to create positive acoustical seal.
 - 1. Jamb hinged closure.
 - 2. Hinged communicating panel.

PART 3 - EXECUTION**3.01 PREPARATION**

- A. Examine flooring for compliance with requirements for installation tolerances and other conditions affecting performance of folding partitions. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install folding panel partitions and accessories in compliance with ASTM E 557 after other finishing operations including painting, have been completed.
- D. Install folding panel partitions in conformance with drawings and approved shop drawings and in strict compliance with manufacturer's written installation instructions.
- E. Match folding panel partitions for color and pattern by installing partitions from cartons in same sequence as manufactured and packaged, if so numbered. Broken, cracked, chipped, or deformed partitions are not acceptable.
- F. Repair or replace folding panel partitions within areas where test results indicate partitions do not comply with requirements and retest partitions.

3.03 FIELD TESTS

- A. Owner will engage an independent testing service to provide in-place tests of each operable partition for Noise Isolation Class (NIC). Tests for measurement of noise isolation between rooms will be performed in general conformance with ASTM E 336; NIC rating will be calculated in accordance with ASTM E 413.
- B. If any operable partition does not initially meet NIC requirements stated above, installer will be responsible for modifying and adjusting partition assembly as required, after which partition will be retested until compliance is achieved.
 - 1. Owner will pay cost of initial in-place field test for each operable partition. Cost of additional testing will be borne by the Contractor.

3.04 ADJUSTING

- A. Lubricate bearings and sliding parts; adjust to ensure smooth, easy operation.

3.05 CLEANING

- A. Clean all folding partition surfaces and clean adjacent surfaces soiled by Work of this section. Avoid use of abrasive cleaners or solutions containing corrosive solvents. Use cleaning materials recommended by manufacturer.

END OF SECTION 10 22 39 00

Task	Specification	Specification Description
10 22 43 00	10 22 39 00	Folding Panel Partitions

SECTION 10 26 00 00 - WALL AND DOOR PROTECTION**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Firm (material producer) with not less than two years of production experience, whose published literature clearly indicates general compliance of products with requirements of this section.
- B. Installer Qualifications: Firm specializing in installation of wall protection systems with not less than one year experience in installations similar to that required for this Project.
- C. Single Source Responsibility: Provide material produced by a single manufacturer for each wall and corner guard type.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Product data for each wall surface protection system component and installation accessory required, including installation methods for each type of substrate. Provide written data on each required component including physical characteristics, such as durability, resistance to fading, and flame resistance.
 - 2. Prepare samples from same material to be used for the Work.
- B. Shop Drawings:
 - 1. Showing locations, extent, and installation details of wall and corner guards, and other protection systems.
 - 2. Show methods of attachment to adjoining construction.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to the Project Site in original factory wrappings and containers, clearly labeled with identification of manufacturer, brand name, quality or grade, fire hazard classification, and lot number. Store materials in original undamaged packages and containers, inside well ventilated area protected from weather, moisture, soiling, extreme temperatures, humidity; laid flat, blocked off ground to prevent sagging and warping.
- B. Comply with instructions and recommendations of manufacturer for special delivery, storage, and handling requirements.

1.06 SEQUENCING AND SCHEDULING

- A. Sequence wall and corner guard and wall and door protection system installation with other Work to minimize possibility of damage and soiling during remainder of construction period.

1.07 MAINTENANCE

- A. Maintenance Instructions: Submit manufacturer's printed instructions for maintenance of installed Work, including methods and frequency recommended for maintaining optimum condition under anticipated traffic and use conditions. Include precautions against materials and methods which may be detrimental to finishes and performance.
- B. Replacement Materials: After completion of Work, deliver not less than 2 percent of each type, color, and pattern of wall and corner guard, and wall protection material exclusive of material required to properly complete installation. Furnish accessory components as required. Furnish replacement materials from same production run as materials installed. Package replacement materials with protective covering, identified with appropriate labels.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Wall and corner guards to be by **KOROGARD** wall protection systems type and color as shown on drawings or SOW. Provided compliance with requirements, products of the following manufacturers will also be acceptable: Local Rep, Melissa Ehrman, (210) 380-5135. ehrmanm@koroseal.com
 - 1. Or Approved Equal

2.03 MATERIALS

- A. Provide wall and corner guards in materials as indicated. Fabricate units with tight seams and joints, with exposed edges rolled. Provide units with surfaces free or evidence of wrinkling, chipping, uneven coloration, dents and other imperfections.
 - 1. Stainless Steel: Minimum 16 gage, Type 430, #4 satin finish.
 - 2. High Impact Vinyl/Acrylic Alloy: Minimum .078" thick, Class A Fire Rating, chemical and stain resistant. Provide material with ability to resist, without damage, a blow of 30 ft. lbs. per sq. in. at 60 degrees F.

- B. Wall and Corner Guards: Provide wall and corner guards in dimensions, mounting, and profile details as indicated in configuration as shown on drawings. Provide material in 90 degree corners unless otherwise indicated, mounting holes 8 inches on center and formed edges.
 - 1. Provide corner guards with aluminum retainer secured to wall with appropriate mounting devices, covered with high impact vinyl/acrylic extrusion, locked in place, to absorb heavy impact with damage to guard, retainer or adjacent wall.
- C. Wall Protection System: Provide crash rails, bumper guards, chair wheel rub rails, and handrails as indicated on drawings and in schedules. Provide system of wall protection in consistent materials, mounted at specified heights.
 - 1. Crash Rails: Provide crash rails designed to absorb shock without damage to adjacent wall in dimensions and finishes indicated.

2.04 FINISHES

- A. Provide materials in colors as selected by Architect from manufacturer's standard colors and patterns.
- B. Provide materials in colors as specified by Architect for custom color.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine areas and conditions in which wall and corner guards and wall protection systems will be installed. Do not proceed until unsatisfactory conditions have been corrected.
- B. Prior to installation of wall and corner guards, clean substrate to remove dust, debris, and loose particles.
- C. Ascertain that substrate is free of previous surface applied material. Prepare substrate surface to accept new material.
- D. Illuminate areas of installation using building's permanent lighting system; temporary lighting alone will not be acceptable.
- E. Verify that materials are those specified before installing.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install surface mounted wall and corner guards and wall and door protection systems and accessories after other finishing operations, including painting, have been completed.
- D. Do not use material with chips, cracks, voids, stains, or other defects which might be visible in the finished Work.
- E. Install material and assemblies to comply with drawings and final shop drawings in strict compliance with manufacturer's printed instructions. Adjust accessories for proper system alignment.

3.03 FIELD QUALITY CONTROL

- A. Remove and replace material which is broken, chipped, stained or otherwise damaged and which does not match adjoining Work. Provide new matching units, installed as specified and in manner to eliminate evidence of replacement.

3.04 CLEANING

- A. Immediately upon completion of installation, clean installed material.
- B. Remove excess adhesive, using methods and materials recommended by manufacturer.
- C. Remove surplus materials, rubbish, and debris resulting from installation upon completion of Work, and leave areas of installation in neat, clean condition.

SECTION 10 28 13 13 - TOILET ACCESSORIES - COMMERCIAL**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Inserts and Anchorages: Furnish accessory manufacturers' standard inserts and anchoring devices that must be set in concrete or built into masonry. Coordinate delivery with other Work to avoid delay.
- B. Single Source Responsibility: Provide products of same manufacturer for each type of accessory unit and for units exposed to view in same areas, unless otherwise acceptable to Architect.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Submit a complete listing of all manufacturers, products, model numbers, and designs proposed for use in the Work of this Section.
- B. Record Documents:
 - 1. Maintain two copies of all shop drawings, product data, and samples, manufacturer's specifications, recommendations, installation instructions, and maintenance data at the Project Site. At Project Closeout, turn over both copies to the Architect who will transmit one copy to The University.

1.05 PROJECT CONDITIONS

- A. Coordination: Coordinate accessory locations, installation, and sequencing with other Work to avoid interference with and ensure proper installation, operation, adjustment, cleaning, and servicing of toilet accessory items.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Product numbers scheduled below are products of the **Bobrick Washroom Equipment, Inc.** Subject to compliance with requirements, other manufacturers offering toilet accessories that may be incorporated in the Work include, but are not limited to, the following:

1. Or Approved Equal

2.03 ACCESSORY SCHEDULE

- A. Provide the following accessories at locations indicated.

1. Paper Towel Dispenser
 - a. Kimberly-Clark – SaniTouch Rolls Towel Dispenser
 - 1) 09990
 - a) 12.63 X 16.13 X 10.2
2. Paper Towel Dispenser with Waste Receptacle
 - a. B-39619 (Surfaced Mounted)
3. Paper Towel Dispenser with Waste Receptacle (Recessed)
 - a. B-3961 (Recessed)
4. Soap Dispenser
 - a. Dial Complete 1 Liter White Dispensers
 - 1) 23400 (Surfaced Mounted)
 - b. GOJO - CX Counter Mount System
 - 1) 8500-01
5. Mirrors with Stainless Steel Frame
 - a. B-165-1824
 - b. B-165-1830
 - c. B-165-1836
 - d. B-165-2460
6. Mirrors with Stainless Steel Frame and Shelf
 - a. B-166-1824
 - b. B-166-1830
 - c. B-166-1836
7. Sanitary Napkin/Tampon Vendor
 - a. B-3500 (Recessed)

- b. B-2800 (Surface Mounted)
- 8. Sanitary Napkin Disposal
 - a. B-353 (Recessed)
 - b. B-354 (Partition Mounted)
 - c. B-254 (Surface Mounted)
- 9. Toilet Tissue Dispenser
 - a. Brobrick B-2888 (Surfaced Mounted)
- 10. Hook Strip
 - a. B-232 x 24 inch
- 11. Mop and Broom Holder
 - a. B-224 x 36 inch (with shelf and rag hooks)
- 12. Folding Shower Seat
 - a. B-517/518
- 13. Grab Bars
 - a. B-5806 Series x lengths indicated
- B. Provide the following accessories at locations indicated. All product numbers listed are by the Bobrick Company unless otherwise indicated.
 - 1. Paper Towel Dispensers and Waste Receptacles:
 - a. Paper Towel & Waste Receptacle; B-3960
 - b. Paper Towel & Waste Receptacle; B-3966
 - c. Paper Towel; B-3860
 - d. Paper Towel; B-3866
 - e. Paper Towel; Bradley 198
 - f. Paper Towel; B-262
 - g. Paper Towel; B-2621
 - h. Paper Towel & Waste Receptacle; Bradley 229
 - i. Paper Towel; B-2860
 - 2. Napkin Dispensers and Disposal:
 - a. Dispenser; Bradley 401-45 (\$0.25)
 - b. Disposal; B-254
 - 3. Toilet Tissue Dispensers:

- a. Recessed Double Holder; Bradley 5412
 - b. Large (Jumbo Roll) Holder; B-2892
 - c. Recessed Toilet Seat Cover Dispenser; B-301
4. Soap Dispensers:
 - a. Basin Mounted; Scott 91910
 - b. Wall Mounted; ASI 5001-SS
5. Grab Bars:
 - a. Bobrick Horizontal; B5805 X 12 inch
 - b. Bobrick Horizontal; B5805 X 24 inch
 - c. Bobrick Horizontal; B5805 X 36 inch
 - d. Bobrick Horizontal; B5805 X 42 inch
 - e. Bobrick Horizontal; B5805 X 48 inch
6. Shower Accessories:
 - a. Type 63: Robe Hook (Wall Mounted); B-2116
 - b. Type 64: Robe Hook and Bumper (Toilet Partition Mounted); B-212. To be provided under the Work of the Toilet Partition section.
 - c. Clothes Hook; B-233
 - d. Folding Handicapped Shower Bench (Right Hand); Bobrick B-517
 - e. Folding Handicapped Shower Bench (Left Hand); Bobrick B-518
7. Mirrors:
 - a. Unframed; as specified in Division 8.
 - b. Framed (18 inch x 36 inch); B-165-1836
 - c. Framed (24 inch x 60 inch); B-165-2460
 - d. W/Stainless Steel Channel & Frame: B-166 Series
 - 1) 18 inch X 36 inch; B166-1836
8. Miscellaneous Accessories:
 - a. Mop and Broom Holder (24 inch Long); Bradley B223 x 24 inch
 - b. Folding Utility Shelf; B-287
 - c. Baby Changing Station; Bobrick Koala Kare KB100-00
 - d. Hat and Coat Rack; Raymond Engineering "Rigid Rak" #354 Series.
 - e. Cup Dispenser; Bradley 9495

f. Shelf; B-295 x 24 inch

g. Shelf; B-295 x 60 inch

2.04 MATERIALS, GENERAL

- A. Stainless Steel: AISI Type 302/304, with polished No. 4 finish, 0.034 inch (22 gage) minimum thickness.
- B. Brass: Leaded and unleaded, flat products, ASTM B 19; rods, shapes, forgings, and flat products with finished edges, ASTM B 16; Castings, ASTM B 30.
- C. Sheet Steel: Cold rolled, commercial quality ASTM A 366, 0.04 inch (20 gage) minimum. Surface preparation and metal pretreatment as required for applied finish.
- D. Galvanized Steel Sheet: ASTM A 527, G60.
- E. Chromium Plating: Nickel and chromium electro deposited on base metal, ASTM B 456, Type SC 2.
- F. Baked Enamel Finish: Factory applied, gloss white, baked acrylic enamel coating.
- G. Stainless Steel Mirror Surfaces: Not less than 0.04 inch (20 gage) AISI Type 302/304 stainless steel sheet, stretcher leveled with No. 8 polished mirror finish. Bond to 1/4 inch minimum hardboard backing.
- H. Galvanized Steel Mounting Devices: ASTM A 153, hot dip galvanized after fabrication.
- I. Fasteners: Screws, bolts, and other devices of same material as accessory unit, or of galvanized steel where concealed.

2.05 MISCELLANEOUS ACCESSORIES

- A. Medicine Cabinet: Unit designed for recessed mounting in nominal 4 inch wall depth consisting of hinged stainless steel framed mirror door concealing storage cabinet with minimum three adjustable shelves. Door equipped with full length, piano hinge and spring buffered, rod type stop and magnetic door catch. Fabricate mirror frame, door, hinge, cabinet and shelves of stainless steel, mirror glass quality, as specified under "Materials, General." Furnish in nominal 18 by 24 inch mirror size.
- B. Facial Tissue Dispenser: Wall mounted recessed unit with 0.034 inch (22 gage) stainless steel, satin finished face plate with rolled rim on dispenser opening, corrosion resistant steel mounting cabinet; minimum capacity 200 tissues.
- C. Mop and Broom Holder/Utility Shelf: Combination unit with 0.05 inch (18 gage), Type 304, stainless steel shelf with 1/2 inch returns, 0.062 inch (16 gage) support brackets for wall mounting. Provide 0.062 inch (16 gage) stainless steel hooks for wiping rags on front of shelf, together with spring loaded, rubber hat, cam type mop/broom holders; 1/4 inch diameter stainless steel drying rod suspended beneath shelf. Provide unit 36 inches long and complete with four mop/broom holders and three hooks.
- D. Mop and Broom Holder: 0.05 inch (18 gage), Type 304, stainless steel hat channel with spring loaded, rubber, cam type mop/broom holders. Provide unit 36 inches long and complete with four holders.
- E. Double Prong Robe Hook: Heavy duty satin finished stainless steel double prong robe hook; rectangular wall bracket with backplate for concealed mounting.
- F. Tumbler and Toothbrush Holder: Satin finished stainless steel unit with 2 1/4 inch diameter hole in center to hold tumbler and two holes on each side to accommodate total of four toothbrushes; rectangular wall bracket equipped with backplate for concealed mounting.

- G. Soap Dish: Satin finished, stainless steel soap dish with rectangular wall bracket equipped with backplate for concealed mounting.
- H. Towel Pin: Satin finished, stainless steel pin projecting minimum of 3 inches from wall surface; rectangular wall bracket with backplate for concealed mounting.
- I. Towel Ring: Satin finished, stainless steel pin projection in nominal 2-1/2 inches from wall with trapezoidal ring 1/4 inch in diameter, Type 18 8 stainless steel; rectangular wall bracket with backplate for concealed mounting.
- J. Fixed Purse Shelf with Ash Tray: 16 inch long by 6 inch deep shelf unit fabricated from minimum 0.034 inch (22 gage) stainless steel, satin finish; 1/4 inch rolled or 1/2 inch channel formed edge on front of shelf. Stainless steel ash tray permanently attached to shelf with hinge for emptying. Provide double roll toilet tissue dispensers with spring tension delivery control mounted under shelf.
- K. Fold Down Purse Shelf: Fold down, 15 inch long by 5-1/2 inch wide, hinged unit of heavy duty cast zamac with stippled satin chrome finish on tray, bright chrome finish on edges; spring loaded to provide automatic return to vertical position.
- L. Retractable Clothes Line: Surface mounted stainless steel housing with minimum 6 foot long, retractable; spring actuated synthetic clothesline and remote, stainless steel retention bracket.
- M. Three Guest Towel Rack: Surface mounted hotel type towel rack designed to hold three sets of bath towels, hand towels, and wash cloths. Fabricate from 1/4 inch diameter gage wire rings welded to upright wire bracket with polished chrome finish.
- N. Bottle Opener: Surface mounted, minimum 18 gage stainless steel bottle opener with satin finish.
- O. Warm Air Hand Dryer: Surface mounted, touch button activation, die cast zinc or aluminum base, with manufacturers' standard white painted cover. Provide 30 second timed power cut off switch.
- P. Diaper Changing Station: Mildew resistant, molded polyethylene body, engineered to support a minimum of 150 lb static weight when opened, with built in dispenser of sanitary liners.
 - 1. Available Products: Subject to compliance with requirements, products that may be incorporated in the Work include, but are not limited to, the following:
 - 2. Products: Subject to requirements, provide one of the following:
 - a. Diaper Deck, American Infant Care Products.
 - b. Koala Bear Care, J.B.J. Industries, Inc.

2.06 FABRICATION

- A. No names or labels are permitted on exposed faces of toilet and bath accessory units. On either interior surface not exposed to view or on back surface, provide identification of each accessory item either by a printed, waterproof label or a stamped nameplate indicating manufacturer's name and product model number.
- B. Surface Mounted Toilet Accessories, General: Except where otherwise indicated, fabricate units with tight seams and joints, exposed edges rolled. Hang doors or access panels with continuous stainless steel piano hinge. Provide concealed anchorage wherever possible.
- C. Recessed Toilet Accessories, General: Except where otherwise indicated, fabricate units of all welded construction, without mitered corners. Hang doors or access panels with full length, stainless steel piano hinge. Provide anchorage that is fully concealed when unit is closed.

- D. Keys: Provide universal keys for access to toilet accessory units requiring internal access for servicing, re-supply, etc. Provide minimum of six keys to Owner's representative.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install toilet accessory units according to manufacturers' instructions, using fasteners appropriate to substrate as recommended by unit manufacturer. Install units plumb and level, firmly anchored in locations and at heights indicated.
- D. Install grab bars to withstand a downward load of at least 250 lbf, complying with ASTM F 446.

3.02 ADJUSTING AND CLEANING

- A. Adjust toilet accessories for proper operation and verify that mechanisms function smoothly. Replace damaged or defective items.
- B. Clean and polish all exposed surfaces strictly according to manufacturer's recommendations after removing temporary labels and protective coatings.

SECTION 10 44 00 00 - FIRE PROTECTION SPECIALTIES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Single Source Responsibility: Obtain extinguishers and cabinets from one source from a single manufacturer.
- B. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10, "Standard for Portable Fire Extinguishers."
- C. Fire Extinguishers: Listed and labeled for type, rating, and classification by an independent testing agency acceptable to authorities having jurisdiction.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Product data for each type of product specified.
 - 2. For fire extinguisher cabinets include rough-in dimensions, details showing mounting methods, relationships of box and trim to surrounding construction, door hardware, cabinet type and materials, trim style, door construction, panel style, and materials.
- B. Samples:
 - 1. Samples for initial selection purposes in form of manufacturer's color charts showing full range of colors available for those units with factory-applied color finishes.
 - 2. Samples for verification purposes of each type of metal finish required, prepared on metal samples of same thickness and alloy indicated for final unit of Work.
 - a. Where finishes involve normal color and texture variations, include sample sets showing full range of variations expected.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 FIRE EXTINGUISHERS

- A. Provide fire extinguishers for each extinguisher cabinet and other locations indicated, in colors and finishes selected by Architect from manufacturer's standard, that comply with authorities having jurisdiction.
- B. Provide fire extinguisher types as follows using fire extinguisher schedule on Drawings:
1. Multi-Purpose Dry Chemical Type: UL Rated 2A-10BC, 5 lb. nominal capacity, in enameled steel container, for Class A, B, and C fires (Use requires special approval by M. D. Anderson Environmental Health and Safety).
 - a. Badger Model B5M-1/B5M1-B
 - b. Or approved equal
 2. Multi-Purpose Dry Chemical Type: UL Rated 4A-60BC, 10 lb. nominal capacity, in enameled steel container, for Class A, B, and C fires (Use requires special approval by M. D. Anderson Environmental Health and Safety).
 - a. Badger Model B10M/B10M-1
 - b. Or approved equal
 3. Stored-Pressurized Water Type: UL rated 2A, 2-1/2 gallons nominal capacity, in a stainless steel container for Class A fires.
 - a. Badger Model WP-61
 - b. Or approved equal
 4. Stored-Pressure Wet Chemical Type: UL-rated 2AK, **Must meet NFPA requirements for kitchen occupancy**, 6-liters nominal capacity, in stainless steel container with pressure-indicating gauge.
 - a. Badger Model WC100
 - b. Or approved equal
 5. Carbon Dioxide Type: UL rated 5 BC, 5 lb nominal capacity, in manufacturer's standard enameled metal container.
 - a. Badger Model B5V
 - b. Or approved equal
 6. Carbon Dioxide Type: UL rated 10 BC, 10 lb nominal capacity, in manufacturer's standard enameled metal container.
 - a. Badger Model B10V
 - b. Or approved equal

7. Carbon Dioxide Type: UL rated 15BC, 15 lb nominal capacity, in manufacturer's standard enameled metal container
 - a. Amerex Model 331
 - b. Ansul Model CD15-1
 - c. Badger Model B15V
8. Halotron Type: UL rated 2A:10 BC, 15 1/2 lb nominal capacity, in enameled steel container with pressure indicating gauge.
 - a. Badger Model 5 HB
 - b. Or approved equal
- C. Extinguisher Drawing Schedule: Provide the following fire extinguishers, brackets, and cabinets at locations indicated:
 1. Type FE-1: Bracket mounted 2A-10BC dry chemical.
 2. Type FE-2: In- cabinet 2A-10BC dry chemical.
 3. Type FE-3: Bracket mounted 2A Stored-Pressurized water extinguisher.
 4. Type FE-4: In-cabinet 2A Stored-Pressurized water extinguisher.
 5. Type FE-5: Bracket mounted 2AK 6-lites Stored-Pressurized Wet Chemical extinguisher.
 6. Type FE-6: Bracket mounted 5-BC Carbon Dioxide extinguisher.
 7. Type FE-7: In-cabinet 5-BC Carbon Dioxide extinguisher.
 8. Type FE-8: Bracket mounted 10-BC Carbon Dioxide extinguisher.
 9. Type FE-9: In-cabinet 10-BC Carbon Dioxide extinguisher.
 10. Type FE-10: Bracket mounted 15-BC Carbon Dioxide extinguisher.
 11. Type FE-11: In-cabinet 15-BC Carbon Dioxide extinguisher.
 12. Type FE-12: Bracket mounted 5-BC Halotron extinguisher.
 13. Type FE-13: In-cabinet 5-BC Halotron extinguisher.
 14. Type FE-14: Bracket mounted 2A-10BC Halotron extinguisher.
 15. Type FE-15: In-cabinet 2A-10BC Halotron extinguisher.
 16. Type FE-16: Cabinet mounted 5BC Carbon Dioxide installed side by side with a 2A Stored-Pressurized water extinguisher.

2.03 MOUNTING BRACKETS

- A. Brackets: Designed to prevent accidentally dislodging extinguisher, of sizes required for type and capacity of extinguisher indicated.
 1. Provide manufacturer's standard metal brackets for extinguishers not located in cabinets.

2.04 FIRE EXTINGUISHER CABINETS

- A. Provide fire extinguisher cabinets where indicated and from the same manufacturer as the extinguishers. Provide sizes required for housing specified fire extinguishers, and as follows:
- B. Construction: Manufacturer's standard enameled steel box, with trim, frame, door, and hardware to suit cabinet type, trim style, and door style indicated. Weld joints and grind smooth. Miter and weld perimeter door frames.
- C. Fire Rated Cabinets: UL listed with UL Listing Mark with rating of wall where it is installed.
- D. Cabinet Type: Suitable for mounting conditions indicated of the following types:
 - 1. Recessed: Cabinet box (tub) fully recessed in walls of sufficient depth to suit style of trim indicated.
 - a. Larsen's Architectural Series 2720-R and FS 2720-R or approved equal
 - 2. Semi-recessed: Cabinet box (tub) partially recessed in walls of shallow depth.
 - a. Larsen's Architectural Series 2720-RL (2-½" Trim Style) and FS 2720-RL or approved equal.
 - b. Larsen's Architectural Series 2720-RM (4-½" Trim Style) and FS 2720-RM or approved equal.
- E. Trim Style: Fabricate trim in one piece with corners mitered, welded, and ground smooth.
 - 1. Trimless with hidden flange of same metal and finish as box (tub) that overlaps surrounding wall finish and is concealed from view by an overlapping door.
 - 2. Exposed Trim: One piece combination trim and perimeter door frame overlapping surrounding wall surface with exposed trim face and wall return at outer edge (backbend).
 - a. Square edge trim with 1/4 to 5/16 inch backbend depth.
 - b. Rolled edge trim with 1-1/4 inch backbend depth.
 - c. Rolled edge trim with 2-1/2 inch backbend depth.
 - d. Rolled edge trim with 4-1/2 inch backbend depth.
 - e. Trim Metal: Of same metal and finish as door.
 - f. Trim Metal: Enameled steel.
- F. Door Material and Construction: Manufacturer's standard door construction, of material indicated, coordinated with cabinet types and trim styles selected.
 - 1. Cold-Rolled Steel: Metal finish
- G. Identify fire extinguisher in cabinet with FIRE EXTINGUISHER lettering applied to door vertically. Provide lettering to comply with authorities having jurisdiction for letter style, red in color, size, spacing, and location.
- H. Identify bracket mounted extinguishers with FIRE EXTINGUISHER in red letter decals applied to wall surface. Use letter size, style, and location as selected by Architect.
- I. Door Style: Manufacturer's standard design.
 - 1. Solid Panel: Full flush opaque panel of material indicated.

J. Door Hardware:

1. Provide manufacturer's standard door operating hardware of proper type for cabinet type, trim style, and door material and style indicated. Provide concealed or continuous type hinge permitting door to open 180 deg.
2. Special Requirement: Provide recessed concealed handle with cam action latch.

2.05 FINISHES FOR FIRE EXTINGUISHER CABINETS, GENERAL

- A. Comply with NAAMM "Metal Finishes Manual" for recommendations relative to applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying strippable, temporary protective covering prior to shipping.

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install in locations and at mounting heights indicated or, if not indicated, at heights to comply with applicable regulations of governing authorities.
 1. Prepare recesses in walls for fire extinguisher cabinets as required by type and size of cabinet and style of trim and to comply with manufacturer's instructions.
 2. Fasten mounting brackets and fire extinguisher cabinets to structure, square and plumb.

SECTION 11 53 00 00 - LABORATORY EQUIPMENT**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Furnish and install metal laboratory casework complete with related items not specified in other Sections, including:
 - 1. Counter tops
 - 2. Sinks
 - 3. Plumbing service fittings
 - 4. Electric service fittings connected to case-work
 - 5. Chemical fume hoods complete with accessories
 - 6. Biological Safety Cabinets complete with accessories

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.04 DEFINITIONS

- A. Plumbing Services Fittings: Gas, air, vacuum, steam and water valves and faucets; remote control valves, and vacuum breakers.
- B. Electric Services Fittings; Convenience outlets, switches and control panels.
- C. Plumbing Services Lines: Gas, air, vacuum, steam, water piping, and associated fittings necessary to carry respective services from service fixtures through equipment to building rough-in outlets in floors or walls.
- D. Electric Service Lines: Conduit, junction boxes, conduit fittings and wire necessary to carry electrical services from service fixtures through equipment to building rough-in outlets in floors and walls.
- E. Visible Surfaces: Exterior surfaces of closed cabinets, backs of cabinet doors, also interior surfaces and shelves of open cabinets and of cabinets with glass or glazed doors.

1.05 QUALITY ASSURANCE

- A. Standards: Except where modified or exceeded by the requirements of this Specification, conform to the following standards:
 - 1. Service Fittings: Scientific Apparatus Makers Association Standard for Laboratory and Hospital Service Fittings.
 - 2. Tolerance for tops: Scientific Apparatus Makers Association Table Top Information Manual.
- B. Plumbing and electrical equipment and Work incorporated in laboratory casework shall conform to the requirements of codes and ordinances applicable to this Project. Final connections shall be made by a licensed plumber.

1.06 SUBMITTALS

- A. Shop Drawings:
 - 1. Fabrication and Installation: Show fabrication and installation details and dimensions for casework, and other items in this section. Show location and details of field joints between units and in tops. Locate laminate joints in locations indicated on drawings. Show fastening types and locations for securing units in place. If they are required, show location, size and details of fillers.
 - 2. Rough-In: Show location and requirements for utility and service connections to this Work.
- B. Samples:
 - 1. Submission of samples shall be required before fabrication is begun, to clearly show the following:
 - a. Each top material to show construction and field joint.
 - b. A full-size base and wall cabinet to clearly show the following:
 - 1) Construction
 - 2) Drawer
 - 3) Door
 - 4) Shelf
 - 5) Finish
 - 6) Hardware
 - c. A full-size corner of table base to show corner and leg construction.
 - d. Each plumbing and electric service fitting.
 - e. Copies of all test reports.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 CASEWORK**A. Manufacturers:**

1. Kewaunee Manufacturing Co. as per drawings.
2. Fisher Hamilton Scientific, Inc. as per drawings.
3. Formaspace:

Austin Texas 78753

www.formaspace.com

Amy Mosley

B. Materials:

1. Sheet Metal: Prime grade cold rolled, leveled. Treated at the mill to be free of scale, ragged edges, deep scratches or other defects.
2. Stainless Steel: ASTM A167, Type 304, unless 316 is noted. No. 4 finish on visible surfaces.
3. Glass: For framed cabinet doors – 1/8 inch thick tempered, clear glass. For hood sashes – 1/4 inch thick, clear safety glass unless noted otherwise. For unframed, sliding cabinet doors, 1/8 inch thick, clear safety glass.
4. Finishes: Color to match Chemsurf natural almond, unless noted otherwise. Color must be consistent.
5. Hardware: Casework Manufacturer's standard items if they conform to the following minimum requirements:
 - a. Surface pull: Cast aluminum with anodic finish or non-ferrous metal with integral or plated finish to match hinges, having 3-1/2 inch or wider boring.
 - b. Flush pull: Casework manufacturer's standard finished to match surface pulls.
 - c. Hinges: 2-1/2 inch high heavy duty, 5-knuckle tight pin institutional type having eased knuckles and weighing not less than 4-ounces per pair. Finish to match pulls.
 - d. Drawer slide: Full extension 150# Accuride drawer slides, Type 304 stainless steel. Nylon roller and ball bearing operation. Self-closing when drawer nears end of its travel and having a positive stop in full extension.

C. Fabrication:

1. Provide manufacturer's standard style, construction and finish unless specified otherwise herein or on Drawings.
2. Fillers: Fabricate fillers from one piece and match surface of adjacent cabinet. Fasten filler in place by concealed means. Fillers for base cabinets shall include a matching base. Fillers for wall cabinets shall have bottom return to rear wall flush with bottom edge of cabinet end. Fillers at cabinet ends shall be not more than 3 inches wide unless otherwise shown on Drawings. Provide fillers to:
 - a. Close the gaps between cabinets and abutting vertical surfaces.
 - b. Close corner joints at abutting lengths of cabinets.

- c. Close dead corner area where a base cabinet abuts a knee space.
 - d. Close the bottom of wall cabinets where they abut at an internal corner.
 - e. Close gaps in toe spaces of base cabinets at inside corners.
 - f. Close gaps between floor and toe space of base cabinets that exceed ½ inch.
3. Provide the following hardware:
- a. Surface pulls: Provide one for each cabinet door, one for each drawer 24 inch wide or less and two pulls for each wider drawer.
 - b. Flush pulls: Provide one for each sliding door.
 - c. Hinges: Provide one pair for each door under 3 feet tall and add ½ pair hinges to each door 3 foot to 5 foot tall. For taller doors provide two pair hinges.
 - d. Catches: Provide one for each hinged door including those with locks and elbow catches or slide bolts.
 - e. Shelf uprights: Plated steel, perforated for clips or brackets, on ½ inch centers.
 - f. Shelf clips: Provide for adjustable shelves through 4 feet long.
 - g. Shelf brackets: Provide for adjustable shelves up to 16 inch wide, when indicated and when more than 4 feet long.
 - h. Drawer slides: Provide one pair on each drawer. Drawer slides must be full extension type. Accuride 150# drawer slides Type 304 stainless steel.

