Animal research requires that procedures be conducted on the animals. The trend is to avoid removing animals from the vivarium for the following reasons: public health — to minimize exposure of public to animals, allergens, infections; public relations & security; animal health; and to minimize the impact on research, which includes the stress of movement, and exposure to an uncontrolled environment. Support space for procedures should be provided within the vivarium. Examples of support space include: procedure laboratories, surgery suites, necropsy, radiology, imaging, and space for other equipment like irradiators.

B. Data

The recommended ratio of animal holding rooms to procedure rooms varies depending on the species to be housed and the research needs. Dedicated procedure space must be allotted for specialized procedure areas such as surgery, imaging, radiotherapy, clinical pathology, or anatomic pathology. The amount of space needed in each procedure room also varies with the intended use of the room; more space is required in rooms designated for surgery or radiology because space must be allowed for personnel to move around surgery or exam tables or radiology and imaging equipment. Consideration must also be given as to whether animals will be housed within the procedure room; rooms containing

specialized research equipment are often designed to allow 1 rack of animals to be housed in the room during the procedures.

The ratio of rodent holding rooms to generic rodent procedure rooms varies from 1 procedure room to 4 housing rooms up to 1 procedure room to 8-12 housing rooms. Although the ratio of procedure rooms to animal holding rooms has steadily increased, the real ratio that should be applied is procedure rooms to cages. Assuming 420-mouse cages/animal room, the ratio of procedure room to cages should be 1:840 or 1:1,260. Dedicated procedure space may be reduced significantly if animal housing rooms are equipped with a sink and a biological safety cabinet, because many routine procedures can be performed in the housing room. Conversely, if the consequence of infection is high, additional procedure space should be considered. Ideally, procedure rooms are located in close proximity to animal holding rooms.

C. Standard

The recommended standard ratio for MDA rodent vivaria is 1 procedure room to 1260 cages. **D.**

6.10 Location and Flood Protection A. Introduction

Research animal facilities must effectively support the research community that uses them. The location of the animal facility should be close to research laboratories and designed to enhance effective management and optimal utilization of the facility. The choice of location for any new building must include consideration of emergency management concepts. The impacts of disasters are similar, regardless of the cause of the disaster, resulting in operational disruptions and property damage. Disaster planning must be part of the basis for deciding vivarium location, both on a site and within a building. Flood protection must be included in the building design.

B. Background

The best site location for a vivarium is based on many factors. This decision is a compromise between the need to locate the facility in close proximity to the research laboratories, while isolating the animal functions for reasons of public health, public relations, security, animal health, and animal husbandry requirements. The best location for the vivarium within the building is also a compromise of competing priorities. For animal facilities that are below grade, the potential risk of flooding is only one of the components that must be considered; others include design considerations to achieve the square footage desired within the building footprint, proximity to other research components, utilities, security, dock operations, materials handling, and code requirements.

Vivarium operations are similar to hospitals and prisons in that the population of interest (in this case, the animals) can't always be readily evacuated out of the building, as is typical in other commercial buildings. For these reasons, building codes written for hospitals and prisons should be considered during vivarium planning. This may include designing reinforced interior rooms to act as safe zones within the vivarium. Other design elements may include annunciators and wiring to have longer fire resistance ratings to allow longer time for staff to move the animals to safety.

C. Data

Buildings housing animal facilities should be physically connected to research laboratory buildings when possible. Pedestrian pathways which include patient or public corridors and general employee

use areas (such as cafeterias and break areas) should not exist between animal facilities and research laboratories. Potential building sites should not be within flood plains. All building entrances, penetrations, or building connections that are below grade must be waterproof and protected by flood walls or gates to one foot above the 500 year flood level. "Bathtub" style flood protection is specified for any MDA facility construction that is below grade. The foundation and exterior walls below the flood level must be waterproofed by application of reinforced membrane waterproofing. The general UTHSCSA preference is not to house research animals in a basement structure, but accepts the fact that it is unavoidable in some specific project circumstances.

D. Standard

Vivarium Location and Flood Protection	
Site location	Outside of flood plain
Location within building	At or above grade preferred
Flood level protection	One foot above 500 yr flood level
Style of flood protection	Bathtub
Waterproofing of foundation &	Reinforced membrane

7. Specialized Facilities & Areas

7.1 Introduction & Background

An animal research facility is a specially designed building type. Functional spaces within typical vivaria include rooms/areas for animal housing, procedures, support functions, animal and materials receiving and storage. Within this specialized facility, there can be the need for even more specialized functional areas that have unique design requirements. These areas should be identified and planned for during programming. Care must be taken by the A/E Team to work with The University to identify required specialized facilities and subsequent unique design and engineering requirements. Additionally, infrastructure to support potential future specialized areas should be considered.

7.2 Data

1. Specialized functional areas of an animal facility may include:

a) Animal holding rooms for specialized containment — typical containment facilities are designed to contain microbiological or chemical hazards. Containment of radioisotopes and other radiological hazards require specialized room shielding, radiation monitors, and areas for donning personal protective equipment. Animals involved in behavior related studies may require stricter noise controls.

b) Specialized Procedure Rooms are procedure rooms designed for specialized studies, which may require specific design criteria. They include specializations such as Teaching and Training facilities, Necropsy, Clinic, and Short-term holding rooms, but also include:

Specialized Procedure Room Examples	
Irradiation Facilities	Special shielding may be required for use of gamma, laser, or ultraviolet radiation. Specialized utilities, such as 220V electrical circuits, may be required by some equipment.
Imaging Facilities	Use of near-infrared or bioluminescent imaging may require specialized lighting or the ability to dim lights in selected parts of the room. Special electromagnetic field shielding may also be required in some cases.
Behavioral Facilities	Use of water filled swim tanks, conditioning chambers, mazes, or other behavioral equipment may require specialized utilities, room layouts and adjacencies, and noise controls.
Non-traditional Animal Housing	Use of frogs, fish, sea urchins, or other non-mammalian animals require housing and environmental controls appropriate to the species.

c) Other special use areas:

1. Vaporized hydrogen peroxide decontamination room
2. Laboratory space for genetic engineering, tissue culture, etc.
3. Pathology laboratories, clinical and anatomic

2. Important attributes:

- a) Accessibility — specialized areas meant for general use should be able to accommodate both barrier and non-barrier animals, while also minimizing the risks of cross contamination.
- b) Environmental control — typically, specialized areas must meet the same environmental standards as regular animal housing rooms. Deviation from standard is only allowed if necessary for the function of the specialized area.
- c) Sanitizeable — fixtures and finishes of specialized areas must be sanitizeable, in accordance with The Guide. Deviations from standards are only allowed if necessary for the function of the specialized area.

7.3 Standard

Within this specialized facility, there can be the need for even more specialized functional areas that have unique design requirements. These areas should be identified and planned for during programming. Care must be taken by the A/E Team to work with The University to identify required specialized facilities and subsequent unique design and engineering requirements.

8.3 Animal Watering System Details

8.3.1 Stainless Steel Room Distribution System A. Standard

1. General

The stainless steel room distribution system is a water delivery piping system designed specifically for an animal automated drinking water system. The system operates normally at a low pressure of 3-5 psi, but is subjected to flushing pressures up to 50 psi.

a) This specification applies to the receiving, handling, storage, and installation of stainless steel tubing and fittings for an animal drinking water system.

b) Furnish all materials in accordance with ANSI/ASTM Standard A450 Stainless Steel Tubing and manufacture in accordance with applicable codes and standards.

c) Purchase the complete piping system from a single manufacturer. Factory cut and fabricate the tubing to system designed lengths, electro-polish, passivate and then cap and/or seal in a bag and suitably box for shipping protection. Individually bag each fitting and suitably box for shipping protection.

d) Inspect shipping cartons upon delivery for damage and material cleanliness. Report promptly to the manufacturer any damaged material.

e) Handle tubing to avoid bending or damage. Keep materials clean and free from grease and oil. Store all tubing and fittings in their original package until ready to use.

f) Store all system material in an area segregated from other construction material. Choose a location inside a building protected from any corrosive atmosphere. Limit access to protect against physical damage, loss and contamination.

B. Products

1. Room Distribution Piping and Fittings

Distributes water from a pressure reducing station into and around each animal room and to flush drain points. Pressure rating is 200 psi minimum. Use piping/fitting design to allow mechanical dismantling for repair or replacement of individual components. Soldered, brazed or adhesive bonded joints are not permitted. Electro-polish externally and passivate all water contact surfaces to attain a uniform inactive oxide surface film.

Room Distribution Piping and Fittings Standards	
Stainless Steel Welded Tubing	1. .50" OD x .035" wall 2. 316 L grade

Electro-polish/ Passivation Process	<ol style="list-style-type: none"> 1. Electro-polish in 135°F solution of 65% phosphoric - 35% sulfuric acid 2. Passivate in 105°F solution of 20% nitric - 80% water 3. Final rinse with 125°F Reverse Osmosis water to remove all chemical residues 4. Electro-polish and passivate after all fabrication and welding
Coupling, Elbow, and Tee Fittings	<ol style="list-style-type: none"> 1. Clean Fitting or equivalent sanitary type 2. 316 L grade stainless steel 3. ID: .43" to exactly match tubing ID 4. Electro-polish both internally and externally and passivate in accordance with 2.1.2 to a finish of 32 RA or better on all water contact surfaces 5. Joint Seal <ul style="list-style-type: none"> • High grade FDA approved silicone • Seal edge width: .05" • ID: .43" for flush internal joint 6. Ferrule: 316 Stainless Steel 7. Retainer hex nut: 303 stainless steel

2. Interconnect Station (I/C) Assembly

- a) Prefabricated piping assembly with a Quick Disconnect (Q) /half coupling fitting welded to one end
- b) Clean Fitting connection or equivalent sanitary type
- c) Design characteristics in accordance with 2.1.3 with base fitting of Q welded at branch port

Quick Disconnect (QD) Standards	
Q Type	1. Industry Standard 1/4" universal style socket
Q Base Fitting	1. .16 L grade stainless steel Fitting length of 1.03" from tubing ID to Q seal

Q Components	<ol style="list-style-type: none"> 1. 316 grade stainless steel 2. Electro-polish both internally and externally and passivate in accordance with 2.1.2 to a finish of 32 RA or better on all machined water contact surfaces 3. Q Seal: High grade FDA approved silicone (De-bur open end of pipe to make it Clean Fitting ready for field assembly)
--------------	--

3. Pipe/Coupler Assembly

- a) Prefabricated piping assembly with a half coupling fitting welded to one end
- b) Clean Fitting connection or equivalent sanitary type
- c) Design characteristics in accordance with 2.1.3
- d) De-bur open end of pipe to make it Clean Fitting ready for field assembly

4. Interconnect Station (I/C)

Located in each animal room as shown on drawings and/or to adequately accommodate manifold connection for mobile or stationary racks or kennel/pen arrangements.

I/C Connection: Edstrom I/C Assembly with universal style **D** socket for hose connection Use Pipe/Coupler assembly for all piping runs not requiring I/C connections

5. Detachable Kynar Recoil Hose

Animal rack water supply hose assembly which can be detached from the room piping for sanitization or during periods of non-use.

Detachable Kynar Recoil Hose Standards	
Tubing coil	Black PVDF (Kynar) (3/8" OD x 1/4" ID, NSF standard 61, FDA grade, chlorine tolerance of .5 to 50 ppm)
Extended Reach	6 feet
Autoclavability	Maximum temperature of 250°F
Quick Disconnect Couplings-Universal Style	<ol style="list-style-type: none"> 1. Q plug on upper end 2. Q socket on lower end 3. 316 grade stainless steel 4. Electro-polish both internally and externally and passivate in accordance with 2.1.2 to a finish of 32 RA or better on all machined water contact surfaces 5. Push lock barb connection
Q Seal	High grade FDA approved
Stainless steel spring supports	3" long both ends

6. Solenoid Flush Valve

Solenoid valve located down stream from the water supply rack connection points at the terminating end of each room distribution piping run for Room Distribution Flushing or in the flush drain header at each rack location for On-Line Rack Flushing.

Solenoid Flush Valve Standards	
Body Material	Electro-polished 316 stainless steel
Input Power	24 Volts Direct Current (VDC), 0.5 amp; Watertight junction box connection screw with connectors
Coil	Epoxy encapsulated one piece
Ports	3/8" FPT
Diaphragm	Teflon

7. Rack Flush Recoil Hose

Animal rack flush hose/check valve/fitting assembly that connects the terminating point of the rack manifold to the drain header. D plug on lower end of hose to plug into supply line/recoil hose Q socket when rack position is vacant.

Rack Flush Recoil Hose Standards	
Tubing coil	Black PVDF (Kynar) (3/8" OD x 1/4" ID, NSF standard 61, FDA grade, chlorine tolerance of .5 to 50 ppm)
Extended Reach	6 feet
Autoclavability	Maximum temperature of 250°F
Hose Fittings	<ol style="list-style-type: none"> 1. Swivel nut with o-ring seal on upper end 2. O plug on lower end — Universal style 3 316 grade stainless steel - wetted parts 4. Push lock barb connection
Stainless steel spring supports	3" long both ends
Check Valve	<ol style="list-style-type: none"> 1 Polypropylene body 2. EPDM O-ring seal 3. Stainless steel spring

8. Capabilities and Features

Stainless steel tubing and fittings to be passive in tap water, 10 ppm chlorinated water or 2.5 pH acidified water

- a) Edstrom Clean Fitting design provides a consistent, smooth, inside diameter conduit for unobstructed water flow throughout the system piping.
- b) Edstrom Clean Fitting seal design assures that no cracks or crevices exist between edge of tubing and mating fitting shoulder when fitting is fully assembled
- c) Pocket created by the port in the I/C Assembly to be less than 2-1/2 tubing diameters long to allow for water exchange during flushing and to minimize the opportunity for microbial

growth

9. Execution

Perform installation with factory certified technicians on the Clean Fitting system or prequalify/train on-site technicians with factory authorized personnel. Instruct on all aspects of cutting tube, de-burring, tube bending and Clean Fitting assembly.

10. Fabrication

- a) Factory de-bur ends of cut tubing so it is ready to assemble into the Clean Fitting
- b) Make field cuts with a stainless steel tubing cutter supplied by the system manufacturer and used only on stainless steel and chamfer outside and inside edges per assembly instructions to remove any burrs.
- c) Make square cuts to accurate lengths and assemble joints tightly.
- d) Use tube bending whenever possible for corners and offsets with a bender supplied by system manufacturer and used only on stainless steel.

11. Installation and Mounting

- a) Attach tubing to the wall, ceilings or other suitable support structure with 18 GA stainless steel clamps and other appropriate brackets. Use stainless steel mounting hardware.
- b) Provide a 2-hole clamp at each I/C station within 2" of the **D** fitting to provide adequate rigidity and support. Provide one-hole clamps at all other mounting points where suitable support can be attained. Space clamps not to exceed 36".
- c) Provide plastic stand-off spacers under each clamp for wall mounting applications to mount piping off the wall by 1/2" with plastic screw anchors and stainless steel self tap screws (#0 x 1-1/4").
- d) Install the entire piping system at a consistent level throughout at a height of 84" to 96" above the floor. Limit any rises and drops.
- e) Provide a stainless steel wall plate on each side of the wall for wall break penetrations. Use silicone sealant to affix the plate to the wall and to make an air tight seal around the pipe. Avoid any mechanical joints inside walls. Do not use wall sleeves.

8.3.2 Pressure Reducing Station

A. Standard

1. General

The Pressure Reducing Station is a panel assembly to provide animal drinking water at a normal operating pressure of 3-4 A-1/2 pounds per square inch (PSI) with a minimum flow of one gallon per minute (GPM).

Edstrom Model 8550 Digital Display Station with Auto Flush and Monitoring Sensors.