2.03 COUNTER TOPS

2.04 PLUMBING SERVICE FITTINGS

- A. Provide types of fittings necessary for the services and pressures indicated on Drawings.
- B. Finish: Polished chrome on brass body unless specified otherwise.
- C. Equip valve handles with color coded plastic index buttons as follows:

Service	Indexing	Button Color	Lettering Color
Cold Water	CW	Green	White
Hot Water	HW	Red	White
Air	AIR	Blue	White
Gas	GAS	Orange	White
Vacuum	VAC	Yellow	White
Distilled Water	DW	White	Black
Steam	Steam	Black	White
Oxygen	OXY	Lt. Green	White
Nitrogen	N2	Gray or Brown	Black or White

- D. Manufacturers:
 - 1. Chicago Faucet Co. as shown on drawings
 - 2. Watersaver Faucet Co., Inc. as shown on drawings

3. Part numbers listed for plumbing service fittings are from Chicago Faucet Co. Laboratory Fittings Catalog N. All fittings supplied under this Section and Division 22 shall be by the same manufacturer.

E. Cabinet Fittings:

1. Typical Lab Faucet: Combination, goose-neck spout. Deck mount: 930T with GN-8B-VB-E7 rigid/swing convertible spout having vacuum breaker and serrated nozzle. 204 handles. Chrome finish.
2. Faucet for R.O. Water: Single, goose-neck spout. Deck mount: reference fixture schedule.
3. Electric Eye Sensor Faucet: Single goose neck spout. Deck mount: 552-117-119-GN-8B-VB-E7 A/C power (hard wire) thermostatic mixing valve, vacuum breaker and serrated nozzle.
4. Eyewash: Deck mount – reference fixture schedule
5. Air, gas, vacuum outlet – reference fixture schedule
6. Special requirement: Provide 4-arm, 2-1/2 inch diameter handle 204 on the above fittings.

F. Temperature Control Valve:

1. For refrigerated water installation.
2. Independent positive pressure balancing section with stainless steel sliding parts.
3. Independent thermostatic temperature control section with stainless steel sliding parts activated by a hydraulic thermostat.
4. Cast bronze valve body.
5. Lawler – No. PX-9700 or approved equal.

G. Mixing Valve

1. Integral shut-off.
2. Adjustable temperature between cold and 105 degrees F.
3. Screwdriver operated combination stop and check valves with removable strainers on inlets.
4. Volume control.
5. Vacuum breaker.
6. Dial thermometer.
7. Tail-piece on mixed water outlet.
8. Visible finish shall be polished chrome plate.

- H. Preparation: Provide openings, accesses, cutouts, etc., in casework units and tops as necessary to permit installation of fittings at the Project Site.

2.05 ELECTRIC SERVICE FITTINGS

- A. Refer to Electrical Specification Sections for service fittings in raceways and in partitions.
- B. Provide types of fittings necessary for the services indicated on the Drawings.

- C. Preparation: Provide openings, accesses, cutouts, etc., in casework, reagent shelf supports, utility chase columns and tops as necessary to permit installation of fittings at the Project Site.

2.06 MISCELLANEOUS ITEMS

- A. Reagent Racks: Open or closed style as indicated; shelf surface uprights and utility chase columns to match counter-top.
- B. Glassware Pegboards: Fisher/Hamilton S.S. Pegboard with integral drip through 18 inch x 24 inch #52L805 (unless noted otherwise). Drip screen #52L880 (18 inches wide) unless noted otherwise. Poly-propylene pegs. Flexible drain hose into nearest sink. Reference to drawings for required brand. Manufacturer shall be the same on all components of the laboratory equipment unless noted otherwise.
- C. Dual Access Wall Cabinets: Mount above reagent rack; unframed sliding glass doors, 1/8 inch thick clear safety glass.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

END OF SECTION 11 53 00 00

SECTION 11 53 13 00 - LABORATORY FUME HOODS AND BIOLOGICAL SAFETY CABINETS**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Furnish and install chemical fume hoods and biological safety cabinets complete with accessories.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.04 DEFINITIONS

- A. Plumbing Services Fittings: Gas, air, vacuum, steam and water valves and faucets; remote control valves, and vacuum breakers.
- B. Electric Services Fittings: Convenience outlets, switches and control panels.
- C. Plumbing Services Lines: Gas, air, vacuum, steam, water piping, and associated fittings necessary to carry respective services from service fixtures through equipment to building rough-in outlets in floors or walls.
- D. Electric Service Lines: Conduit, junction boxes, conduit fittings and wire necessary to carry electrical services from service fixtures through equipment to building rough-in outlets in floors and walls.
- E. Visible Surfaces: Exterior surfaces of closed cabinets, backs of cabinet doors, also interior surfaces and shelves of open cabinets and of cabinets with glass or glazed doors.

1.05 QUALITY ASSURANCE

- A. Standards: Except where modified or exceeded by the requirements of this Specification, conform to the following standards:
 - 1. Biological Safety Cabinets: National Sanitation Foundation Standard #49/American National Standards Institute No. 49 (NSF/ANSI 49/2007).
 - 2. Service Fittings: Scientific Apparatus Makers Association Standard for Laboratory and Hospital Service Fittings.

- B. Testing – Chemical Fume Hoods: Submit proof of design testing by the tracer gas method. All submittals require UTHSCSA Environmental Health and Safety Department approval. The testing method is given in INDUSTRIAL VENTILATION, 22nd Edition, Chapters 10-37 (Reference Current Edition ASHRAE 110). The test report shall include who performed the tests, the procedures and the results given “as manufactured”. Certification measurements to be taken with a hot wire anemometer with calibration traceable within one year. Measurements to be made with the hood sash in the full open position. Final acceptance of hood testing to be by Environmental Health and Safety and Capital Planning and Management.
- C. Testing – Biological Safety Cabinets: Before shipping, each unit shall be tested to meet requirements of N.S.F. Standard #49 for periodic certification. Submit one copy of test with each unit.
- D. Testing – Biological Safety Cabinets: Submit a certified copy of the Personnel, Product and Cross-Contamination (Biological) Tests, N.S.F. Standard #49 performed on one (1) unit from each production run from which cabinets have been purchased. Owner representative may witness test.
- E. Certification – Biological Safety Cabinets and Chemical Fume Hoods: Manufacturer will arrange for certification of cabinets after installation in accordance with N.S.F. Standard #49. Test report requires UTHSCSA Safety Department approval.
 - 1. MDACC will approve certification firm.

1.06 SUBMITTALS

- A. Product Data:
 - 1. Samples: Submission of samples may be required, before fabrication is begun, to clearly show the following:
 - 2. Each plumbing and electric service fitting.
 - 3. Copies of all test reports.
- B. Record Documents:
 - 1. Shop Drawings: Fabrication and Installation: Show fabrication and installation details and dimensions for chemical fume hoods, biological safety cabinets and other items in this section. Show location and details of field joints between units and in tops. Show fastening types and locations for securing units in place. If they are required, show location, size and details of fillers.
 - 2. Shop Drawings – Rough-In: Show location and requirements for utility and service connections to this Work.
 - 3. Certified air flow for hoods.
 - 4. Certification of biological safety cabinets.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 PLUMBING SERVICE FITTINGS

- A. Provide types of fittings necessary for the services and pressures indicated on Drawings.

B. Finish: Polished chrome on brass body unless specified otherwise.

C. Equip valve handles with color coded plastic index buttons as follows:

Service	Indexing	Button Color	Lettering Color
Cold Water	CW	Green	White
Hot Water	HW	Red	White
Air	AIR	Blue	White
Gas	GAS	Orange	White
Vacuum	VAC	Yellow	White
Distilled Water	DW	White	Black
Steam	Steam	Black	White
Oxygen	OXY	Lt. Green	White
Nitrogen	N2	Gray or Brown	Black or White

D. Manufacturers:

1. Chicago Faucet Co. – per drawing
2. Watersaver Faucet Co., Inc. – per drawing
3. Part numbers listed for plumbing service fittings are from Chicago Faucet Co. Laboratory Fittings Catalog N. All fittings supplied under this Section and Division 22 shall be by the same manufacturer.

E. Chemical Fume Hood Fittings

1. CW Faucet: Goose-neck spout. 980-GN2BVB-E7 and 962 VOA to be on both sides of hood. Verify with plans.
2. Vacuum, low pressure air and gas. 962-VOGA-986E7XT to be on both sides of hood – verify with plans.

2.03 ELECTRIC SERVICE FITTINGS

A. Provide types of fittings necessary for the services indicated on the Drawings.

2.04 CHEMICAL FUME HOODS

A. Acceptable Manufacturers: (Hood will be required to match brand of existing or new laboratory furniture)

1. Kewaunee Manufacturing Co. – Hoodaire I Series
2. Fisher Hamilton Scientific, Inc. – Safeaire Constant Volume/Bypass Series
3. or approved equal
4. Another approved manufacturer able to present acceptable evidence of at least three (3) similar satisfactory installations, one of which is at least three (3) years old.

- B. Restricted Bypass air hoods shall be used unless shown otherwise on Drawings. Special purpose hoods (perchloric acid, radioactive, etc.) shall be individually designed. Provide hoods with: Switched fluorescent light fixture; two (2) 20 amp, 120 V., hospital grade, stainless steel GFI duplex receptacles; remote control polished chrome service fittings for water, air, gas and vacuum as indicated on Drawings; plug unused service holes; stainless steel cup sink as indicated on Drawings, plumbed to sanitary sewer system with polypropylene tail-piece and trap (cup sink at all hoods except radioisotopic).
- C. Material: Stainless steel, and/or treated and coated steel, or other approved material as indicated. All interior surfaces to be stainless steel.
- D. Counter tops, interior surfaces, front sash and/or apron: materials with flame spread index of 25 or less.
- E. Hoods shall have a 6 inch wide "picture frame" airfoil at sides, top and bottom. The lower airfoil shall be Type 316 stainless steel.
- F. Bottom air foil: Outside edge of airfoil shall be slightly below the counter top with an unobstructed air space between the airfoil and the counter top to allow air flow when sash is closed.
- G. All interior surfaces to be coved stainless steel. Counter top to be dished stainless steel integral with the sidewalls.
- H. Side panels shall be flush with the entrance edge of the airfoil.
- I. Automatic air bypass: Located at top of sash opening with completely positive operation not dependent upon mechanical or electrical linkage. Bypass shall limit increase in air velocity (500 percent maximum) through the hood face regardless of sash position.
- J. Exhaust slots:
 - 1. Slot air velocity: 1500 fpm minimum.
 - 2. Locate controls to minimize tampering and interference with normal hood operation.
 - 3. Maximum slot area shall be less than two-thirds of the cross sectional area of the respective parts of the plenum.
 - 4. Locate horizontal slots at counter top level, center and top section of hood.
- K. Exhaust requirements: Operate hood at the following face velocity and air flow as indicated on Drawings.
 - 1. Chemical Fume Hood – Class A:
 - a. Face velocity – 100 fpm when sash is open at 18 inches above work surface.
 - b. Air flow, 4 foot hood – 485 CFM.
 - c. Air flow, 5 foot hood – 660 CFM.
 - d. Air flow, 6 foot hood – 785 CFM.
 - e. Air flow, 8 foot hood – 1080 CFM.
- L. Support structure: Accommodate a distributed load of 250 psf and a single concentrated load of 500 lbs. in addition to the hood weight.

- M. Locate sinks and service fittings 6 inch minimum beyond hood face. Locate cup sinks and service fittings at back of hood unless indicated otherwise. All CFH's to be prepiped – no pipes less than or equal to ½ inch. For gas, use schedule 40 black iron. For vacuum and air use type K silver solder (15 percent solder). No flex connectors on gas – all hard piped. Use all domestic material. All hoods to be GFCl, hospital grade stainless steel.
- N. Sash windows: Laminated glass. ¼ inch acrylic plastic and tempered glass acceptable if indicated. Wired glass not allowed.
- O. Base cabinet support unit: Provide vented solvent storage cabinet meeting requirements of OSHA, Section 1910.106(d) (3) or NFPA 30, Section 4-3 unless indicated otherwise. Vent cabinet with 2 inch diameter galvanized screw pipe connected into the hood exhaust duct at approximately 90 inches above finish floor. Vent to be concealed within sidewalls of hood. Provide ¼ inch hardware cloth screen at vent inlets. Venting must not occur inside the hood. Flammable liquid storage cabinet doors to be self closing.
- P. Base cabinet support unit: Standard metal casework.
- Q. Base cabinet support unit: Vented acid storage cabinet. Vent similar to solvent storage cabinet using 2 inch diameter GALV screw pipe. Doors to be self-closing.
- R. Radioisotope and radiochemical hoods: All interior surfaces to be covered stainless steel. Counter top to be dished stainless steel integral with sidewalls.
- S. Provide the following field modifications: Refer to attached drawing.
 - 1. Install Baker Co. AirGard air flow monitor (AFM) or approved equal. (Southwest Bioequip., 713-784-9298). Mount on stainless steel bracket, screwed to face of hood. Verify Baker – refer to Division 23 and Division 25 for air flow monitor.
 - 2. Provide with manufacturer's duct penetration device and airflow monitor probe.
 - 3. Provide 2100 wire mold to enclose probe and power cords.
 - 4. Provide emergency power electrical receptacle on top of hood or on wall directly above and behind hood for power to AFM. This receptacle can be on a circuit with other hood AFM's only.
- T. Exterior of fume hood to match adjacent co

2.05 BIOLOGICAL SAFETY CABINET – CLASS II, TYPE A (****TYPE A1 CABINETS NOT RECOMMENDED- POSITIVE PRESSURE PLENUM A/B3)**

A. Acceptable Manufactures

- 1. The Baker Co., Inc. BioGARD B40A-112 and B60A-112, Steriguard III Advance SG403, SG603 (Ergonomic adjustable base). Class IIA or B3 BSC at UTHSCSA must be installed as IIA-not ducted for B3.

SRS, Inc.
13003 SW Frwy
Suite 125
Stafford, Texas 77477
(281) 980-2845

- 2. NuAire, Inc. – 407-400, 407-600, 425-400 and 425-600 (Ergonomic adjustable base)

Biomedical Solutions
P.O. Box 1646
Sugar Land, Texas 77487-1646

(281) 240-5893

3. Thermo Forma Scientific – Model 1200, 1206, 1214, 1210, 1284, 1286 (Ergonomic adjustable base)

P.O. Box 649
Marietta, Ohio 45750
(800) 827-7133

- B. Units shall meet or exceed requirements of NCI Specification “General Purpose Clean Air Biological Safety Cabinet” (Class II, Type A) and NSF Standard #49.
- C. Units shall be tested and certified as required in Paragraph 1.4, Quality Assurance.
- D. Units to be console type, nominal 4 foot or 6 foot wide as indicated. Unit shall be transportable through a 3'-0" x 6'-8" doorway. Unit and ergonomic stand must be able to be moved easily as one unit with roller lift. Unit shall be installed as a Type A Cabinet, not as a B3.
- E. Units shall be UL listed.
- F. Exterior material: Sealed panels of 16 gage cold rolled steel and dress panels of 18 gage Cold rolled steel. Painted Perma-white.
- G. Interior material: 16 gage Type 304 stainless steel with No. 4 finish. Interior corners shall be radiused (7/16 inch). Work surface to be recessed with radiused corners.
- H. Unit legs: Adjustable.
- I. Sliding View-screen: Slanted with 10 degree angle from the vertical, ¼ inch safety or tempered glass capable of moving to a fully closed position during shutdown periods.
- J. Air intake velocity through 8 inch front access: 100 fpm minimum.
- K. Unit shall be designed to recirculate 70 percent of the air volume and to exhaust 30 percent to the room.
- L. Units shall have standard supply and exhaust HEPA filters, 99.99 percent efficient for 0.3 microns per DOP test. The HEPA filters shall be low resistance type achieving a low static pressure of 0.30 to 0.45 inches water column. Provide one extra set of filters for each cabinet. Filter frames shall be constructed of wood.
- M. Filters shall be front loading.
- N. Stainless steel air diffuser and filter protector provided in Work area.
- O. Control valve or damper to maintain supply and exhaust air balance and shut-off for decontamination.
- P. Unit to have fluorescent fixture mounted outside cabinet providing more than 100 footcandle lighting.
- Q. Electrical power receptacles: Provide following unless indicated otherwise on Drawings; GFI type, on separate circuit from fan motor and lights, located in drip-proof, gas-tight box inside cabinet. For 6 foot units, provide two (2) duplex receptacles. For 4 foot units, provide one (1) duplex receptacle. Stainless steel cover plates.
- R. Air and vacuum on right and left side. Gas not allowed in IIA.
- S. Spill trough drain valve: Stainless steel ball valve.

- T. Locate service fittings 6 inch minimum beyond cabinet face. All cabinets are to be prepped with no pipe less than or equal to ½ inch diameter in size. Make service connections to the cabinet through the top and toward the back of the cabinet. Connections through the back or sides of the cabinet are not acceptable. Connections shall extend 2 inches above the cabinet. Provide schedule 40 black iron pipe for gas piping. Provide type K copper silver solder (15 percent solder) piping for vacuum and air lines. Flexible connectors on gas piping are not acceptable. Install all hard pipe. Use all domestic materials.
- U. Exhaust Air Flow
 - 1. 4 foot 8 inch opening 269 CFM
 - 2. 4 foot 10 inch opening 355 CFM
 - 3. 6 foot 8 inch opening 408 CFM
 - 4. 6 foot 10 inch opening 510 CFM
- V. Unit shall have an audible alarm and a flashing LED to indicate when the sliding view screen is in an unsafe position. Provide mute alarm switch.

2.06 BIOLOGICAL SAFETY CABINET – CLASS II, TYPE B1

A. Acceptable Manufacturers:

- 1. The Baker Co., Inc. – NCB-B4 and NCB-B6

SRS, Inc.
13003 SW Frwy
Suite 125
Stafford, Texas 77477
(281) 980-2845

- 2. NuAire, Inc. – NU-427-400 and NU-427-600 (both with ergonomic base)

Biomedical Solutions
P.O. Box 1646
Sugar Land, Texas 77487-1646
(281) 240-5893

B. Air flow at minimum 0.30 inch and maximum 0.60 inch water column negative static pressure:

- 1. Baker 4 foot cabinet; 256 CFM
- 2. Baker 6 foot cabinet; 374 CFM
- 3. NuAire 4 foot cabinet; 270 CFM
- 4. NuAire 6 foot cabinet; 410 CFM

C. Units shall meet or exceed requirements of NCI Specification “General Purpose Clean Air Biological Safety Cabinet” (Class II, Type B Safety Cabinet) and NSF Standard #49.

D. Units shall be tested and certified as required in Paragraph 1.4, Quality Assurance.

E. Units to be console type, nominal 4 foot or 6 foot wide as indicated. Unit shall be transportable through a 3'-0" x 6'-8" doorway.

F. Units shall be UL listed.

- G. Exterior material: 14 gage cold rolled steel with white baked enamel finish.
- H. Interior material: Type 304 stainless steel with No. 4 finish. Interior corners shall be radiused. Work surface to be recessed with radiused corners.
- I. Unit legs: Adjustable.
- J. View-screen: Vertical sliding, counterweighted, ¼ inch safety or tempered glass.
- K. Air intake velocity through 8 inch front access: 100 fpm minimum.
- L. Unit shall be designed to directly exhaust 70 percent (through a HEPA filter) of the total volume of air handled in the unit from the work surface area to an outside exhaust provided by others. 30 percent recirculation within cabinet.
- M. Units shall have zero-probed supply and exhaust HEPA filters, 99.99 percent efficient for 0.3 microns per DOP test. The HEPA filters shall be low resistance type achieving a low static pressure of 0.30 to 0.45 inches water column. Provide one extra set of filters for each cabinet. Filter frames shall be constructed of wood.
- N. Filters shall be front loading.
- O. Protect supply filter with metal diffuser.
- P. Air-tight control valve or damper to maintain supply and exhaust air balance and shut-off for decontamination.
- Q. Unit to have fluorescent fixture mounted outside cabinet.
- R. Electrical power receptacles: Provide following unless indicated otherwise on Drawings; GFI type on separate circuit from fan motor and lights, located in drip-proof, gas-tight box. For 6 foot units, provide two (2) duplex receptacles. For 4 foot units, provide one (1) duplex receptacle. Stainless steel cover plates.
- S. Gas/vacuum service fittings: Two (2) valves each side wall, unless indicated otherwise on Drawings.
- T. Spill through drain valve: Stainless steel ball valve.
- U. Locate service fittings 6 inch minimum beyond cabinet face. All cabinets are to be prepiped with no pipe less than or equal to ½ inch diameter in size. Make service connections to the cabinet through the top and toward the back of the cabinet. Connections through the back or sides of the cabinet are not acceptable. Connections shall extend 2 inches above the cabinet. Provide schedule 40 black iron pipe for gas piping. Provide type K copper silver solder (15 percent solder) piping for vacuum and air lines. Flexible connectors on gas piping are not acceptable. Install all hard pipe. Use all domestic materials.
- V. Unit shall have an audible and visible alarm to indicate low exhaust air flow by monitoring air mass. Audible and visible alarm when sliding viewscreen is in an unsafe position.

2.07 BIOLOGICAL SAFETY CABINET – CLASS II, TYPE B2

A. Manufacturers:

1. The Baker Co., Inc. – SG 403TX and SG 603TX (ergonomic adjustable base)

SRS, Inc.
13003 SW Frwy.
Suite 125

Stafford, Texas 77477
(281) 980-2845

2. NuAire, Inc. – NU-430-400 and NU-430-600 (ergonomic adjustable base)

Biomedical Solutions
P.O. Box 1646
Sugar Land, Texas 77487-1646
(281) 240-5893

- B. Air flow at minimum 0.75 inch water column negative static pressure:
 1. Baker 4 foot cabinet; 750-800 CFM
 2. Baker 6 ft cabinet; 1150-1200 CFM
 3. NuAire 4 foot cabinet with 8 inch access opening; 754 CFM
 4. NuAire 4 foot cabinet with 10 inch access opening; 674 CFM
 5. NuAire 6 foot cabinet with 8 inch access opening; 1100-1150 CFM
 6. NuAire 6 foot cabinet with 10 inch access opening; 990 CFM
- C. Units shall meet or exceed requirements of NSF Standard #49.
- D. Units shall be tested and certified as required in Paragraph 1.4, Quality Assurance.
- E. Units to be console type, nominal 4 foot or 6 foot wide as indicated. Unit shall be transportable through a 3'-0" x 6'-8" doorway.
- F. Unit shall be UL listed.
- G. Exterior material: Cold rolled steel with white baked enamel finish.
- H. Interior material: Type 304 stainless steel with No. 4 finish. All stainless steel to be welded construction with radiused corners.
- I. Unit legs: Adjustable.
- J. View-screen: Vertical sliding, slanted 10 degree, counter-weighted, ¼ inch safety glass – opens to 8-¼ inch.
- K. Air intake velocity through 8 inch or 10 inch front access: 105 fpm minimum.
- L. Unit shall be designed to directly exhaust 100 percent of the total volume of air handled in the unit from the work surface area to an outside exhaust provided by others.
- M. Units shall have zero-probed supply and exhaust HEPA filters, 99.99 percent efficient for 0.3 microns per DOP test. The HEPA filters shall be low resistance type achieving a low static pressure of 0.30 to 0.45 inches water column. Provide one extra set of filters for each cabinet. Filter frames shall be constructed of wood.
- N. Filters shall be front loading.
- O. Units shall feature a bag-in/bag-out procedure for replacement of exhaust filter.
- P. Protect supply filter with metal diffuser.

- Q. Air-tight control valve or damper to maintain supply and exhaust air balance and shut-off for decontamination.
- R. Unit to have fluorescent fixture mounted outside cabinet.
- S. All electrical components shall be outside Work zone and exhaust flow ducting.
- T. Electrical power receptacles: Provide following unless indicated otherwise on Drawings: GFI type, on separate circuit from fan motor and lights. Provide two (2) duplex receptacles. Stainless steel cover plates.
- U. Air/Gas/Vacuum service fittings: Two (2) remote control valves.
- V. Spill trough drain valve: Stainless steel ball valve.
- W. Locate service fittings 6 inch minimum beyond cabinet face. All cabinets are to be prepped with no pipe less than or equal to ½ inch diameter in size. Make service connections to the cabinet through the top and toward the back of the cabinet. Connections through the back or sides of the cabinet are not acceptable. Connections shall extend 2 inches above the cabinet. Provide schedule 40 black iron pipe for gas piping. Provide type K silver solder (15 percent solder) piping for vacuum and air lines. Flexible connectors on gas piping are not acceptable. Install all hard pipe. Use all domestic materials.

PART 3 - EXECUTION

3.01 COORDINATION

- A. Coordinate installation and service requirements with other trades.

3.02 CASEWORK INSTALLATION

- A. Install this Work under direction of manufacturer.
- B. Floor supported Work: Set in position, level and fasten to adjacent units as required. Fasten counter tops to base cabinets. Seal tops and splashes to abutting vertical surfaces. Install filler panels between cabinets and walls.
- C. Wall mounted Work: Fasten in place to bracing provided in wall system.

3.03 CHEMICAL FUME HOOD AND BIOLOGICAL SAFETY CABINET INSTALLATION

- A. Install new fan and electrical disconnect on equipment supports per Division 07. Install motor starter for ¾ horsepower and larger motors in a protected location near fan. Coordinate with Owner's Representative.
- B. Install new stack per attached detail. Provide guy wire to support stack as required. Coordinate location of guy wire with Owner's Representative.
- C. Paint and identify fan housing.
- D. Provide reinforced neoprene connector between fan and ductwork.
- E. Provide stainless steel transition section between hood or safety cabinet and ductwork.
- F. Install volume control damper in ductwork directly above hood and transition section.
- G. Biological Cabinet- Damper must be gas-tight.

- H. Install new base cabinet under existing hood and install concealed vent(s) to exhaust duct above hood as required.
- I. Connect electrical and mechanical services indicated on Drawings to devices furnished with hood or safety cabinet.
- J. Baker Air Flow Alarm
 - 1. Mount on stainless steel bracket, location as shown on Drawings.
 - 2. Wiring and probe connection to be enclosed in wire mold.
 - 3. Power for alarm to be taken from a receptacle mounted on top of hood.
 - 4. Maintain space over hood sash clear of ductwork, conduit and piping for 9 feet above finished floor to allow full opening of sash.

3.04 CLEANING

- A. Remove debris from area of installation daily and at completion of Project.

SECTION 12 21 13 13 - HORIZONTAL LOUVER BLINDS - METAL**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for horizontal louver blinds. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Horizontal louver blinds with aluminum, wood and polymer slats.

C. Submittals

1. Product Data: For each type of product indicated.
2. Shop Drawings: Show fabrication and installation details for horizontal louver blinds and motorized blind operators..
3. Samples: For each exposed finish.
4. Product certificates **as directed**.
5. Maintenance data.

D. Quality Assurance

1. Fire-Test-Response Characteristics: Provide horizontal louver blinds with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify materials with appropriate markings of applicable testing and inspecting agency.
 - a. Flame-Resistance Ratings: Passes NFPA 701.
2. Product Standard: Provide horizontal louver blinds complying with WCSC A 100.1.

E. Delivery, Storage, And Handling

1. Deliver horizontal louver blinds in factory packages, marked with manufacturer and product name, fire-test-response characteristics, lead-free designation, and location of installation using same designations indicated on Drawings and in a window treatment schedule.

1.2 PRODUCTS**A. Horizontal Louver Blinds, Aluminum Slats **Blinds to be equal to Bali-or approved equal****

1. Slats: Aluminum; alloy and temper recommended by producer for type of use and finish indicated; with crowned profile and radiused corners.
 - a. 1 inch (25 mm) **OR** 1/2 to 5/8 inch (13 to 16 mm), **as directed**.
 - b. Finish: As indicated.
 - 1) Ionized Coating: Antistatic, dust-repellent, baked polyester finish.
 - 2) Reflective Coating: Manufacturer's special coating enhancing the reflection of solar energy on the outside-facing slat surface.
 - c. Perforated Slats: Openness factor of 6 to 7 percent.
2. Headrail: Formed steel or extruded aluminum; long edges returned or rolled; fully enclosing operating mechanisms on three sides and end plugs.
3. Bottom Rail: Formed-steel or extruded-aluminum tube, with plastic or metal capped ends.
4. Maximum Light-Blocking Blinds: Designed for eliminating all visible light gaps if slats are tilted closed and with minimal-sized rout holes for ladders hidden and placed near back edge for

maximum slat overlap; with headrail and bottom rail extended and formed for light-tight joints between rail and adjacent slats or construction.

- a. Finish: Match color, texture, pattern, and gloss of slats as indicated by manufacturer's designations.
5. Ladders: Evenly spaced to prevent long-term slat sag.
 - a. For Blinds with Nominal Slat Width 1 Inch (25 mm) or Less: Braided string.
 - b. For Blinds with Nominal Slat Width 1 Inch (25 mm) **OR** 2 Inches (51 mm)\, **as directed**, or More: Braided string **OR** Manufacturer's standard-width reinforced vinyl tapes **OR** Manufacturer's standard-width cloth tapes, **as directed**.
 - 1) Tape Color, Texture, and Pattern: Color, texture, and pattern as selected from manufacturer's full range.
6. Lift-and-Tilt Control: Motorized operator.
7. Lift Cords: Manufacturer's standard.
8. Tilt Control: Enclosed worm-gear mechanism, slip clutch or detachable wand preventing overrotation, and linkage rod.
9. Lift Operation: Manual.
10. Valance: **As directed**.
11. Mounting: **As directed**.
12. Hold-Down Brackets and Hooks or Pins: Manufacturer's standard.
13. Side Channels and Perimeter Light Gap Seals: Manufacturer's standard.
14. Colors, Textures, Patterns, and Gloss: As selected from manufacturer's full range.

1.3 EXECUTION

A. Installation

1. Install horizontal louver blinds level and plumb and aligned with adjacent units according to manufacturer's written instructions, and located so exterior slat edges in any position are not closer than 1 inch (25 mm), to interior face of glass. Install intermediate support as required to prevent deflection in headrail. Allow clearances between adjacent blinds and for operating glazed opening's operation hardware if any.
2. Flush Mounted: Install horizontal louver blinds with slat edges flush with finish face of opening if slats are tilted open.
3. Jamb Mounted: Install headrail flush with face of opening jamb and head.
4. Head Mounted: Install headrail on face of opening head.
5. Recessed: Install headrail concealed within blind pocket.
6. Connections: Connect motorized operators to building electrical system.
7. Adjust horizontal louver blinds to operate smoothly, easily, safely, and free of binding or malfunction throughout entire operational range.
8. Clean horizontal louver blind surfaces after installation, according to manufacturer's written instructions.

END OF SECTION 12 21 13 13

Task	Specification	Specification Description
12 21 13 33	12 21 13 13	Horizontal Louver Blinds - Metal

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 12 24 13 00 - ROLLER SHADES**PART 1 GENERAL****1.1 SECTION INCLUDES**

- A. Manually operated sunscreen roller shades.
- B. Manually operated room-darkening shades.
- C. Manually operated double-roller sunscreen and room-darkening shades.

1.2 RELATED SECTIONS

- A. Section 06100 - Rough Carpentry: Wood blocking and grounds for mounting roller shades and accessories.
- B. Section 09260 - Gypsum Board Assemblies: Coordination with gypsum board assemblies for installation of shade pockets, closures and related accessories.
- C. Section 09510 - Acoustical Ceilings: Coordination with acoustical ceiling systems for installation of shade pockets, closures and related accessories.
- D. Division 16 - Electrical: Electric service for motor controls.

1.3 REFERENCES

- A. ASTM G 21 - Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Fungi.
- B. NFPA 70 - National Electrical Code.
- C. NFPA 701-99 - Fire Tests for Flame-Resistant Textiles and Films.

1.4 SUBMITTALS

- A. Submit under provisions of Section 01300.
- B. Submit Environmental Certification and Third Party Evaluation per Section 1.5 Qualifications.
- C. Product Data: Manufacturer's data sheets on each product to be used, including:
 - 1. Preparation instructions and recommendations.
 - 2. Styles, material descriptions, dimensions of individual components, profiles, features, finishes and operating instructions.
 - 3. Storage and handling requirements and recommendations.
 - 4. Mounting details and installation methods.
 - 5. Typical wiring diagrams including integration of motor controllers with building management system, audiovisual and lighting control systems as applicable.
- D. Shop Drawings: Plans, elevations, sections, product details, installation details, operational clearances, wiring diagrams and relationship to adjacent work.
 - 1. Prepare shop drawings on Autocad or Microstation format using base sheets provided electronically by the Architect.

- E. Window Treatment Schedule: For all roller shades. Use same room designations as indicated on the Drawings and include opening sizes and key to typical mounting details.
- F. Selection Samples: For each finish product specified, one set of shade cloth options and aluminum finish color samples representing manufacturer's full range of available colors and patterns.
- G. Verification Samples: For each finish product specified, one complete set of shade components, unassembled, demonstrating compliance with specified requirements. Shadecloth sample and aluminum finish sample as selected. Mark face of material to indicate interior faces.
- H. Maintenance Data: Methods for maintaining roller shades, precautions regarding cleaning materials and methods, instructions for operating hardware and controls.

1.5 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Obtain roller shades through one source from a single manufacturer with a minimum of twenty years experience in manufacturing products comparable to those specified in this section.
- B. Installer Qualifications: Installer trained and certified by the manufacturer with a minimum of ten years experience in installing products comparable to those specified in this section.
- C. Fire-Test-Response Characteristics: Passes NFPA 701-99 small and large-scale vertical burn. Materials tested shall be identical to products proposed for use.
- D. Electrical Components: NFPA Article 100 listed and labeled by either UL or ETL or other testing agency acceptable to authorities having jurisdiction, marked for intended use, and tested as a system. Individual testing of components will not be acceptable in lieu of system testing.
- E. Anti-Microbial Characteristics: 'No Growth' per ASTM G 21 results for fungi ATCC9642, ATCC 9644, ATCC9645.
- F. Environmental Certification: Submit written certification from the manufacturer, including third party evaluation, recycling characteristics, and perpetual use certification as specified below. Initial submittals, which do not include the Environmental Certification, below will be rejected. Materials that are simply 'PVC free' without identifying their inputs shall not qualify as meeting the intent of this specification and shall be rejected.
- G. Third Party Evaluation: Provide documentation stating the shade cloth has undergone third party evaluation for all chemical inputs, down to a scale of 100 parts per million, that have been evaluated for human and environmental safety. Identify any and all inputs, which are known to be carcinogenic, mutagenic, teratogenic, reproductively toxic, or endocrine disrupting. Also identify items that are toxic to aquatic systems, contain heavy metals, or organohalogens. The material shall contain no inputs that are known problems to human or environmental health per the above major criteria, except for an input that is required to meet local fire codes.
- H. Recycling Characteristics: Provide documentation that the shade cloth can and is part of a closed loop of perpetual use and not be required to be down cycled, incinerated or otherwise thrown away. Scrap material can be sent back to the mill for reprocessing and recycling into the same quality yarn and woven into new material, without down cycling. Certify that this process is currently underway and will be utilized for this project.
- I. Perpetual Use Certification: Certify that at the end of the useful life of the shade cloth, that the material can be sent back to the manufacturer for recapture as part of a closed loop of perpetual use and that the material can and will be reconstituted into new yarn, for weaving into new shade cloth.

Provide information on each shade band indicating that the shade band can be sent back to the manufacturer for this purpose.

- J. Mock-Up: Provide a mock-up (manual shades only) of one roller shade assembly for evaluation of mounting, appearance and accessories.
 - 1. Locate mock-up in window designated by Architect.
 - 2. Do not proceed with remaining work until, mock-up is accepted by Architect.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver shades in factory-labeled packages, marked with manufacturer and product name, fire-test-response characteristics, and location of installation using same room designations indicated on Drawings and in the Window Treatment Schedule.

1.7 PROJECT CONDITIONS

- A. Environmental Limitations: Install roller shades after finish work including painting is complete and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

1.8 WARRANTY

- A. Roller Shade Hardware, Chain and Shadecloth (except EcoVeil™): Manufacturer's standard non-depreciating twenty-five year limited warranty.
 - 1. EcoVeil standard non-depreciating 10-year limited warranty.
- B. Roller Shade Motors and Motor Control Systems: Manufacturer's standard non-depreciating five-year warranty.
- C. Roller Shade Installation: One year from date of Substantial Completion, not including scaffolding, lifts or other means to reach inaccessible areas.

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturer: MechoShade Systems, Inc.; 42-03 35th Street, Long Island City, NY 11101. ASD. Tel: (718) 729-2020. Fax: (718) 729-2941. Email: info@mechoshade.com, www.mechoshade.com.
- B. Interior Finishes, Local Rep., Loretta Bilderback, Phone (210) 725-9670 Fax (210) 247-6122, Loretta.bilderback@ifsatx.com
- C. Substitutions: Not permitted.
- D. Requests for substitutions will be considered in accordance with provisions of General Conditions.

2.2 APPLICATIONS/SCOPE

- A. Roller Shade Schedule:
 - 1. Shade Type 1: Manual operating, chain drive, sunscreen roller shades in all exterior windows of rooms and spaces shown on the Drawings.
 - 2. Shade Type 2: Manual operating interior, chain drive room darkening roller shades with blackout fabric in all exterior windows of rooms and spaces shown on Drawings, and related mounting systems and accessories.

3. Shade Type 3: Manual operating interior, chain drive "double" solar and room darkening blackout roller shades, operating independently of each other, in all exterior windows of rooms and spaces shown on Drawings, and related mounting systems and accessories.

2.3 SHADE CLOTH

- A. Visually Transparent Single-Fabric Shadecloth: MechoShade Systems, Inc., ThermoVeil group, single thickness non-raveling 0.030-inch (0.762 mm) thick vinyl fabric, woven from 0.018-inch (0.457 mm) diameter extruded vinyl yarn comprising of 21 percent polyester and 79 percent reinforced vinyl, in colors selected from manufacturer's available range.
 1. Dense Vertical Weave: 2- 3 percent openness factor, #1004.
 2. Dense Basket Weave: 5 percent openness factor, #1304.
 3. Color: Black /Brown.

2.4 SHADE BAND

- A. Shade Bands: Construction of shade band includes the fabric, the hem weight, hem-pocket, shade roller tube, and the attachment of the shade band to the roller tube. Sewn hems and open hem pockets are not acceptable.
 1. Hem Pockets and Hem Weights: Fabric hem pocket with RF-welded seams (including welded ends) and concealed hem weights. Hem weights shall be of appropriate size and weight for shade band. Hem weight shall be continuous inside a sealed hem pocket. Hem pocket construction and hem weights shall be similar, for all shades within one room.
 2. Shade band and Shade Roller Attachment:
 - a. Use extruded aluminum shade roller tube of a diameter and wall thickness required to support shade fabric without excessive deflection. Roller tubes less than 1.55 inch (39.37 mm) in diameter for manual shades, and less than 2.55 inches (64.77 mm) for motorize shades are not acceptable.
 - b. Provide for positive mechanical engagement with drive / brake mechanism.
 - c. Provide for positive mechanical attachment of shade band to roller tube; shade band shall be made removable / replaceable with a "snap-on" snap-off" spline mounting, without having to remove shade roller from shade brackets.
 - d. Mounting spline shall not require use of adhesives, adhesive tapes, staples, and/or rivets.
 - e. Any method of attaching shade band to roller tube that requires the use of: adhesive, adhesive tapes, staples, and/or rivets are not acceptable.

2.5 SHADE FABRICATION

- A. Fabricate units to completely fill existing openings from head to sill and jamb-to-jamb, unless specifically indicated otherwise.
- B. Fabricate shadecloth to hang flat without buckling or distortion. Fabricate with heat-sealed trimmed edges to hang straight without curling or raveling. Fabricate unguided shadecloth to roll true and straight without shifting sideways more than 1/8 inch (3.18 mm) in either direction per 8 feet (2438 mm) of shade height due to warp distortion or weave design. Fabricate hem as follows:
 1. Bottom hem weights.
 2. Concealed hemtube.
 3. Exposed hemtube.
 4. Exposed blackout hembar with light seal.
 5. Exposed blackout hembar with polybond seal.
- C. Provide battens in standard shades as required to assure proper tracking and uniform rolling of the shadebands. Contractor shall be responsible for assuring the width-to-height (W:H) ratios shall not exceed manufacturer's standards or, in absence of such standards, shall be responsible for

establishing appropriate standards to assure proper tracking and rolling of the shade cloth within specified standards. Battens shall be roll-formed stainless steel or tempered steel, as required.

- D. For railroaded shadebands, provide seams in railroaded multi-width shadebands as required to meet size requirements and in accordance with seam alignment as acceptable to Architect. Seams shall be properly located. Furnish battens in place of plain seams when the width, height, or weight of the shade exceeds manufacturer's standards. In absence of such standards, assure proper use of seams or battens as required to, and assure the proper tracking of the railroaded multi-width shadebands.
- E. Provide battens for railroaded shades when width-to-height (W:H) ratios meet or exceed manufacturer's standards. In absence of manufacturer's standards, be responsible for proper use and placement of battens to assure proper tracking and roll of shadebands.
- F. Blackout shadebands, when used in side channels, shall have horizontally mounted, roll-formed stainless steel or tempered-steel battens not more than 3 feet (115 mm) on center extending fully into the side channels. Battens shall be concealed in an integrally-colored fabric to match the inside and outside colors of the shadeband, in accordance with manufacturer's published standards for spacing and requirements.
 - 1. Battens shall be roll formed of stainless steel or tempered steel and concave to match the contour of the roller tube.
 - 2. Batten pockets shall be self-colored fabric front and back RF welded into the shade cloth. A self-color opaque liner shall be provided front and back to eliminate any see through of the batten pocket that shall not exceed 1-1/2 inches (38.1 mm) high and be totally opaque. A see-through moiré effect, which occurs with multiple layers of transparent fabrics, shall not be acceptable.

2.6 COMPONENTS

- A. Access and Material Requirements:
 - 1. Provide shade hardware allowing for the removal of shade roller tube from brackets without removing hardware from opening and without requiring end or center supports to be removed.
 - 2. Provide shade hardware that allows for removal and re-mounting of the shade bands without having to remove the shade tube, drive or operating support brackets.
 - 3. Use only Delrin engineered plastics by DuPont for all plastic components of shade hardware. Styrene based plastics, and /or polyester, or reinforced polyester will not be acceptable.
- B. Drive Chain: #10 qualified stainless steel chain rated to 90 lb. (41 kg) minimum breaking strength. Nickel plate chain shall not be accepted.

2.7 MOTOR CONTROL SYSTEMS

- A. IQ/MLC: Specifications and design of shade motors and motor control system are based on the IQ/MLC motor logic control system manufactured by MechoShade Systems, Inc. Other systems may be acceptable provide that all of the following performance capabilities are provided. Motor logic control systems not in complete compliance with these performance criteria shall not be accepted as equal systems.
 - 1. Motor Control System:
 - a. Provide power to each shade motor via individual 3 conductor line voltage circuits connecting each motor to the relay based motor logic controllers (IQ/MLC).
 - b. Control system components shall provide appropriate (spike and brown out) over-current protection (+/- 10 percent of line voltage) for each of the four individual motor circuits and shall be rated by UL or ETL as a recognized component of this system and tested as an integrated system.

- c. Motor control system shall allow each group of four shade motors in any combination to be controlled by each of four local switch ports, with up to fourteen possible "sub-group" combinations via local 3 button wall switches and all at once via a master 3 button switch. System shall allow for overlapping switch combinations from two or more local switches.
 - d. Multiple "sub-groups" from different IQ/MLC control components shall be capable of being combined to form "groups" operated by a single 3 button wall switch, from either the master port or in series from a local switch port.
 - e. Each shade motor shall be accessible (for control purposes) from up to four local switches and one master switch.
 - f. Control system shall allow for automatic alignment of shade hem bars in stopped position at 25 percent, 50 percent, and 75 percent of opening heights, and up to three user-defined intermediate stopping positions in addition to all up / all down, regardless of shade height, for a total of five positions. Control system shall allow shades to be stopped at any point in the opening height noting that shades may not be in alignment at these non-defined positions).
 - g. Control system shall have two standard operating modes: Normal mode allowing the shades to be stopped anywhere in the window's opening height and uniform mode, allowing the shades to only be stopped at the predefined intermediate stop positions. Both modes shall allow for all up / all down positioning.
 - h. Control system components shall allow for interface with both audiovisual system components and building fire and life safety system via a dry contact terminal block.
 - i. Control system components shall allow for interface with external analog input control devices such as solar activated controllers, 24 hour timers, and similar items; via a dry contact terminal block.
 - j. Reconfiguration of switch groups shall not require rewiring of the hardwired line voltage motor power supply wiring, or the low voltage control wiring. Reconfiguration of switch groups shall be accomplished within the motor control device (IQ/MLC).
2. Wall Switches:
- a. Three-button architectural flush mounted switches with metal cover plate and no exposed fasteners.
 - b. Connect local wall switches to control system components via low voltage (12V DC) 4-conductor modular cable equipped with RJ-11 type connectors supplied, installed and certified under Division 16 - Electrical.
 - c. Connect master wall switches to control system components via low voltage (12V DC) 6-conductor modular cable equipped with RJ-12 type connectors supplied, installed and certified under Division 16 - Electrical.
3. The BI and I'CON controller system shall have the capability of two-way communication with the motors. Each I'CON controller, (bus Interface or BI) shall allow for a unique address message to be received from the hand held configurator and/or a PC controller or switch.
- a. Bus line shall consist of 2 twisted pair of 16 ga low voltage wire.
 - b. Shade motor control components (bus interfaces, wall switches, bus supplies, auxiliary control input devices, and similar items) shall be connected in series via the low voltage (12VDC) two way digital communication bus line.
 - c. Bus line shall be capable of being installed in a free topology to provide maximum flexibility for installation and future maintenance.
 - d. Low voltage (12VDC) digital bus line shall be powered by a bus supply transformer, requiring 115VAC (220 - 230 VAC) input drawing a maximum current of 1 amp. A minimum of one bus supply shall be required for every 400 linear feet of bus line. Final bus supply spacing shall be reviewed with the system manufacturer after the number of nodes per 400 ft (120 meters) run of bus line has been determined.
4. Wall Switches:

- a. Shades shall be operated by 4 button low voltage standard switches or programmable intelligent switches [IS]. Standard switch shall be wired to a bus interface and the bus interface will be programmed to transmit an address for the local switch.
- b. Intelligent switches may be installed anywhere on the busline. Each IS shall be capable of storing one control level address to be broadcast along the busline.
- c. An address that is transmitted by either a switch or central controller shall be responded to by those motors with the same address in their control table.
- d. IS shall provide for interface with other low voltage input devices via a set of dry contact terminals located on the switch.
- e. Standard switch or IS may control an individual, sub-group or group of motors in accordance with the address in each motor/BI unit.

2.8 ACCESSORIES

- A. Roller Shade Pocket for recessed mounting in acoustical tile, or drywall ceilings as indicated on the Drawings – as required
 1. Provide either extruded aluminum and or formed steel shade pocket, sized to accommodate roller shades, with exposed extruded aluminum closure mount, tile support and removable closure panel to provide access to shades.
 - a. Provide "Vented Pocket" such that there will be a minimum of four 1 inch (25.4 mm) diameter holes per foot allowing the solar gain to flow above the ceiling line.
- B. Fascia – as required
 1. Continuous removable extruded aluminum fascia that attaches to shade mounting brackets without the use of adhesives, magnetic strips, or exposed fasteners.
 2. Fascia shall be able to be installed across two or more shade bands in one piece.
 3. Fascia shall fully conceal brackets, shade roller and fabric on the tube.
 4. Provide bracket / fascia end caps where mounting conditions expose outside of roller shade brackets.
 5. Notching of Fascia for manual chain shall not be acceptable.
- C. Room Darkening Side and / or Sill Channels (for Shade 0900):
 1. Extruded aluminum with polybond edge seals and SnapLoc-mounting brackets and with concealed fastening. Exposed fastening is not acceptable. Channels shall accept one-piece exposed blackout hembar with vinyl seal to assure side light control and sill light control.
 - a. MechoShade side channels, 1-15/16 inches (49.2 mm) wide by 1-3/16 inches (30.1 mm) deep, two-band center channels, 2-5/8 inches (66.6 mm) wide by 1-3/16 inches (30.1 mm) deep. The 2-5/8-inch (66.6 mm) double-center channels may be installed at center-support positions of multi-band-shade ElectroShades. MechoShade side channels 2-5/8 inch (66.6 mm) may be used as center supports for ElectroShades; shadebands up to 8 high. For shadebands over 8 feet (2438 mm), provide ElectroShade side channels.
 - b. ElectroShade side channels, 2-1/2 inches (63.5 mm) wide by 1-3/16 inches (30.1 mm) deep; two-band center channels 5 inches (127 mm) wide by 1-3/16 inches (30.1 mm) deep. The 2-5/8-inch (66.6 mm) double-center channels may be installed at center-support positions of multi-band-shade ElectroShades. MechoShade side channels 2-5/8 inches (66.6 mm) may be used as center supports for ElectroShades. Also provide for use with manually operated room darkening MechoShades over 8 feet (2438 mm) in height.
 - c. Color: Selected from manufacturer's standard colors.
 - d. Color: Brown/ Black

PART 3 EXECUTION

3.1 EXAMINATION

- A. Do not begin installation until substrates have been properly prepared.
- B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.2 PREPARATION

- A. Clean surfaces thoroughly prior to installation.
- B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION

- A. Install roller shades level, plumb, square, and true according to manufacturer's written instructions, and located so shade band is not closer than 2 inches (50 mm) to interior face of glass. Allow proper clearances for window operation hardware.
- B. Adjust and balance roller shades to operate smoothly, easily, safely, and free from binding or malfunction throughout entire operational range.
- C. Clean roller shade surfaces after installation, according to manufacturer's written instructions.
- D. Engage Installer to train Owner's maintenance personnel to adjust, operate and maintain roller shade systems.

3.4 PROTECTION

- A. Protect installed products until completion of project.
- B. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION 12 24 13 00

Task	Specification	Specification Description
12 24 13 00	12 21 13 13	Horizontal Louver Blinds - Metal
12 31 16 00	01 22 16 00	No Specification Required
12 31 16 00	12 35 53 00	Laboratory Casework, Stainless Steel Cabinets

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 12 35 53 00 - LABORATORY CASEWORK, STAINLESS STEEL CABINETS**1.1 GENERAL****A. Description of Work**

1. This specification covers the furnishing and installation of materials for laboratory casework, stainless steel cabinets. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Quality Assurance

1. Comply with all provisions of specifications for the design, quality testing. Manufacturing and installation of metal kitchen cabinets and specified equipment.
2. All kitchen cabinetry and equipment herein specified and shown on the drawings shall meet the standards, quality of materials, construction, workmanship and finish of Kewaunee Scientific.
3. All metal cabinetry and equipment herein shall be the product of one manufacturer and be the one on which this specification is based.
4. The manufacturer shall, from one year to date of installation, warrant parts or products manufactured and finished against manufacturing defects in material and any such parts which under normal use prove defective within one year from date of installation, shall be repaired or replaced without charge to The University.
5. Wood shall not be used in any portion of the casework construction whether exposed or hidden from view. Except as detailed on the drawings.

C. Submittals

1. Shop Drawings
 - a. Identify location of metal cabinetry and related items.
 - b. Detail cabinets, shelving, countertops, etc, in related and dimensional position, with sections. Locations for roughing-in of plumbing, including sinks, faucets, strainers, cocks, etc. shall be included
2. Certificates: All bidders shall provide to The University independent test results from a nationally recognized testing laboratory on the finishes required for this project with the bid.

1.2 PRODUCTS**A. Material**

1. All metal cabinetry shall be fabricated to Type 304 stainless steel free of scales buckles or other defects.
2. Minimum metal gauge: All minimum thickness of metal referred to herein shall be U.S. standard gauge.
 - a. 20 Gauge: Inner door panels, inner and outer drawer panels, drawer body, and shelves.
 - b. 18 Gauge: Outer door panels, sides, backs, bottoms, and tops.
 - c. 16 Gauge: Top rails, cross rails, drawer slides.
 - d. 14 Gauge: Leveling and corner gussets.

B. Fabrications

1. Cabinet Grade: Premium and complying with the following.
 - a. Align sides, top rails, bottoms and vertical stiles, at intersections, without overlap.
 - b. Rounded edges.
 - c. Full welded seams.
 - d. Grind exposed welds flush and smooth.
2. Cases: The sides of cabinets shall be formed to make a rabbeted stile 1-1/8" wide. Top of case stiles shall be closed by a mitered 45-degree bend from tip of case side. Stiles shall be closed by

welded channel, which contains front shelf adjustment louvers. All case members including intermediate cross rails shall be welded for maximum strength. Use of sheet metal screws to hold intermediate cross rails in place is not acceptable. Sides of all cabinets shall be free from any holes to prevent dust and bacteria from entering the cabinet. Pre-punched holes in the side of any cabinet will not be allowed. All drawer cabinets and cupboard cabinets shall have full backs and bottoms welded into place. Any cabinet without any backs or bottoms will be rejected. All interior bottoms of base and tall cabinets shall be turned down to provide a clean, flush interior free from dust catching ledges and preventing bacterial accumulation. Bottoms of all wall units shall be flushed; recessed bottoms are not acceptable.

3. Doors

- a. Doors shall be double panel reinforced construction 5/8" thick and sound deadened with vertical steel battens. Door fronts and liners shall be welded together for added strength. Door fronts and cases shall be slotted to receive hinges. Hinge wings must be concealed when doors open. Wrap around type hinges are not acceptable. All doors shall have soft rubber bumpers for quiet closing. Rubber bumpers must be securely locked in place. Rubber Bumpers attached by adhesives are not acceptable. All corners of doors shall be welded and ground smooth.
- b. Sliding doors shall be double panel reinforced construction 5/8" thick and operate on nylon rollers suspended from stainless steel track at top of unit and center guide at bottom. Sliding doors shall have recessed door pulls.

4. Drawers

- a. Drawers front shall be double panel reinforced construction with 5/8" thick fronts and sound deadened with vertical steel battens. Drawers shall be all welded construction. All drawers shall have soft rubber bumpers for quiet closing. Rubber bumpers must be securely locked in place. Rubber bumpers attached by adhesives are not acceptable. All edges of drawer fronts shall be closed.
- b. Drawer bodies shall be formed from a single sheet of steel including the bottom, two sides, back and inner front. Interior bottoms of drawers shall be fully covered on four sides for ease in cleaning. The top front of the inner drawer shall be offset to interlock with the outer drawer front.
- c. Flanges on the top of drawer body shall be fully formed channel and bent at a 6-degree angle for maximum strength. Flanges shall be formed to leave the inside of the drawer free from sharp edges. Drawer slide shall be welded to drawer body and be part of a "Z" shaped member in a wrap around design to support drawer body. Drawer slides shall have a 15/16" nylon tired ball bearing roller. Drawer slide shall be roller type, positive in action permitting drawer to be fully opened; yet preventing drawer from accidental removal. Case slides shall be a formed piece of galvanized steel with 15/16" nylon tired ball bearing roller at front of slide. All ball bearing rollers for drawer slide and case slide shall be pre-lubricated to guarantee a smooth, quiet operation. All drawers shall rise upward when opened to prevent engaging of drawers and doors below. Drawers shall have self-closing design during the last 5" of travel.

5. Shelves: Shelves shall be formed from a single sheet of stainless steel with 7/8" face turned back and up at a 30-degree angle and edge of flange shall make firm contact with underside of shelf for sound deadening. All shelves in cabinets shall be adjustable on 1-1/2" center and supported by stainless steel clips placed in embossed louvers. All shelves shall be solid.

6. Hardware: Door catch shall be positive type latch located at upper inside edge of door. Stainless steel strike bracket shall be installed inside of door with accessible removable screws. Bolt shall be nylon self-closing type tested for 300,000 opening and closing cycles. Complete bolt housing shall be recessed behind cross rail. Roller catches and/or friction catches are not acceptable.

7. Hinges: Hinges shall be institutional type, 2-1/2" long, with a metal thickness of least 0.090", containing 5-knuckles, and centered 3" above bottom and below top of door. Doors 45" high and over shall have an additional hinge in center. Hinges shall be stainless steel with smooth rounded joints for easy cleaning. When door is closed, only the joint shall be exposed. Both hinge wings shall be encased, one within the door, the other within the case. Hinges shall be attached to the door and the case by screws. Hinges welded to door and/or case are not acceptable.

8. Door and Drawer Pull: Door and drawer pull shall be stainless steel with a brushed satin finish. Shoulder screws shall be used so that when handles are mounted they do not cause the door to buckle or cave. Sliding doors shall have recessed door pulls.
 9. Base Cabinet Legs: All base cabinets and sink units shall be furnished with integral stainless steel legs with adjustable levelers. Bottom of base cabinets shall be approximately 6" above the floor.
 10. Locking Mechanism: All cabinet doors shall be provided with stainless steel angle hasps, with half-inch diameter holes for pad locking, as shown on the drawings. The left door of each door pair shall have a sliding flush bolt on the inside face, as shown on the drawings, to prevent the pair of doors from swinging open when pad locked.
- C. Steel Cabinet Finish
1. Test Procedure: Chemical spot tests shall be made by applying 10 to 15 drops (approximately 0.5 cubic cm) of each reagent listed in Table 1 to the surface to be tested. Each reagent spot shall be open to the atmosphere. Ambient temperature is 68-72 degrees F (20-22 degrees C). After one hour, chemicals shall be flushed away with cold water and the surface, washed with detergent and warm water at 150 degrees F (65 degrees C). Surface shall be examined under 100-foot candles of illumination.
- D. Laboratory Cabinets Performance Requirements
1. Base Cabinets.
 - a. Cabinets Load Test: A 48" wide standing height combination cupboard and drawer cabinet shall be freestanding with installed counter top. Cabinet shall sit 1" off the floor on all four leveling screws and be capable of supporting a uniform distributed load of 2,000 lbs. Door and drawer operation shall not be affected by the load.
 - b. Leveling device for floor mounted cabinets shall be capable of supporting a load of 500 lbs. Without failure and capable of adjustment after load is removed.
 - c. Cabinet Door Test: An open door shall withstand a load of 200 lbs. applied directly at the outer edge. Door shall be moved through a 180 degree arc and weight removed. Operation of the door after test shall be normal without distortion that will adversely affect operation for the door catch.
 - d. Life Cycle Test.
 - 1) Door hinge shall operate for 300,000 opening and closing cycles without a failure.
 - 2) Positive door catch shall operate for 300,000 opening and closing cycles without failure.
 - 3) Drawer shall be tested and operated with a load of 100 lbs. for a minimum of 150,000 opening and closing cycles. After test, drawers shall operate freely without evidence of dragging or scraping.
 2. Wall Cabinets
 - a. A 48" wide, 30" high, 12 3/4" deep hinged wall case shall support a load of 1lbs. on cabinet bottom and 100 lbs. on each adjustable shelf for a total of 300 lbs. Cabinet shall not show any significant permanent deflection of cabinet, cabinet bottom or shelves. Doors shall operate smoothly when cabinet is fully loaded.
 - b. An adjustable shelf shall support a uniformly distributed load of 100 lbs. When load is removed, shelf should show no significant permanent distortion.
 - c. Performance of hinge and catch shall be the same as used on base cabinets.
- E. Working Surfaces
1. Stainless Steel: Sink and counter tops shall be fabricated of 16 gauge, Type 304, 18-8 solid stainless steel formed down and back making a 1 1/2" high face on all exposed edges. Drainboards and cabinet tops shall be rigidly reinforced the full length of the top. Drainboards shall be two-way pitched to the bowl to provide drainage without channeling or grooving. Drainboards, flanges and splashes shall be integral, being formed from one sheet of metal. Raised edge surrounding unit shall be seamless die formed at front and ends of unit. Sink bowls shall be fabricated of 16 gauge, Type 304, 18-8 solid stainless steel seamless electrically welded to drainboard. All joints shall be electrically welded, ground and polished to a satin finish. Entire units shall be thoroughly sound deadened on under surface with sprayed or trowelled

undercoating. Wood shall not be used. All tops shall have stainless steel runners to facilitate fastening to cabinets.

1.3 EXECUTION

A. Insulations

1. Install cabinets, shelves, counter tops and other equipment level and square. Install sink units to provide positive drainage of bottom surface of the sinks.
2. Wall cabinets shall be hung from the metal stud framing system wherever possible. If the wall cabinets must be hung from the wall surfacing at any location, proper anchors shall be used. Install wall cabinets level and aligned.
3. Install base cabinets firmly on ground. Level all the surfaces by adjusting the leg levelers. Attached countertops to inslatted base cabinets with stainless steel screws as required. Caulk with silicone all around counter tops where it interfaces with the existing walls. Install the flat back panels to the wall surfaces by the most appropriate method and caulk as required.

B. Inspection

1. Inspect installed work of other trades and installation conditions for acceptability. Inform Owner of discrepancies that will jeopardize a complete and proper installation
2. Cleaning: Touching up marred and/or abraded finished surfaces, clean components to post construction accepted levels, remove crating and packing material, broom sweep premises.

Task	Specification	Specification Description
12 36 23 13	06 41 00 00	Architectural Wood Casework

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 12 36 61 16 - SOLID SURFACING COUNTERTOPS**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Fabricator Qualifications: All work of this section shall be fabricated and installed by a fabrication professional who has been accredited by the manufacturer of the solid surfacing materials. The fabricator shall be skilled in the knowledge and ability required to provide work in accordance with the manufacturer's "Fabrication and Installation Manual" and shall have a minimum of five (5) years of fabrication experience and shall have completed a minimum of five (5) fabrication projects of similar scope and size to the fabrication and installation work of this Project.
- B. Source Quality Control: Obtain and provide materials from a single manufacturer of solid surfacing materials with not less than five (5) years of successful experience in supplying principal materials. Provide secondary and alternate materials only as recommended by the manufacturer of the primary materials.
- C. Wherever possible, check dimensions of supporting structure at the Project Site by accurate field measurements before final submittal of shop drawings and fabrication of stone. Where necessary, proceed without field measurements and coordinate installation tolerances to ensure proper fit of stonework.

1.04 SUBMITTALS

- A. Samples:
 - 1. Samples for initial selection purposes in form of manufacturer's color charts consisting of actual pieces or sections of pieces showing full range of colors and patterns available for each type of solid surfacing material indicated.
 - 2. Samples for Verification Purposes: Submit three sets not less than 12 inches by 12 inches in size, of color, grade, and finish of each type of solid surfacing material required. Include the full range of exposed color and texture to be expected in the completed work. Architect's review will be for color and texture only. Compliance with all other requirements is the exclusive responsibility of the Contractor.
- B. Shop Drawings:

1. Submit cutting and setting drawings showing sizes, dimensions, sections, and profiles of solid surfacing material units, the arrangement, and provisions for jointing and other necessary details for reception of other work.
2. Submit drawings for the fabrication and installation of countertops with integral bowls. Indicate dimensions, size, and location of cutouts, and relation to plumbing work.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Protect solid surfacing material from damage during loading, shipment, delivery, and storage. Use non staining materials for blocking and packing. Stack and block solid surfacing material units at the Project Site in accordance with fabricator's recommendations.

1.06 WARRANTY

- A. Solid Surfacing Material Fabrication and Installation:
 1. Provide manufacturer's standard ten (10) year limited warranty. The manufacturer shall warrant that the materials provided under this Section shall not develop visible defects of otherwise fail due to manufacturing defects within a period of ten (10) years from the date of Substantial Completion of the Work.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. The notes and schedules on the Drawings establish manufacturer and model/design required for the Project. Provide the products listed unless Architect approves products of other manufacturer specifically for this Project.

2.03 MATERIALS

- A. Solid surfacing material shall be composed of a homogeneous mixture of thermoset polymer, cast with an acrylic or polyester resin into a hard, durable, polished unit.
 1. "WilsonArt"
 2. or approved equal

2.04 SOLID SURFACING MATERIAL SCHEDULE

- A. Provide solid surfacing materials in color and finish scheduled below:
 1. WilsonArt
 2. or approved equal

2.05 FABRICATION

- A. **Fabrication shall be performed by a fabricator, accredited by the manufacturer**, in accordance with manufacture's recommendations and reference manuals.

- B. Shop fabricate components to greatest extent practicable to size and shapes indicated, in accordance with approved shop drawings.
- C. Comply with the manufacturer's recommendations for the use of specific types of stationary equipment and stationary tools. Site fabrication and finishing processes shall be in accordance with the manufacturer's recommendations.
- D. Form seams between components, unless otherwise indicated, using manufacturer's standard structural adhesive. Adhesive shall be color coordinated to match solid surfacing material color and shall form inconspicuous seams. Seams shall not be permitted along the long side of any areas of less than 36 inches across.
- E. Provide factory cutouts for plumbing fittings and bath accessories as indicated on the drawings and as recommended by the solid surfacing manufacturer.
- F. Cut and finish component edges with clean sharp returns. Rout radii and contours to exact template sizes. Repair or reject defective or inaccurate work.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Prepare substrate plane, plumb and level, secure in place with all fasteners set flush. Shim supporting structure as required to provide an acceptable surface for attaching finish materials.
- D. Install components plane, plumb and level, in accordance with approved shop drawings and product data.
- E. Pre-fit finish material in place. Scribe material as required to provide proper fit with adjacent materials.
- F. Provide additional support for material seams in both horizontal and vertical locations. Separation/release paper shall be provided between all supports and seams to prevent direct adhering of finish material to substrate.
- G. Form field joints using manufacturer's recommended adhesive, with inconspicuous joints in finished work.
- H. Prior to installing fabrications, make sure that substrate is clean and dry. Place silicone "dads" on substrate in accordance with manufacturer's recommendations.