B. Products

1. Enclosure/Panel

All parts shall be constructed of 18 gauge 300 Series Stainless Steel, except back panel of 16 gauge, with commercial satin finish on all exposed surfaces. The two gasketed doors shall have stainless hinges at each side to swing open and provide full access to all components:

- a) Surface Mount Cabinet: 16" H x 25.5"W x 6.5 D
- b) Recessed Back Box: 16" H x 25" W x 6" D
- c) Recessed Door Frame:
17.5" H x 26.5" W

2. Display/Interface Module

- a) Door mounted with digital readout of system pressure and LED Indicators for function status
- b) Enclosure- ABS plastic, water resistant
- c) 3-Character Display with pressure reading in psi, kPa/bar
- d) Signal outputs for digital or network system connections
- e) Output: 24vdc to solenoid valve
- f) Inputs: Pressure transducer, flow switch

- g) LED Indicators: High and low pressure, flow, solenoid power and service
- h) Plug-in cable connectors

3. Wetted Components for Piping, Fittings, Valves, etc.

Wetted Components Standards	
Piping	1/2" O.D. Tubing- 316L Stainless Steel
Fittings	Thread/Clean Joint Compression - 316L Stainless Steel
Shut-off Valve	Ball Valve - 316 Stainless Steel
Flexible Hose	Silicone Hose reinforced with polyester braid
Inlet Connection	Clean Joint Fitting - 1/2" Tube x 1/2" male pipe thread (MPT)
Outlet Connection	Flexible Hose with Clean Joint Fitting for 1/2" Tube

4 Water Filter

5" Housing standard (other options available)

Water Filter Standards	
Housing	Polypropylene with 3/8" female pipe thread (FPT) ports
Replacement Cartridge	5 micron spun polypropylene
Flow Rate	5 GPM at 50 psi
Screen	50 mesh Stainless Steel -unfiltered model only

5. Pressure Regulator High Flow Design

Pressure Regulator Standards	
Materials- wetted parts	316 Stainless Steel Diaphragm: Silicone, 6" diameter Seat: Silicone
Ports	1/2" MPT inlet, 3/4" MPT outlet
Pressure Capacity	75 psi (max) inlet
Low Pressure Unit	Range: 2-8 psi adjustable outlet
	Standard setting: 3 psi Flow rate: 10 GPM psi setting

High Pressure Unit	Range: 4-17 psi adjustable outlet Standard setting: 15 psi Flow rate: 14 GPM @ 0 psi setting
--------------------	--

6. Pressure Transducer (CE Approved)

- a) Range: 0-25 psi (0.5% accuracy)
- b) Wetted Materials: 316 Stainless Steel

7. Flow Switch

Non-Adjustable (UL Recognized)

Flow Switch Standards	
Wetted Materials	Ryton-R4 and 316 Stainless Steel
Flow Rate Actuation of Switch	80 A-20m1/min
Switch Function	N.O. (normally open with no flow)
Switch Rating	Single Pole Single Throw (SPST) .17 amp at 120 Volts AC

8. Solenoid Valve

- a) Normally closed (UL Listed)
- b) Wetted Materials: Electro-polished 316 Stainless Steel Body:
- c) Ports: 3/8" FPT
- d) Coil: Epoxy encapsulated one piece 24 volts direct current (vdc), .5 amps **8.3.3 Reverse**

Osmosis Water Purification System

A. Standard

1. General

The Reverse Osmosis Water Purification System is a complete pre-engineered system designed specifically for animal drinking water applications. The water purification system is custom designed and built to meet the requirements for a specific application. Custom factors include the quality and quantity of water provided, storage tank capacity, distribution pump output, and pre-treatment and/or post-treatment options. A microprocessor controller automatically controls and monitors the system operation. V5- Watchdog ready interface is standard for remote monitoring and alarm communication.

Feedwater Requirements to the System

Local water conditions may dictate additional pretreatment to achieve specified performance

Flow rate	12 gpm @0psi minimum
Temperature	77F (25C) ideal, 85F (30C) maximum. <i>Water temperature will affect permeate production rate. For a 1°F drop in temperature a 2% drop in water production is expected</i>

pH 5.8 - 11.0

Chlorine Concentration Tolerance

Cellulose Acetate (CA)	2.0 ppm max
Membrane Polyamide (PA)	0.0 ppm max
Membrane	
Total dissolved solids	1000 mg/l max
Turbidity	5 SDI
Hardness	15 grains per gallon
Manganese	9.05 ppm
Organics	ppm
Silicas	ppm
Iron	2 ppm in concentrate

B. Products

1. Major System Components

a) **Reverse Osmosis Unit** - Pre-treat feedwater, process water through RO unit equipped with automated clean-in-place and flush systems, pH, conductivity and temperature monitoring, control panel with LCD graphics display and devices including pumps, piping, fittings, valves, sensors, and transmitters.

2. Pretreatment pH Buffer System maintains feedwater at pH .8-6.2

Pretreatment Standards	
Solution Metering Pump	Positive displacement, diaphragm type with stroke length and frequency adjustments
Solution Tank (floor standing with recess for mounting solution pump)	1. Material: polyethylene 2. Capacity: 35 gallons 3. Low level detection switch: PVC

pH Sensor/Transmitter	1. Display: graphics display on controller 2. Automatic temperature compensation 3. Range: 0-14 pH 4. Accuracy: A-0.2% depending on electrode calibration
1)	
pH Probe _	1. Glass electrode 2. PVDF housing with Viton seals

3. Chlorination System

Maintains feedwater at 0.3-2.0 ppm chlorine concentration for chlorine tolerant (CA) membrane only

Chlorination System Standards	
Solution Metering Pump	Positive displacement, diaphragm type with stroke length and frequency
Solution Tank (Floor standing with recess for mounting)	1. Material: polyethylene 2. Capacity: 35 gallons 3. Low level detection switch: PVC

4. Prefilter

- a) Sized to application
- b) Housing: polypropylene
- c) Cartridge: 5 micron spun polypropylene

5. Reverse Osmosis Machine Cabinets and frame - floor standing

Reverse Osmosis Machine Standards	
Overall Size	60"W x 38"D x 78"H max with membranes
Six Membrane Model	60"W x 38"D x 78"H max with membranes
Five or Less Membrane Model	60"W x 35D x 78"H max with membranes
Material	300 series stainless steel
Optional Neutralization Tank	Separate floor standing assembly

6. Reverse Osmosis Pump and Membranes

Reverse Osmosis Pump and Membrane Standards	
Pump/ Motor	1. Type: multistage centrifugal 2. Pump material: stainless steel

	3. Motor: 208-230/460 VAC, 60Hz, 3 phase, 3 HP 4. Control: automatic with manual on/off inlet valve
Membranes	1. Type: spiral wound, 4.0" dia. x 40" length 2. Material: cellulose acetate (CA) standard; polyamide (PA) optional 3. Housing: 304 stainless steel; 4.5 dia x 49" high

7. Sensors/Transmitters and Controls

Sensor/Transmitter and Control Standards	
Inlet 3-way Valve	Type: motorized valve Wetted material: PVC w/Viton seals
Temperature sensor monitors permeate water temperature	Wetted material: 316 stainless steel
Pressure sensors/transmitter monitoring parameters	1. Pre-filter/Supply Water pressure 2. Post-filter 3. RO pump outlet 4. Final pressure (Concentrate outlet pressure from membrane) 5. Permeate line pressure
	6. Wetted material: 316 stainless steel
Flow sensor/transmitter measure flow rates	1. Concentrate to drain 2. Permeate 3. Wetted material: 316 stainless steel, PVDF, ceramic and Viton seals
Pressure sensor monitors permeate line pressure and system shuts down when over-Permeate purity valve directs permeate flow to storage tank or drain	Wetted material: 316 Stainless Steel
	1. Type: 3-way motorized valve 2. Wetted material: 316 Stainless Steel w/Teflon seats
Conductivity Sensor/ Transmitter - Monitors inlet water conductivity for use in program calculations	

Display	Graphics display on controller
Mounting	Directly to inlet piping
Cell Constant	K€1.1
Range	5uS/cm-10 mS/cm
Accuracy	3% of measured value
Alarm Set Point	For high conductivity
Wetted Materials	PVDF with Viton seals & graphite
Conductivity Sensor/ Transmitter - Monitors permeate water to direct flow	
Display	Graphics display on controller
Mounting	Directly to inlet piping.
Cell Constant	K15.1
Range	0.5uS/cm-200uS/cm
Accuracy	3% of measured value
Alarm Set Point	For high conductivity
Wetted Materials	PVDF with Viton seals & stainless steel electrode
Permeate Check valve: stops back flow into permeate side of	Wetted materials: 316 Stainless steel

8. Control Panel

In reverse osmosis, the cabinet operates entire system.

Control Panel Standards	
Controller	Microprocessor based
Display	64x240 character LCD graphics
Alarm	Audible with disable mode.
Alarm Warning	Messages are displayed on control panel graphics display
Remote Alarm	Relay with dry contacts and V5 connection for controller alarms; Second relay with dry
Input	24VAC, 60Hz, 1 phase isolated

9. Maintenance Equipment

Provides automated operational processes for membrane maintenance

- Automatic Flush System activates a bypass solenoid to increase water flow across the membrane automatically at preset time intervals.
- Automatic Clean-in-place System cleans membrane with a cleaning solution automatically as required or a minimum of every 90 days.

Automatic Clean-in-place System Standards

<i>Cleaning solution injection assembly proportionately injects solution into water supply line to fill clean-in-place tank</i>	
Tank	1. Material: polyethylene 2. Capacity: 18 gallons 3. Level detection switch: PVC
Process Control Valves	Fill solenoid: stainless steel
Recirculation valves	1. Motorized ball valve 2. Wetted material: PVC—inlet valve, 316 Stainless steel-CIP and permeate valve
Tank drain solenoid valve:	316 Stainless Steel
Neutralization Tank Option <i>Provides means to manually neutralize cleaning solution</i>	
Holding tank	1. Material: polyethylene 2. Capacity: 30 gallons 3. Drain Valve: PVC

10. Piping, Tubing, Fittings, and Connections

Piping, Tubing, Fittings, and Connections Standards	
Wetted Materials	1. Feed Water: PVC/CPVC/Polypropylene/ 316 stainless steel 2. Permeate water: 316 stainless steel
Sample Valves	1. Pre and post filters and concentrate flow (Ball type — PVC body) 2. Permeate flow (Needle type — 316 stainless steel)
Connections	1. Inlet: 1" FPT or 1" pipe solvent welded 2. Permeate outlet: 3/4" FPT 3. Drains: <ul style="list-style-type: none"> Concentrate Drain: 3/4" FPT CIP Drain: 3/4" FPT

11. Storage and Re-pressurization Equipment

Provides atmospheric tank storage and pump systems to accumulate the RO product water and re-pressurize for delivery through the supply header.

12. Storage Tank Assembly - Floor Standing

Floor Standing Storage Tank Assembly Standards	
Capacity	Sized to application (90-1100 gallons)
Material	1. Tank and Gasket: Polyethylene 2. Cover: Polypropylene 3. Hardware: 316 stainless steel
Seal	Bolt down cover with gasket
Level Control	Level sensing pressure sensor/transducer
Switches	Back-up overflow float switch
Air Vent Filter	0.2 micron

13. Purified Water Distribution Dual Pump Skid

Purified Water Distribution Dual Pump Skid Standards	
Type	Centrifugal
Wetted Material	1. Pump: 316L stainless steel passivated 2. Piping/Fittings: 316 stainless steel; passivated & electro-polished
Motor	1. 208-230/460 VAC, 60 Hz, 3 phase (sized to application, 1.5 - 2.0 HP) 2. Maximum 1.5 HP output pressure 55 psi el Hz; 40 psi Op Hz 3. Maximum 2.0 HP output pressure: 62 psi (0 Hz, 44 psi gi Hz 4. Transformer may be required for all other VAC applications 5. 200 VAC/60 Hz convert to 240 VAC 6. 380 VAC/60 Hz convert to 480 VAC
Motor Starter	Frame-mounted and pre-wired to motors
Floor Standing Frame	Stainless steel
Size	30"Dx36"VVx49.5"H

14. Interconnect Piping, Fittings, and Valves

Interconnect Piping, Fittings, and Valve Standards

Piping Material	1. Feed Water: PVC/CPVC/Polypropylene/ Brass/ Stainless steel 2. Permeate Water: 316 stainless steel
Valve Material	1. Inlet Valve: PVC with Viton seals CIP 2. Permeate Valve: 316 stainless steel with Teflon seats

15. Pressure Tank (Floor Standing)

Provides pressurized storage of RO product water

Floor Standing Pressure Tank Standards	
Capacity (<i>Size per application</i>)	1. 86-gallon tank with 25.4 gallon working capacity at 40/55psi drawdown 2. Optional 34-gallon tank with 10 gallon working capacity at 40/55psi
Wetted Material	Polypropylene, butyl - FDA approved with stainless steel fitting
Size	1. 26"D X17.2"H - (86 gallon) or 2. 22" dia x 29-1/2" H — (optional - 34 gallon)

16. System Maintenance Kit Provides equipment and supplies to check for proper system operation

System Maintenance Kit Standards	
Conductivity Meter	Portable battery operated meter to measure water purity
Standard Solutions	Initial supply for calibrating pH and conductivity analyzers
Chlorine Test Kit	Measures chlorine concentration
Daily Log Sheets	Tabulated forms to record operational data if unit is not monitored by V5 Watchdog

17. Capabilities and Features

Automatic operation with a microprocessor controller to control the entire system and minimize personal attention requirements

18. System Performance

- a) Specifications are based on designated operating parameters
- b) Reject feedwater contaminants to listed levels for each membrane type

CA Membrane Reject Contaminant Percentages	
Salt Rejection	93-97%
Organic Rejection	200 MW
Bacteria Rejection	99%
Pyrogen Rejection	99%
Particle Rejection	99%

- c) Assume typical water with a mixture of monovalent and polyvalent salts
- d) Expect some performance variations based on water temperature and local water conditions
- e) Provide feedwater within temperature range of 50-85o F (10-30oC) or membrane life may be shortened. Max temperature is 104o F (40oC)
- f) Produce permeate at designated rates based on 60F feed water temperature. For every 1F below 60F, expect a 2% reduction on in the permeate production shown below:

Permeate Production	
CA Membrane	0.4 - 2.4 GPM (585-3510 GPD)
PA Membrane	0.9 - 5.2 GPM (1242-7452 GPD)

- g) Recover permeate at a 50% ratio of feedwater as a standard, but base actual recovery on analysis of supply water
- h) Membrane life may be reduced if temperature is outside of 50-85o F (10-30oC). Maximum temperature 104o F (40oC)

19. Automated System Control

- a) Activate RO machine when water level in storage tank reaches refill point
- b) Activate pH pump when RO operates and monitor pH level with pH sensor/ transmitter to automatically keep feedwater adjusted to pHg.8-6.2
- c) Activate chlorine pump to maintain chlorine level in feedwater at pre-established set concentration of 0.3-2.0 ppm. Prevent microbial growth internally in RO with adequate chlorination (CA membrane only).
- d) Check inlet pressure to automatically shut down RO machine for pump protection if water pressure or flow is lost.
- e) Check temperature of water to automatically shutdown RO machine for internal component protection if permeate water temperature rises above 100 F

- f) Check conductivity of product water with sensor/analyzer for product water diversion to drain if sensor detects water quality below set purity.
- g) Activate one distribution pump when pressure tank pressure reaches the cut-in set point and shut down at cut-out set point.
- h) Operate two distribution pumps alternatively during run cycles to prevent stagnation from occurring.
- i) Provide automatic back-up of pump operation by operating only the good pump if either pump fails
- j) Display operational status on message screen.
- k) Activate RO system and flush solenoid valve to automatically increase water flow across membrane at preset daily/hourly time intervals to flush sediment from membrane surfaces
- l) Determine need for membrane cleaning and activate as required based on sensor readings.
- m) Activate automatic clean-in-place system to clean membranes with a special solution as required or a minimum of every 3 months.
 - Inject cleaning solution concentrate proportionately into RO water as it fills clean-in-place tank
 - Control flow into tank with level detection switch
 - Circulate solution mixture through reverse osmosis unit for preset time period
 - Soak solution for preset time
 - Drain solution mixture from tank
 - Flush cleaning solution out of RO unit and continue to operate until acceptable purity level is attained
- n) Provide daily log reporting from sensor readings and store in controller memory.

20. Automated System Monitoring

- a) Display alarm conditions on controller graphics screen.
- b) Activate audible buzzer and alarm message when alarm occurs.
- c) Close dry contact relay for controller alarm remote transmission to another device.
- d) Close dry contact relay for power loss alarm transmission to another device.
- e) Allow 98 days of operational data to be stored in the controller memory.
 - View daily log data on the controller display one day at a time. Scroll to other days.
 - Allow daily log data to be transferred to an attached PC for archiving or printouts.
- f) Provide data transmission to send RO operational data and alarm messages to a remote message display of a V5 Watchdog computer.
- g) Provide alarm messages for abnormal conditions
 - High, low and empty product water storage tank levels
 - Low solution levels in pH buffer and chlorine solution tanks
 - Low inlet pressure
 - High feed-water temperature
 - Low flow from RO pump
 - High/Low pH of feedwater
 - High conductivity of product water
 - Distribution pump failure

8.3.4 Recoil Hose Flush Station

A. Standard

1. General

The Recoil Hose Flush Station shall be a panel assembled, self-contained unit designed for wall-mounting. It shall provide a method to internally flush up to six Detachable Recoil Hoses at one time. The flushing procedure involves connecting up to six recoil hoses to the Flushing Station and

automatically flushing them with water and then evacuating the hoses with compressed air. Periodic flushing may control bacterial growth in the recoil hoses. For more effective bacterial control, the recoil hoses can be chlorine sanitized by installing a separate Chlorine Injector Station in the feedwater line to the Recoil Hose Flush Station.

2. Description of Operation

The Recoil Hose Flush Station is designed to flush up to six recoil hoses with water or a sanitizing solution (with *separate* Chlorine Injector Station) and then evacuate the hoses with compressed air. The Manual Flush Station has ball valves which are turned manually to introduce either water or air. The Automated Flush Station is equipped with a Controller with user-settable times which controls two solenoid valves. This permits the flush sequence to be completed by just pushing one button. The Controller has both 2- cycle and 4-cycle operation. Two-cycle operation has the capabilities to control the length of a plain water flush and air evacuation. Four-cycle operation is selected when the water supply is chlorinated to sequence through 4 timed steps: initial flush, soak period, second flush, and air evacuation.

Recoil Hose Flush Station Operating Parameters	
Water Supply Pressure	40-60 psi/75 psi maximum
Water Supply Flow	4 gpm minimum
Compressed Air	Clean, oil free
Compressed Air Pressure	15-60 psi/75 psi maximum
Compressed Air Flow	10 cfm (cubic feet per minute)

B. Equipment, Components, and Standards

Recoil Hose Flush Station Equipment and Component Standards	
Panel Size	Approximately 35" H x 25" W
Material	300 series 18 gauge stainless steel with pre-punched holes for mounting screws
Wetted Components	1. Piping: 1/2" OD Tubing - 316SS 2. Fittings: Thread/Compression Type 316SS 3. Check Valves - air & water inlet - Stainless Steel
Click Disconnects	1. Material: 316 Stainless steel (wetted parts only) 2. Style: Universal with ball check in quick disconnect D plug

Valves	Solenoid operated Stainless Steel 115 VAC 50/60 Hz normally-closed pilot-operated type.
Plumbing Connections	1. Water/Air Inlet: Flange with swivel nut
	for 1/2" Male Pipe Thread (MPT) adaptor 2. Drain: 1/2" OD 316 Stainless Steel Compression fitting with 15' of drain piping
Recoil Hose Flush Station Control Panel Specifications (Model 5480 only)	
Enclosure	NEMA 12, Size 10-1/2" H x 8-1/2" VV x 5" D 304 Stainless Steel
Electrical Requirements	115 volts alternating current (VAC), 50/60 Hz, single phase, 1 amp with ground fault interrupter (GFI circuit) required (must be hard wired)
GP Controller Features	1. Start and Reset Buttons 2. 32-character LCD 3. Power and Alarm indicator lights 4. Audible Alarm with Silence Button 5. Keypad with dome switches 6. Selectable 2-cycle and 4-cycle flush modes 7. Cycle settings: <ul style="list-style-type: none"> • Flush 1: Preset to 2 minutes; range is 1-9 minutes • Soak (4-cycle only): Preset to 30 minutes; range is 1-99 minutes • Flush 2 (4-cycle only): Preset to 2 minutes; range is 1-9 minutes • Air Evacuate: Preset to 15 seconds; range is 1-99 seconds

8.3.5 Chlorine Injection Station A. Standard

1. General

The Chlorine Injector Station shall be a panel assembled self-contained unit designed for wall mounting. It will provide chlorinated water for the Recoil Hose Flush Station and other applications where the water flow rate is constant. Both units are UL LISTED.

The Chlorine Injection Station is for use only with auto Recoil Hose Flush Station with a Controller to provide control functions. The unit shall include a metering pump, a 4-gallon tank, a flow switch, a mixing chamber, electrical controls and wall mounting hardware. All components shall be compatible with either tap water or purified water supply. The approximate dimensions are 38" H x 35"W x10" D.

2. Description of Operation

The Chlorine Injector Station is designed to mix a sodium hypochlorite solution into the water flow. When water flow is detected by the flow switch, the metering pump will start injecting the chlorine solution. The pump will keep operating until water flow stops. The sodium hypochlorite solution is stored in a 4 gallon polyethylene tank.

3. Operating Parameters

Chlorine Injection Station Operating Parameters	
Water Supply Pressure	1. 75 psi maximum 2. Recoil Hose Flushing - 40-60 psi
Water Supply Flow	1. 0.25 gpm minimum 2. Recoil Hose Flushing - 4 gpm minimum 3. Water Supply Temperature: 40-120°F
Chlorine Concentration	0-20 ppm, adjustable ranges
Treatment Capacity Per Tank	Half full tank will treat approximately 1350 gallons of water at 20 ppm

B. Equipment, Components, and Standards

Chlorine Injection Station Equipment and Component Standards	
Panel	1. Size: Approximately 23.5" H x 35 W 2. Material: 300 series 18 gauge stainless steel with pre-punched holes for mounting screws
Piping, Fittings, Valves, etc.	
Piping	1/2" OD Tubing - 316SS
Fittings	Thread/Compression Type - 316SS
all Valve	3/8" FPT - 316SS

Inlet Connection	Flange with swivel nut for 1/2 MPT adaptor
Outlet Connection	1/2 OD compression fitting
Flow Switch	
Activation Flow Rate	.25 gallons/minute minimum
Construction	PVC with hermetically sealed switch
Electrical Rating	120 Volts AC, 50/60 Hz, (.5 amps maximum), normally closed.
Mixing Chamber	
Construction	Polypropylene; 3/8 NPT ports
Mixing Tube	PVC Pipe
Chlorine Injection Pump/Tank Standards	
Construction	Glass fiber reinforced thermoplastic. All exposed fasteners are stainless steel
Flow Rate	Maximum capacity 26 ml/minute, maximum pressure 140 psi
Electrical Rating	1. 120 volts AC, 50/60 Hz 2. Average input power is 168 watts @ maximum speed
Suction and Injection	1. A foot valve with integral strainer is provided for the suction line 2. The injection point has an anti-siphon check valve with 1/2" NPT male connection
Solution Tank	1. Capacity: 4 gallon, size 12" x 6" x 12" 2. Material: Polyethylene
Control Panel (Model 301 only)	

Enclosure	NEMA 12, Size 10"x 8" x 6"; 304 Stainless Steel
Electrical Requirements	120 Volts AC, 50/60 Hz, single phase, 1 amp with ground fault interrupter (GFI circuit) required (must be hard wired)
Controls	Selector switch for chlorinated water or plain water
Junction Box	
Enclosure	Weatherproof, aluminum 2-gang switch box
Electrical Requirements	Must be powered from GP Controller on auto Recoil Hose Flush Station
Controls	Must be controlled by GP Controller on auto Recoil Hose Flush Station

8.3.6 Rack Manifold Flush Station A. Standard

1. General

The automatic rack manifold flush station shall be a panel assembled self-contained unit designed for wall mounting. It will provide chlorinated water at an operating pressure of approximately 17 psi for flushing and sanitizing mobile rack manifolds.

The flush station shall consist of a metering pump, a 4 gallon tank, a flow switch, an inlet water filter/mixing tube, pressure regulator, wall mount hardware, a poly recoil hose with quick disconnect on the outlet side for connection to the mobile rack watering manifold and a solenoid valve and Controller for either 1-cycle or 3-cycle operation. The approximate dimensions are: 40" H x 37" VV x 10" D.

Automated Flush Station with stainless steel solenoid valve and Controller, for tap water or purified water supply

2. Description of Operation

The rack manifold flush station is designed to mix a sodium hypochlorite solution into the water flow. When a rack manifold is connected to the rack manifold flush station and water flow is detected by the flow switch, the metering pump will start injecting the chlorine solution. The pump will keep operating until the preset time has elapsed (automatic units) or water flow stops. The sodium hypochlorite solution is held in a 4- gallon polyethylene tank.

The automated rack manifold flush station uses the GP Controller to control and monitor both 1-cycle and 3-cycle operation. One-cycle operation controls the length of flush time only. Three-cycle operation sequences through 3 timed steps: initial flush, soak period, and final flush.

3. Operating Parameters

Rack Manifold Flush Station Operating Standards	
Water Supply Pressure	25 psi minimum/75 psi maximum
Water Supply Flow	2 gpm minimum
Water Supply Temperature	40-120°F (4 - 49°C)
Flush Station Output Pressure	15-17 psi
Flush Station Output Flow	0.25 gpm minimum, 1.0 gpm typical
Chlorine Concentration	20 ppm recommended, adjustable
Flush Cycles per Tank <i>This is 180-480 manifold flush cycles depending on flush time and flow rate.</i>	One full tank will treat approximately 720 gallons of water at 20 ppm or 1300 gallons at 10 ppm.

B. Equipment, Components, and Standards

Rack Manifold Flush Station Equipment and Component Standard	
Panel	<ol style="list-style-type: none"> 1. Size: Approximately 23.5"H x 35"W 2. Material: 300 series 18 gauge stainless steel with pre-punched holes for mounting screws
Piping, Fittings, Valves, etc.	
Piping	1/2" OD Tubing-316SS
Fittings	Thread/Compression Type-316SS
Valves	<ol style="list-style-type: none"> 1. Solenoid operated Stainless Steel 115 VAC 50/60 Hz; normally closed pilot- operated type and stainless steel ball type 2. Check Valves: 316 Stainless Steel 3. Inlet Connection: Flange with swivel nut for 1/2 MPT adaptor
Flow Switch	
Activation Flow Rate	.25 gallons/minute minimum
Construction	PVC with hermetically sealed switches
Electrical Rating	115 Volts AC, 50/60 Hz (.50 amps maximum), normally closed
Mixing Chamber	
Construction	Polypropylene with 3/8 NPT ports
Mixing Tube	PCV pipe
Chlorine Injection Pump/Tank	

Construction	1. Glass fiber reinforced thermoplastic 2. All exposed fasteners are stainless steel
Flow Rate	1. Maximum capacity 31 ml/ minute
	2. Maximum pressure 100 psi
Electrical Rating	1. 115 volts AC, 50/60 Hz 2. Average input power is 130 watts at maximum speed
Suction and Injection	1. A foot valve with integral strainer is provided for the suction line 2. The injection point has an anti-siphon check valve with 1/2" NPT male connection
Solution Tank	1. Capacity: 4 gallon, Size 12"x 6" x 12" 2. Material: Polyethylene
Pressure Regulator	
Construction	316 Stainless steel wetted parts
Ports	1 1/2" MPT inlet, 3/8" MPT outlet
Pressure Capacity	75 psi maximum inlet, 17 psi outlet
Flow	17 psi - 13 gpm
Recoil Hose Assembly	
Hose Material	Polyurethane - 3/8" C.D. by 1/4" ID, black, FDA Grade
Hose Reach	10 feet
Quick Disconnect	Universal Style stainless steel socket
Control Panel	
Enclosure	NEMA 12, Size 10" H x 8" W x 6" D 304 Stainless Steel Construction
Electrical Requirements	115 volts AC, 50/60 Hz, single phase, 1 amp with ground fault interrupter (GFI circuit) required (must be hard wired)

Controls

Manual: Selector Switch for Chlorinated Water or Plain Water
 Automatic: GP Controller features

1. Start and Reset Buttons
2. 32-Character LCD
3. Power and Alarm indicator lights
4. Audible Alarm with Silence Button
5. Keypad with dome switches
6. Selectable 1-cycle and 3-cycle flush modes
7. Cycle settings:
 - Flush 1: preset to 2 minutes; range is 1 - 9 minutes
 - Soak (3-cycle only): Preset to 30 minutes; range is 1 - 99 minutes
 - Flush 2 (3-cycle only): Preset to 2 minutes; range is 1 - 9 minutes

9. Glossary of Terms

1. **A/E** — and acronym referring to the Architecture and Engineering team
2. **AAALAC, International** - an acronym referring to the Association for Assessment and Accreditation of Laboratory Animal Care, International
3. **AHRs** — an acronym for Animal Housing Rooms
4. **AHU** — an acronym commonly referring to an air handling unit
5. **ARSAC** — an acronym referring to the Animal Research Strategic Advisory Committee
6. **ASC** — an acronym for application specific controllers
7. **ASHRAE** - American Society for Heating, Refrigeration, and Air Conditioning Engineers
8. **ASME** — American Society of Mechanical Engineers
9. **ASTM International** — American Society for Testing and Materials
10. **BAS** — Building Automation System
11. **BCuP5** - a metal alloy used in welding copper pipe
12. **BOD** — an acronym that stands for Basis of Design
13. **BREB** - a UTHSCSA acronym referring to the Basic Research & Education Building on the Bastrop Campus
14. **BSC** — biological safety cabinet
15. **BSC IIA2** — biological safety cabinet that provides personnel, product, and environmental protection; self-exhausts approximately 30% back into the room and re-circulates the rest.
16. **BSC IIB1** - biological safety cabinet that provides personnel, product, and environmental protection; exhausts more than 50% via a remote ventilated system (i.e., building exhaust) and re-circulates the rest. Also known as 70% exhaust.
17. **BSC IIB2** - biological safety cabinet that provides personnel, product, and environmental protection; exhausts 100% via a remote ventilated system (i.e., building exhaust). No recirculation.
18. **BSL1** — Biosafety Level 1, basic level of protection appropriate for well-characterized agents not known to cause disease in healthy humans
19. **BSL2** — Biosafety Level 2, moderate risk agents that cause human disease by ingestion or through percutaneous or mucous membrane exposure; emphasis on precautions with needles and sharp instruments