3.02 CLEANING

- A. At Substantial Completion remove temporary protection and thoroughly clean work.
- B. Do not use wire brushes, acids, abrasive cleansers, or solutions which might cause discoloration or abrasion.
- C. Clean by scrubbing with a soft cloth using liquid detergents as recommended by the manufacturer and water. Rinse with clear water. Repoint joints where necessary.

9. Glossary of Terms

1. Introduction - Not Used

2. Piping Systems

2.1 General

A. Introduction and Background

Piping supply services may include, but not be limited to, the following:

- Domestic Hot and Cold Water • Liquid Nitrogen
- Reverse Osmosis Water System* • Fire Protection Systems
- Compressed Air* • Sanitary Waste and Vent
- Specialty Gases* (Oxygen, Carbon Dioxide, etc.) • Storm Sewer
- Vacuum* • Site Utilities
- Natural Gas*

**In many cases point-of-use equipment will meet need. A/E Team to discuss with Owner.*

B. Data

1. Plumbing systems design shall be performed by individual(s) certified in Plumbing Engineering /Design (C.I.P.E or C.P.D.) by the American Society of Plumbing Engineers or by a Texas licensed professional engineer having minimum five years experience designing the types of plumbing systems included within this project.

2. The NE team is required to make themselves aware of all applicable codes and ordinances and assure compliance thereto.

3. Where provisions for future equipment, fixtures or building expansion are required, systems equipment capacity, pipe sizing and arrangement shall accommodate proposed future demand.

4. To preclude congestion of commodities within the interstitial space located above the vivarium, the A/E team shall discuss space allocation for each of the disciplines, which include mechanical, electrical, plumbing, and controls. Each of the disciplines shall have an assigned area and/or elevation designated as their design space. When one discipline has to enter or pass through a space assigned to another discipline, they shall interface to assure access to perform maintenance on the device is possible.

5. While in many cases piping material is identified in the following sections, the NE Team should refer to the most current UTHSCSA Master Specifications for final material selection.

C. Standard

1. The piping distribution systems, with the exception of liquid nitrogen, are anticipated to be routed on a common trapeze pipe rack located in the interstitial space to provide horizontal distribution to vivarium rooms and support areas.

2. Liquid nitrogen will be supported by a dedicated hanger or riser with limited horizontal distribution.

3. Building fire protection will occupy a separate routing coordinated with other utilities.

4. Upper levels of sanitary waste, lab waste, and storm drain systems will be gravity flow systems. Basement areas will require a pumping system to a level that the systems can discharge into gravity systems.

5. Where applicable, all services will utilize chases within the building footprint for vertical routing to multiple floor levels.

6. Piping distribution systems and primary equipment will be sized using a diversity factor determined for each system based on programming.

7. Where possible, piping distribution systems should not be routed above vivarium animal holding spaces to avoid possible flooding and water damage to animals housed below the piping.

2.2 System Descriptions

2.2.1 Domestic Hot and Cold Water

A. Introduction

1. Domestic hot and cold water will be provided for all toilet rooms, emergency shower/eyewash units, all lab and vivarium areas and all other devices that require a domestic water supply. Water will also be required for process water, trap filler water, soft water and mechanical water.
2. A domestic water booster pump system will elevate the incoming water pressure to adequate levels to serve upper floors as required. Lower floors will be protected from overpressure conditions by pressure reducing valves.
3. Steam-to-water, single wall, semi-instantaneous water heaters in parallel will produce hot water for all building needs. Water heaters will be supplied with steam to the coils and have water on the shell side. Point of use booster heaters will be employed at equipment such as cage and rack washers, glass washers, and laundry facilities to address special temperature needs.
4. All hot water will be softened. Softeners will normally be duplex, automatic regeneration type. Softening equipment will also serve the animal watering RO system.

B. Background

1. Separate heaters and distribution systems shall be employed to provide process hot water to equipment such as cage and rack washers, glass washers, and other equipment as required to address special temperature needs. Water heating equipment and distribution systems shall be designed to provide the required temperature and quantity of hot water at all times.
2. Animal watering shall utilize reverse osmosis water from a dedicated system and shall be furnished as part of the packaged automated animal watering system. The animal watering system shall be designed and sized to provide a three day supply of purified water in the event there is an interruption of the facility's main incoming domestic water service.

C. Standard

1. Potable water will be supplied from the city main service line. Water will be piped to plumbing fixtures which include water closets, urinals, lavatories, lab sinks, sinks in fume hoods and all other equipment and fixtures which require water. After entering the building, the water service will be split into two systems, one system will be potable water for the public areas and the other system will be for the vivarium areas. The city main will be protected against contamination with the installation of a double check valve assembly on the incoming water service. The building water system will be protected from the vivarium water system with a double reduced pressure backflow preventer (if a booster pump is required the reduced pressure backflow preventer will be installed after the booster pump assembly).
2. The system will be designed to maintain a maximum velocity of eight fps in mains and risers, six fps in branches at design flow conditions.
3. The system will be designed to prevent water hammer conditions by providing shock arrestors for quick closing valves, individual fixtures and batteries of fixtures.
- 4 Piping will be sized to maintain a minimum of 30 psi at the most remote flush valve and 8 psi at the most remote lavatory faucet.
5. Shut-off valves will be provided at branch connections.
6. Vacuum breakers will be provided at hot and cold water hose stations and laboratory faucets.
7. A triplex booster pump will be provided (if required) to elevate the incoming water pressure so it may

reach the upper floors with adequate pressure. The pumps will be set up for a lead lag-lag operation with a split as designed by the A/E team. The size of the pumps will be determined by the estimated load of the building. Variable speed drive pumps will be used for low flow conditions.

8. Hot water will be generated from a single or multiple (depending on the load requirements) semi-instantaneous water heaters. The heater(s) temperature will be set at 120°F. The water temperature will be maintained throughout the system by the use of a re-circulation system or hot water temperature maintenance system.

9. Domestic hot water temperature shall not exceed 110 degrees F at faucet and shower outlets.

10. Incoming water service will be ductile iron pressure pipe, class 52, bituminous coated outside, push-on type joints with molded rubber compression gaskets. The lining of the piping will be cement mortar or fusion-bonded epoxy or ceramic epoxy. Fittings will be mechanical joint, ductile iron, bituminous coated outside.

11. Hot and cold water (potable and laboratory) piping 2 inch and smaller will be Type K soft annealed seamless copper tubing with wrought copper solder fittings. Joints to be applied with grade HB lead-free solder.

12. Hot and cold water (potable and laboratory) piping 3 inch and larger will be Type L hard drawn seamless copper tubing with wrought copper or cast bronze, grooved ends fittings. Joints will be rolled groove with ductile iron with copper color alkyd enamel paint coating and synthetic rubber, grade E EPDM gaskets, flush seal design, conforming to the copper tube sizes.

13. All piping, components subject to sweating, heat loss or freezing will be insulated with appropriate thickness of fiberglass insulation with a fire-resistant jacket.

14. All piping in accessible areas will be indicated with system and direction of flow through color coded labels.

2.2.2 Reverse Osmosis Water

A. Introduction

There may be several needs for pure water supply in a small animal vivarium. Some of the experimental research may need pure water supply in procedure room laboratory benches/sinks. In addition, the animal watering system is also assumed to need a pure water supply for animal hydration. The animal watering system requirements will be addressed in a separate design standard covered by Section 3.2.9, Mechanical Systems, System Descriptions, Animal Watering.

B. Background

The primary source of water comes from a state-approved domestic source such as a municipal water system. Even though approved for domestic consumption, the water quality from these sources could vary widely in trace mineral content and not be pure enough for use in wet lab experiments or for animal watering.

The National Research Council (NRC) Guide indicates animals should have access to potable, uncontaminated drinking water. Also, water quality and the definition of potable water can vary with locality. Periodic monitoring for pH, hardness and microbial or chemical contamination may be necessary to insure water quality is acceptable. Water can be treated or purified to minimize or eliminate contamination when protocols require highly purified water. The selection of water treatments should be carefully considered because many forms of water treatment have the potential to cause physiologic alterations or effects on experimental results.

In most UTHSCSA applications, the domestic/potable water quality will require both water softening to reduce mineral hardness and then further water purification, usually by reverse osmosis (RO) to provide water of the required level of purity for laboratory research and animal watering use.

Special attention should also be placed upon the high purity water distribution system piping connections and integrity.

Depending on the actual applications, the pure water requirements in laboratory space may be better met through commercial point-of-use generators thereby reducing the need for extensive piping distribution systems. In large vivarium applications, the central water treatment/RO system is probably the correct application to supply animal watering needs via a piping distribution system.

C. Data

1. Provide water softener systems to reduce hardness as required to supply water heating equipment, pure water production equipment, and other systems, fixtures and equipment which hard water may adversely affect operation or longevity. Water with a hardness of more than two grains per gallon shall not be delivered to equipment requiring softened water.
2. The facility may be equipped with a high purity water system to serve laboratory needs and other building demands requiring a pure water source. CAP type II water will be produced to meet a resistivity of 1.0 megohm/cm, and supplied to all programmed outlets. Point-of-use polishers will be utilized where higher purity is required by individual users.
3. Dedicated pure water equipment will include a multimedia filter, activated carbon chlorine removal, and double pass, staged reject reverse osmosis generator. Additional primary equipment will be evaluated based on supply water chemistry analysis and product water needs. The system will be supplied with soft water from the buildings duplex water softener system.
4. Ultra-violet lights will be used to control bio-burden build-up in the circulation system. The animal watering system will utilize RO feedwater from the central RO system.
5. A separate RO water storage tank will be located in the vivarium to provide water to the animal drinking water system. The RO water shall be chlorinated prior to filling the vivarium drinking water storage tank. The vivarium storage tank will be sized to provide a three-day supply of water.
6. Each point of use valve will be looped no greater than 6 pipe diameters from the loop to minimize the length of dead legs.
7. Each loop will be hydraulically designed with fabrication drawings being required of the Contractor to document the system installation as designed.
8. The distribution piping system from the RO system to the animal watering system will be natural, unpigmented polypropylene pipe and socket fittings with socket fusion joints. Provisions will be made in the project specifications to allow for joint sampling to ensure fabrication performance and joint uniformity.
9. High purity water will be continuously circulated in loops at 5.0 FPS velocity minimum.
10. Each outlet will be assigned a use value of 10 liters per day with an average flow rate of 1 GPM. Equipment loads will use actual manufacturer's consumption loads. All loads will be totaled, a diversity factor applied, and the primary equipment sized to provide that volume over a 12-hour period.
11. The main storage tank, located in the mechanical room, will be sized to store 4 hours of peak consumption rate, plus pipe volume, plus freeboard.

D. Standard

High Purity Water System	
Water softener required	Supply water hardness will usually require for vivarium and procedure use.

Water quality required	CAP type II, 1.0 megohm/cm
Central System vs. Point of Use?	Point of Use generators of high purity water preferred for laboratory applications. Central system probably required for supply to animal watering system.
RO water requires recirculation	Yes, at 5 fps minimum flow. Recirculating RO water should be treated by ultra-violet lights.
RO water distribution piping	Natural, unpigmented polypropylene pipe and socket fusion joints. Fusion process must be reviewed and approved by owner before allowed on job.
Dead legs	Minimize to within 6 pipe diameters.
Capacity	Use diversity among outlets to reduce storage.

E. References

Affiliated Engineers Inc. January, 2002. Mitchell BSRB Updated Basis of Design Document. Various Sections, Section 8, Design Parameters.

2.2.3 Compressed Air

A. Introduction

Compressed air for the vivarium areas, autoclave areas, as a source for temperature control air, and for main risers will be provided at 100 psig, regulated as required, and dried to 35° F pressure dewpoint. Distribution run-outs to lab floors, will be as required for autoclaves, etc.

B. Standard

1. Production Equipment

- Air compressors will be oil-free, scroll type machines, air-cooled, in a duplex configuration. Each compressor will be sized to meet 100% of full load conditions. An alternator will rotate each compressor through the lead position to give equal run time to each machine.
- Air dryers will be refrigerated type to dry the air to 35° F pressure dewpoint. Two dryer units will be

provided, each capable of 100% air load.

- c. Coalescing and particulate filters will be provided after each compressor.
- d. Particle filters will be provided downstream of the dryers. Filters will be in parallel with pressure indicators, sized for 100% of systems flow. Particle size of filtration will be 0.1 micron absolute.
- e. The air compressors will be sized by totaling the CFM required per outlet and using a diversity factor based on the total number of outlets. An air receiver will be provided to absorb heavy system intermittent demand.
- f. Mains and risers will be sized for distribution at 100 psig.

2. Distribution System

- a. The compressed air piping system will be Type L copper tube and fittings with 95-5 lead free solder joints. Branches will be taken off the top of the mains and the piping will be pitched for drainage. The distribution system will be sized so that the uniform friction loss does not exceed 10% of the delivered pressure and the velocity does not exceed 4000 feet per minute.

3. Design Criteria

- a. Lab outlets will be assigned a flow value of 1 CFM per outlet. A diversity factor will be applied based on the total number of outlets. Other equipment requiring a compressed air supply will utilize manufacturer's data.

C. References

Affiliated Engineers Inc. January, 2002. Mitchell BSRB Updated Basis of Design Document. Various Sections, Section 8, Design Parameters.

2.2.4 Special Gases, O₂ and CO₂

A. Introduction

- 1. Special gases will be determined based on the laboratory and vivarium program.
- 2. Special gases will be supplied from a bottled manifold system located near the lab or in a location selected at design.
- 3. Each outlet will be assigned a value of 1 standard cubic foot per minute (SCFM) The system will be sized based on the total of all the outlets.
- 4. Piping will be stainless steel or piping appropriate for the type of gases required.
- 5. After the piping has been installed it will be purged internally with clean dry compressed air of sufficient quantity that will dislodge sediment or dirt.

B. Background

In addition to the special, unidentified gases noted above, this design standard section will also cover the use of specific gases to include oxygen (O₂) and carbon dioxide (CO₂).

C. Standard

1. Oxygen

- a. Gaseous oxygen for the procedure rooms will be provided at a pressure of 50 pounds per square inch gauge (psig) at the most remote outlet.
- b. Oxygen source will be from a cylinder room or similar area with distribution to the required point of use.
- c. The system piping will be sized by totaling the CFM required per outlet and using a diversity factor based on the total number of outlets.
- d. The oxygen piping system will be Type K copper tube and fittings pre-cleaned and capped for oxygen service per NFPA 99 and ASTM 819 with brazed joints. The distribution system will be sized so that the uniform friction loss does not exceed 10% of the delivered pressure and the velocity does not exceed 4000 feet per minute.

- e. Outlets will be assigned a flow value of 1 CFM per outlet. A diversity factor will be applied based on the total number of outlets.
- f. O₂ manifolds will have automatic cylinder changeover.
- g. 4 inch and smaller use Type L hard drawn seamless copper tubing, factory oxygen cleaned, nitrogenized, capped and bagged.
- h. The fittings will be wrought copper, solder cup ends, factory oxygen cleaned, nitrogenized, capped and bagged.
- i. The joints to be brazed with alloy classification BCuP5, with continuous nitrogen gas purge.

2. Carbon Dioxide (CO₂)

- a. Carbon dioxide will come from a bottled manifold system located near the lab or in a location selected at design.
- b. CO₂ will be provided for any procedure rooms and other areas determined by the program.
- c. Carbon dioxide will be distributed to all areas programmed in Type K copper tube and fittings pre-cleaned and capped for oxygen service NFPA 99 and ASTM B819 with brazed joints.
- d. Underground piping will be Type K copper tubing oxygen pre-cleaned and capped per NFPA 99 and ASTM B819 with brazed joints.
- e. Carbon dioxide piping will be sized at 1 CFM per outlet, the flow totaled, and a diversity factor applied based on the total number of outlets. Incubators will be assigned a use flow of 5 CFM.
- f. After the piping has been installed it will be cleaned by blowing dry oil-free nitrogen gas.

NFPA 99

ASTM

2.2.5 Laboratory Vacuum

A. Introduction

The need for a central vacuum system in a small animal vivarium will be based upon the type of research conducted in the procedure rooms, surgery suites, imaging areas and necropsy rooms. The final vivarium facility program will determine the need, if any, for a central vacuum system in the facility.

B. Background

If the program requires a central vacuum system, the requirements in the following sections should be followed.

C. Data

1. The A/E team shall develop plans, schematic diagrams, schedules and details indicating all information required to clearly illustrate the intent of system design.
2. Floor plans shall include, but not be limited to location, sizes and identification of all: piping from source equipment or existing piping connections to terminals; intake and exhaust piping from source equipment to termination through roof or connection to existing piping; master and local alarm panels; alarm sensors; pressure gauges; relief valves; relief valve discharge terminals; zone valve wall cabinets; in-line shut-off and service valves; future valved connections; source equipment; inlets, outlets and slides. Schematic diagrams shall include, but not be limited to identification and sizes of all of the above information.
3. NFPA 99 guidance should be followed, as appropriate, for the design of a central vacuum system.

D. Standard

1. If required, the central laboratory vacuum system at 19" Hg (Mercury) gauge at the most remote laboratory inlet will be provided to serve all lab, fume hood, and bio-safety cabinet vacuum inlets.
2. Lab vacuum will be produced by a packaged duplex rotary screw vacuum pump system with receiver and automatic controls. Each vacuum pump will be sized for 100% of full load. An alternator will rotate each machine through the lead position to give each unit equal run time. A vacuum receiver will be installed to allow any liquids or solids introduced into the piping to be contained.
3. The lab vacuum piping system will be Type L copper pipe and wrought copper fittings with 95-5 lead-free solder joints. The distribution system will be sized so line velocities do not exceed 5000 feet per minute and total friction loss does not exceed 3.5" Hg. Vacuum exhaust piping will discharge to atmosphere and utilize Type CPVC pipe and fittings.
4. Each vacuum inlet will be assigned a load value of 0.5 standard cubic feet per minute (SCFM). The total flow will be calculated by totaling all the inlets and applying an appropriate diversity factor. In-line vacuum filters will be provided on each BSL2 and BSL3 inlet, bio-safety cabinet inlet, and other inlets as programmed.
5. Locate medical air compressors and vacuum pumps in a dedicated mechanical room in accordance with NFPA 99. Mechanical room shall provide a clean, relatively cool environment (i.e., not to exceed 100 degrees F ambient temperature). Equipment shall be located with adequate access space for regular monitoring and servicing. Provide floor drain adjacent to equipment pads. Floor drains serving vacuum pumps shall be provided with smooth, acid resistant interior coating. Provide a hose bib within mechanical room.
6. Terminate medical vacuum exhaust discharge outdoors above roof level, at least 25 feet horizontally (may be more depending upon prevailing wind direction and velocity) from all air intakes, doors, windows, louvers or any other building openings. Combine exhaust from each vacuum pump into one discharge pipe, sized for no restriction while flowing maximum discharge possible, and shall be provide with an isolation valve at the header for each pump served. Exhaust piping for vacuum pumps shall be sized using the total scfm for the system (both lead and lag pumps) and the total developed length of run. Exhaust piping shall be sized and arranged to prevent moisture and back-pressure from entering pump. Provide valved drip- leg at base of exhaust stacks. Coordinate with vacuum pump system technical representative and verify that proposed sizing of exhaust piping complies with manufacturer's recommendations.
7. Place a source shut-off valve for each vacuum and gas system at the immediate outlet (or inlet, in the case of vacuum) of the source of supply, so that the entire supply source, including all accessory equipment, can be isolated from the entire pipeline system. Provide each main line supply line with a shut-off valve. Locate valve accessible by authorized personnel only and locate downstream of the source valve and outside of the source room, enclosure, or where the main valve enters the building. Provide medical vacuum and gas services with line pressure and vacuum gauges at the source (and immediately inside the building, where source is remote from building).

2.2.6 Natural Gas

A. Introduction

A small animal vivarium will have the need for cage washing and sterilization. This process is usually done through the use of clean steam which may be produced by steam boilers or clean steam generators. The normal fuel for steam or hot water boilers is natural gas and the piping requirements for that energy source will be addressed in this section.

B. Data

All natural gas piping on the customer side of the utility meter shall be designed, installed and tested in accordance with NFPA 54, Fuel Gas Code.

C. Standard

When natural gas is required in the vivarium to support steam generation for cage cleaning and sterilization, the following requirements should be met:

1. All piping and valves shall be located and sized on drawings.
2. The A/E team shall include a natural gas system distribution schematic indicating information required to clearly illustrate the intent of system design including, but not limited to, supply source, piping mains, risers, pressure regulating valves, all shut-off valves, branch and individual connection piping to equipment and outlets. Calculated flow rates and developed piping lengths used for system design shall be noted at supply entrance, base of risers, sectional floor valves, branch piping to equipment and outlets, and at each connection to equipment and outlets.
3. The A/E team shall include details on contract drawings to clearly identify installation requirements for all natural gas system components included within the project, including but not limited to; service entrance, gas fired equipment connections, emergency shut-off valves, laboratory zone valves, pressure regulator venting, concealed pipe casing venting termination, roof penetrations, floor and wall penetrations.
4. The NE shall include schedules on contract drawings to clearly identify natural gas system demand, pressures and equipment served.
5. Building natural gas distribution systems shall be metered and valved in accordance with the gas suppliers requirements.
6. The design of building supply and distribution systems shall provide a volume of gas at the required flows and pressures to ensure safe, efficient and code compliant operation during periods of peak demand. Piping shall be sized in accordance with referenced codes and standards.
7. Natural gas pressures shall not exceed five pounds per square inch gauge on customer side of the meter.
8. Provide readily accessible manual shut-off valve outside of building at service entrance.
9. Avoid locating gas piping within confined or unventilated spaces where leaking gas might collect.
10. Do not locate gas piping beneath building slab on grade. Do not locate gas piping within stairways, electrical or telecommunications rooms.
11. Main distribution piping risers shall be located exposed within mechanical equipment rooms where possible. Where distribution mains cannot be located within mechanical equipment rooms, utilize chases within the building footprint. Natural gas piping installed above ceilings, within chases, within partitions, within spaces utilized as return air plenums, or any non- exposed location shall be encased within a sleeve vented to the exterior of the building.
12. Exposed and accessible shut-off valves shall be provided as required for proper operation, servicing and troubleshooting of the distribution system and connected components. Locations shall include but not be limited to the following; at the base of each riser, at each branch connection to risers, at each piece of equipment, where recommended by equipment manufacturer and at strategic locations to allow sectional isolation while limiting disruption of services to large portions of the system.
13. Exposed and accessible capped valves shall be provided where required for future connections.
14. Valves, regulators, flanges, unions and similar appurtenances shall be accessible for operation and servicing and not be located above ceilings, within partitions or spaces utilized as return air plenums.
15. No natural gas line, including service drops shall be smaller than 1/2" inside diameter. Local connections to individual equipment and outlets may be smaller than 3/4", as required for the particular component.
16. Natural gas piping will be Schedule 40 black steel pipe and fittings with welded joints up to the emergency shut off valves. Valves will have screwed or flanged ends. An emergency electric power shut off control will be located at lab exits. Operation of this control will close the emergency gas shut off valve and interrupt natural gas flow to the entire floor.
17. Natural gas piping will be sized at 5 CFH per outlet, the flow totaled, and a diversity factor applied based on the total number of outlets.

NFPA 45, Fuel Gas Code.

2.2.7 Liquid Nitrogen

A. Introduction

Liquid nitrogen (LN2) temperature is -320 degrees Fahrenheit. Nitrogen expands 700 times from liquid to gaseous state. These unique characteristics of LN2 provide for specific applications in refrigeration and also require unusual design attention for specific applications. Relative to applications in a small animal vivarium, LN2 could be used for cryo-biological freezing and storage of tissue samples.

B. Background

Because of LN2's low temperature, special piping and insulation requirements must be considered in the design of distribution piping and spaces that will house LN2 freezers or storage equipment.

C. Data

1. LN2 process piping must conform to the requirements of ASME B31.3 Process Piping Code.
2. Normal pressure rating for LN2 piping is 150 psig with normal applications requiring operating pressures of 20-70 psig (pounds per square inch gauge).

D. Standard

1. A liquid nitrogen supply system will be provided for LN2 freezers in the segregated freezer rooms. The liquid nitrogen source will be from an exterior bulk liquid nitrogen storage tank.
2. In these freezer rooms, liquid nitrogen will be piped to the freezers through a piping system from the exterior bulk system. Oxygen (O₂) depletion monitors will be placed in the freezer rooms. These monitors will be connected to the BAS system and alarm when LN2 leaks into the freezer room.
3. Pipe runs will be minimized to limit loss of product. Distribution piping will be vacuum insulated 304 stainless steel liquid nitrogen piping. The piping will be double wall with the inner space vacuum sealed at the factory to minimize gas conduction and convection. Multi-layer super insulation minimizes radiation and will be sandwiched between the double pipe walls.
4. Super insulation consists of multiple layers of cryogenic grade spacer paper and aluminum foil or double aluminized Mylar.
5. All carrier piping will be schedule 5, type 304 stainless steel (SS) or Invar with all interior connections welded. SS bellows are required between the inner and outer jacket to account for differential shrinkage due to temperature gradient.
6. Vacuum jacketed piping will normally be custom fabricated at the factory with 20 foot sections optimal for manufacturing and shipping.
7. Vacuum jacketed LN2 piping sections are usually joined by way of bayonet type connections in the field.
8. Pipe routing will be designed such as to minimize field connections. Pressure relief valves will be required in any spot where liquid can be trapped. Pipe should be supported by hangers every 10 feet.
9. Design team should be aware that over-all length of LN2 piping system will shorten 3-1/2 inch per 100 feet of pipe when filled with LN2 due to thermal contraction.
- 10.02 monitors in the freezer room shall alarm to the BAS upon oxygen depletion due to displacement of oxygen by the heavier nitrogen gas. The BAS should be programmed to close LN2 feed valve upon O₂ depletion in the freezer room.
11. Freezer room exhaust shall be located close to the floor in LN2 freezer rooms. Temperature sensors should also be located in the low exhaust duct to alarm to the BAS upon low temperature caused by leakage of LN2 into the freezer room.

Liquid Nitrogen Piping Requirements	
Pipe	Schedule 5, type 304 SS double walled vacuum jacketed
Insulation	Multiple layers of cryo paper and Al foil or Al. Mylar
Relief Vents	Required wherever liquid can be trapped between valves
Shrinkage	3-1/2 inches per 100 feet of pipe when LN2 filled
O ₂ Deletion Monitors	Required in freezer rooms with alarms and logic to shutoff to BAS
Room Exhaust	Must be low, 18 inches from floor
Temp Sensor	Should be located in low exhaust alarming to BAS on low temp.

Chart Industries Design Guide for Liquid Nitrogen Piping, 2004

2.2.8 Fire Protection A. Introduction

With the exception of elevator shafts and the CenterPoint Energy main power supply vault, all areas of the building will be protected by a total coverage automatic wet sprinkler system.

1. Office and general building spaces will be classified as Light Hazard occupancies.
2. Animal holding rooms, animal procedure rooms, penthouse and other mechanical areas will be classified as Ordinary Hazard Group 1.
3. Dock areas, all laboratories, including corridors between labs, will be classified Ordinary Hazard Group 2.
4. UTHSCSA Environmental Health and Safety should be consulted on all fire protection design guidelines.
5. The fire suppression system will be hydraulically designed in accordance with NFPA-13 guidelines.

B. Data

1. Areas subject to freezing conditions will be protected by a dry pipe sprinkler system.
2. Hydraulic design densities will be determined from discussions with the insurance underwriter and local fire local fire authorities. Fire hose cabinets (valve without hose) will be provided as approved by the insurance authority.
3. 2-1/2' fire department valve connections will be provided in all stairwells at each floor landing and on each floor as required so that a travel distance from a hose valve to most remote points can be serviced with a hose stream with a distance not exceeding 130 feet.
4. A fire pump and jockey pump will be provided to satisfy pressure and flow requirements for the facility to supplement the available pressure and flow from the municipal water system.
5. An appropriately sized tank will be provided to supply fire pump and be in accordance with City of Houston requirements.
6. The fire service to the building will be split from the domestic service outside the building.

C. Standard

1. Automatic Sprinklers

- a. The maximum allowable velocity permitted in the automatic sprinkler system shall be thirty-two (32) feet per second.
- b. Use fast response sprinkler heads throughout the facility.

2. Water Flow Test

- a. A water flow test must be conducted to determine the characteristics of the water supply. The water flow test shall be conducted by a licensed fire protection contractor.
- b. The insuring agency and local water department shall be present to witness the test.
- c. The procedure utilized for the test including the hydrant locations and the time of day must be recorded.
- d. For design purposes, a minimum of 10 pounds per square inch gauge (PSIG) safety factor shall be applied to the test results to allow for future fall off in the flow and pressure. The fire protection system shall be designed with this safety factor applied.

3. Piping and Fittings (See UTHSCSA Master Specifications for latest material requirements.) a.

Underground piping and fittings:

1. Pipe: Class 52 ductile iron, ANSI A21.51.
2. Fittings: Ductile iron mechanical joint, 250 lb., ANSI A2.10.
3. Lining: Cement mortar lining for pipe and fittings, ANSI A21.4.
4. Coating: Bituminous seal coating.
5. Joints: Push-on gasketed joints ANSI A21.11 with neoprene gasket.

b. Interior above ground piping and fittings:

1. Piping: Welded or seamless black steel pipe, ASTM A53, A135 or A795.
2. Class: Schedule 40 for 6" in. and smaller and Schedule 30 for 8" in. and larger.
3. Fittings: Malleable iron threaded, Class 150 or 300 ANSI B16.3 as required due to system pressure.
4. Fittings: Cast iron threaded, Class 125 or Class 250, ANSI B16.4 as required due to system pressure.
5. Fittings: Malleable iron mechanical grooved fittings and couplings ASTM A-47, 500 psi minimum with EPDM gasket, U.L. Listed or F.M. Approved.
6. 2" through 6" size — rolled groove type; 8" size and larger — cut groove type
7. Fittings: Factory fabricated wrought steel butt-welded, ANSI B16.9.
8. Fittings: Cast iron flanged, Class 125 or 250, ANSI B16.1 with 1/8" minimum, red rubber gaskets.

NFPA 13.

2.2.9 Sanitary Waste and Vent**A. Introduction**

A sanitary waste and vent system will be provided to drain all domestic waste producing fixtures, lab sinks, mechanical equipment, and all animal areas. All fixtures will be trapped and vented to atmosphere. The building system is anticipated to flow by gravity to the exterior municipal sanitary sewer. Lift pumps will be provided to serve areas incapable of gravity flow. The duplex sanitary ejector will have each pump sized at 100%. The duplex systems will have a removal system for each pump.

B. Background

1. The NE shall develop plans, schedules, isometric or flat riser diagrams and details indicating all information required to clearly illustrate the intent of system design. All piping shall be located and sized on contract drawings.
2. Floor plans and riser diagrams shall include, but not be limited to identification of all sanitary waste piping from fixtures to connection to exterior sewer, all vent piping from fixtures and stacks to termination through roof, cleanouts, fixture and equipment identification, traps and trap primer lines.
3. Calculated fixture units used for system design shall be noted at house drains exiting the building, base of stacks, floor branch connections at stacks, ejector pump system discharge and interceptor inlets.
4. Invert elevations shall be noted at all drains exiting the building perimeter, connections to exterior sewers, uppermost point of each main and branch line located below ground level, and all other points where required to clearly establish proper slope and coordination with other piping systems and building components.
5. Bottom of pipe elevations shall be noted for unburied piping at locations where close coordination is required to prevent conflicts with other systems and/or building components.
6. Graphically identify each stack on plans and riser diagrams. Stack identification on riser diagrams shall correspond to stack identification on plans. Graphically indicate floor levels and floor elevations on riser diagrams.
7. Details shall be provided for, interceptors, cleanouts, roof penetrations, floor and wall penetrations, sewage ejector pump systems and all other components that require installation explanation beyond the information included within plans and riser diagrams.
8. Schedules shall clearly identify: Capacity, size, model, options and other requirements for all interceptors and sewage ejector pump equipment; Piping materials and piping support spacing.

C. Data

1. The waste systems will be designed using fixture drain loads established by the governing State and local codes, maintaining a minimum 2 FPS velocity.
2. Condensate waste will be insulated to a point 20 feet downstream of the point of origin.
3. A sampling manhole will be provided on the building sewer prior to connection to the municipal sanitary sewer.
4. Cleanouts will be accessible from walls or floors and interstitial levels.

D. Standard

1. Sanitary waste and vent systems shall be provided for all plumbing fixtures, floor drains, food service fixtures and equipment, and all other domestic waste producing equipment, systems and devices that are required by code to discharge into the sanitary sewer.
2. Waste and vent systems shall be designed using fixture drain loads established by code and provide

proper operation during periods of peak demand.

3. Main waste and vent stacks shall utilize chases or be located adjacent to columns where possible for vertical routing to multiple floor levels.
4. Capped waste and vent connections for future extensions shall be located accessibly and not extend more than 24" from an active line. Waste and vent connections shall be located at elevations that will allow future installation of properly sloped piping without the need to dismantle or relocate installed ductwork, piping, conduit, light fixtures, etc.
5. The building system is anticipated to flow by gravity to the exterior municipal sanitary sewer. Sanitary waste serving fixtures located below the 500 year flood plane or waste that cannot be discharged by gravity shall flow into a gas-tight, covered and vented sump from which the waste shall be lifted by automatic pumping equipment and discharged into a sanitary waste drain capable of gravity flow. Sewage ejector pumps shall be minimum duplex system sized to discharge peak calculated load with one pump out of service. Pumps shall be connected to emergency power source. Sumps and ejectors handling sewage shall not receive storm or subsoil/foundation drainage.
6. Above ground floor drains, P-traps and first 20 feet of connected drainage piping receiving condensate or ice machine waste shall be properly insulated to prevent condensation.
7. Provide cleanouts at locations and with clearances as required by the code, at the base of each waste stack and at intervals not exceeding 90 feet in horizontal runs. All interior cleanouts shall be accessible from walls or floors. Coordinate the location of all cleanouts with the architectural features of the building and obtain approval of locations from the Project Architect.
8. No buried waste line shall be smaller than 2". No vent line shall be smaller than 1-1/2". No roof vent terminal shall be smaller than 3". Waste piping serving water closets shall not be smaller than 4".
9. Locate all sanitary vent terminals a minimum of 25 feet horizontally from or 3 feet vertically above all air intakes, operable windows, doors and any other building openings.
10. Avoid locating drains above sensitive equipment or areas where water leakage would cause major property loss or contamination, including but not limited to computer data centers, food preparation, food storage, animal holding rooms, etc.
11. Do not locate drainage or vent piping within stairways, electrical or telecommunications rooms.
12. Provide floor drains in all toilet rooms that are designed to be occupied by more than one user at a time (e.g., containing two or more water closets or a combination of one water closet and one urinal).
13. All traps shall be properly vented in accordance with the applicable code.
14. Provide automatic trap primer for all floor, floor sinks and hub drains that may be susceptible to trap seal evaporation.
15. Provide a submersible sump pump in each elevator pit. Sump pumps shall be simplex, plug in type with automatic, float actuated on/off control. Pump discharge shall not be directly connected to storm or sanitary systems. Electrical service shall be connected to emergency power source. Provide electrical power switch for pump control and a hose bib for pump effluent discharge. Locate switch and hose bib within access of elevator door.
16. Sanitary waste and vent piping serving all domestic waste fixtures and animal areas will be heavy-duty, cast iron, pipe and fittings.
17. Cast iron pipe sizes 8" and smaller will utilize standard weight, no-hub couplings. Cast iron pipe sizes 10" and larger will be hub and spigot with Tyseal gasket push joints.
18. Lab sinks and cup sinks in hoods will be piped with schedule 40 flame retardant polypropylene pipe and fittings with mechanical joints. Fixture traps and branches will be polypropylene. Branches will then connect to the main cast iron sanitary waste and vent system.

E. References

Affiliated Engineers Inc. January, 2002. Mitchell BSRB Updated Basis of Design Document. Various Sections, Section 8, Design Parameters.

2.2.10 Storm Sewer

A. Introduction

A storm water drainage system will be provided to convey rainwater from roof and area drains to the site municipal storm sewer system. The system is anticipated to flow by gravity to the site storm water system. Lift pumps will be duplex with each pump sized at 100% provided to serve areas incapable of gravity flow. A building subsoil foundation drain system will be provided as determined by soil boring analysis.

B. Background

1. The NE shall develop plans, schedules, isometric or flat riser diagrams and details indicating all information required to clearly illustrate the intent of system design. All piping shall be located and sized on contract drawings.
2. Floor plans and riser diagrams shall include, but not be limited to identification of all roof drains, area drains and piping.
3. Area square footages used for system design shall be noted at each roof drain, area drain, house drains exiting the building, base of downspouts, branch connections at downspouts, and sump pump system.
4. Invert elevations shall be noted at all drains exiting the building perimeter, connections to exterior sewers, uppermost point of each main and branch line located below ground level, and all other points where required to clearly establish proper slope and coordination with other piping systems and building components.
5. Bottom of pipe elevations shall be noted for unburied piping at locations where close coordination is required to prevent conflicts with other systems and/or building components.
6. Graphically identify each roof drain, area drain and downspout on plans and riser diagrams. Identification on riser diagrams shall correspond to identification on plans. Graphically indicate floor levels and floor elevations on riser diagrams.
7. Details shall be provided for, cleanouts, roof drains, area drains, sump pump systems, roof penetrations, floor and wall penetrations, and all other components that require installation explanation beyond the information included within plans and riser diagrams.
8. Schedules shall clearly identify: Capacity, size, model, options and other requirements for all sump pump equipment; Piping materials and piping support spacing.

C. Data

The storm water system will be designed using 8" per hour rainfall intensity in conjunction with code established areas-to-pipe sizes allowed. Horizontal piping inside building will be insulated.

D. Standard

1. Storm water drainage systems shall be provided to convey rainwater from roof and area drains to the site municipal storm sewer system. Secondary emergency overflow systems shall be installed to protect parapeted roof structures in the event of primary system blockage. The overflow system shall utilize parapet scuppers or secondary piping discharging through the exterior building wall immediately below the roof level. Aesthetics of scuppers and/or secondary piping termination shall be determined by the Project Architect.
2. Primary and secondary roof drain systems shall be designed using 8" per hour rainfall intensity in conjunction with code established areas-to-pipe sizes allowed.
3. Storm drains that cannot be discharged by gravity shall flow into a gas-tight, covered and vented sump from which the drainage shall be lifted by automatic pumping equipment and discharged into a storm drain capable of gravity flow. Storm water lift pumps shall be minimum duplex system sized to discharge maximum calculated load with one pump out of service. Pumps shall be connected to emergency power source. Sumps and lift pumps handling storm drainage shall not receive sanitary drainage.
4. Roof drainage system shall not connect to subsoil/foundation drainage or any open storm drain piping located within the building.
5. Roof drain and emergency overflow drain sumps and horizontal piping to first vertical downspout shall be

insulated to prevent condensation.

6. Provide cleanouts at the base of each vertical downspout and at intervals not exceeding 90 feet in horizontal building drain. Provide clearances as required by code. All interior cleanouts shall be accessible from walls or floors. Coordinate the location of all cleanouts with the architectural features of the building and obtain approval of locations from the Project Architect. Horizontal roof drain piping located above building ground floor level will not require cleanouts.

7. No roof drain shall have an outlet connection smaller than 3".

8. Avoid locating drain sumps or piping above sensitive equipment or areas where water leakage would cause major property loss or contamination, including but not limited to computer data centers, MRI rooms, food preparation, food storage, food serving, animal housing care areas, etc.

9. Do not locate drain sumps or piping within stairways, electrical or telecommunications rooms.

10. Appropriate subsoil and foundation drainage shall be provided as required by the geotechnical report. Due to elevations of foundations and city utilities, all subsoil drainage shall be discharged from the building through a lift station with duplex pumps. Each pump shall be sized for 100% of design capacity. Sumps and pumps handling sub-soil/foundation drainage shall not receive any sewage or roof drainage.

11. All interior downspouts and interior storm drainage piping, and all such piping up to a point five feet (5') outside the building walls, or to any other point indicated on the Drawings, shall be service weight cast iron soil pipe, hub and spigot for pipe ten inch (10") and larger and hubless for eight inch (8") and smaller. Each piece of pipe and each fitting shall be coated at the factory with asphaltum or coal tar pitch and with the manufacturer's mark or name cast on it.

12. Exterior storm water drainage piping from a point five feet (5') outside building walls or to point shown shall be ductile iron pipe with restrained mechanical joints.

2.2.11 Site Utilities

A. Introduction

1. Water services shall be brought to the site from the Municipal system. Domestic, fire protection, and lawn irrigation water supply systems shall be metered and isolated from the municipal water supply in accordance with City of Houston requirements.

2. Sanitary Sewer services shall be brought to the site from the Municipal system. Provide sanitary drainage system to serve site and structures.

3. Storm Sewer services shall be brought to the site from the Municipal system. Provide storm drainage system to serve site and structures.

4. Natural gas service shall be brought to the site from the Local Gas Supplier's System. Coordinate with Gas Company for service line easement and meter placement requirements. Coordinate routing of gas service with other site utilities.

B. Background

1. The site utilities will be designed by an approved and licensed Civil Engineering consultant.

2. Sanitary and storm drainage systems shall be entirely separate.

3. All storm sewer lines and structures shall be constructed according to City of Houston standards.

4. Provide on-site detention as required by the City of Houston.

5. All sanitary sewer lines and structures shall be constructed according to City of Houston standards.

6. All site natural gas lines and structures shall be constructed according to NFPA 54 and the Gas Company's

standards.

C. Standard:

1. Water Services

- a. Provide fire hydrants as required by City of Houston Fire Marshal. Maximum spacing between hydrants should not exceed 300 feet. Locate such that any portion of the exterior of any building shall be within 300 feet of a hydrant, with consideration given to accessibility and obstructions. Nominal distance between a fire hydrant and the building fire department connection should not exceed 100 feet.
- b. The building water supply will be provided by the existing municipal water main.
- c. The building fire protection water supply will be provided from the building water system.
- d. The building water supply will connect to the existing municipal water main. A single feed will run into the building and split inside the building to a domestic supply and fire protection supply. Backflow protection to the municipal main will be provided in the form of parallel reduced pressure backflow preventers.
- e. The building fire protection water supply will be a sub-system of the building's internal water supply. A fire department Siamese connection will be provided.

2. Sanitary Service

- a. The building sanitary sewer will flow by gravity to the city sanitary sewer system. Manholes will be placed approximately 200 feet apart.
- b. System design shall prevent site sanitary waste water from flowing into the building piping systems. Provide backwater valves manufactured by Tideflex on inlet piping of manholes, area inlets or junction boxes directly receiving discharge from building systems.
- c. Wastes which are likely to damage or increase maintenance costs on the sanitary sewer system, detrimentally affect sewage treatment, or contaminate surface or subsurface waters, shall be pretreated to render them innocuous prior to discharge into a drainage system. Provide detailed plans and specifications of the pretreatment facilities to the Municipal Authority when such plans and specifications will aid in enforcing the provisions of the Municipality's Codes, Laws or Ordinances. Piping conveying wastes from their point of origin to sewer connected pretreatment facilities shall be of such material and design as to adequately perform its intended function to the satisfaction of the Administrative Authority. Drainage discharge piping from pretreatment facilities or interceptors shall conform to standard drainage installation procedure.
- d. Provide interceptors for all drainage that may contain grease. Interceptors shall be precast concrete with two-compartments (construction and size based on the City of Houston Plumbing Code). Each compartment shall be provided with two gas and water tight 24" minimum diameter manholes for access. Interceptors shall be properly vented to atmosphere and located outside the building footprint convenient to vehicular access for servicing. Provide waste sampling well immediately downstream of interceptor per City of Houston requirements.
- e. Provide chemical waste treatment basins when effluent is expected to have a pH less than 6 or more than 10 before discharging into municipal sewer systems. Basins shall be provided with gas and water tight cover of adequate size for servicing. Basins shall be properly vented to atmosphere and located outside the building footprint convenient to vehicular access for servicing. Provide waste sampling well immediately downstream of basin per City of Houston requirements.
- f. Effluent having a temperature above 113° F shall not be discharged to the municipal drainage system.

3. Storm Sewer Service

- a. The building storm sewer will flow by gravity to the city storm sewerage system. Manholes will be placed approximately 200 feet apart. Multiple storm sewer connections are anticipated due to the area being drained.

b. System design shall prevent site storm water from flowing into the building piping systems. Provide backwater valves manufactured by Tideflex on inlet piping of manholes, area inlets or junction boxes directly receiving discharge from building systems.

4. Natural Gas Service

a. The A/E team shall investigate natural gas availability, service location, available service pressure, and any restrictions on the use of the natural gas. Interruptible and non- interruptible gas services shall be evaluated regarding program requirements. Ownership and maintenance of proposed gas service shall be determined. Include an "allowance" in the project equal to the estimated costs (quote) of the utility company as a separate item in design phase estimates.

b. Unless otherwise approved by The University, the A/E shall include all costs associated with the installation of gas service (including materials, labor, procurement, scheduling, etc.) in the bid documents as the Contractor's responsibility, both during bidding and construction.

c. Where natural gas service piping, meters, regulators, and other appurtenances are provided by the utility company, and the construction costs are assessed to UTHSCSA, the A/E shall obtain from the utility company a written scope of work, quote, contact person, and any scheduling requirements.

d. Finished site work, such as concrete/asphalt paving, seeding, directly related to the natural gas line installation, or other miscellaneous work associated with the natural gas service installation shall be determined and defined in the bidding documents as the responsibility of the contractor, rather than the utility company.

e. Natural gas pressures shall not exceed five pounds per square inch gauge on customer side of the meter.

Site Utility Services	
Pipe Material:	Sanitary sewer piping will be heavy duty cast iron.
(See Master	Storm sewer piping will be reinforced concrete piping.
Specifications)	Water supply will be Class 52 ductile iron piping.

3. Mechanical Systems

3.1 General Criteria

3.1.1 Temperature & Humidity Design Conditions

A. Introduction

Laboratory animals must be housed in comfortable, clean, temperature and humidity- controlled rooms. Animal welfare must be considered in the design process and the HVAC system must provide a comfortable environment for both the research animals and human staff. There can be a marked difference between the

environment in the primary and secondary enclosure. Temperature/humidity ranges are recommended for the secondary enclosure (animal room) with the historical assumption that these conditions produce an acceptable environment.

B. Background

Most laboratory animals prefer a relative humidity around 50%, but can tolerate a range of 30 — 70% as long as it remains relatively constant and the temperature range is appropriate. The ventilation system should be capable of adjustments in dry-bulb temperatures of IC (± 2 F) and usually range from 61F to 84F.

C. Standard

Recommended Dry-Bulb Temperatures and Humidity for Animal Housing		
	Temperature (°F)	Humidity
Mouse	64F to 79F	40-70% RH
Hamster	64F to 79F	40-70% RH
Guinea pig	64F to 79F	40-70% RH
Rabbit	61F to 72F	40-70% RH
Dog	64F to 84F	30-70% RH
Non-human primate	64F to 84F	45-70% RH
Chicken	61W to 81F	45-70% RH

3.1.2 Building HVAC Loads

A. Introduction

In the past UTHSCSA has not required the MEP consultant to provide building load calculations for vivaria, labs or any other type building. It is the intent of this document to require the consultant to provide electronic load calculations for all projects. The intent of this process is to identify room requirements early in the design so that there is an understanding of what cooling load is anticipated for each room in the building. The load calculations and associated notes made in the software inputs will:

1. Allow all parties to review and agree on what is anticipated for each room early in the project.
2. Serve as a basis of design document that can be updated as project changes are made.
3. Allow utilities management to plan for chilled water and steam requirements early in the project.
4. Select most stringent requirement to determine room air quantity (heat load or air change).
5. Allow user to see how many animals were assumed in the room calculation (notes).
6. Allow user to see what equipment was assumed in the room calculation (notes).
7. Allow verification of envelope energy requirements.

B. Background

Computer based HVAC load calculation programs have been available for many years and are typically used by most consultants on all projects. What is being asked of the consultant that is normally not done, is to itemize a list of equipment expected for each room as well as assumed animal counts. The software is

generally used for commercial applications. Inputs are specific to lighting, equipment, people and the building envelope. Therefore, the equipment input must sum up the animal and equipment heat loads. To allow all parties to know what is included in the equipment input, the notes section for each zone will break down how many animals were used for the calculation and what equipment and heat load was assumed for the calculation. Additionally, the notes shall describe other room requirements such as: type and number of BSCs expected in the room, quantity of exhaust required for the BSC or the room, and relative room pressurization (positive or negative), etc.

C. Data

In past projects, identification of specific room requirements has been limited to the programming architect or the equipment consultant. Eventually, the information is then forwarded to the engineer to begin the design process. The goal is to include the engineer early in the design process so that a document is generated that clearly identifies specific room requirements. These room requirements can then be calculated and submitted to The University for review prior to system layout or equipment selection. The goal is to speed up the design process by allowing faculty, users, project managers and internal engineering to review one design document all at one time. The review comments are then incorporated into the load calculation software, verified and then used by the engineer to begin the design of the supply and exhaust systems.

D. Standard

The consultant shall input all project rooms/entire building heat loads into the calculation. The software employed by the consultant shall include all ASHRAE standards. The UTHSCSA preferred software is Elite Software — CHVAC Commercial HVAC Loads. The load calculations shall be based on project programming and shall be submitted to The University through the project manager for review by all parties. An architectural floor plan with room numbers shall be provided to correlate the plan with the load calculation printout.

ASHRAE Handbook —Fundamentals. 2005.

3.1.3 Noise and Vibration

A. Introduction

Many animals are extremely sensitive to noise and vibration, which can produce detrimental effects on research. Designers shall take every opportunity to control vibration and to locate vibration sources away from animals and activities sensitive to vibration. Specific vibration recommendations shall be made by an experienced vibration consultant early in the design process. Steel structures shall not be precluded for use in structural design relative to vibration without analysis. Blanket use of sound attenuators at the room zone level should be avoided.

B. Background

Animal housing and most procedure spaces should be carefully designed to facilitate animal wellbeing; meet research requirements; minimize experimental variables; and provide isolation from wide variations in vibration and noise sources.

Noise controls should be considered in all facility designs and operations. Moreover, the facility should assess the following factors: intensity, frequency, rapidity of onset, duration, vibration potential of sound, hearing range, noise-exposure history, and sound-affect susceptibility of species, stock, or strain. Exposure to sound louder than 85 dB can have numerous adverse affects on animals. Examples of these adverse effects include: increased nervousness, irritability, hearing impairment, anxiety, hypertension and decreased productivity.

When designing a renovation or new construction all items should be considered and noise abatement measures should be implemented as needed. When selecting sound absorption materials, the ergonomics of sanitizing and handling the materials in the facility should also be kept in mind.

Consideration shall be given to vibration of floor-framing systems caused by mechanical and electrical equipment such as pumps, chillers, fans, emergency generators, and transformers and other sources such as foot traffic, parking garage traffic, and movement of heavy equipment.

Designers should consider the effects of noise generated by equipment and materials in facilities. Likewise, designers should separate animal housing and procedures areas from high noise areas and activities and consider installing sound attenuating material as needed. Small-animal holding rooms should be located convenient to a central cagewash, but at a minimum they should be separated from the cagewash by a corridor. Likewise, to minimize the impact of noise and vibration, the holding rooms should be separated from mechanical rooms or other noise-generating areas in the facility. This is particularly necessary for barrier areas where genetically sensitive animals are housed.

Rodents can hear ultrasound. Their hearing range is from 20 Hz to 100 KHz. Since ultrasonic motion detectors transmit ultrasonic sound waves in the frequency range from 25 KHz to 40 KHz, the lab rodents may be subject to auditory stress. A sister cancer research institution had ultrasonic motion detectors installed in the vivarium corridors. The ultrasonic sound waves could not penetrate the walls at low level. However, when the doors of the animal rooms were opened, the rodents were stressed with full level of ultrasound which

decreased reproductive performance. After the removal of the ultrasound sources, the rodents reproductive performance returned to normal levels.

C. Standard

To control vibration transmitted into the animal facility space, the NE team shall consider the following items during the early design phases:

Noise and Vibration Standard	
Recommendation	Justification
Structural system should have relatively short column spacing and be relatively stiff so that any transmitted vibration occurs at high frequencies.	Vibrations occurring at higher frequencies are more easily dampened with instrumentation vibration-dampening systems and isolation tables than vibrations occurring at lower frequencies
Framed floors, corridors and animal facility spaces should not be combined in the same structural bay.	To reduce vibration occurrences and reduce detrimental effects on research animals and personnel.
Animal facility spaces should be located away from sources of vibration.	To reduce vibration occurrences and reduce detrimental effects on research animals and personnel.
Animal facilities should be located on grade- supported slabs.	This not only reduces vibration concerns but more easily accommodates pits required for cage and rack processing, and the risk of water leakage to lower levels is eliminated.

Ultrasonic motion detectors should not be used for lighting controls or security.	Ultrasonic motion detectors should not be used in vivarium corridors. Ultrasound noise levels should not be more than 15 dB above normal (ambient) ultrasound levels in cage rack rooms. Other possible application is passive infrared (P I R) occupant sensors.
Small-animal holding rooms should be separated from the cagewash by a corridor.	To reduce vibration occurrences and reduce detrimental effects on research
Vibration isolators should be installed appropriately on equipment that may be a source of vibration.	To reduce point source vibrations and reduce detrimental effects on research animals.

3.1.4 Building Pressure Relationships

A. Introduction

Differential pressures can be used to inhibit the passage of pathogenic material between rooms. Higher pressures are used in clean areas relative to dirty or bio-hazardous areas in order to minimize contamination.

B. Background

Consideration should be given to the manipulation of air-pressure differentials in surgical, procedural, housing and service rooms. For example, areas for quarantine, housing of nonhuman primates, and use of animals exposed to hazardous agents should be kept under relative negative pressure; whereas areas for surgery, for clean-equipment use and storage, and for housing of pathogen-free animals should be kept under relative positive pressure with clean air.

The HVAC system must be adequate and adaptable so that pressure relationships can be modified as required over the life of the facility.

C. Standard

Room Type	Negative	Positive Pressure
Quarantine rooms	X	
Housing rooms of non-human primates	X	
Housing rooms for animals exposed to	X	
Cage wash - Soiled side to corridor	X	
Cage wash — Clean side to corridor		X
Necropsy rooms	X	
Autoclave - Equipment preparation	X	
Autoclave — Sterile staging		X
Surgery		X
Clean-equipment use and storage rooms		X
Housing rooms of pathogen-free animals		X

Bedding and feed storage rooms		X

3.1.5 Pipe Sizing A. Introduction

Steam, chilled and heating hot water piping represent the majority and largest piping systems serving the vivarium and support spaces. These systems support all the air handling systems and the vivarium process equipment, and are part of the heating, ventilating and air conditioning (HVAC) system. Pipe systems such as storm, sanitary, domestic water, reverse osmosis (RO) water, lab gases, LN2, fire protection, etc. although equally as important, have been excluded from the general sizing criteria since project specifics in many cases drive the design and sizing criteria. The following criteria shall be used in sizing the HVAC piping systems:

1. All piping sized for actual need without over sizing, to minimize initial pipe, valve, fitting, insulation and installation cost.
2. All piping sized for actual load to avoid unnecessary energy losses through pipe, steam piping in particular.
3. Maintain lower steam velocities near vivarium areas as needed to avoid noise transmission into occupied spaces.
4. Maintain higher chilled water delta where possible to reduce pipe sizes.

B. Background

To maintain the cooling and heating needs of the vivarium, the steam, steam condensate, heating hot water and process water systems shall be sized to accommodate current and future needs. Sizing for future load should be included only when an actual load is anticipated. System diversity should also be considered by the A/E team at the various building mains and risers. Smaller branch piping directly off the main and the end of mains, should follow the tabled criteria below.

C. Data

Based on reviewing many past UTHSCSA projects, HVAC piping is always generally over sized. The NE team shall look at possible diversity in the different systems to avoid the additional cost associated with oversized pipe. There are no known utility problems associated with pipe mains being too small.

D. Standard

HVAC Piping Sizing Requirements		
Item		Direction
Chilled and Process Water		
% " to 2"		2-3 ft friction loss per 100 ft of pipe.
2" and greater		3-4 ft friction loss per 100 ft of pipe.
Heating Hot Water Piping		
% ' to 2"		2-3 ft friction loss per 100 ft of pipe.
2" and greater		3-4 ft friction loss per 100 ft of pipe.
Steam Piping		
Low (5-15 PSIG) and (16-80 PSIG) pressure piping	Medium	50-80 ft per second (3000-4800 FPM)

High Pressure Piping	
(81-120 PSIG)	80-100 ft per second (4800-6000 FPM)
Condensate Return Piping	
5-30 PSIG return line	Maximum 10" water gage per 100 ft of travel using twice the running load.
31 PSIG and greater	66 ft per second maximum.

3.1.6 Ductwork Sizing**A. Introduction**

Sheet metal ductwork distributes supply air or gathers exhaust air from the various vivarium spaces. Duct size, along with duct construction class determine the limits at which air can be effectively moved by the building air handling units and exhaust fans. Since duct construction is so intertwined with duct sizing, both topics are discussed herein. A typical duct system will include low and medium pressure duct construction classes. Generally, the duct sized for a low pressure class has a lower duct velocity or FPM (feet per minute) and requires less rigidity than a medium pressure duct that has a greater duct velocity. The lower velocity duct is normally at and around the room air device and is separated from the higher velocity medium pressure duct mains by a terminal unit that acts like a pressure regulator. This allows the main distribution ductwork to be smaller and maintain higher velocities which in turn reduces initial cost and requires less space above the ceiling. Exhaust systems requiring HEPA and charcoal filtration fall into the high pressure construction class. The duct classes are typically broken out as follows:

1. Low Pressure Ductwork - 2" water gauge (pressure measurement)
2. Medium Pressure Ductwork - 6" water gauge (pressure measurement)
3. High Pressure Ductwork - 10" water gauge (pressure measurement)

Once installed, each pressure class of duct is tested with an inclined or U-tube manometer, tubing, calibrated orifice and a test fan. Before the system ducts are attached to their respective fans or terminal units, a tube is inserted into the duct being tested. The other end of the tube is attached to one end of the manometer. The test exhaust fan is then energized and regulated to raise the fluid (water column or gauge) in the manometer to a 2", 6" or 10" differential as needed to meet the duct pressure class being tested. During the test the duct should not experience any opening of joints, tearing of joint corners, screw or rivet pullout, longitudinal seam separation, sealant failure or excessive deflection (oil canning). If any of these occur, the affected area shall be evaluated for repair or replacement, corrective measures taken and the entire system retested.

B. Background

To maintain the requirements of the vivarium, the duct systems must move air as efficiently and quietly (85 dB or less) as possible. The duct systems must also be constructed to withstand abnormal conditions which occur during loss of power, control failures or equipment failures. The duct systems must also accommodate normal air fluctuations associated with variable air flow without any flexing or oil canning of the ductwork. Oil canning of any ductwork is unacceptable in the vivarium. Typically, round duct is less susceptible to oil canning and is preferred.

Improperly sized duct, normally undersized, can cause discomfort or insufficient air change rate in vivarium spaces because designed air quantities cannot be achieved. Undersized duct and improper duct fittings also require the amount of horsepower needed to supply and exhaust vivarium spaces to increase. When the horsepower increases, the static pressure in the duct also increases and so will the air noise in the duct. If the duct static pressure increases beyond the limits of the duct construction rating, duct failures can occur. The duct static pressure ratings and criteria noted in the table below are minimum standards. The AE team shall fully investigate the duct systems required for the project and increase the duct size and

construction class as required to meet specific project requirements. The AE team shall also carefully review ductwork shop drawings so that ducts, fittings and transitions effectively move air without increasing system static pressures. The duct systems should deliver the air to and from the building in the most efficient manner through proper duct sizing. Ductwork, however should not be oversized.

C. Data

Based on shared experience between designer and maintenance provider, the following elements listed in the table below should be used in designing a UTHSCSA vivarium.

D. Standard

Ductwork Sizing and Construction Requirements Vivarium and Support Areas	
Item	Direction
Supply duct from air handling unit (AHU) to risers and mains. Exhaust duct from mains and risers to exhaust fans.	Galvanized duct (unless otherwise noted) constructed to 6" pressure class. Duct sized for maximum friction loss of 0.157100 ft or 2000 FPM velocity, whichever is lower. Vertical risers serving multiple floors may be sized at 2500 FPM. End of main shall be sized for .057100 ft.
Supply duct from main to terminal unit. Exhaust duct from terminal unit to main.	Galvanized duct (unless otherwise noted) constructed to 6" pressure class. Maximum duct friction loss of 0.127100 ft preferred.
Supply duct from terminal unit to room air device. Exhaust duct from air device to terminal unit.	Galvanized duct (unless otherwise noted) constructed to 2' pressure class. Duct sized for maximum friction loss of 0.08"/100 ft or as required to meet room noise criteria level (could involve lowering duct velocity/larger duct size).
Biological Safety Cabinet exhaust to terminal unit	Galvanized duct constructed to 6" pressure class (304 stainless steel for IIB2). 10"-12" round duct minimum. Generally duct size equals terminal unit connection size.

Chemical Fume Hood (includes Radioisotope type) to terminal unit	316 (or 304, if approved by owner) stainless steel duct constructed to 6" pressure class. 12" round duct minimum. Generally duct size equals terminal unit connection size. Duct may be connected to galvanized general exhaust main.
Cage wash exhaust from grille/equipment to terminal unit	304 stainless steel duct (unless otherwise noted) constructed to 3" pressure class. Duct sized for friction loss of 0.15"/100 ft or 1800 FPM velocity. AE to size those ducts that are moisture laden (includes tunnel and rack washer) at the 1800 FPM velocity to remove moisture. Exhaust ductwork serving grilles in large open areas in the cage wash area can be galvanized, if not subject to constant moisture.
Cage wash exhaust from terminal unit to main. Cage wash exhaust from main to exhaust fan	304 stainless steel duct meeting 6" pressure class. Duct sized for friction loss of 0.2"/100 ft or 2200 FPM velocity. AE to size those ducts that are moisture laden (includes tunnel and rack washer) at the 2200 FPM velocity to remove moisture. Exhaust ductwork serving large open areas in the cage wash area can be galvanized, if not subject to constant moisture. Where one exhaust fan system serves all vivarium general exhaust and cage wash exhaust, a dedicated main
Exhaust main upstream of filter caisson including run out to terminal unit.	304 stainless steel duct constructed to 6" pressure class. Duct sized for maximum friction loss of 0.15"/100 ft or 2000 FPM velocity, whichever is lower. End of exhaust main shall be sized for .05"/100 ft.

Exhaust main downstream of caisson, where required.	304 stainless steel duct constructed to 10" pressure class. Duct sized for maximum friction loss of 0.15"/100 ft or 2000 FPM velocity, whichever is lower.
Office Areas on Separate Air Handling Unit	
Supply duct from AHU to risers and mains	Galvanized duct constructed to 4' pressure class. Duct sized for maximum friction loss of 0.15"/100 ft or 1600 FPM velocity, whichever is lower. Vertical risers serving multiple floors may be sized at 2000 FPM. End of supply main shall be sized for .05"/100 ft.
Duct from main to terminal unit.	Galvanized duct constructed to 4' pressure class. Duct sized for maximum friction loss of 0.12"/100 ft preferred.
Duct from terminal unit to air device.	Galvanized duct constructed to 2" pressure class. Duct sized for maximum friction loss of 0.08"/100 ft or as required to meet room noise criteria (could involve lowering duct velocity/larger duct size). Runout ducts to individual diffusers may use a maximum of 6' flexible duct. Remaining runout length shall be rigid galvanized duct
Return and outside air ducts to air handling unit	Galvanized duct constructed to 4" pressure class. Duct sized for maximum friction loss of 0.10"/100 ft or 1600 FPM velocity, whichever is lower.
Return air transfer openings, boots and duct	Openings and ducts near mechanical room sized at 500 FPM, all other openings sized at 300 FPM.
Joining, Fittings, and Duct Sealing Standards (All Areas)	

Joining	SMACNA approved Flanged and gasketed transverse joints for medium and high pressure galvanized systems. Low pressure joints and transverse and longitudinal joints shall be minimum Pittsburgh Lock with sealant. All stainless steel duct joints shall be welded.
Fittings	Rectangular supply elbows shall have turning vanes, round or radius rectangular elbows shall be full radius, offsets shall be mitered or radiussed and transitions shall not exceed 30 degree angle for concentric or eccentric transitions.
Duct Sealing	All galvanized duct seams and joints must be sealed with an owner approved sealant and fiberglass scrim tape for a tighter, low leakage duct system.