20. **BSL3** — Biosafety Level 3, high, possibly lethal, risk agents that cause human disease by inhalation exposure; emphasis on control of aerosols
21. **BSL4** — Biosafety Level 4, high individual risk of life-threatening disease by the aerosol route and for which no treatment is available
22. **BSRB** George & Cynthia Mitchell Basic Sciences Research Building
23. **CABIR** - a UT M. D Anderson Cancer Center acronym referring to the Center for Advanced Biomedical Imaging Research Building
24. **CAP type II** - College of American Pathologists (CAP), laboratory reagent grade water which maintains 1,000 colonies of bacterial per ml of water maximum, and the electrical resistance of the water may not drop below 2 Megohms at the outlet.
25. **CCTV** - an acronym that refers to closed circuit television
26. **CFM** - cubic feet per minute, a measure of air flow
27. **CFR** - Code of Federal Regulations
28. **CMU** - an acronym referring to concrete masonry units
29. **CO₂**- Periodic table symbols for carbon dioxide
30. **CPVC** - chlorinated polyvinyl chloride, a type of plastic commonly used for water distribution
31. **dB** - abbreviation for the word "decibel," which is used in reference to a unit or quantitative measurement for sound
32. **DDC** - an acronym for direct digital control
33. **DVMS** - Department of Veterinary Medicine and Surgery
34. **EH&S** - a UTHSCSA acronym referring to the Department for Environmental Health & Safety
35. **EPDM gaskets** - gaskets made of Ethylene propylene diene monomer
36. **°F** -the universal symbol for Degrees Fahrenheit
37. **FPM**- feet per minute
38. **fps** -feet per second
39. **FRP** -**fiberglass** reinforced plastic
40. **ft** - abbreviation for the measurement feet, equaling 12 inches
41. **FTE** - Full time equivalent - the measure of one full time employee's work time
42. **GHz** - International System of Units abbreviation for "gigahertz," which means one billion cycles per second"
43. **GLP** - an acronym referring to good laboratory practices
44. **GMP** - guaranteed maximum price or good manufacturing practice
45. **GPM** - gallons per minute
46. **HEPA** - and acronym for high efficiency particulate air filter
47. **HIPAA** - an acronym for Health Insurance Portability and Accountability Act enacted by the U.S. Congress in 1996.
48. **HVAC** - heating, ventilation, and air conditioning
49. **Hz** - International System of Units abbreviation for "hertz," which means "one cycle per second"
50. **I.R.I.** - Industrial Research Institute
51. **IDF** - intermediate distribution frame, a cable rack that interconnects and manages the telecommunications wiring between a main distribution frame and workstation devices.
52. **IEEE** - Institute of Electrical and Electronics Engineers, Inc.
53. **IS** - a UTHSCSA acronym referring to the Information Security team on a project
54. **kV** - kilovolt, one thousand volts
55. **LN2** - liquid nitrogen
56. **mA** - one thousandth of an Ampere, which is a unit of measure of electrical current produced in a circuit by 1 volt acting through a resistance of 1 Ohm.
57. **MBC** - an acronym for master building controllers
58. **Mbps** - an acronym for megabytes per second
59. **MCC** - an acronym that refers to motor control centers
60. **MEC** - an acronym for modular equipment controllers
61. **MEP** - standard industry abbreviation for "Mechanical, Electrical, and Plumbing," usually used as a noun to refer to the company/contractor providing the engineering of those services.
62. **micron** - unit of measure equaling 1,000,000th of a meter or approximately 0.00003937 inches.

- 63. **NEC** - an acronym referring to the National Electric Code
- 64. **NFPA** - National Fire Protection Association
- 65. **NIH** - an acronym for the National Institute of Health
- 66. **NIST** - National Institute of Standards and Technology
- 67. **Nm** - Newton meter, a compound unit of torque corresponding to the torque from a force of one Newton applied over a distance of one meter; dimensionally equivalent to a joule
- 68. **NRC** - National Research Council
- 69. **O₂** - Periodic table symbol for oxygen
- 70. **PC/DOS** - operating system for IBM type computers
- 71. **pH** - symbol used to represent the measurement scale that determines the acidity or basicity of hydrogen ions in a solution.
- 72. **PIR** - an acronym for "Passive Infra-Red" sensor, which is an electronic device that measures infrared light radiating from objects in a field of view
- 73. **PM** - standard industry abbreviation for the title of Project Manager
- 74. **PRS** - an acronym for pressure reducing station
- 75. **PRV** - an acronym that stands for pressure reducing valve
- 76. **psi** - pounds per square inch
- 77. **psig** - and acronym referring to pounds per square inch gauge
- 78. **PVC** - an acronym for polyvinyl chloride - a material used in constructing a variety of materials from plumbing fixtures to vinyl siding.
- 79. **RH** - relative humidity
- 80. **RO System** - reverse osmosis water generating equipment and distribution piping
- 81. **RTD** - resistance temperature detector, a wire-wound and thin film device that measures temperature through the physical principle of the positive temperature coefficient of electrical resistance of metals.
- 82. **SCFM** - standard cubic feet per minute, the volumetric flow rate of gas corrected to "standardized" conditions of temperature, pressure, and relative humidity
- 83. **SMACNA** - Sheet Metal and Air Conditioning Contractors National Association
- 84. **STC** - Society for Technical Communication
- 85. **TDLR** - an acronym for the Texas Department of Licensing and Regulation
- 86. **UL** - Underwriters Laboratory
- 87. **UPS** - an acronym for uninterruptible power systems
- 88. **UTHSCSA** - Acronym referring to the University of Texas Health Science Center, San Antonio.
- 89. **VMS** - vivarium management system
- 90. **VSD** - an acronym for variable speed drives
- 91. **Wi-Fi** - an abbreviated term that refers to wireless fidelity which is a method through with radio waves transmit signals.

END OF SECTION 13 00 00 00

Task	Specification	Specification Description
13 30 00 00	13 00 00 00	Small Animal(Rodent) Vivarium, Construction Standard
13 34 00 00	13 00 00 00	Small Animal(Rodent) Vivarium, Construction Standard
13 34 19 00	01 22 16 00	No Specification Required
13 34 19 00	13 00 00 00	Small Animal(Rodent) Vivarium, Construction Standard
13 34 23 00	13 00 00 00	Small Animal(Rodent) Vivarium, Construction Standard
13 34 23 13	13 00 00 00	Small Animal(Rodent) Vivarium, Construction Standard
13 34 23 31	13 00 00 00	Small Animal(Rodent) Vivarium, Construction Standard
13 42 00 00	13 00 00 00	Small Animal(Rodent) Vivarium, Construction Standard
13 42 63 00	13 00 00 00	Small Animal(Rodent) Vivarium, Construction Standard
13 42 63 16	13 00 00 00	Small Animal(Rodent) Vivarium, Construction Standard
13 49 00 00	13 00 00 00	Small Animal(Rodent) Vivarium, Construction Standard

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 14 21 00 00 - ELECTRIC PASSENGER ELEVATORS**PART 1 GENERAL****1.1 SUMMARY****A. Section Includes:**

1. Electric traction passenger elevator system.
2. Passenger cab, interior finishes, control panel and facings including cab doors.
3. Fire rated hoistway doors, sills, and frames.
4. Guide rails and brackets, hoisting cables, brake, counterweights, governor and safeties.
5. Pit buffers.
6. New drive motor, control system, power supply, and accessories.

B. Related Sections:

1. UTHSCSA General Conditions.
2. Metal Fabrications: Pit ladder, pit access platform, governor access, platform and accessories.
3. Plumbing Fixtures: Pit drainage.
4. Panel Boards: Electrical power to the machine room including main switch and breaker.
5. Unit Masonry System: Masonry for fire rated shafts, machine rooms and hoistway openings.
6. Provide conditioned air as per the control manufacture's requirements, for the elevator equipment room.
7. Provide overcurrent shunt trip if sprinklered and/or disconnect/breaker in the elevator equipment room downstream of any "ATS" (automatic transfer switch).
8. Networking: Ethernet connection for monitoring. The Ethernet cable running to the Elevator shall be of Shielded type. Need wires to provide dial tone for emergency intercom. Ethernet cable shall be CAT5e, or approved equal.
9. Fire Alarm: Heat and smoke sensing devices, relays to connect the Fire Alarm to elevator and equipment in machine room.
10. Structural Steel: Structural hoist, divider, and sheave beams and other steel items.

C. Work Required by Other Sections:

1. The contractor shall coordinate all work required by applicable codes including fire and smoke rated hoistway enclosures, pits, shaft venting, operable fire alarm systems, etc.

2. The Contractor is responsible for the building fire control system shall furnish three dry contacts (4 are required if shunt trip breaker is provided) per elevator wired to the elevator controller system for the recall of the elevator.
3. The Contractor shall be responsible for providing dial tone for each elevator in the machine room. The Contractor shall extend telephone cable to elevator controller and one Ethernet connection for remote monitoring per group and/or simplex car(s).
4. The Contractor shall be responsible for providing HVAC to meet elevator manufacturer's specifications.
5. All structural beams and hoisting rails shall have been placed by the General Contractor.
6. The elevator pit: The contractor shall include ladder, guarded light, and GFI receptacle. The ladder, light switch, stop switch, and alarm silence switch shall be mounted by the ladder and the ladder shall be mounted on the access side of the hoistway opening. (Lock Side). Provide a visual indication when alarm silence switch is activated. The pit illumination shall be not less than 10 foot candles.
7. The elevator controls shall accept two inputs from the emergency electrical system. One input shall be from a set of Form C contacts which shall change state when electrical system has switched to emergency operation. A second input shall be from a set of normally open contacts which shall close 0-50 seconds prior to any controlled change of the emergency electrical system and shall open after the change. This input shall be designated as the pre-transfer signal. **The Elevator controller/software provided will be hooked up to an Emergency Power Overlay.**
8. The Contractor shall extend the necessary cabling from the elevator controls to the network for remote monitoring with the Liftnet option at the Central Campus Elevator Shop. **The monitoring will use the Ethernet connection option.**
9. Crane service shall be provided for the hoisting of the machine room equipment.
10. Necessary cabling for cameras inside elevators.

Fax: (479) 968-7986
- J. Elevator controller manufactures:
 1. Motion Control Engineering (MCE)
 2. SmartRise Engineering (Smartrise)
- K. Remote Monitoring: Integrated Display Systems, Inc. (LIFTNET remote Monitoring)

1.3 SYSTEM DESCRIPTION

- A. The following 1.3B thru D are minimums; the Architect based on the calculated occupancy of the building shall size the elevators as to not overburden the elevators more than their rated duty cycle.
- B. Characteristics of Elevator No. as follows: Passenger elevator.
 1. Type: Electric geared traction - Top mounted machine room.
 2. Control: Motion Control Engineering Inc.- Series **iControl** or Smartrise Engineering Only. The controller shall have ports for communication with any data or computer terminals. Remote monitoring by Ethernet Connection, using the LIFT-NET option. etc.
 3. Drive System: Variable voltage variable frequency.
 4. Rated Net Capacity: Minimum (##) lbs.
 5. Rated Speed: (##) ft/min.
 6. Car Interior Dimensions: (##") wide x (##") deep.
 7. Cab Height: (##").
 8. Cab Clear Ht. to suspended ceiling: (##").
 9. Hoistway and Cab Entrance Frame opening size: (##") x (##").
 10. Door Type/Operation: Select One: center opening, center opening two speed, single slide; side opening two speed.
 11. Number of Stops: (##), travel distance: (##).

- 12. Number of Openings: Number (##); (#) at front and (#) at rear.
- 13. Rope brake for unintended motion and ascending car protection. Shall be Hollister-Whitney or Owner approved equal.
- C. Operation: (select one)
 - 1. Simplex Collective.
 - 2. Duplex Collective
 - 3. Group microprocessor controlled demand allocation.
- D. Door Operation and Control Features:
 - 1. Automatic power door operation with infra-red curtain unit. Mechanical reopening devices shall not be provided. **See Sec. 2.20.D**
- E. Spare wires: 10% or 5 wires minimum whichever is greater, wires for camera and card reader. See Security specification for details.
- F. Remote Monitoring: Integrated Display Systems, Inc. (LIFTNET remote Monitoring). Remote monitoring will use the Ethernet option. Provide all Software and labor.

1.4 FIREMAN'S SERVICE

- A. Provide "Firefighter's Operation" in accordance with current ASME A17.1 code.
 - 1. Keyed for "FEO-K1"
 - 2. Ask owner/AHJ for designated Landing.*-
 - 3. Interconnect elevator system with building fire alarm, and smoke alarm system.

1.5 INDEPENDENT SERVICE

- A. Provide "Independent Service".

1.6 EMERGENCY ELECTRICAL OPERATION

- A. Interconnect elevator control system with building emergency electrical supply. Cars will need to have all software and hardware to accomplish this.
 - 1. In the event of a normal power failure, the elevator system shall be designed to operate from the emergency electrical supply. The elevator controls shall receive an input indicating that the electrical supply is from the emergency source. The elevator controls shall then allow one unit at a time to be lowered to the egress level, open the doors, and become inactivated.
 - 2. After all of the elevators have been lowered and become inactivated, one selected unit shall resume operation on the emergency electrical system. In the event that the selected unit fails, after a set time delay the next elevator in line shall assume operation.
 - 3. A pre-signal input to the elevator controls shall initiate the same emergency operation

detailed above and land/stop all elevators prior to a controlled power outage.

4. Once normal power is restored, the elevator controls shall return all units to normal operation.
5. Car lighting shall be on emergency power, if available. Install new overcurrent protection/disconnect.
6. **EMERGENCY POWER OPERATION** - When emergency power is detected by an input, the elevator cars in the Library building shall be returned to the main lobby one at a time, and remain there with doors open. Once all cars have been returned to the lobby, one or more cars may be selected to run under emergency power. Selection of the cars that will run under emergency power shall be done automatically by the Group Supervisor. This automatic selection may be overridden through manual selection. The actual number of cars allowed to run under emergency power shall be a pre-programmed value and the Group Supervisor/overlay shall not allow any more than the pre-programmed number of cars to run on emergency power.

Elevator will have to have spare outputs to power a remote emergency power visual display if needed for selector switch showing elevator is at the designated level and doors are in the normally open position to meet current A17.1 Code 2.27.2.4.3

1.7 SUBMITTALS FOR REVIEW

A. Submit as listed in the General Conditions:

1. Shop Drawings: Include following information:
 - a. Motor, brake, drive system, valves, controller, selector, governor, and other component locations.
 - b. Car, machine beams, guide rails, buffers, wire ropes, counterweights and other components in hoistway.
 - c. Rail bracket spacing and maximum loads imposed on guide rails requiring transfer to structure.
 - d. Individual weight of principle components and load reactions at points of support.
 - e. Loads on hoisting beams.
 - f. Clearances and over travel.
 - g. Locations of components in machine room. Show arrangement so that moving elements and other equipment can be removed for repairs without disturbing other components. Arrange equipment for clear passage through doors and access doors.
 - h. Location in hoistway and machine room of connections for car light and telephone.
 - i. Locations of access doors, doors, and frames.
 - j. Expected heat dissipation of elevator equipment in machine room.
 - k. Electrical characteristics and connection requirements.
2. Samples: Illustrate cab interior finishes and car and hoistway door and frame finishes.

1.8 CONTRACTOR'S RESPONSIBILITIES AT SUBSTANTIAL COMPLETION

- A. Similar to procedures for submittals.
- B. Include clear and reproducible schematics of all wiring diagrams of installed electrical equipment and changes made in the work. List symbols corresponding to identity or markings on machine room and hoistway apparatus. All diagnostic troubleshooting tools, hardware and software shall be provided.