3.2 System Descriptions

3.2.1 Plant Steam and Condensate

A. Introduction

Plant steam is used directly or indirectly for four processes; heating the building systems, creating clean steam, providing the heat source for washing and sterilizing of animal caging, and providing the heat source for washing and sterilizing glassware for the laboratory function. All four processes require an uninterrupted steam source to support the day-to-day vivarium operations. Generally, steam is extended to a piece of equipment for heat transfer. As the steam comes in contact with cooler surfaces, it is converted to liquid condensate. In most cases, this condensate is reclaimed and returned to the steam generator (boiler) to be reheated and returned to a high pressure gas state. However, some condensate will not be returned to the steam generator because of system inefficiencies or the condensate is not suitable for reuse. Softened makeup water is then preheated and extended to the generator to begin the steam generating process once again. Steam is either generated within the building or is generated at a central utility plant. The fuel source for the steam generation is usually natural gas.

B. Background

To maintain the requirements of the 24 hour/365 day vivarium operation, high pressure debris free steam must be extended to the various support equipment. On the Main/North Campus, steam enters the building central plant at approximately 225 pounds per square inch gauge (PSIG) (could be as high as 425 PSIG) and is reduced to 70-150 PSIG through pressure reducing stations. Each station shall consist of a 1/3 capacity pressure reducing valve (PRV), 2/3 capacity valve and a full line valved bypass (AE to confirm bypass need).

Pressure reductions greater than 100 PSI shall involve at least two reduction stages. Dedicated building steam boiler pressures should not exceed 100 PSIG. High steam pressures shall be limited to equipment within the central plant. Steam to equipment on the vivarium floor shall not exceed 80 PSIG.

Within the building main mechanical room, steam is used to heat domestic hot water, heat the heating hot water and create clean steam. Heat exchangers are used for the steam to steam or steam to heated liquid transfer. Steam to the vivarium decontamination bulk sterilizers, rack washers, tunnel washers, sterile bulk sterilizers and glassware washers and sterilizers shall not exceed 70 PSIG. Verify steam requirements with equipment supplier. Steam flow to all cage wash and glasswash equipment shall be controlled by the equipment served. Steam to clean steam generators and heating hot water exchangers shall be controlled through 1/3, 2/3 valve arrangement. All plant steam piping shall be carbon steel.

Steam traps shall be provided at steam pressure reducing stations, equipment, end of pipe run, extended pipe runs, bottom of risers, steam headers, flash tanks, etc. All high pressure steam condensate shall be routed through flash tanks before being returned to the condensate return pump receiver. At the Main/North Campus, the condensate return pump shall pump condensate to the condensate transfer pump for return to TECO. For boiler systems, the condensate return pump shall pump condensate to the de-aerator boiler feed unit to be reused for makeup to the steam boiler. Condensate return pumps shall be duplex electric or steam powered. All pressure reliefs and vents shall be extended through the roof.

Plant steam shall have no direct contact with clean steam generator vessels, clean steam piping system, clean steam de-aerator vessel or direct injection into sterilizer chambers. The AE, owner and washing/sterilizing equipment provider shall establish and coordinate washing and sterilizing requirements at the programming phase.

C. Data

Based on shared experience between user, builder and maintenance provider, the following elements listed in the table below should be used in designing the UTHSCSA vivarium.

D. Standard

Steam System Requirements	
Item	Direction
Steam Pressure Ranges PSIG	
5-14	Low Pressure
15-80	Medium Pressure
81-120	High Pressure
121-425	High Pressure (TECO)
<i>(Maximum steam pressure to equipment, although lower more efficient steam pressures are recommended. Consult washing/sterilizing equipment manufacturer for exact steam pressure, quantities and steam quality required.)</i>	
Heating Hot Water System	80 PSIG max
Domestic Hot Water System	80 PSIG max
Clean Steam Generator	80 PSIG max
De-aerator	30 PSIG max
Bulk Sterilizer	70 PSIG max
Rack washer	70 PSIG max
Tunnel washer	70 PSIG max
Glass washer	70 PSIG max
Glass Dryer	70 PSIG max
Glass Autoclave	70 PSIG max
Distribution Piping	
Steam — All pressures	Standard weight carbon steel

Condensate — All pressures	Schedule 80 carbon steel for piping smaller than 1". Standard weight for piping larger than 1"
Screwed Pipe	Low and Medium pressure steam and condensate piping smaller than 2 Y2
Welded pipe	Low and Medium pressure steam and condensate piping larger than 2", and all high pressure steam and condensate piping.
Pipe slope	Maintain gravity condensate return as much as possible. Steam piping shall slope opposite steam flow
Pressure Reducing and Control valves	Pilot operated
Boilers (where required)	Minimum 2 - Gas fired water tube boilers each at 100% capacity, on emergency power. Three boilers each at 50% preferred. Boiler designed for 100 PSIG maximum.
De-aerator (where required)	Minimum 1 — de-aerator with 1 receiver and multiple feed pumps (1 standby) all on emergency power. Unit shall be equipped with steam preheat option to maintain boiler feed water at 210 degrees. Softened water boiler feed.
Condensate transfer pump (where required)	Minimum 1 receiver with multiple pumps on emergency power (1 standby). Pumps shall accommodate TECO condensate return system pressures 35-60 PSIG and 25-150 GPM flow rate.
Condensate return pump	All condensate return pumps shall be low pressure. Electric condensate return pumps shall be duplex on emergency power. Steam pressure powered condensate return pumps require only one pump.

Blowdown separator	1 required with discharge tempered to 120 degrees maximum.
General	Boilers and de-aerators shall be of the same manufacturer where possible.

3.2.2 Clean Steam

A. Introduction

Clean steam is used for humidification and sterilization. Clean steam is considered clean because there are no chemicals (amines) added to the steam to protect the distribution piping from corrosion. This clean steam is considered suitable for injection into the supply air serving the vivarium and support area air handling units during low humidity days. A relative humidity of 50% should be maintained year round. Clean steam is also injected into the glasswash and bulk sterilizers to complete the sterilization process. Clean steam can be generated by a plant steam to clean steam exchanger or by an electric clean steam generator. The water used to generate the steam is usually a combination of condensed clean steam (condensate) accumulated in the distribution piping and reverse osmosis (RO) makeup water. These two makeup water sources are gathered at a clean steam de-aerator. The de-aerator removes the oxygen from the liquid by heating it to 212 degrees before pumping it to the clean steam generator. The generator receives the heated water and converts it to steam at the desired pressure. The steam is then distributed by way of stainless steel piping to the air handlers and sterilizers. Currently, all clean steam serving UTHSCSA vivarium is generated through plant steam to clean steam generators.

B. Background

The clean steam must be available 24 hours/365 days a year to maintain the environmental conditions of the animals. Therefore, redundant clean steam generators are required. Generally, 70 PSIG clean steam is extended to the washing and sterilizing equipment. The pressure is reduced to 15 PSIG for the clean steam humidification system serving the air handlers. All metals in contact with the clean steam shall be stainless steel to avoid corrosion in the system. This should also include pipe vents and reliefs that could allow condensation to drip and mix with the clean steam.

The AE team shall coordinate the specification of all humidification, washing and sterilizing equipment with the manufacturer, so that all metals in contact with the clean steam are made of stainless steel. Any lapse in this requirement compromises the entire clean steam system. Some individual washing and sterilizing equipment will require both clean and plant steam. Needs should be coordinated with equipment manufacturer.

C. Data

Based on shared experience between user, builder designer and maintenance provider, the following elements shall also be used in designing an UTHSCSA vivarium.

D. Standard

Clean Steam System Requirements	
Item Direction	
Steam Pressure Ranges PSIG	
5-15	Low Pressure

16-80	Medium Pressure
<i>(Maximum steam pressure to equipment, although lower more efficient steam pressures are recommended. Consult washing/sterilizing equipment manufacturer for exact steam pressure, quantities and steam quality required.)</i>	
De-aerator	30 PSIG max
Bulk Sterilizer	70 PSIG max
Rack washer	70 PSIG max
Tunnel washer	70 PSIG max
Glass washer	70 PSIG max
Glass Dryer	70 PSIG max
Glass Autoclave	70 PSIG max
AHU Humidifiers	15 PSIG max.
Distribution Piping	
Steam — All pressures	304 schedule 40, seamless stainless steel.
Condensate — All pressures	304 schedule 40, seamless stainless steel.
Welded pipe	All steam and condensate piping.
Pipe slope	Maintain gravity condensate return as much as possible. Steam piping
Pressure Reducing Valves (station)	Pilot operated. Valves sized 1/3, 2/3 with bypass.
Clean Steam Generators	Minimum 2- steam to steam generators each sized for 85 to 90% capacity. Parts in contact with clean steam shall be 304 stainless steel. Generators shall produce 70 PSIG steam. All related controls shall be on emergency power.

Packaged Clean Steam De-aerator	Minimum 1 de-aerator with 1 receiver and multiple feed pumps (1 standby) all on emergency power. Unit shall be equipped with steam preheat option to maintain generator feed water at 210 degrees. All surfaces in contact with clean steam shall be stainless steel. Where screwed pipe is required on the system, provide thread sealers or seal tapes compatible with metal and high temperature. Provide RO makeup water.
Condensate return pumps	Provide steam pressure powered condensate return pump where required. All parts in contact with clean steam condensate shall be 304 stainless steel.
Slowdown Separator	1 required, discharge blow down shall be tempered to 120 degrees maximum.

NIH Design Policy and Guidelines-Animal Research Facilities, Spring 2003.

3.2.3 Heating Hot Water

A. Introduction

Heating hot water is used for the vivarium air handlers to preheat the 100% outside air to 4550 degrees in the winter. As the air is ducted to the individual animal rooms and support areas, a hot water reheat coil in the duct further heats the air as needed to maintain the desired temperature in the animal room or support zone. Generally, a thermostat in the room controls the reheat coil and the coil is in use year round to reheat the supply air. The air handler discharge ranges from 50-52 degrees. One heating hot water system will normally serve the entire building even if other occupancy types share the building. Natural gas is used to fuel a steam boiler that allows an exchanger (converter) to convert the steam to a heating hot water source, or natural gas is used to fuel a heating hot water boiler directly. In some cases steam may be used to preheat and reheat the air. Also, in some cases, the gas boilers are outfitted to handle fuel oil as an alternate fuel, but only in an emergency. Steam preheat/reheat boilers and duel fuel boilers are not recommended.

B. Background

To meet the 24 hour/365 day environmental heating requirement of the vivarium, the heating hot water system must maintain 140-160 degrees to the building air handling units and reheat coils. Generally, a 20 degree delta between heating hot water supply and return is required year round. A circulation pump shall be provided at the

air handling unit preheat coil to maintain constant water flow through the coil. This will minimize the chance of freezing the coil when outside air temperatures are slightly below freezing.

The heating hot water system shall include an air separator and expansion tank to remove air in the piping system. The air separator shall be located on the suction side of the pump. Heating hot water return from the building shall first enter the steam to hot water exchanger/converter, then through the air separator and finally distributed to the building by the pump. Heating hot water distribution piping is generally schedule 40 black steel sized to 2 to 3 ft. friction loss per 100 feet of pipe. Where feasible, copper may be substituted for smaller branch lines. Piping shall be no smaller than 1/2"

C. Data

Based on shared experience between user, builder, designer and maintenance provider, the following elements listed in the table below should be used in designing an UTHSCSA vivarium.

D. Standard

Heating Hot Water Requirements	
Item	Direction
Entire heating hot water system	All system components including controls shall be on emergency power,
Building heating hot water pumps	End suction pumps, minimum of 2 pumps each sized for 100% capacity and on emergency power. Pumps shall be provided with variable speed drives (VSD), isolation valves, strainer, check valve, flex connectors and housekeeping pad (inertia base where required). Typical for all buildings.
Distribution piping	Piping shall be schedule 40 black steel. Small branch lines may be copper where feasible. Dielectric unions shall be provided where dissimilar metals come in contact. Gaskets in the system shall be able to meet the maximum system temperature range plus 10% increase.
Air Separator	Provide at suction to pump
Expansion Tank	Provide and connect to air separator or provide at system high point. A/E team to verify best location.
Isolation Valves	Provide heating hot water supply and return isolation valves at bottom of riser, each floor take off from riser and at each piece of equipment.

Steam to Heating Hot Water Converter/Heat exchanger (Where applicable)	A minimum of two converters each sized for 100% capacity. Three converters at 50% each preferred.
Gas Fired Hot Water Boiler (where applicable)	A minimum of two water tube boilers each sized for 100% of the building capacity and on emergency power.
AHU preheat coil pump	One in-line pump per air handling unit, on emergency power.

3.2.4 Chilled Water

A. Introduction

Chilled water is the means by which heat is rejected from the building to the outdoors. Normally, heat from lighting fixtures, people, equipment and solar radiation is transferred to the chilled water system through various heat exchange devices located throughout the building. Since the vivarium portion of the building requires 100% outside air, all ambient heat is rejected at the air handler. The additional heat gained within the vivarium will be removed by the 100% exhaust system. Rejected heat at the air handlers and exchangers is then removed from the building through chilled water return lines leading back to the chilling source. The chiller, through the use of refrigerants, re-cools the water and the chilled water is returned to the building to begin the cycle again. The chiller must at the same time reject the heat to the atmosphere through either an air cooled or water source method.

B. Background

To meet the 24 hour/365 day chilled water needs of the vivarium, chilled water typically in the range of 42 degrees, must be delivered to the building and distributed to the various air handlers to maintain interior environmental conditions. Discharge air temperatures from the air handlers ranges from 50-52 degrees. Chilled water is also delivered to the process water loop, if required. The process water loop is used to reject heat from equipment such as environmental rooms, autoclaves and other miscellaneous high heat producing equipment that requires chilled water at 60 degrees in lieu of the typical 42 degrees. Typically, the process water loop is separated from the chilled water loop by a plate and frame heat exchanger. Process water side pumps should include a redundant pump with all pumps being on emergency power.

Return temperatures from the building shall be at least 14 degrees warmer than chilled water supply during peak, or greater if returning to TECO. The AE consultant must verify the design requirements of the existing system providing the chilled water. Generally, higher chilled water temperature deltas are recommended at the Main Campus air handling unit coils to reduce the GPM (gallons per minute) flow required by the building. This allows reduced pipe size, pump size, energy use and reduced GPM requirement from TECO. Where central utility provides chilled water to secondary pumps serving a one story building or low rise portion of a high rise building or heat exchangers located at the lower levels, a bypass shall be provided around the pumps to allow pumping from the main utility pumps during light load conditions.

Chilled water distribution piping is generally schedule 40 black steel sized for 2 to 3 ft friction loss per 100 feet of pipe. Where feasible, copper may be substituted for smaller branch lines. Piping shall be no smaller than %".

C. Data

Based on shared experience between user, builder, designer and maintenance provider, the following elements listed in the table below should be used in designing an UTHSCSA vivarium.

D. Standard

Chilled Water System Requirements	
Building chilled water pumps and process water pumps	Horizontal splitcase pumps, minimum 2 pumps each sized for 100% capacity and on emergency power. Pumps shall be provided with VSD, isolation valves, strainer, check valve, flex connectors and housekeeping pad (inertia pad where required). Typical for plant, building primary or secondary chilled water pumps as applicable.
Distribution piping-Chilled and Process water	Piping shall be schedule 40 black steel. Small branch lines may be copper where feasible. Where chilled water piping also serves the high rise portion of the building, the A/E team shall investigate need for 150 PSI versus 300 PSI class fittings. Dielectric unions shall be provided where dissimilar metal come in contact.
Isolation valves	Provide chilled water supply and return isolation valves at TECO entrance, bottom of each riser, each floor take-off from riser and each piece of equipment.
Air Cooled Chiller (where applicable) Water cooled chiller and cooling tower (where applicable)	A minimum of two chillers each sized for 100% capacity and each on emergency power.

Building chilled water and process water plate and frame heat exchangers (where applicable)	A minimum of two heat exchangers each sized for 100% capacity shall be provided.
Entire chilled and process water systems serving vivarium space and equipment	Completely on emergency power along with associated controls.

3.2.5 Supply Air & Filtration A. Introduction

Supply air to the vivarium and associated support areas shall be of the best quality. Generally vivaria will require 100% outside air once through cooling. Support office areas where feasible shall be provided with a re-circulating type system. The 100% outside air from its introduction into the building, conditioning process, distribution and final dispersion into the various vivarium rooms, require significant consideration by the AE consultant. The supply air introduced into the vivarium shall be taken from the outdoors at points in the building that are free from contaminants such as vehicular emissions, sewer gases, boiler gases and lab exhaust. Wind studies shall be performed through the AE consultant prior to the design phase, to verify the selected vivarium intake area will be free of hazards when modeled for the various seasonal wind currents.

B. Background

As the air is drawn into the building through louvers, velocities shall remain low to eliminate any chance of wind drawn rain into the building and ultimately air handling unit prefilters. To maintain the 24 hour/365 day a year 52-55 degree supply air environmental requirements of the vivarium, each 100% outside air handling unit shall consist of an intake plenum, isolation damper (as needed), 30% prefilter, preheat coil (energy recovery if required), clean steam humidifier, cooling coil, fan section, sound attenuator (as needed), 90% final filter, HEPA filter (as needed), discharge plenum, isolation damper and variable speed drive. Multiple air handlers manifolded together shall be provided for the vivarium air quantity requirement, including partial redundancy in order to meet environmental conditions with one fan out-of-service. The AE consultant when designing the system shall build into the design and selection of air handling unit equipment, component failures, emergency air reduction measures and automated control sequences that maintain the environmental conditions of the animals at all times. While maintaining supply air to animal areas for environmental conditions is of most importance, the AE consultant shall also be cognizant of ultimately maintaining pressure gradients across barrier and biohazard areas. In the event pressure gradients cannot be maintained, the design and control of the supply air along with the exhaust air shall be coordinated so that all spaces at minimum remain neutral.

The supply air shall be distributed from the air handler to the vivarium spaces through galvanized ductwork designed to minimize noise transmission into the vivarium spaces during both normal operations and start-up/shut-down sequences and minimize energy losses associated with poor duct distribution or construction. Individual room supply air control shall be maintained by pressure independent terminal units outfitted with reheat coils to maintain temperature control. The terminal unit maintains a constant air quantity to the room to maintain air change rates while the reheat coil maintains space temperature. The terminal unit shall be capable of multiple air quantity set points to accommodate positive, negative or zero

air flow (as would be required by sanitization of the animal room). Terminal unit upsizing generally will minimize the noise transmission into the rooms. Although not preferred, some applications may require an additional sound attenuator for noise control. Low pressure galvanized ductwork from the terminal unit to the dispersion air device shall be selected to minimize air noise transmission into the animal room.

Dispersion of supply air into the room shall be studied by the AE consultant to determine the most effective distribution. In the animal holding rooms, supply air distribution is of utmost importance. Generally the supply air is distributed from the center of the ceiling to maintain even flow across the room to avoid cold or drafty spots. Radial flow diffusers provide even supply air distribution in animal related rooms. Louvered face diffusers are effective in all other support spaces, but should be evaluated on an as needed basis by the AE consultant. Radial face supply air diffusers should be provided at biological safety cabinet and fume hood locations to avoid disturbance of hood face velocity flows.

C. Data

Based on shared experience between user, builder, designer and maintenance provider on past projects, the following elements listed in the table below should be used in designing an UTHSCSA vivarium:

D. Standard

Supply Air, Conditioning, Filtering and Distribution Requirements	
Item	Direction
Outside Air	
Air quality at intake location	Wind study
Intake louver sizing	Less than 500 FPM
Conditioning Air Handling Unit (AHU)	
Intake plenum	Size for smooth transition into filter section at low velocity.
AHU intake isolation (if needed)	Opposed blade damper
Pre filter	Minimum 30%
Access sections	Required between coil banks
Heating coil	Maintain 45 degree @inter
Humidifier	Maintain 50% relative 31 inter
Cooling coil 1 pre cool	Maximum 450 FPM
Cooling coil 2 final cool	Maximum 450 FPM @2-56
Supply fan	Direct drive plug type

Final filter	Minimum 90%
HEPA filter	Verify requirement
Discharge plenum	Size for effective filtration
Discharge isolation damper	Used for unit shutdown
Variable speed drive	Control filter loading
Distribution Ductwork	
Supply low/medium pressure duct	Galvanized (externally insulated)
Duct sizing for low/medium pressure duct	Size duct to minimize air noise, avoid pressure losses.
Duct construction for low and medium pressure duct	Use round duct where possible or reinforce to avoid duct flexing during system shutdown/startup.
Animal holding, animal suite corridors, procedure, necropsy, surgery and lab - pressure independent terminal unit device for each room	Tracking supply valve with reheat to include 4 preset air quantities capable of positive or negative control while maintaining room offsets. Also provide with 100% shutoff control and constant volume in animal areas. Fail position shall be last position. Valves similar to Phoenix type system.
Cage wash, storage, support areas, support area corridors and office area - pressure independent terminal unit device for each room. Multiple offices or rooms with similar requirements can be served from one terminal unit (not to exceed 4 offices).	Variable air volume supply air valve with reheat. Similar to Titus industries units. Internal insulation shall be lined.

Room Distribution Device

Animal, procedure and lab hood room air device	Flush face radial air distribution design.
All support areas	Flush louvered or perforated face diffusers.

3.2.6 Ventilation & Air Change Rates
A. Introduction

According to the Guide for the Care and Use of Laboratory Animals (National Research Council, 1996), the guideline of 10 to 15 fresh-air changes per hour has been used for vivarium room envelopes for many years and is considered an acceptable general standard. The purposes of ventilation which manifests itself in the form of room air change rates are to:

1. Supply adequate oxygen;
2. Remove thermal loads caused by animal respiration, lights, equipment and personnel;
3. Dilute gaseous and particulate contaminants and control odors;
4. Adjust the moisture content of room air and;
5. Create static-pressure differentials between adjoining spaces.

B. Background

Even though calculations can be used to determine minimal ventilation needed to prevent heat buildup, other factors such as odor control, allergen control, particle generation and control of metabolically generated gases might necessitate ventilation beyond the calculated minimum for heat load. In addition, the method of animal cage ventilation, the operational use of a fume hood or a BSC during procedures involving animal cage cleaning and animal examinations should also be considered. In general, the recirculation of air in a vivarium is prohibited. Typical animal holding and procedure rooms from UTHSCSA's BSRB vivarium were modeled and used for the basis of ACR calculations. The assumptions and results of these calculations are provided in Appendix 8.1 and 8.2. The calculations indicate that the small animal holding room's heat load required an ACR of approximately 6 air changes per hour while the larger, more equipment driven procedure room required approximately 10 air changes per hour. These ACR calculations only account for heat load and do not address the other factors such as odor control, etc.

Vivarium spaces must be protected against contamination from outside sources. In some instances, high-efficiency particulate air (HEPA) filters are recommended for air supplied to animal-holding, procedural and surgical facilities. Also, consideration should be given to the regulation of air-pressure differentials in surgical, procedural, housing and service areas. For example, areas for quarantine, housing and use of animals exposed to hazardous materials should be kept under negative pressure; whereas areas for surgery, for clean equipment storage and for housing of pathogen-free animals should be kept under positive pressure with clean air. The HVAC system must be adaptable so that pressure relationships can be modified as required over the life of the facility.

C. Data

A study was done by UT UTHSCSA Facilities and DVMS departments seeking a consensus of opinion regarding minimally acceptable air change rates from reputable and well-known owner / operators of facilities housing animals used in research. Based on information gathered and reviewed by members of the ARSAC Design Standards Subcommittee, the following table of air change rates is presented as representing the consensus of opinion found. The rates given, therefore, comprise the minimum acceptable building air change rate settings for the various small animal rodent vivarium areas:

D. Standard

Acceptable Minimum Air Changes Per Hour (ACH) By Room Type	
Animal Housing (100% ventilated cage racks)	10
Animal Housing (any number of static cage racks)	15
Procedure Rooms	10
Washroom	40 occupied / 20 unoccupied
Autoclaves	40 occupied / 20 unoccupied
Support (clinic, cryogenics, irradiator, x-ray, etc.)	10
Necropsy	15

3.2.7 Exhaust & Filtration

A. Introduction

Exhaust air from the vivarium and associated support areas shall exit the building at or near the highest part of the building and away from any fresh air intakes. The exhaust fan locations should be evaluated by the A/E Team to minimize noise and odor levels at the street level. Wind studies shall be performed by the NE consultant prior to the design phase. Generally, separate biohazard/radioisotope exhaust and general exhaust systems suffice; however in larger vivaria the systems should be divided into cage wash, biohazard, radioisotope (RI) and general exhaust systems to minimize duct riser sizes up through multistory buildings.

B. Background

The vivarium exhaust systems serve multiple space types. Generally, toilet, janitor closet, animal holding, animal holding corridor, procedure room, cage wash, sterilization, storage, bedding storage and lab exhaust is considered general exhaust. B1 biological safety cabinet and chemical fume hood exhaust shall be included in the general exhaust system. B2 biological safety cabinet and radioisotope hood exhaust shall be routed to the

combined biohazard/radioisotope exhaust fan system. In some cases, the biohazard and radioisotope exhaust have a separate exhaust fan system as well as separate filtration requirements. The animal biohazard general exhaust system shall support all biohazard animal holding rooms, quarantine and necropsy. If there are research-specific exhaust filtration requirements, they should be established early in the programming phase.

All fan systems shall operate 24 hours/365 days a year. Each fan system shall include an intake plenum, sound attenuator (as needed), fan, individual exhaust fan isolation, bypass damper and discharge at least 15'-0" above the roof. Exhaust discharge velocity shall not be less than 3000 FPM (feet per minute) with 3500 FPM preferred. Multiple fans grouped/manifolded together shall make up the exhaust requirement for each fan system. The AE consultant when designing the system shall build into the design and selection of the fans, component failures, emergency air reduction measures and automated control sequences that maintain the environmental conditions of the animals at all times. Ultimately, the AE shall be cognizant of maintaining pressure gradients across barrier and biohazard areas. In the event pressure gradients cannot be maintained, the control of the exhaust along with the supply air shall be coordinated so that all spaces at minimum remain neutral.

The exhaust air ducts from the vivarium spaces to the exhaust fans shall be designed to minimize noise transmission and energy losses associated with poor duct distribution or construction. Individual room exhaust air control shall be maintained by pressure independent terminal units. The terminal unit maintains a constant air flow and tracks the supply air terminal unit to maintain the vivarium spaces positive or negative as required by the program. The terminal unit shall be capable of multiple air quantity set points to accommodate positive, negative or zero air flow (as would be required for sanitation of the animal room). Terminal unit upsizing generally will minimize the noise transmission into the rooms. Although not preferred, some applications may require an additional sound attenuator at the terminal unit. Low pressure galvanized ductwork from the room exhaust device to the terminal unit shall be sized to minimize air noise transmission into the animal room.

The exhaust air devices in animal holding rooms shall consist of a series of thimbles and exhaust grilles. The thimbles penetrate through the ceiling to receive the exhaust duct from the ventilator racks but can also be used as general exhaust directly from the animal room when static cage racks are used. Generally, up to two racks can be accommodated by one thimble. An additional general exhaust grille shall exhaust the additional air required by the room air change rate requirement. In the animal rooms, the thimbles and general exhaust grille are located in the ceiling and served by one terminal unit. In procedure rooms, generally one thimble is provided to receive a ventilator rack and shall be provided with a dedicated terminal unit. All other exhaust air devices shall be standard perforated face or louver type grille.

C. Standard

Exhaust Air, Filtering and Distribution Requirements	
Item	Direction
Exhaust Air Dispersion	
Exhaust Air dispersion location	Highest roof level. Provide wind study.
Minimum dispersion velocity. FPM (feet per minute)	Minimum 3000 FPM, 3500 FPM preferred minimum
Minimum exhaust discharge height above roof	15'-0"
Typical Exhaust Fan System	
Exhaust fan discharge	Provide high velocity nozzle.
Exhaust fan discharge sound attenuator if required	Confirm requirement with sound consultant.

Fan isolation	Provide individual automatic fan isolation with stainless steel or aluminum damper construction.
Fan motor	Direct drive with vibration cutout switch.
Fan system type	High plume and high velocity laboratory exhaust systems as manufactured by Strobic Tri-stack.
Number of fans in fan set.	2,3,4 or 6 fan sets. Each fan set shall require one backup fan.
Fan intake plenum (double wall with stainless steel internal liner).	Double wall plenum sized to accommodate all exhaust fans.
Plenum intake velocity range	Between 900 —1200 FPM.
Bypass damper.	Minimum of two per system.
Biohazard and Radioisotope Filtration	Depends on agents used. Contact EH&S for exact filtration requirement
Filter inlet and outlet isolation	Bubble tight damper.
Filter Caisson construction	304 stainless steel
Filter Caisson	Provide 1 redundant unit for each filter set required.
Prefilter efficiency (bag in/bag out)	30% pleat
Final filter	99.97 % HEPA

Prefilter/final filter maximum velocity	400 FPM.
Charcoal filter media	Coconut shell carbon in stainless steel trays.
Charcoal filter residence time	No less than .25 seconds. Size caisson accordingly.
Distribution Ductwork	
Duct sizing for low/medium pressure duct.	Size duct to minimize air noise, avoid pressure losses.
Duct construction for low/medium pressure duct.	Use galvanized round duct where possible or reinforce to avoid duct flexing during system shutdown/startup.
Animal holding, animal suite corridors, procedure, necropsy, surgery, cage wash and lab — pressure independent terminal unit device for each room.	Tracking exhaust valve to include 4 preset air quantities capable of positive or negative control while maintaining room offsets. Also provide with 100% shutoff control and constant volume in animal areas. Fail position shall be last position. Valves shall be similar to Phoenix type system.

Storage, support areas, support area corridors and office area — pressure independent terminal unit device for each MOM.	Variable air volume exhaust terminals shall be equal to Titus Industries. Match supply air room grouping.
Biohazard B2 cabinets and radioisotope hood ductwork	Welded 304 stainless steel from BSC/hood to exhaust fan plenum.
Room Exhaust Device	
Ventilated cage rack exhaust for procedure rooms and animal holding rooms	Provide one 6" drop to receive thimble for every two racks. Single racks will also require one 6" drop for thimble.
Animal holding and procedure rooms	Painted stainless steel perforated face or louvered grille.
All support areas	Painted steel perforated face

3.2.8 Control Systems

A. Introduction

The building mechanical systems include some of the largest as well as the majority of the equipment serving a vivarium. The heating, ventilation and air conditioning system (HVAC) represents the majority of the mechanical equipment. The HVAC system continuously maintains air flow, air cleanliness, temperature, humidity, odor transmission and containment. It is for this reason that the HVAC control system is tasked with monitoring the plumbing and electrical systems, monitoring user critical equipment and controlling and monitoring the HVAC systems. Through the individual system sensors and controllers, the building automation system (BAS) must automatically react to continuous temperature changes and sudden system failures to maintain the required vivarium and vivarium support space environmental conditions. Fire protection, elevators, communication systems and security system are not controlled or monitored by the BAS, although the fire protection system does provide control interface to some HVAC systems to shutdown or energize in case of fire or smoke.

B. Background

Most UTHSCSA buildings are controlled and monitored through the existing Siemens Apogee building

automation system. The building automation system in new buildings shall accommodate the existing system infrastructure and accomplish building control and monitoring functions through direct digital control (DDC), regardless of vendor. The system architecture includes the master building controllers (MBC) provided to interface and monitor modular equipment controllers and application specific controllers. Modular equipment controllers (MEC) will provide control and monitoring of systems through system devices, as well as specific points such as critical alarms. Application specific controllers (ASC) provided for control and monitoring of packaged equipment, typically not Siemens, are monitored by the MBC. Communication between controllers shall occur through Ethernet communication protocol. The building shall be monitored and controlled locally at the building operator work station or other approved EH&S work stations and monitored remotely at UTHSCSA/EH&S Monitoring Services. All AC power to the BAS controllers shall be on emergency power. The need for uninterruptible power systems (UPS) for the various controllers shall be evaluated by the AE, conformant to the requirements of the various spaces. Typically the controller and the system equipment should be on the same power source, however if this is not possible,

the equipment sequences shall be designed to incorporate loss of power, power transfer, equipment failure and initiation of redundant equipment scenarios. Maintaining pressure relationships during power failures is one of the main considerations.

The BAS system including all component devices and controllers shall maintain memory during power losses, restart quickly after power failure, have high speed communication, be capable of supporting GLP (Good Laboratory Practices) quality verification, include accurate graphic representation of the various systems and allow for system trending. The BAS components shall be of the latest manufacturer generation at the time of submittal, but shall be of tested and proven design and reliability. The BAS system shall exchange information with other specialized control systems such as the Edstrom Watchdog system which controls and monitors animal room lighting and watering and receives temperature and humidity conditions from the Siemens system. The Phoenix air tracking system will also be interfaced with the Siemens BAS system to send temperature, airflow and alarm conditions for each zone.

C. Data

Based on shared experience between user, builder, designer and maintenance provider on past projects, the following elements listed in the table below should be used in designing an UTHSCSA vivarium.

D. Standard

General Control System Highlights	
Item	Direction
Building Automation System	Siemens Apogee unless otherwise directed by the EH&S Director, in
Typical animal holding room controller	1 stand alone controller per room (1 additional misc. space can be
Typical animal holding room alarms	Low/high temp, lighting level, low/high room pressure
Typical user critical equipment alarm to	Environmental rooms, incubators, freezers, LN2 freezers, etc.
Typical equipment alarmed locally at	B1 & B2 biological safety cabinets and fume hoods
Typical systems using application specific controllers, although	Control air, vacuum, RO, water softener, domestic water pumps, clean
Application Specific Controllers provided by packaged equipment	Provide dry set of contacts for connection to BAS to pick up general alarm, plus allow for pick
Control valve and damper actuators	All electric

3.2.9 Animal Drinking Water

A. Introduction

A normal rodent drinks approximately 0.1 ml of water per gram of body weight daily. In older caging systems, water is provided via glass or plastic water bottles that fit on the wire bar lid of the cage. A standard mouse drinking water bottle contains 250ml and rat bottles 500ml. Water bottles must be changed at least as often as the cage, if not more often depending on the size and condition of the animal. Water bottles must also be changed at least weekly to prevent the formation of bio-film. An automated drinking water system allows for a constant supply of fresh drinking water without the need for water bottles. Care should be taken in the design to avoid malfunctions which lead to flooded cages and, conversely, obstruction of water flow.

B. Background

The National Research Council (NRC) Guide indicates animals should have access to potable, uncontaminated drinking water. Also, water quality and the definition of potable water can vary with locality. Periodic monitoring for pH, hardness and microbial or chemical contamination may be necessary to insure water quality is acceptable. Water can be purified and/or treated to minimize or eliminate contamination when protocols require highly purified water. The selection of water treatments should be carefully considered because many forms of water treatment have the potential to cause physiologic alterations or effects on experimental results.

In most UTHSCSA applications, the domestic/potable water quality will require both water softening to reduce mineral hardness and then further water purification, usually by reverse osmosis (RO) to provide water of the required level of purity for laboratory research and animal drinking water use.

Special attention should also be placed upon the high purity water distribution system piping connections and integrity. At the Mitchell BSRB, UTHSCSA has experienced continued leaking joints in the polypropylene RO water piping system since the building construction was completed. Many joints and connections are no longer accessible causing significant building damage when joints and connections fail and begin to leak. The failures at that project have been attributed to difficult-to-use electrical joint fusing machines and operator errors during initial installation.

C. Standard

Drinking water is distributed to animal cages via a stainless steel distribution system composed of two separate pipes: one for delivery of fresh drinking water and one for disposal of flush waste water. Clean drinking water from the source point is delivered to the pressure reducing station (PRS) via appropriate piping material. From the PRS, all distribution piping is stainless steel to the cage rack connection points and waste flush termination. At each cage rack position, there is a recoil hose from the delivery pipe to the cage rack inlet on the rack manifold. From the terminal end of the rack, a recoil hose connects to the flush piping which discharges into a sink or floor drain (waste flush water is discarded, never re-circulated). The animal drinking water system should be computer controlled to allow for user-defined flush schedules. The system must generate alarms for abnormal conditions, such as prolonged flow, flush failure, pressure problems, etc., with user-defined alarm and notification parameters and schedules. Notification methods include phone call, email, paging, and critical alarming to the Building Automation System.

See Appendix 8.3 for the following detailed sections on the Animal Drinking Water System:

1. Stainless Steel Room Distribution System
2. Pressure Reducing Station
3. Reverse Osmosis System

Recoil Hose Flush Station

5. Chlorine Injection Station

6. Rack Manifold Flush Station

3.2.10 Bedding Delivery & Removal

A. Introduction

The rodent colony uses bedding at a rate of approximately 8-10 ounces of clean bedding per processed cage each day. Soiled bedding is generally at least 1.25 times heavier than clean bedding. For example, the current (as of 3/21/07) census of 15,000 cages has a daily cage change rate of 3,000 cages. At this rate, 1,500-1,875 pounds of clean bedding and approximately 1,875-2300 pounds of soiled bedding are processed each normal work day. As the colony grows, the washroom must become more efficient in terms of staff time. The vacuum bedding system allows for maximum efficiency on both the clean bedding delivery side and the soiled bedding removal side.

B. Background

Prior to the advent of automated bedding delivery and removal systems, bedding was received as pallets of 50 40lb bags. Clean bedding delivery was accomplished by manually dumping each bag into the bedding dispenser, which could average as much as 5 minutes per bag. The hopper only holds approximately 2-3 bags' worth of bedding, so manual filling was required quite often. Given the amount of bedding used each day, this task could require up to 0.5 FTE each day. The automated system uses ½ ton bulk bags, out of which the bedding is vacuumed via a wand into the storage silos and requires approximately 10-15 minutes per bulk bag. At a rate of 2 bulk bags (the equivalent of 50 40lb bags), this requires less than 0.1 FTE per day. As the bedding dispenser requires clean bedding, the system conveys the clean bedding directly from the storage silo to the dispenser.

On the soiled side, cage waste was previously dumped into a rolling dumpster that could only be filled to ³/₄, full so that the compactor cart lifter could handle it. The dumpster then had to be rolled up to the institutional waste compactor which could take as much as 30 minutes per trip. Given the amount of cage waste generated each day, at least 4 trips to the dumpster had to be made, requiring up to 0.5 FTE each day. The automated system uses a dump station, into which the bedding waste is dumped. The waste is conveyed from the dump station directly to a dedicated waste container, thus requiring 0 FTE.

C. Standard

Clean Bedding Delivery Requirements	
Item	Direction
Filling	Both wand for bulk bags and dump station for bags must be provided. The
	panel should be located so that it is conveniently reached by either filling area.
Storage and delivery	All components should be 304 stainless steel. Filling funnel should have a drain trap to facilitate rinsing.

Storage silo	Provide storage for 2.0 to 3.5 cubic yards of bedding material. Silo should have alarming capabilities for high and low bedding levels. Silo interface with delivery piping must be optimized to prevent eddying or dead space.
Bedding dispenser interface	The bedding dispensers' storage hoppers must have level sensors to indicate a full/not full bedding level and automatically replenish the bedding volume. A control panel for the clean bedding delivery system should be located near the bedding dispenser storage hopper.
Delivery piping	Readily accessible cleanouts must be provided at reasonable intervals to facilitate cleaning and servicing. Piping must be routed with minimal bends and turns.
Soiled Bedding Collection Requirements	
Item	Direction
Collection & delivery piping	Must be constructed of 304 stainless steel. Readily accessible cleanouts must be provided at reasonable intervals to facilitate cleaning and servicing. Piping must be routed with minimal bends and turns.
Waste Collection Funnel	The waste collection funnel should have a drain trap to facilitate rinsing. It should be positioned at the load end of the washer in the most ergonomically feasible location.
Controls	The waste collection control panel should be located near the waste collection funnel.

3.2.11 Cage Wash and Sterilization

A. Introduction

Cage washing and sanitation is the backbone of the animal care program. Proper sanitization and, where applicable, sterilization is of paramount importance in maintaining colony health and well being, as well as personnel health and safety.

B. Background

Washing times and conditions should be sufficient to kill vegetative forms of common bacteria and other organisms that are presumed to be controllable by the sanitation program. When hot water is used alone, it is the combined effect of the temperature and the length of time that a given temperature (cumulative heat factor) is applied to the surface of the item that disinfects. Effective disinfection can be achieved with wash and rinse water at 143-180 F or more. The traditional 82.2 C (180 F) temperature requirement for rinse water refers to the water in the tank or in the sprayer manifold. Because of the nature of the research, chemicals are not used. Hot water alone is relied upon to effectively sanitize equipment.

Conventional methods of cleaning and disinfection are adequate for most animal-care equipment. However, if pathogenic microorganisms are present or if animals with highly defined microbiologic flora or compromised immune systems are maintained, it might be necessary to sterilize caging and associated equipment after cleaning and disinfection. Sterilizers should be regularly calibrated and monitored to ensure their safety and effectiveness. Hazardous waste must be rendered safe by sterilization, containment, or other appropriate means before being removed from the facility (US EPA 1986)."

C. Standard

Cage Rack Type Washer Requirements	
Item	Direction
Seven phase	Pre-wash, wash, 2 nd wash (alkaline or acid), soak, first rinse, second rinse, final rinse, exhaust/dry
Temperature guarantee	180°F guarantee on wash and rinse phases, with visual and audible
Chamber construction	All stainless steel
Chamber Size	Chamber: 46" wide x 87" long x 87" high
Pit Size	Minimum 86" wide x 101" long x 6" deep, nominal, to be coordinated with equipment. Washer chamber to align with finished floor. Drain location coordinated with equipment.
Microprocessor Control	Controls to be programmable by end user and password protected.
Tunnel Type Washer Requirements	
Item	Direction
Five phases / Sections	Pre-wash, wash, re-circulated rinse, final rinse, dryer
Temperature guarantee	180°F guarantee on wash and rinse phases, with visual and audible alarming
Chamber construction	All stainless steel

Conveyor	36" wide stainless steel roller-type, gravity- type with corrosion free bearings and shafts. Belt speed to be adjustable from 2-10 feet per minute. Photoelectric eye at discharge end to automatically stop belt when an item reaches the end, with a visual and audible alarm for a stopped condition.
Dryer	99% plastic cage drying
Microprocessor Control	Controls to be programmable by end user and password protected.
Sterilization Requirements	
Item	Direction
Cycles	Allow for general purpose steam sterilization of unwrapped equipment, wrapped instruments and utensils, and liquids in vented or unsealed containers at temperatures ranging from 105C — 135C (220°F - 275°F).
Temperature uniformity	Within chamber, A- 18C during cycles.
Microprocessor controls	Control all system functions, monitor system operations, visually and audibly alert operator of cycle malfunctions and on command visually indicate chamber temperature and pressure. Control system to be compatible with PC/DOS support software.
Non-operating end controls	Consists of only door operations, chamber pressure gauge, emergency stop, and displaying process conditions. Mount in the fascia on the unload side of the sterilizers opposite the door.

3.2.12 Monitoring Instrumentation

A. Introduction

Fluctuations in environmental conditions can compromise animal health and well-being. Design standards exist that define the acceptable ranges for these conditions, but there must be a way of ensuring that conditions remain inside the acceptable range for the following parameters:

1. Temperature
2. Humidity
3. Differential pressure
4. Actual supply and exhaust air flow rates
5. Air change rate (air changes per hour)

B. Background

Regular monitoring of the HVAC system is important and is best done at the individual-room level. All monitoring devices must communicate with an electronic system that records measurements at regular intervals. A separate, independent Vivarium Management System (VMS) capable of monitoring temperature and relative humidity is preferred in order to provide confirmation of room environmental conditions. The system should allow for easy manipulation of point logging intervals, alarm parameters, alarm notification structure, and other critical elements. The VMS provides the animal facility management staff instant access to critical environmental information as well as reports designed to meet regulatory requirements. An open protocol will allow for information to be shared across platforms (i.e., Building Automation System (BAS) and VMS so that BAS information (air flow, differential pressure, etc.) can be incorporated into VMS reporting.

C. Standard

Parameter	Monitoring Device Requirements
Temperature & Relative Humidity	<ol style="list-style-type: none"> 1. Monitor devices located within the room, not the ductwork 2. Stainless steel, watertight housing enclosure 3 Guard to protect sensor probes 4 NIST traceable sensors 5. Temp sensor: 100 OHM platinum thin-film RTD 6. Humidity sensor: interchangeable capacitive element with filter 7. Calibrated accuracy to within $\pm 1^{\circ}\text{F}$ & $\pm 5\%\text{RH}$ 8. Temperature range $0-120^{\circ}\text{F}$ ($-18 - 49^{\circ}\text{C}$) 9. Humidity Range $20-85\%\text{RH}$
Differential Pressure	4-20 MA Current Loop <ol style="list-style-type: none"> 1. Pressure range: 0.0 to 40.1 0.0 40.25 inches of water column bi-directional 2. Accuracy 43% full scale 3. 4-20 MA linear output
Air flow	<u>Duct mounted sensor</u>

1. Size to provide a single monitoring point near the center of the duct cross sectional area
2. Mounting hardware: stainless steel
3. Sensor: PVC plastic
4. Air tight installation
5. Transducer
6. 4-20 MA Current Loop
7. Calibration accuracy CFM A-10%
8. Pressure range 0--.1, 0-.025, and 0-0.5 inches of water column
unidirectional set to 65% scale at design of air supply flow
9. 4-20 MA current loop to panel analog input
10. Connection to sensor with flexible PVC twin tubing; barbed connections

3.2.13 Sequence of Operations

A. Introduction and Background

The interaction of the operation of the vivarium mechanical and electrical equipment is monitored and controlled by the building automation system (BAS). How the BAS controls the equipment is defined in instructions and contingency plans defined in the pre-established building controls program. The control functions are defined by way of system logic diagrams that are based upon the design team's expected sequence of operations for various facility operational conditions.

The vivarium design team must specify the logic of equipment sequence of operations. In many cases, the sequence of operation is specified only in general, and often ambiguous, terms with much of the sequence left to the Contractors controls programmer. The controls programmer should not be put in the position of having to complete the design sequence which often results in sequences which are not optimal or desired for the project. Therefore, logic diagrams must be included in design documents provided by the design team and approved by The University. To assist the design team with this, UTHSCSA provides design guideline and master specification documents that help define functional intent of the system operation.

B. Data

In developing the sequence of operations logic, the design team must consider the following range of facility operational conditions:

1. Normal Operations (Start/Stop Permissives and Interlocks)
2. Loss of Normal Power (Re-Start on Emergency Power)
3. System Safety Interlocks
4. Equipment and Component Failure Modes
5. N-1 Operational Contingencies (Redundancy with Single Failure)
6. N-2 Failure Curtailment Strategies (System Unable to Operate at Full Load)
7. Critical Alarms
8. Maintenance of Room Pressure Relationships during Upset Conditions

In all cases, the vivarium design team is responsible for identifying and documenting the sequence of operation

May 2013 Small Animal(Rodent) Vivarium, Construction Standard

University of Texas, Health Science Center, San Antonio 13 00 00 00 - 55

for the facility early in the project's design life. This design information must be prepared with input from UTHSCSA and must be reviewed and agreed upon prior to the preparation of Construction Documents by the design team.

Sequence of Operations

Identify Expected Levels of	Design Team and UTHSCSA
Preparation of Logic Diagrams	Design Team Using UTHSCSA
Prepare Detailed Sequence of	Design Team

Review and Accept Sequence of Operations UTHSCSA as Owner and End User

3.2.14 Waste Disposal

A. Introduction

Types of waste generated within the animal facility include conventional, biological, and hazardous. Waste should be collected in leak-proof containers with tight fitting lids and disposable liners. Adequate staging and storage space must be provided within the facility footprint to accommodate the accumulation of waste during the normal work day. Storage of collected waste in corridors is not desirable. Storage rooms should be free of feral and/or loose rodents, insects, and other vermin. Care must be taken during design to ensure that adequate waste stream management space is included.

B. Background

Non-hazardous, conventional waste can be disposed of as regular institutional waste and taken to an approved landfill by the institution's waste collection contractor. Biological waste must be rendered safe by sterilization, containment, or other appropriate means before being removed from the facility (US EPA 1986). Infectious waste, including animal carcasses, is placed in an acceptable biohazard bag inside a biohazard box, which is collected by a licensed contractor and removed to an incineration facility. Radioactive waste must be collected, contained appropriately, and stored in a dedicated room for the duration of the radioactive decay period as appropriate for the radioisotopes involved.

C. Standard

Waste Disposal Requirements	
Item	Direction
Conventional	Landfill by approved institutional
Biological	Rendered safe by sterilization and contained before removal
Infectious	Bagged and boxed before incineration by outside contractor
Radioactive	Contained and stored in separate room during applicable decay period prior to disposal by qualified contractor

3.3 Redundancy Requirements 3.3.1 General Information

A. Introduction

Research animals cannot easily be relocated for a myriad of reasons including, but not limited to, colony size, health status, cage type, and time constraints. Thus, animal housing facilities must remain operational at all times, i.e., normal environmental conditions which pose no health hazard to the animals. Redundant mechanical and electrical systems must be provided to ensure uninterrupted service for the following areas:

1. Environmental control — temperature, relative humidity
2. Differential pressure (room to suite, suite to corridor, etc.)
3. Animal housing sanitization equipment (cage washers)
4. Equipment decontamination and sterilization equipment (autoclaves)

B. Background

Mechanical systems that serve animal housing and use areas must be able to maintain required conditions during both planned and unplanned outages. For example, an air handling unit may be equipped with three fans each able to provide 50% of the CFM capacity. If one fan is down for any reason, the other two fans are able to provide 100% of the required CFM. The institution recognizes, however, that this is just one method in which to accomplish the goal of redundancy.

According to the National Research Council Guide, when a partial HVAC system failure occurs, systems should be designed to supply facility needs at a reduced level. It is essential that life-threatening heat accumulation or loss be prevented during mechanical failure. Acceptable reduced levels for areas requiring uninterrupted service are defined in each specific Design Standard (e.g., ventilation rates, environmental conditions, bio-containment, etc.).

American Society for Heating, Refrigeration, Air Conditioning Engineers (ASHRAE) states that animal room conditions must be constantly maintained. This may require year round availability of refrigeration and, in some case, dual/standby chillers and emergency electrical power for motors and control instrumentation.

The National Institute of Health outlines in its Vivarium Design Policy and Guidelines — without exceptions - HVAC systems must be reliable, redundant, and operate without interruption. Since most animal studies are of long duration, they must be performed under consistent conditions in order to achieve repeatable results. Thus, the failure of the HVAC system is unacceptable. Therefore, the HVAC system must be designed to provide backup in the event of component failure. Central HVAC systems thus should be provided with multiple chillers, pumps, cooling towers, etc. to improve reliability."

C. Standard

Standards for redundancy will depend on the building project requirements. The AE consultant is expected to provide the most cost effective method for providing uninterrupted service based on the specific project.

4. Electrical Systems**4.1 Design Criteria****A. Introduction**

The electrical system in an animal research facility should be designed to safely provide adequate, reliable, and cost-effective power. In such facilities, the electrical system is as critical as the mechanical and plumbing systems. Redundancy is of primary concern in the system. Electrical systems must accommodate a large, redundant mechanical system with its air handlers, associated pumps, and fans for supply and exhaust systems as well as a system to provide appropriate lighting under both normal and emergency operating situations.

B. Background

Because of the inability of the operator of a vivarium to easily relocate the animal occupants of the facility for any reason, the electrical system must have the ability to provide power on an uninterrupted basis to the building systems serving animal housing areas. Other rooms, because of the nature of hazardous materials present, also have extremely stringent ventilation and room pressure offset requirements that must be maintained at all times. Life safety as well as research integrity preservation issues must be considered in the facility design philosophy.

C. Data

Some of the systems that must remain functional in both normal and abnormal conditions are:

1. Air supply
2. Air exhaust
3. Animal room lighting
4. Animal feeding and watering system
5. Data gathering and building control system
6. Environmental rooms
7. Security system
8. Cage washing and sanitizing equipment (at reduced capacity)

In facilities containing animal operating rooms, applicable regulations covering hospitals may be used as a guideline for those rooms. These would include but not necessarily be limited to special grounding systems, isolation/voltage regulation-type transformers, surgical or high- intensity overhead lighting, and local operating room type distribution grounding panels.

D. Standard

Electrical System Design Criteria	
Code Compliant	National Electric Code (latest edition)
Normal Power	Separate, redundant feeders from the local power distribution company with automatic switch over capability
Emergency Power	All animal life support backed up by emergency generator sized for NI-capacity
Loading	All emergency equipment to be prioritized for restart on emergency

4.2 System Descriptions

4.2.1 Normal Power Service and Distribution

A. Introduction/Background

In an animal facility, the electrical system is as critical as the mechanical and plumbing systems. Redundancy is of primary concern electrically as well as mechanically. Electrical systems in animal research facilities should be designed to provide adequate, reliable, and cost-effective power. Electrical

systems must accommodate a large, redundant mechanical system, including air conditioning equipment for supply and a segregated, redundant exhaust system.

B. Standard

1. Primary Power Distribution System Description

- a) Primary power for the facility will be obtained from a local public utility usually at 4.16 kV. The primary system will be dual fed, double ended. Transformers necessary to step down the utility distribution voltage to 4.16 kV will be located in a power distribution vault in the building or outdoor pad mounted onsite.
- b) Primary 4.16kV switchgear will consist of medium voltage vacuum circuit breakers. The breakers will be electrically operated.
- c) Primary power will be distributed to secondary unit substations by way of dedicated feeders.
- d) The primary switchgear will provide automatic transfer of all loads to one feeder circuit in the event one of the two feeders fails.
- e) The switchgear will be provided with ground fault protection. The switchgear main overcurrent protection device will be coordinated with the utility overcurrent devices.

2. Secondary Power Distribution System Description

- a) Power at the standard 480 / 277 volt, 3-phase level will be obtained from 4.16kV step- down transformers. These transformers will be arranged in a double-ended arrangement with normally open bus tie breakers between the secondary switchboards. Transient voltage surge suppression will be provided at the main switchboards.
- b) 480 volt, 3-phase power will be distributed to motor control centers (MCC's) to serve concentrated motor loads. These MCC's will contain combination disconnect starter units, 120 volt control transformers and shall be equipped with push-to-test pilot lights.
- c) 480 / 277 volt, 3-phase power will be distributed to proper distribution panels to serve 277 volt lighting panels and step-down transformers to obtain 208 / 120 volts.
- d) 208 / 120 volts will be distributed from branch circuit panel boards to serve receptacles and equipment. Transient voltage surge suppression will be installed in each branch circuit panel board.

Mitchell BSRB BOD

4.2.2 Emergency Power Systems and Distribution

A. Introduction/Background

In an animal facility, the electrical system is as critical as the mechanical and plumbing systems. Redundancy is of primary concern electrically as well as mechanically. Electrical systems in animal research facilities should be designed to provide adequate, reliable, and cost-effective power. Electrical systems must accommodate a large, redundant mechanical system, including air conditioning equipment for supply and a segregated, redundant exhaust system.

B. Standard

1. System Description

- a) Emergency power will be provided by diesel engine generator sets. The units will generate 480/277 volt, three-phase power, which will be connected to a paralleling switchboard. This switchboard will serve the emergency distribution panels in the building. Automatic transfer switches will be utilized to connect to the emergency source based upon a pre-set priority if the normal source of power fails. Transfer

switches will be located near the normal source unit substation. Paralleling switchboard vendors will be pre-approved for the project.

- b) A permanently mounted load bank will be provided to allow for the required testing of generators.
- c) The quantity of generators will be such that a generator can be taken out of service and the remaining generators can assume the load.
- d) 480 volt, three-phase power will serve motors and large equipment loads, such as system pumps, air handling units and exhaust fans.
- e) 480/277 volt, three-phase power will serve life safety lighting and step-down transformers to obtain 208/120 volts.
- f) 208/120 volts will serve the fire alarm system, selected receptacles and small critical equipment loads.
- g) Loads other than life safety types to be served would include but not be limited to freezers, cold rooms, incubators, receptacles in communication, electrical and mechanical rooms, selected receptacles in laboratories and selected MEP equipment as identified by the design team. If the building contains rooms requiring pressure offsets, additional loads will require connection to the emergency system such as ventilation and control systems that will ensure such pressure offsets are maintained at all times.
- h) Seventy-two full load running hours of fuel will be provided.

2. Explanation of Operation

a) Failure of the normal source of power will be sensed by devices in each automatic transfer switch. Upon detection of power failure a signal will be sent to the generator switchgear, which will send a start signal to all active generators. The first generator, which achieves proper voltage and frequency, will connect to the emergency switchgear bus. The

remaining generator(s) will synchronize with the first generator prior to connecting to the bus. The automatic transfer switches will connect to the emergency bus when the voltage and frequency reach the correct levels.

b) A load sensing system will be provided such that if one generator can carry the emergency load requirement, the remaining generator(s) can be shut down. Conversely, if the switchgear senses the operating generator is becoming overloaded, a signal will be sent to start a second generator.

c) When the normal source returns and after a preset time delay (to establish that the presence of the normal source is not temporary), the transfer switch will connect the load to the normal source. After removal of the load from the engine generator, the unit will continue to run for a preset cool-down time period before stopping.

4.3 Lighting

A. Introduction

Strict control of light cycles in animal housing rooms is essential. It is standard practice for all animal housing room lights to be automatically controlled. In addition, there should be positive feedback to assure proper functioning of the lights, such as a photocell located in the room. It should not be assumed that by monitoring the status of the relay controlling the lights, the lighting within the room is also monitored. According to a 2004 study, disturbed lighting for socially-housed male mice can cause physiological and behavioral changes indicative of stress, not only leading to much higher

levels of corticosterone, but also to shorter agonistic latency within the groups. (Van der Meer)

B. Background

Our typical set up is lights on at 0700 and off at 1900. However, there are applications requiring light/dark cycles that differ from the standard. Therefore, the light control system must be easily manipulated to make necessary changes. The lighting system must provide a means of positive feedback to indicate alarm conditions.

Researchers need to access their animals at all times of the day and night, according to their research requirements. Access during dark hours must be accommodated by the use of an override switch located at the animal room. Ideally, this dark cycle override would be a red lamp which is invisible to most rodents. Override should be for a fixed period of time, typically 15 minutes, to prevent light cycle disruption. Light override period should be adjustable to allow for periods shorter or longer than the typical override period.

Light fixtures must be sealed to prevent the transfer of air and potential contaminants between the room and above ceiling space. Surface mounted fixtures are preferable, as they are more easily sealed. Fixtures with perforations in the ballast housing are totally unacceptable.

C. Standard

Light Levels	
Off / Dark Cycle	0 ft-C
Low / Dark Cycle Override	10-15 ft-C
Medium / Animal Housing Light Cycle	25-35 ft-C
High/Procedure Room Light Cycle, Sanitation of room between	804t-C
Lighting Standard Requirements	
Cycle Controls	Individual room Light/Dark cycles are controlled centrally by the Building Automation System to ensure consistency in diurnal cycles. On/Off times and override durations are easily changed by authorized Animal Facility personnel. The system will allow rooms to be programmed individually.
Monitoring	A photocell connected to the Building Automation System (BAS) is located in each room to monitor the actual lighting condition in the room. Ideally, the photocell records the actual light level in foot-candles. Minimally, the photocell records lights on or off.

Override	A local switch is located at the room to override the lights. Duration of override is programmable by the authorized Animal Facility personnel. During light cycle, the override switch turns the lights off. During the dark cycle, the override switch turns the lights on to the Low level. Ideally, the dark cycle override would be a red lamp(s).
Fixtures	Fixtures are gasketed and weatherproof. Surface mounted fixtures are preferred, since they are easier to seal. Fixtures do not have any perforations that would allow air exchange between the room and the space above the fixture.
Alarming	Conditions outside normal settings must generate an alarm, both within the system and as a critical alarm, via dry contact, to Monitoring Services.

4.4 Wiring Devices

A. Introduction

The electrical wiring devices used in animal vivaria construction follow design parameters of other systems to provide a safe, consistent environment for the animals and human occupants during both normal and emergency operating conditions.

B. Background

The electrical devices provided for a vivarium are generally no different from those in other installations. Consideration is, however, given to a few areas, making the use of the devices more suitable considering the animal inhabitants of the building. Two such considerations are in vermin control and damage from moisture.

C. Data

Light fixtures, timers, switches, outlets, and other devices should be properly sealed to prevent vermin from living there. Wiring devices can become warm during use, and would provide good breeding areas

for vermin if allowed access inside the devices. Surface mounted, energy- efficient fluorescent lights are most commonly used in animal facilities. As another precaution, light bulbs or fixtures should be equipped with protective covers to ensure the safety of the animals and personnel.

The electrical devices in some rooms in a vivarium should be capable of operating safely in high-moisture areas, simply because water is used regularly in the areas by operating personnel to maintain cleanliness of the rooms. Moisture-resistant switches and outlets protected by ground-fault interrupter circuitry should be used in areas of high water use. Operating personnel should be consulted during the design stage for recommendations of which rooms should have such devices.

D. Standard

Vivarium Wiring Device Requirements	
Seal all wiring devices	Prevent access by vermin
Seal and waterproof wiring devices and light fixtures	Prevent water damage and air leakage

4.5 UPS

A. Introduction

Uninterruptible Power Supply (UPS) systems are used to provide power to electrical devices in the event of failure of the device primary power source. UPS systems are only designed to provide power for a short period of time, sometimes only long enough to allow the equipment to perform an orderly shut down automatically, or to give the equipment operator time to shut the system down in an orderly manual sequence. A UPS system may also provide smooth, uninterrupted power to a device during the interim time between loss of normal power and establishment of emergency power coming from a facility emergency generator. Such transfers sometimes are accompanied by power "spikes" or other anomalies. If such anomalies are considered harmful to a device, then the use of a dedicated UPS system may be called for to minimize the risk of harm in a power failure event.

B. Background

In the context of this design standard, UPS systems are not to be confused with Emergency Power Systems, described elsewhere.

C. Standard

No provision for a large, centralized UPS system will be provided. UPS systems, if required by equipment used by the occupants, should be provided by The University of that equipment.

Mitchell BSRB BOD

4.6 Lightning Protection

A. Introduction

Studies by the American Geophysical Union confirm that conventional lightning protection systems are highly effective in reducing lightning-caused fires and damage to buildings and structures.

Specifying compliance with UL or NFPA standards is key to safe and effective lightning system performance.

B. Background

UTHSCSA facilities Basis of Design (BOD) documents indicate past practice of specifying lightning protection systems meeting Underwriters Laboratories Master Label Certification requirements.

C. Data

Lightning protection systems that have received the UL Master Label Certificate comply with national standards and include all of the following specified components:

1. Network of rooftop air terminals
2. Network of grounding terminations
3. Network of conductors interconnecting the air terminals and grounds
4. Interconnections with metallic bodies
5. Lightning protection surge arrestor devices on all incoming power and communication lines.

D. Standard

Vivarium facilities will be protected with a lightning protection system meeting UL Master Label Certificate requirements.

5. Information Technology Systems

5.1 IT Cabling

A. Introduction

Data, voice, and visual communication (IT Systems) capability is vitally important in an animal vivarium facility. The foundation of the IT systems installed in any facility is that of the various cabling materials used in those systems. Quality of the installed IT system as well as its capability to be successfully upgraded in the future are both dependent upon the selection of cabling materials.

B. Background

The communications cabling will be designed following the tenets of the UT UTHSCSA Premise Distribution System Standards document in accordance with AVAYA Communication Certified Systimax Structured Cabling System parameters to provide a vendor-neutral network transport.

The communications cabling will be specified as a competitively bid structured cabling system equivalent to the AVAYA Systimax Structured Cabling System.

The Information Technology (IT) structured cabling system will be designed and sized to accommodate the cabling needs of all low voltage systems not identified with proprietary cabling requirements. The IT structured cabling system will be defined as, and comprised of, raceways, conduits, sleeves, cable tray and runway, copper cabling and fiber optic cabling serving low voltage systems. This system will function to provide interconnectivity for low voltage systems that will meet the needs of current systems and those requirements in the future.

C. Data

1. Applicable Codes, Guidelines, and Standards
 - a) NFPA 70-National Electrical Code (NEC)
 - b) BICS I Telecommunications Distribution Methods 11th Edition
 - c) ANSITTIA/EIA-568-A Commercial Building Telecommunications Cabling Standards
 - d) ANSI/TIA/EIA-569-A Commercial Building Standards for Telecommunications Pathways and Spaces
 - e) ANSI/TIA/EIA-606 The Administration Standard for the Telecommunications Infrastructure of Commercial Buildings
 - f) ANSITTIA/EIA-607 Commercial Building Grounding and Bonding Requirements for Telecommunications
 - g) TIA/E IA 568-A-5 568-A Addendum 5 - Category 6a
 - h) TINEIA TSB-67 Transmissions Performance Specifications for Field Testing of Unshielded Twisted-Pair Cabling Systems
 - i) TIA/E IA TSB-72 Centralized Optical Fiber Cabling Guidelines
 - j) AVAYA Communication Certified SYSTIMA>Structured Cabling system Technical Specifications

D. Standard

1. Load Calculation Criteria

- a) Device locations will be established during the Information Technology (IT) user meetings and are to be indicated on the 100% construction documents for review by UTHSCSA.
- b) The Standard Information Outlet (S10) device for office and support spaces is configured typically in a "Gad" faceplate with two (2) copper data jacks and two (2) copper voice jacks.
- c) Each SIO for Vivarium Laboratory and Double Module Laboratory spaces will be configured into a "Duplex" faceplate with one (1) copper data jack and one (1) copper voice jack. Provisions have been included in the raceway sizing criteria for one (1) pair of multimode fiber optic cable. SIO details will be included on drawings.
- d) All SIO locations will be confirmed with UTHSCSA Telecom & Network Services for final voice and data jack configurations. Each SIO type to be indicated on the plan set and detailed.