- C. Tools, electrical prints, parts catalogs, keys, two hoistway door keys, protective cab pads and twelve (12) month written warranty on equipment shall be turned over upon final inspection of the elevator to Facilities Management/ Elevator section.
- D. Maintenance Manuals: Submit three copies of bound manuals for each elevator or group of elevators, with full maintenance and operating instructions, parts listing, recommended parts inventory listing, purchase source listing for major and critical components, emergency instructions, repair manuals, adjusting manuals, wiring diagrams, and similar information. Furnish owner with any special tools required for maintenance or adjustment of controllers and related equipment. All special tools, special software, & software updates, licensing required for continued operation and diagnostic maintenance of provided controller shall be provided to owner free of charges additional to this contract.
 - 1. No products shall be provided that have programmed built-in shutdown dates or counters.
 - 2. Proprietary items are not acceptable.
 - 3. Provide a twelve (12) months warranty in writing for all new equipment.
 - 4. Provide one computer for diagnosing and adjusting per elevator or group, as required.
- E. Certificates and Permits: Provide Owner with copies of all inspection/ acceptance certificates and operating permits as required by governing authorities to allow normal, unrestricted use of elevators.
- F. Service and training:
 - 1. As part of the purchase price and agreement, a full, unconditional, one-(1) year warranty on all parts and labor shall be provided from the elevator contractor. The warranty shall include all parts, labor, shipping, field service or technician time, labor or travel expenses, and verbal or written correspondence with the controller manufacturer or his representatives, including that which might be incidental to the proper installation and operation of the equipment.
 - 2. The controller manufacturer shall provide for and present to The University, at no cost to The University, a training and troubleshooting course prior to project completion. "This course shall be comprised of documentation, circuit diagrams and hands-on training. This course shall be part of a standard training school covering the care, installation, troubleshooting, maintenance and repair of the elevator and its components. The contractor shall provide factory training, for a minimum of three (3) people.
- G. Punch List: All punch list items shall be resolved before substantial completion and final payment.

1.9 QUALITY ASSURANCE

- A. Perform Work in accordance with ASME A17.1, AWS D1.1, NFPA 70, AISC, and as supplemented in this section.
- B. Fabricate and install door and frame assemblies in accordance with NFPA 80 and UL 10B.
- C. Qualifications:
 - 1. Contractor:
 - a. Maintain a warehouse and maintenance service in the City of San Antonio, Texas.

- b. Minimum (3) years, prior to bid date of this project, in the business of providing elevator service and having warehouse facilities.
 - c. Maintain in San Antonio, Texas an adequate stock of parts for emergency and replacement purposes.
 - d. Qualified personnel available in San Antonio, Texas to insure fulfillment of maintenance and/or repair service on a 24-hour emergency call basis with a 2 hour response time.
- 2. Installer: Supervisor and employees shall be on payroll of elevator contractor.
- 3. Equipment: **Approved by the University of Texas** and guaranteed by the selling company.
- 4. Parts, accessories, and appurtenances: Erected, installed, adjusted, tested and placed in operation by competent mechanics skilled in this work and under the direct control and supervision of the Installer's experienced foreman.

1.10 REGULATORY REQUIREMENTS

- A. Conform to applicable ASME A17.1 code for manufacture and installation of elevator system.
- B. Conform to State of Texas Accessibility Standards for provisions for the disabled.
- C. Products Requiring Electrical Connection: Listed and classified by Underwriters' Laboratories, Inc.

1.11 WARRANTY

- A. Provide at Contract Close-out.
- B. Provide labor and material to correct defective work for twelve- (12) month's period after Date of Final Acceptance.
- C. Warranty: Include coverage for elevator operating equipment and devices.
- D. Equipment Warranty: Provide The University of Texas a manufacturer's written twelve (12) month equipment warranty on all equipment installed.

1.12 MAINTENANCE SERVICE

- A. Provide at substantial completion.
 - B. Provide service and maintenance for system and components for twelve (12) months from date of substantial completion.
 - C. Elevator contractor shall schedule a walk through inspection two (2) months prior to the expiration of the twelve (12) month service contract. Maintenance items shall be completed prior to the end of service contract.
 - D. Examine system components monthly. Clean, adjust, and lubricate equipment.
 - E. Include systematic examination, adjustment, and lubrication of elevator equipment. Repair or replace parts whenever required. Use parts produced by the manufacturer of the original equipment. Replace wire ropes when necessary to maintain the required factor of safety.
- 1. Include monthly Fire Service test, emergency light test and enter into log book on

premises.

2. Include cleaning Hoistway sills and Car sills, monthly.
3. Include elevator cab handrails.
- F. Perform work without removing cars during peak traffic periods. . Peak traffic hours are; 7:30-8:30, 11:30-1:30 and 4:30-5:00.
- G. Maintain in San Antonio, Texas an adequate stock of parts for replacement or emergency purposes. Have personnel available to ensure the fulfillment of this maintenance service on a 24 hour/ day, 7days/ week emergency call basis for this maintenance period with a 2-hour maximum response time.
- H. Perform maintenance work using competent and qualified personnel under the supervision and in the direct employ of the elevator contractor.
- I. Maintenance service shall not be assigned or transferred to any agent or subcontractor without prior written consent of The University.
- j. Call Backs: Contractor shall respond to all call backs for warranted items 24 hours per day, 7 days a week, including all Holidays, within 2 hours time of being notified of the call, at no additional cost to The University during the 12 month warranty period.

1.13 EXTRA MATERIALS TO OWNER:

- A. All items listed below shall be furnished to The University.
- B. Supply three extra keys for each key cylinder, keyed switch, two hoistway door keys and two tamper proof drivers per elevator.
- C. Tools, electrical prints (3 reproducible copies), parts catalogs, keys, door keys, software and other proprietary components shall be turned over to the Elevator Section upon final inspection of the elevator.
- D. Provide one computer for diagnosing and adjusting per elevator or group of elevators as required. Include updates or modifications of test equipment for 10 years.

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Equivalent products by the following are acceptable except where specified in the specifications:
 1. Thyssen/Dover Corporation-Elevator Division
 2. United Technologies Otis Elevator Company.
 3. Motion Control Engineering, Inc.
 4. PTL Car and Hall fixtures: (See car panel on last page)
 5. Innovation Industries Car and Hall fixtures: (See car panel on last page)

6. Elevator Products Corporation: (See car panel on last page)
7. Hollister-Whitney Elevator Corporation
8. GAL Door Manufacture
9. Smartrise Engineering
10. Integrated Display Systems, Inc. (LIFTNET remote Monitoring)
11. Owner approved equal.

2.2 MATERIALS

A. Steel:

1. Shapes: ASTM A 36, ANSI A17.1.
2. Sheet: ASTM A 446, galvanized, stretcher leveled, Commercial Grade.

B. Stainless Steel: ASTM A 167, Type 302 or 304, No. 4 satin/brushed finish.

C. Aluminum: Anodizing quality.

1. Extrusions: ASTM B 221.
2. Sheet: ASTM B 209, alloy 6063.

D. Plywood: APA Structural I, Grade C-D, sanded.

E. Plastic Laminate: NEMA LD-3, General Purpose Type.

F. Paints:

1. Primer for steel: Red Oxide.
2. Primer for wood: Alkyd primer/sealer.
3. Enamel: Semigloss alkyd.

2.3 ELECTRICAL SYSTEM CHARACTERISTICS

A. Electrical Characteristics:

1. Power Voltage: 480 volts, three-phase, 60 Hz.
2. Control Voltage: 120 volt, single-phase, 60 Hz.
3. Motor Drive Characteristics:
 - a. VVVF/AC closed loop flux vector
4. Refer to Division 16, - Equipment Wiring Systems: Electrical connections.

2.4 ELECTRICAL COMPONENTS

- A. Boxes, Conduit, Wiring, and Devices: Required by NFPA 70.
- B. Fittings: Steel compression type for electrical metallic tubing.
- C. Spare Conductors: Include 10 percent or a minimum number of 6 extra conductors, two shielded coax cables for camera and necessary shielded audio cables (5 pair minimum) in traveling cables. Do not parallel conductors to increase electric current capacity unless individually fused. Open runs of wire other than traveling cable and cables to car door safety devices shall not be accepted.
- D. Do not use conduit as a grounding conductor. All raceways shall have green grounding conductor.
- E. Include wiring and connections to elevator devices remote from hoistway and between elevator machine rooms. Provide additional components and wiring to suit machine room layout.
- F. Provide identification (circuit #, panel # and location of feeder panel, room #etc.) of the following electrical circuits for the elevator controller, cab lights, sump pump and pit lighting. Located on or adjacent to the disconnecting means.

2.5 OPERATIONAL CONTROLLER:

- A. Motion Control Engineering, Inc. iControl (MCE) or Smartrise Engineering. Controller enclosures shall be NEMA 1.
- B. Drive Control
 - 1. Series iControl
 - 2. Closed-loop 16K PWM AC Drive
 - 3. Stand Alone (Simplex)
- C. Landing System shall be compatible with controller selected.
- D. OPTIONS:
 - 1. MONITORING WITH LIFT-NET (Monitoring System) with embedded interface. The Monitor will be located in the UTHSCSA Central Campus (elevator shop) or owner approved location. The Monitor will use the Ethernet connection option. **Provide all Software and Labor** for remote monitoring of the elevators. The software license should be for 35 elevators
 - 2. MONITORING BY REMOTE LOCATION Using the **Ethernet connection option**.

2.6 MACHINE

- A. The machine shall be a single worm geared traction type with motor, brake, gearing and driving sheave mounted in the proper alignment on a steel bedplate. Sound isolation pads shall be mounted beneath the bedplates.
- B. The worm shall be of hardened and ground steel, integral with the worm shaft, and shall be provided with a ball or roller thrust bearing designed to take the end thrust of the worm in both directions.

- C. The ring gear shall be hobbled from a bronze rim, which shall be accurately fitted and bolted to the gear spider.
- D. The sheave and gear shall be supported by heavy-duty ball or roller bearings. The roller and anti-friction metal bearings shall be provided with an adequate means of lubrication.

2.7 MOTOR

- A. The motor shall be of a design suitable for the anticipated traffic and be rated for a high starting torque and low starting current. The motor shall be suitable for use with a variable voltage variable frequency type system and shall meet ANSI 519 requirements for electrical harmonic distortion.
- B. The elevator shall be provide with automatic self-leveling to a tolerance of (+/-) 1/4 inch and shall correct for travel variations and rope stretch.
- C. The armature shall be dynamically balanced and supported by ball bearings of adequate capacity.
- D. The motor shall be rated A.C., NEMA code letter "G" or as required for the torque and duty requirements.
- E. The motor shall be totally enclosed non-ventilated with a class F insulation rating.

2.8 BRAKE

- A. The electric brake shall be spring applied. The controller shall actuate the brake and allow smooth, positive stops. The brake shall be designed for automatic application in the event of power supply failure. Failure of the brake to lift as detected by a mechanical switch shall cause the control system to take the elevator out of service at the next stop and remain out of service until the condition is corrected.

2.9 GOVERNOR

- A. The governor shall be designed to cut off power to the motor and apply the brake whenever the governor indicates the car has excessive speed in either direction.

2.10 ROPES

- A. Provide traction steel hoist ropes of size and number to insure proper wearing qualities.
- B. Compensation for weight of hoist ropes to be furnished when required to maintain the proper counterbalance ratio.
- C. Governor Ropes shall be iron.

2.11 COUNTERWEIGHTS

- A. Each elevator shall be suitably counterbalanced for smooth and economical operation. Cast iron or steel plate weights shall be contained in a structural steel frame.
- B. The counterweight shall be equal to the complete elevator car and approximately 40% of the specified load.

2.12 CAR STRUCTURAL FABRICATION

- A. Frame: Fabricated steel frame of formed or structural steel shapes, gusseted and rigidly welded.
- B. Platform: Fire retardant treated plywood subflooring assembly laid over steel stringers and ready to receive floor finish. The platform shall be completely isolated from the car sling and bracing members by vibration absorbing materials.
- C. Sling: Shall consist of heavy steel stiles, properly affixed to a steel crosshead and safety channels with bracing members to remove all strain from the car enclosure.
- D. Type of loading: Will be classified as Class "C3".

2.13 SAFETIES:

- A. The car safety shall be Type B, mounted on the bottom members of the car frame and shall be operated by a centrifugal speed governor located over the hoistway.

2.14 Pit Buffer:

- A. Spring, Oil, or Equivalent Buffers. Buffers of the spring, oil, or equivalent type shall be installed under cars and counterweights of passenger and freight elevators. Spring buffers or their equivalent may be used where the rated speed is not in excess of 200 ft/min.
- B. Install buffer/s in pit to accommodate type B safety.

2.15 LUBRICATION

- A. Grease Fittings: Provide for lubricating bearings requiring periodic lubrication.
- B. Lubrication Points: Shall be visible and easily accessible.

2.16 CAB FABRICATION

- A. Cab Design: Passenger Elevator:
 - 1. Flooring: Protect from damage during construction.
 - 2. Sides and rear walls: Plastic laminate with clip on panels.
 - 3. Handrails: Stainless steel, cylindrical profile.
 - 4. Front and rear returns and transom: Stainless steel with No. 4 finish.
 - 5. Ceiling: Translucent suspended.
 - 6. Canopy: Baked enamel on steel.
 - 7. Ventilation: 1/2-speed blower mounted above ceiling, with grille.
 - 8. Lighting: Fluorescent or Light Emitting Diode (L.E.D.) with solid lens diffuser or ceiling. **Lighting shall be on emergency power**, if available at the building. **NO INCANDESCENT LIGHTS.**
 - 9. Provide wall hooks and removable protective mats for cab walls.
 - 10. Provide stainless steel license holders for display of required certificates. Design the holder to use non-visible tamper-proof fastenings. Holder shall enclose a 5" x 7" sign.

2.17 CAR OPERATING PANEL

- A. Provide one flush mounted Car Operating Panel (C.O.P.) if single door entrance or two C.O.P.'s if front and rear doors are provided. Submit design
 - 1. All hardware shall be Innovation Industries Inc. or Owner approved equal.
- B. Position all devices to comply with all ADA, TAS, ASME A17.1 latest codes, and all applicable codes and laws.
- C. Include matching service cabinet integral with front return panel, with hinged door and EX514 lock in each car containing:
 - 1. Independent service switch. (Toggle Switch.)
 - 2. Inspection switch. (Toggle Switch.)
 - 3. Fan or blower switch. (Toggle Switch 2 speed if required.)
 - 4. Light switch. (Toggle Switch.)
 - 5. Stop switch. (Toggle Switch or Push Pull)
 - 6. Locate a 120 V, 15 Amp GFI convenience receptacle in service cabinet.
 - 7. Emergency light test button/switch.
- D. ADA Flush Telephone:
 - 1. Integral with car operating panel.
 - 2. Acceptable manufacturer: Use a dial up phone on all campuses; Wurtec Inc. Cat. #11-933 series or Owner approved equal.
 - 3. All lettering on car panel shall be engraved and filled; silk screened lettering is not acceptable.
- E. Additional operating switches for the special features specified.
- F. Elevator identification number, capacity 1/2 inch high, engraved and filled. Locate at top of panel.
- G. Include an L.E.D. emergency light integral to the car operating panel.
- H. CAR PANEL DESIGN FROM TOP TO BOTTOM: Can be modified to comply with any codes.
 - 1. Capacity of Elevator
 - 2. Elevator identification number
 - 3. "Optional location" Car position indicator
 - 4. Emergency light (L.E.D.)
 - 5. Service panel
 - 6. Firefighter service instructions on inside of panel cover for item 7 below. The front of the

cover shall have the words "FIREFIGHTERS' OPERATION" in red letters at least 10mm high.

7. Firefighter visual signal, phase two key switch, door open/close buttons, stop switch and call cancel button shall be behind locked cover, Keyed to meet A17.1 2007 code.
8. Car buttons
9. Door open and door close buttons
10. Alarm button
11. Telephone
12. Car panel shall be designed to cover all cutouts. Cover shall be hinged on one edge and held in place by eight or more EX513 keyed locks. Service panel shall be keyed for EX514 key. Fire service shall be keyed for key.
13. 5"x7" Certificate window must meet TDLR height Min-Max (3'-7') requirements or be deleted.

2.18 CAR AND COUNTERWEIGHT GUIDES AND GUIDE SHOES

- A. Guides for the car and counterweight shall be planed or milled steel guide rails, properly fastened to the building structure with steel brackets. Check alignment of rails.
- B. Roller guides, consisting of a minimum of three tires, shall be mounted on the top and bottom of the car and counterweight frame, and shall be held in contact with the guide rail by adjustable devices. Roller guides shall run on dry, unlubricated rails.

2.19 CAR TOP INSPECTION STATION

- A. Provide station device to operate each elevator from on top of the car during adjustment, inspection, maintenance, and repair.
- B. Operating means shall conform to the following:
 1. Device shall be of the continuous-pressure type; operate the car at a speed not exceeding 150 ft/min; operate the car subject to the electrical protective devices required by ASME A17.1 Rule. Device shall be used only for the purpose of adjustment, inspection, maintenance, and repair of the elevator or hoistway equipment.
- C. Provide each elevator with an electric light protected with a guard and a GFI convenience outlet fixture on the car top.

2.20 CAB ENTRANCES:

- A. Cab Doors: Stainless steel 0.058 inch (1.5 mm) thick metal, of insulated sandwich panel construction, flush design, rolled profiles, rigid construction. Door shall be hung on sheave type hangers with polyurethane tires that roll on a polished track. The hanger shall be provided with adjustable eccentric rollers to take the up-thrust out of the door. The door shall be guided at bottom by non-metallic shoes sliding in the below listed threshold. Front return panels shall have the same finish as the doors.
- B. Cab Door Returns: Stainless steel; 0.058 inch (1.5mm) thick metal, standard design with smooth invisible joints.

- C. Thresholds: Nickel Silver “U” shaped saddles.
- D. Door Operation and Control Features:
 - 1. A closed loop design heavy duty operator shall be furnished and installed that is compatible with the elevator controller. The system shall be designed to operate the car and hoistway doors simultaneously. Door movements shall be electrically cushioned at both limits of travel and the door operating mechanism shall be arranged for manual operation in the event of a power failure. A door protection system using microprocessor controlled infra-red light beams (Janis or Microscan or approved equal) shall be provided. The beams shall project across the car opening detecting the presence of a passenger or object. If door movement is obstructed, the doors shall immediately reopen. A mechanical reopening device shall not be provided. Doors shall automatically open when the car arrives at the landing and shall automatically close after an adjustable time interval or when car is dispatched to another landing. Direct drive geared operators, A.C. controlled units with oil checks, stationary door vane or other deviations of these are not acceptable. Door operator shall not require proprietary tools for adjusting.
 - 2. Nudging:
The doors shall remain open as long as the electronic detector senses the presence of a passenger or object in the door opening. If the door movement is obstructed longer than a field programmable time value, a buzzer shall sound and the doors shall close at a reduced speed.
 - 3. The current door hold time shall be changed to a shorter field programmable time when the door protection system is activated.
 - 4. The microprocessor control system shall provide separate timers for car call door hold open time and hall car door hold open time. The door hold open times shall be field programmable.
 - 5. Acceptable door operators;
 - a. ThyssenKrupp/Dover HD-73/91 door operator with MCE's SmarTRAQ door controller.
 - b. GAL Manufacturing Corp.; Model MOVFR
 - c. ThyssenKrupp HD-LM Door Operator.
- E. Door Restrictor: Shall be vane (Dover) style mounted to car door and brackets installed in hoistway.

2.21 ACCESSIBILITY PROVISIONS

- A. Conform to State of Texas Accessibility Standards for provisions for the disabled.
 - 1. Car Panel: Locate highest button in the control panel and highest operable part of the telephone a maximum of 48 inches above floor.
 - 2. Braille: All car control buttons shall be designated by Braille and raised standard alphabet characters for letters, Arabic symbols for numbers or standard symbols as required in ASME/ANSI A17.1.
 - 3. Handrails: Provide handrails on sides of cab.

4. Car Position Indicators: The controller shall have a position indicator output to drive the required position indicator which shall indicate the corresponding floor numbers as the car passes or stops at a floor. An audible signal shall sound as the position indicator changes floors.
 - a. Only Digital Style hall and car Position indicators or units that require no bulbs or maintenance shall be provided.
5. Hall Lanterns: The controller shall have outputs to drive the visible and audible signals that are required at each hoistway entrance to indicate which elevator car is answering a call. Audible signals shall sound once for up, twice for down.
6. Braille on hoistway door frames: Provide 2 inch high raised numerals with Braille on each landing jamb to identify landing number, characters shall be centered 60 inches above floor.

2.22 HOISTWAY ENTRANCES

- A. Hoistway Doors: Stainless steel; 0.058 inch (1.5 mm) thick metal, of insulated sandwich panel construction, flush design, rolled profiles, rigid construction.
- B. Hoistway Door Frames: Stainless steel; 0.058 inch (1.5 mm) thick metal, of rolled profiles, standard design with smooth invisible joints.
- C. Door and Frame Construction: 1-1/2 hour fire rating; insulated sandwich panel door construction 1-1/4 inch (32mm) thick, minimum.
- D. Door Hangers: Furnish and install sheave type two point suspension hangers and tracks. The sheaves shall have polyurethane tires with ball bearings properly sealed to retain grease. The hangers shall be provided with adjustable eccentric rollers to take the up-thrust of the doors. The tracks shall be drawn steel shapes, smooth surface and shaped to conform to the hanger sleeves. The doors shall have secondary retainers at the top and bottom of the doors.
- D. Sills: "U" shaped saddles.
 1. Material: Extruded aluminum, except **provide nickel silver at egress floor.**
- E. Interlocks: Each hoistway entrance shall be equipped with an approved type of interlock that has been tested as required by the appropriate code. The interlock shall be designed to prevent operation of the car away from the landing until the doors are locked in the closed position, and shall prevent opening the doors at any landing from the corridor side without the use of a special tool. Interlocks shall bear Underwriters' Laboratories "B" label of approval.
- F. Hoistway door unlocking devices shall be provided on all floors and comply with ASME A17.1. These devices shall permit authorized personnel to gain access to the hoistway when the elevator car is away from the landing.

2.23 LANDING CONTROLS

- A. Landing Buttons: Standard round Illuminating type, one for originating UP and one for originating DOWN calls, one button only at terminating landings; including indications required by ASME A17.1. Hall button covers to be engraved and filled with pictograph detailing "In case of fire use stairs".
- B. Provide Landing Position Indicators: Only Digital Style hall and car Position indicators or units that require no bulbs or maintenance shall be provided.

- C. Car Direction Indicators: Through engraved stainless steel using L.E.D. lamps.
- D. All screws to be Hex-Pin tamper proof.

2.24 FINISHES

- A. Structural Metal Surfaces: Clean surfaces of rust, oil or grease; wipe clean with solvent; prime and paint.
- B. Machine Room Components: Clean and degrease; prime one coat, finish with one coat of enamel.
- C. Galvanized Surfaces: Clean with neutralizing solvent; prime one coat.
- D. Aluminum: Mill finish.
- E. Wood Surfaces not exposed to Public View: One coat primer; one coat enamel.
- F. Stainless Steel: #4 Satin.

PART 3 - EXECUTION

3.1 SITE INSPECTION

- A. Examine work of others that affects the Elevator System. Report defects that will affect equipment or system operation to The University.
- B. Before fabrication, take job site measurements and verify that Work required by others is complete. Check measurement of space for equipment and means of access for installation and operation.

3.2 INSTALLATION

- A. Install in accordance with ASME A17.1, manufacturer's instructions, and applicable codes.
- B. Arrange equipment in machine room so that elements requiring removal or maintenance are readily accessible without disturbing other components. Arrange for clear passage between components.
- C. Set all hoistway entrances in vertical alignment with car openings and true with plumb sill lines.
- D. Install machinery, guides, rails, controls, car and all equipment and accessories to provide for a quiet, smooth operation free of sideways movement, oscillation or vibration.
- E. Mount machine directly over hoistway on steel beams or (mount machine adjacent to shaft with transfer pulley over opening). Isolate and dampen vibration with properly sized sound-reducing anti-vibration pads.
- F. Erect hoistway sills, headers and frames prior to the erection of rough walls and doors; erect fascia and toe guards after rough walls are finished.
- G. Grout sills and hoistway entrance frames.
- H. Clean field welds; remove oxidation and residue. Apply touch up primer and paint.
- I. Connect equipment to building utilities.

3.3 ERECTION TOLERANCES

- A. Quality Control: Tolerances.
- B. Guide Rail Alignment: Plumb and parallel to each other in accordance with ASME A17.1 and ASME A17.2.1.
- C. Cab Movement on Aligned Guide Rails: Smooth movement, with no objectionable lateral or oscillating movement or vibration.

3.4 FIELD QUALITY CONTROL

- A. Quality Control: Field inspection, testing, adjusting, and balancing.
- B. Perform tests required by ASME A17.1, A17.2.1 and TDLR.
- C. Tests:
 - 1. Test elevator in presence of Owner to ensure proper operation and compliance with specified requirements; make final adjustments as appropriate. Test shall confirm elevator system operates with the fire alarm system and the emergency electrical system.
 - 2. Operating Tests: Load each elevator to its rated capacity and operate continuously for 30 minutes over its full travel distance, stopping at each level and proceeding immediately to the next. Record temperature rise of elevator machine during 30-minute test period. Record failures of elevator to perform as required.
- D. Obtain inspections and permits and make such tests as are required by governing authorities. Deliver test certificates and permits to Owner.
- E. Provide one week written notice of date and time of tests.

3.5 TESTING

- A. QEI Certified Testing in accordance with ASME A17.1 will be witnessed by Owner and contractor furnished QEI inspector. **Elevator shall not be QEI certified unless 100% completed. (NO PUNCH LIST).**
- B. Damage of any kind to the car or the adjoining structure which results from performance of any test shall be repaired at no additional cost to The University.

3.6 ADJUSTING

- A. Contract Close-out: Adjusting installed work.
- B. Adjust for smooth acceleration and deceleration of car so not to cause passenger discomfort. General riding quality, leveling accuracy and quietness of operation shall be acceptable to The University's representative.
- C. Adjust automatic floor leveling feature at each floor to achieve (+/-) 1/4 inch from floor level.

3.7 CLEANING

- A. Prior to substantial completion: Clean installed work and surrounding areas finishes.
- B. Remove protective coverings from finished surfaces.

- C. Clean surfaces and components ready for inspection.

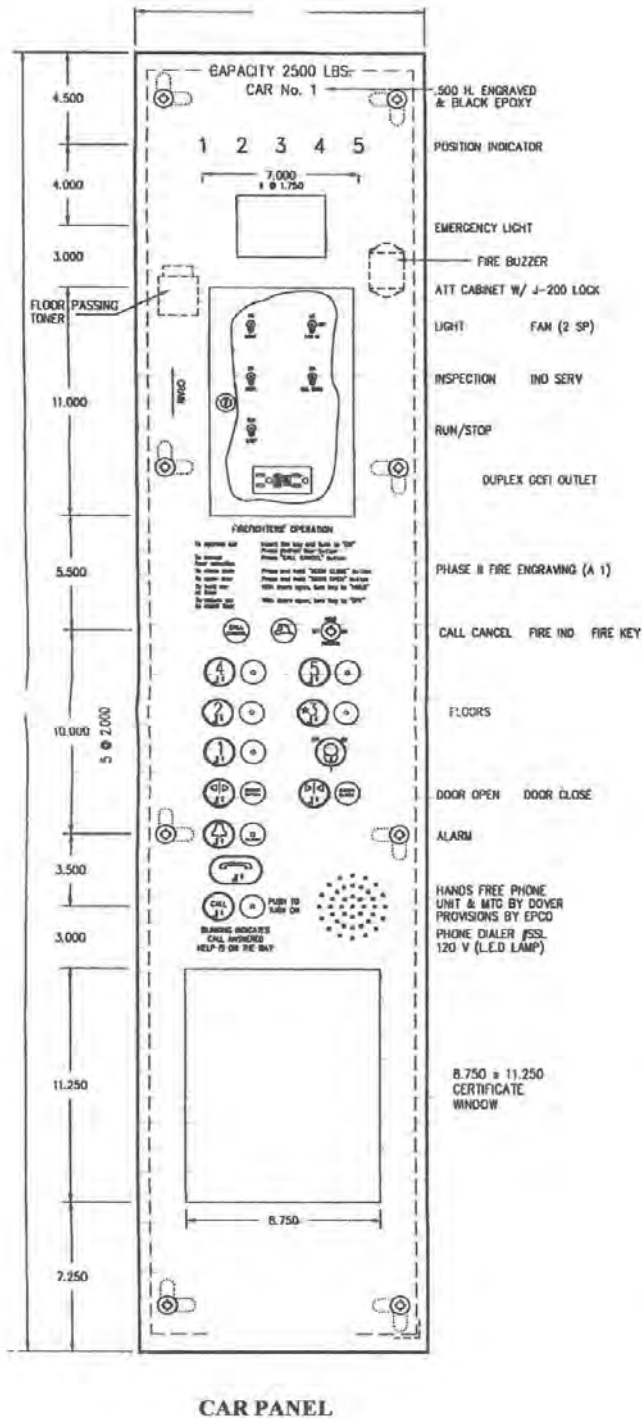

3.8 PROTECTION OF FINISHED WORK

- A. Substantial completion: Protect installed work and surrounding areas finishes.
- B. Do not permit construction traffic within cab after cleaning.

3.9 TEMPORARY USE OF ELEVATORS

- A. Elevators shall not be used during construction. Contractor shall provide separate construction elevator

4.0 Sample of car panel; See attached "Car Panel" example. (**Design COP** to meet **current code**)

END OF SECTION 14 21 00 00

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 14 24 00 00 - HYDRAULIC PASSENGER ELEVATORS**PART 1 - GENERAL****1.1 SUMMARY****A. Section Includes:**

1. Hydraulic passenger elevator system.
2. Hydraulic cylinder.
3. Cab with doors, frames, and finishes.
4. Hoistway doors and frames.
5. Motor and pump, controllers, hoistway equipment, and accessories.

B. Related Work:

1. UTHSCSA General Conditions.
2. Construction Facilities and Temporary Controls: Temporary power supply, in machine room.
3. Unit Masonry System: Masonry for fire rated shafts and hoistway openings.
4. Metal Fabrications: Pit ladder and accessories.
5. Panelboards: Electrical power to the machine room including main switch and breaker.
6. Networking: Ethernet connection for monitoring. The Ethernet cable running to the Elevator shall be of Shielded type. Need wires to provide dial tone for emergency intercom. Ethernet cable shall be CAT5e, or approved equal.
7. Fire Alarm: Heat and smoke sensing devices, relays to connect the Fire Alarm to elevator and equipment in machine room.
8. Structural Steel: Structural hoist, divider, and sheave beams and other steel items.

C. Work Required by Other Crafts:

1. The Contractor shall coordinate all work required by applicable codes including fire and smoke rated hoistway enclosures, pits, shaft venting, operable fire alarm systems, etc.
2. The Contractor is responsible for the building fire control system shall furnish three dry contacts (4 are required if shunt trip breaker is provided) per elevator wired to the elevator controller system for the recall of the elevator.
3. The Contractor shall be responsible for providing dial tone for each elevator and machine room. The Contractor shall extend telephone cable to elevator controller and one Ethernet connection for remote monitoring per group and/or simplex car(s).
4. The Contractor shall be responsible for providing HVAC to meet elevator manufacturer's specifications and have temporary power available for installation work.

5. The elevator pit: The contractor shall include ladder, guarded light, sump with flush cover and GFI receptacle. The ladder, light switch, stop switch, and alarm silence switch shall be mounted by the ladder and the ladder shall be mounted on the access side of the hoistway opening. (Lock Side). Provide a visual indication when alarm silence switch is activated. The pit illumination shall be not less than 10 foot candles.
6. The elevator controls shall accept two inputs from the emergency electrical system. One input shall be from a set of Form C contacts which shall change state when electrical system has switched to emergency operation. A second input shall be from a set of normally open contacts which shall close 0-50 seconds prior to any controlled change of the emergency electrical system and shall open after the change. This input shall be designated as the pre-transfer signal. **The Elevator controller/software provided will be hooked up to an Emergency Power Overlay.**
7. All structural beams and rails shall be in place.
8. Crane service shall be provided for the hoisting of the machine room equipment.
9. Necessary cabling for cameras inside elevators.

1.3 SYSTEM DESCRIPTION

A. The following 1.3B through G are minimums; the Architect based on the calculated occupancy of the building shall size the elevators as to not overburden the elevators more than their rated duty cycle.

B. No pressure hoses shall be allowed.

C. Characteristics of Elevator No. # as follows:

1. Type: Hydraulic; cylinder in buried casing.
2. Control: Motion Control Engineering Inc. Series Motion 2000 or Smartrise Engineering. The controller shall have an Ethernet port(s) for communication with any data and computer terminals such as a Monitoring System, remote monitoring by Ethernet connection, using the Liftnet option.
3. Electric Power Characteristics: For elevator drive equipment: (Hp, Determine by Vendor) Hp. 480 Volt, three-phase 60Hz. For lighting: 120 Volt, 60 Hz.
4. Rated Net Capacity: ##### lbs.
5. Rated Speed: ### ft/min, ### ft/min Full load up.
6. Car Interior Dimensions: (#'-#") wide x (#'-#") deep.
7. Cab Height: (#'-#").
8. Cab Clear Ht. to suspended ceiling: (#'-#").
9. Hoistway and Cab Entrance Frame opening size: (#'-#") x (#'-#").
10. Door Type/Operation: Select one: center opening, center opening two speed, single slide; side opening two speed.
11. No. of Stops: Number (#) stops: Travel distance: (##'-#").
12. No. of Openings: Number (#): (#) at front and (#) at rear.

D. Operation:

1. Duplex Collective.
2. Simplex Collective
3. Group microprocessor controlled demand allocation.

E. Door Operation and Control Features:

1. Automatic power door operation with infra-red curtain unit. Mechanical reopening devices

shall not be provided.

- F. Mechanical/Electrical limit switches shall be placed in the hoistway near the terminal landings and be designed to cut off the electric current and stop the car should it run beyond either terminal landing.
- G. The elevator shall be provided with a self-leveling feature that will automatically bring the car to the floor landings. This feature shall be entirely automatic and independent of the operating device and shall correct for overtravel or undertravel. The car shall be maintained level with the landing irrespective of the load.
- H. Spare wires: 10% or 5 wires minimum whichever is greater and wires for camera and card reader. See spec for Security.

1.4 FIREMAN'S SERVICE

- A. Provide "Firefighter's Operation" in accordance with ASME A17.1.
 - 1. Keyed for "FEO-K1"
 - 2. Ask owner/AHJ for designated Landing.
 - 3. Interconnect elevator system with building fire alarm, and smoke alarm system.

1.5 INDEPENDENT SERVICE

- A. Provide "Independent Service".

1.6 EMERGENCY OPERATION:

- A. Battery operated emergency return device to return elevator to the Lowest Floor and open car and landing doors if emergency power is not available.
 - 1. Auxiliary (form "C") contacts are required to be incorporated in shunt trip, or fused type disconnects for emergency lowering device.
- B. When normal power is restored, automatically return elevator to normal operation.
- C. Interconnect elevator control system with building emergency electrical supply. Cars will need to have all software and hardware to accomplish this. **(If Emergency Power is available)**
 - 1. In the event of a normal power failure, the elevator system shall be designed to operate from the emergency electrical supply. The elevator controls shall receive an input indicating that the electrical supply is from the emergency source. The elevator controls shall then allow one unit at a time to be lowered to the egress level, open the doors, and become inactivated.
 - 2. After all of the elevators have been lowered and become inactivated, one selected unit shall resume operation on the emergency electrical system. In the event that the selected unit fails, after a set time delay the next elevator in line shall assume operation.
 - 3. A pre-signal input to the elevator controls shall initiate the same emergency operation detailed above and land/stop all elevators prior to a controlled power outage.
 - 4. Once normal power is restored, the elevator controls shall return all units to normal operation.

5. Car lighting shall be on emergency power, if available. Install new overcurrent protection/disconnect.
6. **EMERGENCY POWER OPERATION** - When emergency power is detected by an input, the elevator cars in the Library building shall be returned to the main lobby one at a time, and remain there with doors open. Once all cars have been returned to the lobby, one or more cars may be selected to run under emergency power. Selection of the cars that will run under emergency power shall be done automatically by the Group Supervisor. This automatic selection may be overridden through manual selection. The actual number of cars allowed to run under emergency power shall be a pre-programmed value and the Group Supervisor/overlay shall not allow any more than the pre-programmed number of cars to run on emergency power.

Elevator will have to have spare outputs to power a remote emergency power visual display if needed for selector switch showing elevator is at the designated level and doors are in the normally open position to meet current A17.1 Code 2.27.2.4.3

1.7 SUBMITTALS FOR REVIEW

- A. Submit Three Copies within 60 days maximum of notice to proceed and prior to starting installation.
 1. Shop Drawings: Include following information
 - a. Motor, hydraulic pumps, valves, controller, selector, governor, and other component locations.
 - b. Car, machine beams, guide rails, buffers, and other components in hoistway.
 - c. Rail bracket spacing and maximum loads imposed on guide rails requiring transfer to structure.
 - d. Individual weight of principle components and load reactions at points of support.
 - e. Loads on hoisting beams.
 - f. Clearances and over travel.
 - g. Locations of components in machine room. Show arrangement so that moving elements and other equipment can be removed for repairs without disturbing other components. Arrange equipment for clear passage through doors and access doors.
 - h. Locations in hoistway and machine room of connections for car light and telephone.
 - i. Locations of access doors, doors, and frames.
 - j. Expected heat dissipation of elevator equipment in machine room.
 - k. Electrical characteristics and connection requirements.
 2. Samples: Illustrate cab interior finishes and car and hoistway door and frame finishes.

1.8 CONTRACTOR'S RESPONSIBILITIES AT SUBSTANTIAL COMPLETION

- A. Similar to procedures for submittals.
- B. Include three legible and reproducible schematics for each elevator of all as built wiring diagrams of installed electrical equipment and changes made in the work. List symbols corresponding to identity or markings on machine room and hoistway apparatus.
- C. Tools, electrical prints, parts catalogs, keys, two hoistway door keys, proprietary components (if previously approved), and twelve (12) month written warranty on equipment shall be turned over upon final inspection of the elevator to Facilities Management/Elevator section.
- D. Maintenance Manuals: Submit three copies of bound manuals for each elevator or group of

elevators, with full maintenance and operating instructions, parts listing, recommended parts inventory listing, purchase source listing for major and critical components, emergency instructions, repair manuals, adjusting manuals, wiring diagrams, and similar information. Furnish owner with any special tools required for maintenance or adjustment of controllers and related equipment. All special tools, special software, & software updates, licensing, required for continued operation and diagnostic maintenance of provided controller shall be provided to owner free of charges additional to this contract for ten (10) years.

1. No products shall be provided that have programmed built-in shutdown dates.
 2. Proprietary items are not acceptable.
 3. Provide a twelve (12) months warranty in writing for all new equipment.
 4. Provide one computer for diagnosing and adjusting per elevator or group, as required.
 5. Provide one copy of master electric and hydraulic schematic and one copy of lubrication chart.
- E. Certificates and Permits: Provide Owner with copies of all inspection/ acceptance certificates and operating permits as required by governing authorities to allow normal, unrestricted use of elevators.
- F. Service and training:
1. As part of the purchase price and agreement, a full, unconditional, one-(1) year warranty on all parts and labor shall be provided from the elevator contractor. The warranty shall include all parts, labor, shipping, field service or technician time, labor or travel expenses, and verbal or written correspondence with the controller manufacturer or his representatives, including that which might be incidental to the proper installation and operation of the equipment.
 2. The controller manufacturer shall provide for and present to The University, at no cost to The University, a training and troubleshooting course prior to project completion. "This course shall be comprised of documentation, circuit diagrams and hands-on training. This course shall be part of a standard training school covering the care, installation, troubleshooting, maintenance and repair of the elevator and its components. The contractor shall provide factory training, for a minimum of three (3) people

1.9 QUALITY ASSURANCE

- A. Perform Work in accordance with ASME A17.1, AWS D1.1, NFPA 70, AISC, and as supplemented in this section.
- B. Fabricate and install door and frame assemblies in accordance with NFPA 80 and UL 10B.
- C. Qualifications:
1. Manufacturer:
 - a. Maintain a warehouse and maintenance service in the City of San Antonio, Texas.
 - b. Minimum (3) years, prior to bid date of this project, in the business of providing elevator service and having warehouse facilities.
 - c. Maintain in San Antonio, Texas an adequate stock of parts for emergency and replacement purposes.
 - d. Maintain qualified personnel available at San Antonio, Texas to insure fulfillment of

maintenance and/or repair service on a 24 hour emergency call basis. With a 2-hour maximum response time for emergency call out.

2. Installer: Employees and supervisor on payroll of elevator equipment manufacturer.
3. Equipment: **Approved by The University of Texas Health Science Center at San Antonio** and guaranteed by the selling company.
4. Parts, accessories, and appurtenances: Erected, installed, adjusted, tested and placed in operation by competent mechanics skilled in this work and under the direct control and supervision of the Installer's experienced foreman.

1.10 REGULATORY REQUIREMENTS

- A. Conform to applicable ASME A17.1 code for manufacture and installation of elevator system.
- B. Conform to State of Texas Accessibility Standards for provisions for the disabled.
- C. Products Requiring Electrical Connection: Listed and classified by Underwriters' Laboratories, Inc.

1.11 WARRANTY

- A. Contract Closeout.
- B. Provide labor and material to correct defective work for twelve (12) month period after Date of Final Acceptance.
- C. Warranty: Include coverage for elevator operating equipment and devices.
- D. Sealed Jack assembly: 20 year unconditional warranty. Jack packing is excluded from this warranty.

1.12 MAINTENANCE SERVICE

- A. Provide at substantial completion
- B. Provide service and maintenance of elevator system and components for twelve (12) months from Date of Final Acceptance.
- C. Elevator contractor shall schedule a walk through inspection two (2) months prior to the expiration of the twelve (12) months service contract.
- D. Examine system components monthly. Clean, adjust, and lubricate equipment.
- E. Include systematic examination, adjustment, and lubrication of elevator equipment; maintain hydraulic fluid levels. Repair or replace parts whenever required. Use parts produced by the manufacturer of the original equipment.
 1. Include monthly Fire Service, battery lowering, emergency lighting Inspections and tests and maintain log book in machine room.
 2. Include cleaning of Hoistway sills and Car sills.
 3. Include repair of elevator cab handrails.

- F. Perform maintenance service without removing cars during peak traffic periods. Peak traffic hours are; 7:30-8:30, 11:30-1:30 and 4:30-5:00.
- G. Maintain in San Antonio, Texas an adequate stock of parts for replacement or emergency purposes. Have personnel available to ensure the fulfillment of this maintenance service on a 24 hour emergency call basis for this maintenance period. The maximum response time shall be 2-hours.
- H. Perform maintenance work using competent and qualified personnel under the supervision and in the direct employ of the elevator manufacturer.
- I. Maintenance service shall not be assigned or transferred to any agent or subcontractor without prior written consent of The University.
- J. Drain hydraulic tank reservoir, clean and refill with new oil if oil becomes or is contaminated from construction dust or negligence of keeping dust and dirt out of oil or at the request of The University.
- K. Call Backs: Contractor shall respond to all call backs for warranted items 24 hours per day, 7 days a week, including all Holidays, within 2 hours time of being notified of the call, at no additional cost to The University during the 12 month warranty period.

1.13 EXTRA MATERIALS TO FACILITIES MANAGEMENT/ELEVATOR SECTION:

- A. All items listed below shall be furnished to the Facilities Management/Elevator Section.
- B. Supply three extra keys for each key cylinder, keyed switch and two hoistway door keys per elevator.
- C. Tools, electrical prints (3 reproducible copies), parts catalogs, job prints, keys, door keys, and other proprietary components shall be turned over to the Facilities Management/Elevator Section upon final inspection of the elevator.
- D. Provide one computer for diagnosing and adjusting per elevator or group of elevators as required. Include updates or modifications of test equipment for 10 years.

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Equivalent products by the following are acceptable except where specified in the specifications:
 - 1. ThyssenKrupp Corporation-Elevator Division
 - 2. United Technologies Otis Elevator Company.
 - 3. Motion Control Engineering, Inc.
 - 4. PTL Car and Hall fixtures. (See car panel on last page)
 - 5. Innovation Car and Hall fixtures. (See car panel on last page)
 - 6. Owner approved equal.
 - 7. Elevator Products Corp. (EPCO). (See car panel on last page)

8. GAL Door Manufacture
9. Smartrise Engineering
10. Maxton Manufacturing Company
11. Integrated Display Systems, Inc. (LIFTNET remote Monitoring)
12. Owner approved equal.

2.2 MATERIALS

- A. Steel:
 1. Shapes: ASTM A 36.
 2. Sheet: ASTM A 446, galvanized, stretcher leveled, Commercial Grade.
- B. Stainless Steel: ASTM A 167, Type 302 or 304.
- C. Aluminum: Anodizing quality.
 1. Extrusions: ASTM B 221.
 2. Sheet: ASTM B 209, alloy 6063.
- D. Plywood: APA Structural I, Grade C-D, sanded.
- E. Plastic Laminate: NEMA LD-3, General Purpose Type.
- F. Paints:
 1. Primer for steel: Red Oxide.
 2. Primer for wood: Alkyd primer/sealer.
 3. Enamel: Semigloss alkyd.

2.3 ELECTRICAL SYSTEM CHARACTERISTICS

- A. Electrical Characteristics:
 1. 480 volts, three phase, 60 Hz.
 2. 120 volt, single phase, 60 HZ
 3. Refer to Electrical Guidelines.

2.4 ELECTRICAL COMPONENTS

- A. Boxes, Conduit, Wiring, and Devices: Required by NFPA 70.
- B. Fittings: Steel compression type for electrical metallic tubing.
- C. Spare Conductors: Include 10 percent or a minimum number of 6 extra conductors, two shielded coax cables for camera and necessary shielded audio cables (5 pair minimum) in traveling cables.

Do not parallel conductors to increase electric current capacity unless individually fused. Open runs of wire other than traveling cable and cables to car door safety devices shall not be accepted.

- D. Do not use armored flexible metal conduit or any raceway as a grounding conductor. All raceways shall have green ground wire and be bonded.
- E. Include wiring and connections to elevator devices remote from hoistway and between elevator machine rooms. Provide additional components and wiring to suit machine room layout.
- F. Provide identification (circuit #, panel # and location etc.) of the following electrical circuits for the elevator controller, cab lights, and pit lighting. Located on or adjacent to the disconnecting means.

2.5 OPERATIONAL CONTROLLER:

- A. Motion Control Engineering, Inc. or Smartrise Engineering). Controller enclosures shall be NEMA 1.
- B. Drive Control
 - 1. Model;
- C. Landing System shall be compatible with controller selected. (Select one)
- D. ADDITIONAL FEATURES:
 - 1. Standard Security
 - 2. Remote Monitoring by Integrated Display Systems, Inc. (LIFTNET remote Monitoring)The controller shall have an Ethernet connection for communication with any data and computer terminals such as Liftnet remote monitoring by Ethernet connection, etc.
 - 3. Oil Viscosity Control: When the oil temperature drops below the optimum operating temperature means shall be provided to maintain the proper viscosity of the oil. There shall be an automatic means to disconnect the viscosity control if it fails.
- E. OPTIONS:
 - 1. MONITORING WITH LIFTNET (Monitoring System) with embedded interface. The Monitor will be located in the UTHSCSA Central Campus (elevator shop) or owner approved location. The Remote Monitor will use the Ethernet connection option. **Provide all Software and labor** for remote monitoring of the elevators.
 - a. **The monitoring will use the Ethernet connection option.**

2.6 COMPONENTS

- A. Motors, Pumps, Valve, Fluid Tank, Hydraulic Fluid, Jack unit.
- B. Power Unit (Oil Pumping and Control Mechanism):
 - 1. Pump and valves: Specifically designed for elevator application; the pump shall be of the positive displacement type. Pump/valve assembly shall be suspended within the oil

reservoir by a rubber isolated suspension system to allow easy removal of components without draining oil from the reservoir. A silencer shall be installed in the oil reservoir interior. The design shall be such that the silencer shall contain no degradable parts. Where pump/valve assembly requires location outside of reservoir, drip pan under entire unit shall be provided. The pan shall be designed to hold reservoir capacity for protection from catastrophic failure. Sound isolation shall be provided under the pump/valve assembly.

2. Oil Control Valve: Shall contain in a single housing; high pressure relief valve; check valve; automatic unloading up start valve; lowering and leveling valve and magnetic control. Valve shall be compatible with viscosity control. Welded manifolds with separate valves to accomplish each function will not be permitted.
 - a. The acceptable valve manufactures are:
 - 1) ThyssenKrupp
 - 2) Maxton
3. Motor: NEMA Code Letter G or as required for torque and duty requirements. (Determine by Vendor) hp motor @ rated load amperes. Class F insulation rating. Motor shall be designed for oil-hydraulic elevator service, of standard manufacture, and of duty rating to comply with specified speed and load. Motor rating for the number of starts per hour shall be suitable for the expected use of the elevator (minimum 120 starts per hour).
4. Starter: Provide "Soft Start" electronic mode voltage reduction for operation of starters.

C. Jack Unit:

1. Designed and constructed in accordance with the applicable requirements of the ASME A17.1 Code; Sized to lift the gross load to height specified; Factory tested to insure adequate strength and freedom from leakage; No brittle material, such as gray cast iron, shall be used in the jack construction.
2. Components:
 - a. Plunger: Heavy seamless steel tubing accurately turned and polished.
 - b. Stop ring: Electrically welded to plunger to positively prevent plunger from leaving the cylinder head.
 - c. Accessories:
 - d. Internal guide bearing, packing or seal of suitable design and quality.
 - e. Drip ring around cylinder top.
 - f. Cylinder constructed of steel pipe and provided with a pipe connection and air bleeder.
 - g. Brackets: Welded to the jack cylinder for supporting elevator on pit channels.
3. Provide required cylinder hole for hydraulic jack complete with an outer steel casing per ASME A17.1 and an inner watertight schedule 40 PVC casing.

2.7 LUBRICATION

- A. Grease Fittings: For lubricating bearings requiring periodic lubrication.
- B. Lubrication Points: Visible and easily accessible.

2.8 CAR STRUCTURAL FABRICATION

- A. Frame: Fabricated steel frame of formed or structural steel shapes, gusseted and rigidly welded.
- B. Platform: Fire retardant treated plywood subflooring assembly laid over steel stringers and ready to receive floor finish. The car sling shall be completely isolated from piston by vibration absorbing materials.
- C. Sling: Shall consist of heavy steel stiles, properly affixed to a steel crosshead and safety channels with adequate bracing members to remove all strain from the car enclosure.
- D. Type of loading: Shall be classified as class "C3".

2.9 CAB FABRICATION (Retain all, except new translucent suspended ceiling)

- A. Cab Design: Passenger Elevator:
 - 1. Flooring: Rubber flooring Forbo Dual #707 Barley, or approved equal.
 - 2. Sides and rear walls: Plastic laminate clip on panels.
 - 3. Handrails: Stainless steel, cylindrical profile, on rear wall.
 - 4. Front and rear returns and transom: Stainless steel with No. 4 finish.
 - 5. Ceiling: Translucent suspended. ___#_ft._#_"_in. under ceiling.
 - 6. Canopy: Baked enamel on steel. ___#_ft._#_"_in. under canopy.
 - 7. Ventilation: 1/2-speed blower mounted above ceiling, with grille.
 - 8. Lighting: Fluorescent or Light Emitting Diode (L.E.D.) with solid lens diffuser or ceiling. **Lighting shall be on emergency power**, if available at the building. NO INCANDESCENT LIGHTS.
 - 9. Provide wall hooks and removable protective mats for cab walls.
 - 10. Provide stainless steel license holders for display of required certificates. Design the holder to use non-visible tamper-proof fastenings. Holder shall enclose a 5" x 7" sign.

2.10 CAR OPERATING PANEL

- A. Provide one flush mounted car operating panel (C.O.P.) if single door entrance or two C.O.P.'s if front and rear doors are provided. Submit design
 - 1. All hardware shall be Innovation Industries Inc. or Owner approved equal.
 - 2. All lettering on car panel shall be engraved and filled; silk screened lettering is not acceptable.
- B. Position all devices to comply with all ADA and ASME A17.1 latest codes.
- C. Include matching service cabinet integral with front return panel, with hinged door and EX514

(Innovation Industries Inc. Key) lock in each car containing:

1. Independent service switch. (Toggle Switch)
2. Inspection switch. (Toggle Switch.)
3. Fan or blower switch. (2 speed Toggle Switch)
4. Light switch. (Toggle Switch)
5. Stop switch. (Toggle Switch or Push Pull)
6. Locate a 120 Volt, 15 Amp GFI convenience receptacle in service cabinet.
7. Emergency light test button.

D. ADA Flush Telephone:

1. Integral with car operating panel.
2. Acceptable manufacturer: Use a dial up phone on all campuses; Wurtec Inc. Cat. #11-933 series or Owner approved equal.
3. Emergency telephone shall be line powered or on emergency power if applicable and building is supplied with emergency power.

E. Additional operating switches for the special features specified.

F. Elevator identification number (____), and capacity 1/2 inch high, engraved and filled. Locate at top of panel. ~~Fire service operating instructions shall be engraved and filled on car panel.~~

G. Include an L.E.D. emergency light integral to the car-operating panel.

H. CAR PANEL DESIGN FROM TOP TO BOTTOM (See Car Panel Example):

1. Capacity of Elevator
2. Elevator identification number (ADMIN-1)
3. "Optional location" Car position indicator
4. Emergency light
5. Service panel
6. Firefighter service instructions on inside of panel cover for item 7 below. The front of the cover shall have the words "FIREFIGHTERS' OPERATION" in red letters at least 10mm high.
7. Firefighter visual signal, phase two key switch, door open/close buttons, stop switch and call cancel button shall be behind locked cover, Keyed to meet A17.1 2007 code.
8. Car buttons
9. Door open and door close buttons

10. Alarm button
11. Telephone
12. Certificate holder; 5"x7" Certificate window is deleted or must meet TDLR height Min-Max from floor of (3'-7') requirements
13. Car panel shall be designed to cover all cutouts. Cover shall be hinged on one edge and held in place by eight EX513 keyed locks. Service panel shall be keyed for EX514 key. Fire service shall be keyed for "FEO-K1" key.

2.11 CAR TOP INSPECTION STATION

- A. Provide station device to operate each elevator from on top of the car during adjustment, inspection, maintenance, and repair.
- B. Operating means shall conform to the following:
 1. Device shall be of the continuous-pressure type; operate the car at a speed not exceeding 150 ft/min; operate the car subject to the electrical protective devices required by ASME A17.1. Device shall be used only for the purpose of adjustment, inspection, maintenance, and repair of the elevator or hoistway equipment.

2.12 CAB ENTRANCES

- A. Cab Doors: Stainless steel 0.058 inch (1.5 mm) thick metal, of insulated sandwich panel construction, flush design, rolled profiles, rigid construction. Door shall be hung on sheave type hangers with polyurethane tires that roll on a polished track. The hanger shall be provided with adjustable eccentric rollers to take the up-thrust out of the doors. The doors shall be guided at bottom by non-metallic shoes sliding in the below listed threshold. Front return panels shall have same finish as doors.
- B. Cab Door Frames: Stainless steel; 0.058 inch (1.5mm) thick metal, standard design with non-detectable joints.
- C. Thresholds: Nickel Silver "U" shaped saddles.
- D. Door Operation and Control Features:
 1. A closed loop design heavy duty operator shall be furnished and installed that is compatible with the elevator controller. The system shall be designed to operate the car and hoistway doors simultaneously. Door movements shall be electrically cushioned at both limits of travel and the door operating mechanism shall be arranged for manual operation in the event of a power failure. A door protection system using microprocessor controlled infra-red light beams (Janis or Microscan or approved equal) shall be provided. The beams shall project across the car opening detecting the presence of a passenger or object. If door movement is obstructed, the doors shall immediately reopen. A mechanical reopening device shall not be provided. Doors shall automatically open when the car arrives at the landing and shall automatically close after an adjustable time interval or when car is dispatched to another landing. Direct drive geared operators, A.C. controlled units with oil checks, stationary door vane or other deviations of these are not acceptable. Door operator shall not require proprietary tools for adjusting, **all adjustments or diagnostics shall be provided on the door controller.**
 2. Nudging:
The doors shall remain open as long as the electronic detector senses the presence of a passenger or object in the door opening. If the door movement is obstructed longer than a

field programmable time value, a buzzer shall sound and the doors shall close at a reduced speed.

3. The current door hold time shall be changed to a shorter field programmable time when the door protection system is activated.
4. The microprocessor control system shall provide separate timers for car call door hold open time and hall car door hold open time. The door hold open times shall be field programmable.
5. Acceptable door operators;
 - a. ThyssenKrupp/Dover HD-73/91 door operator with MCE's SmarTRAQ door controller.
 - b. GAL Manufacturing Corp.; Model MOVFR
 - c. ThyssenKrupp HD-LM Door Operator.
6. Door Restrictor: Shall be vane (Dover) style mounted to car door and brackets installed in hoistway.

2.13 ACCESSIBILITY PROVISIONS

- A. Conform to State of Texas Accessibility Standards for provisions for the disabled.
 1. Locate highest button in the control panel and highest operable part of the telephone a maximum of 48 inches above floor.
 2. Braille: All car control buttons shall be designated by braille and raised standard alphabet characters for letters, Arabic symbols for numbers or standard symbols as required in ASME/ANSI A17.1.
 3. Provide handrails on sides and rear of the interior of the elevator car.
 4. Car Position Indicators: The controller shall have a position indicator output to drive the required position indicator which shall indicate the corresponding floor numbers as the car passes or stops at a floor. An audible signal shall sound as the position indicator changes floors.
 - a. Only Digital Style hall and car Position indicators or units that require no bulbs or maintenance shall be provided.
 5. Provide landing lanterns with audible ADA signal when car is arriving at landing; 1 for up stops and 2 for down stops.
- B. Braille on hoistway door frames: Provide 2 inch high raised numerals with braille on each landing jamb to identify landing number, characters shall be centered 60 inches above floor.

2.14 HOISTWAY ENTRANCES

- A. Hoistway Doors: Stainless steel; 0.058 inch ([1.5 mm) thick metal, of insulated sandwich panel construction, flush design, rolled profiles, rigid construction.
- B. Hoistway Door Frames: Stainless steel; 0.058 inch (1.5 mm) thick metal, of rolled profiles, standard offset bolted design with non-detectable joints.

- C. Door and Frame Construction: 1-1/2 hour fire rating; insulated sandwich panel door construction 1-1/4 inch (32mm) thick, minimum.
- D. Door Hangers: Furnish and install sheave type two point suspension hangers and tracks. The sheaves shall have polyurethane tires with ball bearings properly sealed to retain grease. The hangers shall be provided with adjustable eccentric rollers to take the up-thrust out of the doors. The tracks shall be drawn steel shapes, smooth surface and shaped to conform to the hanger sheaves. The doors shall have secondary retainers at the top and bottom of the doors.
- E. Interlocks: Each hoistway entrance shall be equipped with an approved type of interlock that has been tested as required by the appropriate code. The interlock shall be designed to prevent operation of the car away from the landing until the doors are locked in the closed position, and shall prevent opening the doors at any landing from the corridor side without the use of a special tool. Interlocks shall bear Underwriters' Laboratories "B" label of approval.
- F. Hoistway door unlocking devices shall be provided on all floors and comply with ASME A17.1. These devices shall permit authorized personnel to gain access to the hoistway when the elevator car is away from the landing.

2.15 LANDING CONTROLS

- A. Landing Buttons: Standard round Illuminating type, one for originating UP and one for originating DOWN calls, one button only at terminating landings; including indications required by ASME A17.1. Hall button covers to be engraved and filled with pictograph detailing "**In case of fire use stairs**".
- B. One (1) Landing Position Indicator: Only Digital Style hall and car Position indicators or units that require no bulbs or maintenance shall be provided.
- C. Car Direction Indicators: Through engraved stainless steel using L.E.D. lamps.
- D. All screws to be Hex-Pin tamper proof.

2.16 FINISHES

- A. Structural Metal Surfaces: Clean surfaces of rust, oil or grease; wipe clean with solvent; prime and paint.
- B. Machine Room Components: Clean and degrease; prime one coat, finish with one coat of enamel.
- C. Galvanized Surfaces: Clean with neutralizing solvent; prime one coat.
- D. Aluminum: Mill finish.
- E. Wood Surfaces not exposed to Public View: One coat primer; one coat enamel.
- F. Stainless Steel: #4 Satin.

PART 3 - EXECUTION

3.1 SIGHT VISIT

- A. Examine work of other Sections that affects the Elevator System. Report defects that will affect equipment or system operation to The University's Representative.

- B. Before fabrication, take job site measurements and verify that Work required by others is complete. Check measurement of space for equipment and means of access for installation and operation.

3.2 INSTALLATION

- A. Install in accordance with ASME A17.1, manufacturer's instructions, and applicable codes.
- B. Casing:
 - 1. Excavate for hydraulic hole casing. Set steel casing in hole free of rocks and other protrusions. Backfill open space between the hole and steel casing with settling sand. The PVC casing shall be of suitable size to allow a minimum annular space of 1-1/2" inches between the PVC and steel casing. After plumbing the PVC fill the 1-1/2" inch annular space between the steel casing and PVC casing with settling sand. There shall be a minimum 1-1/2" inch annular space between the PVC casing and the elevator hydraulic jack. PVC casing shall be sealed at the bottom with a schedule 40 PVC cap that fits the casing. The PVC casing shall be brought up to the finish floor level. Following installation of hydraulic jack in the PVC casing, fill the annular space with Union-guard 160 by Pacific Standard Chemical Co. or (Owner approved substitute). Follow Manufacture's recommended installation procedure. The PVC casing shall be grouted into concrete floor slab with a non-shrinking concrete. There shall be a 1" galvanized nipple installed through the concrete cap into the 1-1/2" annular space between the PVC and hydraulic jack with a bleeder valve mounted on top to monitor the pressure between the PVC and jack.
 - 2. Prior to installing jack, remove water and debris from PVC casing.
 - 3. Double wrap hydraulic jack with an approved coating designed to protect the unit from electrolytic and chemical corrosion. Any other underground piping shall be similarly protected.
 - 4. Install jack assembly plumb, centered, and shimmed; use centering lugs to prevent displacement.
 - 5. Spring, oil, or Equivalent