2. Equipment Sizing Criteria

a) Preliminary Backbone Sizing

1. Voice Riser Cabling: Pair count is based on one and one half (1.5) riser pairs for each voice station jack served by the Intermediate Distribution Frame (IDF) Room. The riser cables will be sized to contain a minimum of 20% unallocated pairs for future use.
 2. Data Riser Cabling: Fiber count has been preliminarily set at twenty-four (24) multimode and six (6) strands off singlemode fibers and twelve (24) single-mode fibers routed to each IDF.
 3. Data Interconnecting Cabling: Fiber count had been preliminarily set at six (6) strands of multimode fibers routed across each floor between IDF's.
- b) Pathway capacities will be utilized to the maximum of 40% to 50% fill and sized to allow for 50% future growth. At least one (1) spare riser sleeve or conduit will be provided between floors.

3. IT Equipment Rooms

a) Building Entrance Facility (BEF)

1. The building BEF will be located on plan level 1 within the BEF/Main Distribution Frame (MDF) room and will be the point where the building connects to the campus networks. All fiber optic and copper cabling coming into the building will terminate in this room. This room will contain the building demarcation point, lightning protection, and cable transition. Connections to the MDF will bring services to the Distribution Switch.
2. Data network services will enter the building through optical fiber cabling from the existing IDF Room.
3. Voice services will be provided in the building either through copper cabling provided by the local exchange carrier or by a local PBX

4. Space should be designed into the BEF/MDF room to accommodate an owner provided PB)system or LEC system equipment.

b) Main Distribution Frame Room (MDF)

1. The building MDF will be co-located with the BEF within the BEF/MDF room and will be the point from which the building services originate. The Distribution network switch will be located in the MDF, distributing network services to the entire building via the Fiber data backbone.

2. The MDF will also provide the cross-connect point to distribute telephone service from the telephone switch equipment to each IDF. The telephone switch equipment cabinets will be rack mounted. From the backplane of the telephone switch equipment cabinets, telephone services will be distributed to a rack mounted termination point. From the telephone switch equipment blocks, cross-connects will route telephone service to intra-building backbone cables. All communications cabling within this room will be secured using a Velcro type "Tie-Wrap" instead of the plastic type "Tie-Wrap".

c) Intermediate Distribution Frame Room (IDF)

1. IDF's will be located in an area convenient to the floor it will serve to provide a lockable protected & climate controlled environment for terminating all backbone and station cabling on that floor. Workgroup Access Layer Switches will also be housed in the IDF's, distributing network services to the entire floor via the data station cabling.

2. Each network device will be configured with redundant power supplies and will require two (2) 120 volt, 20 amp branch circuits. All circuits for active electronics will be fed from the standby power system with rack mounted uninterruptible power system (UPS) units provided by The University for each equipment rack.

3. All 120 volt circuits for active electronics will be specified as dedicated, with separate neutral and equipment grounding conductors routed back to the nearest stand-by power panel without mechanical equipment loads. One (1) convenience outlet fed from the normal power system will be provided in each IDF.

4. Equipment panels for security, fire alarm, building automation systems, etc. will be centrally located within the interstitial spaces and co-located on the wall space(s) designated by Network Service within the IDF's on those floors without interstitial spaces.

4. Electrical Requirements

a) Each network device will be configured with redundant power supplies and will require two (2) 120 volt, 20 amp branch circuits. A minimum of one (1) 120 volt, 30 amp branch circuit will be provided. All circuits for active electronics will be fed from the standby power system with rack mounted uninterruptible power units (UPS) provided for each equipment rack. Owner to verify all power requirements for equipment provided.

b) All 120 volt circuits for active electronics will be specified as dedicated, with separate neutral and equipment grounding conductors routed back to the nearest stand-by power panel without mechanical equipment loads. Convenience outlets fed from the normal power system will be provided 25' on center on the perimeter wall of the IDF room.

c) Fluorescent lighting, fed from the standby power system will be installed within the HUB room.

5. Equipment and Material

a) Cabling System Pathways

1. Multiple 4" conduits and cable tray shall connect the MDF to the stacked IDF's, and 4" sleeves shall be provided between IDF's on each floor.

2. Each IDF room shall be provided with cable runway over the equipment racks. The cable runway will be bonded and properly grounded in compliance with the NEC to the cable tray system.

3. Horizontal distribution will start with multiple 4" conduit sleeves from the IDF cable runway to a cable tray. The cable tray will be run through the public corridors of the floor plate on floors without an interstitial space and routed throughout the interstitial spaces to serve the station conduits for the spaces on the interstitial level

and the floor below. Cable tray will be an aluminum, ladder-type.

4. Station conduits will be run from the cable tray to the outlet location. Conduits will be 1" minimum, with end bushings and metallic grounding clamps for bonding the conduit to the cable tray.

b) Voice Backbone Cabling

1. Intra-building voice backbone cabling will be high pair count copper cables. Both ends will be terminated on rack-mounted X LBET (extra large building entrance terminal frames) 110 style connection blocks. The MDF will connect to the IDF with an intra-building voice backbone cable. These cables will create the cross-connect fields to distribute telephone services throughout the building.

c) Voice Station Cabling

1. Each voice jack in the building will be connected to the IDF on that floor by a 4- pair UTP, category 6a cable. All four pairs of the cable will terminate at the outlet location and in the IDF using the T568B wiring scheme. Category 6a rated 8P8C type jacks will be used at the outlet locations, and category 6a rated, rack mounted type termination points will be used in the IDF's. Plenum cabling will be specified in all areas designed with plenum return air systems.

d) Data Backbone Cabling

1. Data backbone cabling will be multi-mode and single-mode optical fiber cable, and all IDF's will be a home run connection to the MDF. Data backbone cabling will be terminated in rack mounted, rack installed, Light Shelf Terminations (LST's) using AVAYA SC type fiber connectors.

e) Data Station Cabling

1. Each data jack in the building will be connected to the IDF on that floor by a 4- pair UTP, category 6a cable. All four pairs of the cable will terminate at the outlet location and in the IDF using the T568B wiring scheme. Category 6a rated 8P8C type jacks will be used at the outlet locations, and category 6a rated, rack mounted style termination point will be used in the IDF's. Plenum cabling is specified in all areas designed with plenum return air systems

f) Data Patch Cables

1. Owner provided, data patch cables will be provided to match the rack mounted terminations. These cables will complete the category 6a rated channel.
2. Pre-terminated multi-mode optical fiber patch cables will be provided to match the jack-fields, outlet, and cable equipment.

g) Inner duct

1. Backbone fiber optic cabling will be installed in flexible, corrugated, nonmetallic inner duct. This inner duct will protect the cables and segregate conduits and conduit sleeves. Inner duct is specified as UL listed and comply with NFPA 70 for all installations.

h) Equipment Racks

1. Fiber optic data patch panels will be rack mounted in each **IDF** and rack mounted on ?LBET frames within the BEF/MDF room. Active electronic equipment will be installed in floor mounted equipment racks. Vertical and horizontal wire management will be provided.

i) Cable Runway

1. Cable runway will be used in the BEF/MDF room and IDF's. The runway provides flexibility in the tight confines of the communications rooms and helps to insure an orderly cabling installation. It is also used to help brace the equipment racks.

j) Communications Ground

1. A communications grounding system will be installed to connect all of the building IDF's with the HUB room. The grounding system will be derived from the building electrical service to insure there is no difference in potential between it and the building communications systems.

k) Wireless Access Points

1. Category 6a cabling shall be pulled into designated locations specified by Network Services to accommodate Wireless Access Points.
2. Wireless Access Points will be installed by owner.

6. Distribution

- a) Cable distribution within the building will be accomplished using the IT structured cabling system in conduits, conduit sleeves, cable trays and cable runways.
- b) Line voltage, BAS, Security, CCTV and speaker cabling will NOT be routed in the IT structured cabling raceway. All "other" cabling will be routed in the pathway designated for the IT structured cabling system to insure coordination of all system cabling paths.
- c) D-rings and cable runways will be used only in the BEF/MDF room and IDF's.

5.2 Security

A. Introduction

The objective of security is to ensure the safety of the animals, staff, equipment, and data. Conventional entrances, such as man-doors and dock bay doors, must be equipped to control access to the animal facility. Proximity card readers and number pads are used within the vivarium. Security must be designed so that approved users may move about the facility easily with minimal hindrance while unapproved individuals are denied access.

In addition to conventional entrances, security at other potential entry points must be considered. Windows, air intakes, and other central utility entrances and exits must be protected from intruders.

B. Background

The levels of security required for the animal facility are:

1. External Perimeter: Entrances leading into the vivarium from non-vivarium spaces.
2. Internal Perimeter: Entrances from vivarium administrative space into animal housing and use space.
3. Functional Area Perimeter: Entrances into specific areas within the facility, e.g., imaging suite, cryo-preservation laboratory, irradiator rooms, animal receiving and quarantine, receiving dock, etc.
4. Animal Housing Suite: Entrance into discrete group of animal housing and procedure rooms
5. Animal Housing/Procedure Room: Entrance into a specific housing/procedure room

C. Standard

Security Requirements	
Item	Direction
Perimeters and Suites	UTPD card readers, digital recording security cameras trained on all external and internal perimeter entrances and throughout animal housing area corridors
Housing/Procedure Rooms	Individual room control requiring a PIN to enter, programmable through the electronic facility management system (e.g. Edstrom Watch-Dog)

Non conventional entry points	Intrusion alarms, mesh covers, or other appropriate means of preventing entry
Duress Alarms	One in each locker room, central administrative area, each animal housing suite, strategic locations in housing area corridors
Card Reader and PIN access systems	Must be programmable and able to allow multiple levels of security

D. References

National Research Council, Institute of Laboratory Animal Resources. 1996. The Guide for the Care and Use of Laboratory Animals. pg 43-44.

5.3 Closed Circuit Television (CCTV) Surveillance

A. Introduction

Security in the animal facility is of paramount importance. Proximity card readers, locks and keys, and PIN key pads afford a level of perimeter and internal access control. However, it is important to monitor the movements of people and equipment once inside the facility via strategically located surveillance cameras. Closed circuit TV (CCTV) surveillance cameras are used to identify events such as individuals entering the facility inappropriately (e.g., "tailgating," insufficient or incorrect protective clothing, etc.), individuals behaving in an inappropriate manner (e.g., incorrect animal transport, horse playing, etc.), and unauthorized use or removal of property.

B. Background

UTPD's Crime Prevention and Technical Services groups should be involved from the beginning of a project to allow for thorough assessment of security needs. Ideally, there would be virtually total surveillance coverage of all main corridors. Minimally, all perimeter entrances and internal entrances, like locker rooms, must be visually monitored and recorded by UTPD. Many requests to review surveillance camera recording are in response to inappropriate behavior, rather than true security issues, so it is desirable for DVMS to also be able to monitor animal facility CCTVs. Since the videos are used to positively identify individuals and what they are doing, it is very important that the camera produce a clear image that can be zoomed and remain clear when zoomed. Communication between camera and monitoring devices must be secured against tampering or other damage.

C. Standard

CCTV Requirements	
Item	Direction
Cameras	Must provide clear view of the area of coverage, even when zoomed on the monitor. Should be able to zoom and pan.
Camera locations	<ul style="list-style-type: none"> - at all perimeter entrances to the facility - at all locker room or other entrances into the animal housing area - all elevator lobbies and elevators - all main corridors

Recording devices	<ul style="list-style-type: none"> - multi-camera capabilities - programmable alarming - network client software license for DVMS Project Manager
Cable security	
Monitoring	All animal facility CCTVs are monitored by UTPD. Ideally, all vivarium CCTVs are also monitored in the DVMS Project Management (PM) office through the use of an Intellex or comparable recording device. Minimally, all perimeter and internal entrance CCTVs are monitored in DVMS the PM's office.

National Research Council, Institute of Laboratory Animal Resources. 1996. The Guide for the Care and Use of Laboratory Animals.

Project Manual, South Campus Vivarium, GMP-2 100% Construction Document Submittal

5.4 Fire Alarm

A. Introduction

Life safety in the animal facility is of paramount importance. However, this must be balanced by the needs of the animals. An acceptable compromise must be reached that accomplishes the goal of adequately notifying human occupants of a danger while causing the least disruption to the animal colony.

B. Background

Many times, an alarm is triggered in the absence of a real danger to life safety. It is desirable that these false alarms cause no disruption to the animal colony. Audible alarms must be able to emit a chime, rather than a horn, within the animal housing suites and main hallways. Only visual alarms are allowed within animal housing rooms and must have red lenses.

A variance from the Texas Department of Licensing and Regulation (TDLR) was required to allow visual only fire alarms within animal rooms. (See Variance Application for details in the Appendix.)

C. Standard

Fire Alarm Requirements	
Item	Direction
Animal room visual alarms	Red lens, weatherproof gasket, sealed

D. References

National Institute of Health. 2003. NIH Design Policy and Guidelines, Animal Research Facilities. Design Standard B.4.2.

Project Manual, South Campus Vivarium, GMP-2 100% Construction Document Submittal

5.5 Wireless Data**A. Introduction**

The modern animal housing facility is equipped with many different computer-based systems including, but not limited to, building automation, vivarium management, breeding colony management, and communications. Access to these systems is often required away from a hard-wired wall jack.

The term "wireless network" can be used to describe any type of network that is wireless, but the term is most commonly used to describe a telecommunications network that does not use wires to establish interconnections between nodes. Wireless computer networks are examples of these types of telecommunications networks.

Wireless Fidelity ("Wi-Fi") is a commonly used wireless computer network that uses radio waves. Radio technologies called IEEE 802.11 are transmitted from access points. Wireless devices use receivers to detect the signal. A Wi-Fi network can be used to connect computers to each other, to other wireless devices & networks, or to the Internet.

5.6 Communication**A. Introduction**

Communication within and between animal facilities is an important aspect of departmental operations. Staff members must be able to communicate quickly and accurately. Most of the animal care staff do not carry institutional pagers, so there must be a mechanism for communication to and from these individuals. Overhead paging and hallway telephones serve this purpose. Hallway telephones also allow for returning pages, for those individuals with pagers or Blackberry devices. The wireless system allows uninterrupted computer communication throughout the facility. (e.g., for animal care staff moving from room to room using ViewPort or other data management system to enter data.)

B. Background

A number of communication devices are used in the animal facility, including but not limited to, phones, pagers, Blackberry devices, wireless computers, and ViewPort. It is imperative that these devices be configured with wiring or signaling devices such that they have uninterrupted service throughout the facility. It is unacceptable to have "dead spots" where a signal may be lost. On the other hand, the increasing use of radio transmitters in personal communication devices is resulting in more incidences of unintentional interferences with other electronic equipment. The wireless network interfaces, cellular phones, personal digital assistants, and two-way radios contain transmitters that are powerful enough to cause interferences in many electronic systems such as telephones, personal computers, electronic control systems, etc. Some research centers have experienced interferences in their freezer electronic control systems, electronic actuators controlling air dampers, and transducers controlling branch line pressure when a handheld two-way radio is operated nearby.

C. Coordination

Contact UTHSCSA Information Technology for specifications

5.7 Database Information Management**A. Introduction**

A vast amount of information is generated in the animal facility on a daily basis. Environmental conditions must be recorded on a regular basis through the building automation system (BAS) and/or other environmental monitoring systems. As the animal care staff performs routine procedures, completion of the procedures must be documented. Any other activity that has a relationship to animal health and wellbeing should also be documented. Electronic management of

data is preferred to paper copies, since electronic records may be sorted, graphed, searched, and archived.

B. Background

Commercially available database systems are available for collection, documentation, and manipulation of vivarium information. The system should allow for easy data entry, searchable records, and reporting capabilities. Data security is of paramount importance and must be protected through the use of passwords, restricted access based on job function, and other appropriate controls.

C. Standard

Database Information Management Requirements	
Item	Direction
Data security	System must follow policies and guidelines described in the M. D. Anderson Information Security's <i>Security Policy and Operations</i> Manual and Information Security institutional policy.
Multiple Users	System must allow multiple users at any given time
System to system interface	Ideally, the system will utilize an open protocol to allow communication between database systems
User interface	Must be user-friendly and intuitive. Must be customizable and tailored to the specific facility.
Compliance	Comply with 21 CFR Part 11, Electronic Records; Electronic Signatures

6.0 Architectural Materials & Finishes

6.1 Functional Areas

A. Introduction & Background

An animal research facility is a specially designed building type. The design and size of the facility depends on the scope of the animal research program, the species to be used, the physical location

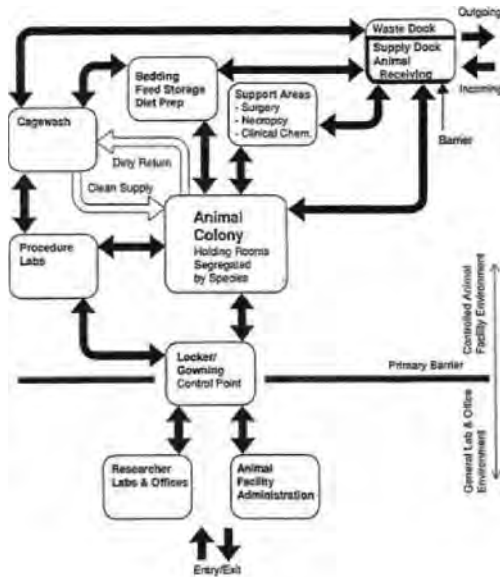

in relation to the other research areas, and the geographic location. The vivarium must maintain closely controlled environmental conditions and must be designed to protect the research animals from exposure to conditions, pathogens, and agents that could alter research results. Functional areas must be defined in order to develop a well-planned and efficient facility.

B. Data 1. Functional areas of an animal facility may include:

- a) Animal Housing Rooms (AHRs) - AHRs can be organized as individual rooms accessed from a corridor system or multiple rooms could be organized into self-contained suites.
- b) Procedure Rooms — procedure rooms should be located within or close to the AHRs. Maximum flexibility is maintained by designing procedure rooms that can be used interchangeably as animal housing rooms, i.e., procedure rooms should be identical to animal housing rooms. Procedure room furniture and fixtures should be modular and mobile, to allow for total room conversion between procedure and housing.
- c) Barrier Facilities — This area is designed to maintain bio-security for specific pathogen free animals. The rooms operate under positive pressure to keep contaminants out. As in containment facilities, control and monitoring systems and equipment are utilized in barrier facilities to maintain the required pressures and flows.
- d) Barrier Elements - Airlocks, locker rooms, pass-through autoclaves, etc., provide the primary barrier and access control that separates the controlled animal care environment from external influences.
- e) Cagewash — The cagewash complex is the central area for decontamination, cleaning, and sanitizing of animal care equipment and supplies. These areas are dominated by equipment-generated heat, moisture, noise, and vibration. The major equipment items include cage & rack washers, tunnel washers, autoclaves, bedding dispensers and dump stations, and bottle filling stations.
- f) Cage Storage — Storage space is required for items that are used in daily operations, such as staged or processed cages, bottles, racks, carts, etc.
- g) Feed, bedding, & equipment storage — This storage area should be located to facilitate operational flow. Appropriate separate storage areas for these and other items should be included.
- h) Quarantine — A specialized containment area is needed to house incoming animals that could be a source of infection. This area should be physically separate from the central housing area to minimize the potential for contamination.
- i) Dedicated Receiving Dock - A dock specific to animal functions is generally required. An elevator dedicated to animal usage should be located near the dock.
- j) Necropsy - This area is used for post mortem procedures on euthanatized or otherwise deceased animals. This function should either be located physically separate from "clean" areas or separated by a pressurized pass-through air lock.
- k) Containment Facilities - These areas are designed for working with potentially infectious biological agents. They operate under negative pressure to prevent the escape of air to the general environment. Wastes and effluents are separately contained and decontaminated.
- l) Veterinary Care — This area may include laboratory, surgery, and clinical care functions.
- m) Office Space — Office area is required inside the vivarium for veterinary and animal care staff.
- n) Staff Support Areas teak area, cafeteria as, workstation, lockers, and rest-room facilities. All are intended to support veterinary and research staff during their work shift.
- o) Mechanical/Electrical Equipment Spaces — This area includes mechanical equipment rooms, and electrical and telecommunications closets. It is desirable to locate the spaces and devices in a manner that allows the separation of maintenance functions from animal care functions.
- p) Corridors - These should be wide enough to accommodate animal rack, cart, and material traffic flow, not just egress requirements. Corridors should have a clear width of 7'-0" to 8'-0". Corridors should have

impervious finishes so that they are easy to clean and maintain. Protective components such as bumper and corner guards, bull nose blocks and cove bases are frequently employed to protect walls and doors from heavy, abusive traffic.

The general organization of a vivarium is illustrated below:

Animal Facility
Diagrammatic Model Showing
Basic Flows and Spatial Relationships

2. Important Attributes

- Internal circulation systems need some form of control over clean vs. dirty (or supply vs. return) traffic.
- The cagewash complex is divided by walls into type-of-use areas, including decontamination, soiled equipment processing, clean equipment processing, autoclave equipment preparation, and autoclave sterile staging.
- Areas of potential contamination, such as necropsy and quarantine, should be located outside the central housing area.
- The animal receiving areas should be subdivided to distinguish between incoming animals and receiving, and outgoing waste.

6.2 Corridors

A. Introduction

Animal facilities should be constructed to be practical, functional, and efficient. Corridors within animal facilities must be able to accommodate the passage of large equipment, bulk materials and supplies, animal transport crates, and research equipment and personnel. The use of single or dual corridor systems is a basic decision that must be made early in facility design.

B. Background

The decision regarding single or dual corridor systems should be based on the following factors: available space, need for contamination control, species to be housed, and cost constraints. Corridors should be wide enough to facilitate the movement of personnel and equipment. Corridors 8 feet wide can accommodate the needs of most facilities. Floor-wall junctions should be designed to facilitate cleaning. In corridors leading to dog and swine housing facilities, cage-washing facilities, and other high-noise areas, double-door entry or other noise traps should be considered. Wherever possible, water lines, drainpipes, electric- service connections, and other utilities should be accessible through access panels or chases in corridors outside the animal rooms. Fire alarms, fire extinguishers, and telephones should be recessed or installed high enough to prevent damage from the movement of large equipment. A map of the corridor system should be provided in main hallways to facilitate wayfinding.

C. Data

Clean-dirty dual corridors systems should be used whenever possible to promote contamination control. Main facility corridors should be 8 feet wide. Junctions between floors, wall, and ceilings should be sealed. Bumper rails or guards and corner guards should be used to protect walls from damage.

D. Standard

Table listing standard

Corridor system Dual; clean-dirty traffic flow
Minimum width 8 ft

6.3 Animal Room Doors

A. Introduction & Background

Doors are installed in animal facilities in corridors and animal rooms. Corridor doors are required to separate functional areas, provide noise control, and enhance facility security. Doors in animal rooms provide many functions, including providing enclosure for the animals, maintaining air balance, providing noise control, and enhancing facility security.

B. Standard

1. Corridor doors should be wide enough to accommodate the movement of equipment and animals. Double-door (vestibule) entries should be considered in corridors that separate high-noise areas. Corridor doors and doors in other high traffic areas are subject to the most extreme abuse in the vivarium. Push button actuators should be provided to discourage people from forcing the doors open with a rack, cart or other piece of equipment. In addition, these doors may require a piano style hinge in order to ensure long term durability. Doors separating elevator lobbies and doors with hold opens should be pocketed or shielded to protect the edge of the door from impacts. The hardware should be carefully chosen to avoid being clipped off by a rack, cart or other piece of equipment.

2. Animal room doors should be large enough to accommodate the movement of cages and equipment. Doors should have seamless construction with smooth, flush surfaces, without visible joints or seams on exposed faces or edges. Animal room doors should be painted hollow metal or FRP, 4'-0" wide by 7'-10" tall (minimum) and should be equipped with recessed or shielded handles, threshold sweeps, and kick-plates. All frames should be grout- filled, welded hollow metal with a painted finish. Procedure room doors should be sound retarding painted steel doors with acoustical seals, engineered for attenuation rating of 45 STC minimum.

3. Normally, animal room doors should open inward and be self-closing. If code requires outward opening, the door can be recessed into the corridor wall. Animal housing and procedure room doors

should have a view window with shutter. The view window can be coated with a red film similar to that found in a photo darkroom. The red filter will allow animal care staff to check the room without disturbing the animals' day/night cycle. The spectral energy/light range in which mice are sensitive is approximately 325nm to 625nm, so the red film should be chosen based on its ability to screen within that range.

4. Sliding automatic breakaway aluminum entrance doors should be installed at cage wash and clean cage storage.

5. Hardware protection (bumpers) should be installed for all locksets at holding and procedure rooms.

6.4 Exterior Windows

A. Introduction

In general, exterior windows are not recommended for animal research facilities and are inappropriate for areas within animal facilities where their presence interferes with the ability to control room temperature (due to heat loss) or photoperiod. Windows can be acceptable in rooms for some species, such as nonhuman primates, dogs, and other large mammals and might be considered as part of the environmental enrichment program for these species. Direct sunlight may even be required in some species of neo-tropical primates in order to obtain necessary vitamin D.

B. Background

The traditional use of windows in building design was to provide light, view, and fresh air for building occupants. This need has diminished over the past few decades as buildings have become more sealed, mechanically ventilated, and electrically lit. There is a growing recognition that the presence of windows makes an important contribution to the occupant's job satisfaction, health, and productivity.

Despite these advantages for the human occupants, windows are not generally recommended for rodent facilities because they:

1. Allow fluctuations of photoperiod and light intensity within the housing room during daylight hours;
2. Interfere with room temperature control due to solar heating; and 3. Reduce building security.

Since small animals such as rodents need strictly controlled light and dark cycles to maintain animal health and breeding, exterior windows are not normally provided in small animal housing rooms.

C. Standard

Exterior Windows	
Rodent housing room	None
Rodent procedure room	None
Support spaces	Variable based on function and presence of animals

6.5 Floors

A. Introduction

Floors should be moisture-resistant, nonabsorbent, impact-resistant, and relatively smooth, although textured surfaces might be required in some high-moisture areas and for some species (such as farm animals). Floors should be resistant to the action of urine and other biologic materials and to the adverse effects of hot water and cleaning agents. They should be capable of supporting racks, equipment, and stored items without becoming gouged, cracked, or pitted. Depending on their use, floors should be monolithic or have a minimal number of joints. If sills are installed at the entrance to a room, they should be designed to allow for convenient passage of equipment.(1991; (U.S.) 1996) Flooring material should be carried up the walls a minimum of 150 mm (6 inches) to provide an integral covered base for ease of cleaning. (Facilities 2006)

1. Durable and capable of supporting heavy equipment & caging systems
2. Nonabsorbent and easily sanitizable
3. Smooth but with non-slip surfaces
4. Able to be carried up the wall for at least 150mm

B. Background

Some materials that have proved satisfactory are epoxy aggregates, hard-surface sealed concrete, and special hardened rubber-base aggregates. Correct installation is essential to ensure long-term stability of the surface. Resinous epoxy flooring is recommended for all floors within animal facilities that are subject to abuse, frequent cleaning, and continuous movement of cages and equipment. Areas that are hosed down shall be surfaced with resinous flooring materials.

Some areas within the animal facility may not require the same amount of cleaning and disinfecting as the areas in which cages and animals are held or transported. These areas are program driven and may consider the use of a monolithic sheet vinyl flooring material. (Facilities 2006)

Polymer flooring that incorporates antimicrobial agents should be considered for use in areas where the control of microbial contamination is desirable, such as surgical suites, necropsy areas, or barrier facilities.

C. Standard

Vivarium Floors	
Animal holding and procedure rooms	Resinous epoxy
Necropsy rooms	Polymer/antimicrobial
Corridors	Resinous epoxy

Cage wash and sterilization areas	Resinous epoxy
Loading docks	Hard surface sealed concrete
Support areas	Monolithic sheet vinyl
Offices	Monolithic sheet vinyl

6.6 Drainage**A. Introduction**

Adequate drainage is essential in animal facilities. These facilities produce large volumes of waste water during equipment sanitation and animal husbandry tasks. Drainage for either sinks and/or floor drains may be required in support areas, animal procedure rooms, and holding rooms. Floor drains are required in cage wash areas, many equipment processing areas (for autoclaves, etc.), large animal or aquatic animal holding rooms, and janitorial rooms. Many rodent holding rooms and clean support areas can be effectively sanitized by vacuuming and mopping rather than by wet wash down; in these areas, floor drains are not required or desired. The main advantage of including floor drains in these areas is to gain flexibility. Disadvantages include: installation costs, higher rate of insect infestation, contamination resulting from sewage backups, rack instability due to sloped flooring, escape of sewer gas from underutilized drains, and reduction of floor space due to drain troughs. Any unused drain in an animal housing or procedure room must be plugged to create a seal against sewer gas escape, vermin traffic, and other permeating issues so that it may be readily removed if the drain becomes needed in the room.

B. Background

Floors should be sloped at least 1.5 cm per M (3/16 in/ft) to floor drains to ensure rapid removal of water and drying of surfaces. Variation in the substrate (floor flatness) should not exceed 1/8th in/10 ft. Drains should be located at the lowest point of the floor or drain trough. The bottom of troughs should be sloped a minimum of 2 cm per m (1/4 in/ft). Floor drains should always be sealed effectively by continuously containing fluids or other means. Automatic trap priming should be considered as a method to ensure that traps remain continuously filled. Drain pipes should be at least 4 inches (10.2 cm) in diameter; larger pipes are recommended in some areas, such as large animal runs and farm-animal facilities. A run-flush drain or heavy-duty disposal unit is recommended for disposal of solid waste.

C. Standard

Drainage Standard Requirements	
Sloped floor required for floor drains	Minimum slope =1 .5cm/M
Sloped trough required for drain	Minimum slope .0cm/M
Floor substrate variation	<1/8 th in/10 ft
Minimum drain diameter	4 in
Trap priming	Automatic
Disposal unit	Preferred for solid waste

6.7 Walls

A. Introduction

Walls should be smooth, moisture-resistant, nonabsorbent, and resistant to damage from impact. They should be free of cracks, of unsealed utility penetrations, and of imperfect junctions with doors, ceilings, floors, and corners. Surface materials should be capable of withstanding cleaning with detergents and disinfectants and the impact of water under high pressure. The use of curbs, guardrails or bumpers, and corner guards is required to protect walls and corners from damage. All joints between walls and appurtenances such as bumpers or guardrails must be sealed with an owner approved caulk or sealant. Walls must provide sound isolation. Other requirements include:

1. Durable and capable of withstanding moderate impact;
2. Non-absorbent, free of cracks & crevices, and easily sanitizable; and 3. All penetrations must be sealed.

B. Background

Concrete masonry units (CM U) are effective for walls, but the block must be sealed to prevent moisture absorption and the joints must be tooled to prevent collection of dirt. Ceramic tile and glazed block are not recommended because of the number of exposed joints. Cement fiber wallboard may be a viable alternative building material to replace CMU. Gypsum wallboard can be considered for certain applications in low moisture, low traffic areas. Cement fiber or gypsum wallboard surface must be properly prepared and coated with approved primer and topcoat to reduce the potential for moisture intrusion.

C. Standard

Vivarium Wall Requirements	
Animal holding & procedure rooms	Cement fiber wallboard or CMU
Necropsy rooms	Cement fiber wallboard or CMU
Corridors	Cement fiber wallboard or CMU
Cage wash & sterilization areas	CMU
Loading docks	CMU
Support areas	Cement fiber wallboard or CMU
Offices	Gypsum wallboard

6.8 Ceilings

A. Introduction

Ceilings should be smooth, moisture-resistant, and free of imperfect junctions. Surface materials should be capable of withstanding cleaning with detergents and disinfectants. Ceilings of plaster or fire-proof plasterboard should be sealed and finished with a washable paint. Exposed plumbing, ductwork, and light fixtures are undesirable unless the surfaces can be readily cleaned. Access panels are not desirable in animal housing and procedure rooms. Where access panels are required, the panels should be corrosion-resistant and gasketed.

Other requirements include:

1. Able to withstand disinfection
2. Moisture-resistant, free of cracks & crevices, and easily sanitizable
3. All penetrations must be sealed
4. Exposed pipes are not acceptable
5. Surface mounted light fixtures are desirable as they can be sealed and do not allow air exchange between the room and the above ceiling space

B. Background

Plasterboard or cement fiberboard are acceptable construction materials for ceilings. Ceilings formed by the concrete floor above are satisfactory if they are smoothed and sealed or are painted. Generally, suspended ceilings are undesirable unless they are fabricated of impervious materials and free of imperfect junctions.

C. Standard

Vivarium Ceiling Requirements	
Animal holding & procedure rooms	Cement fiber wallboard
Necropsy rooms	Cement fiber wallboard
Corridors	Cement fiber wallboard
Cage wash & sterilization areas	Cement fiber wallboard
Loading docks	Cement fiber wallboard or
Support areas	Cement fiber wallboard
Offices	Suspended lay-in tile
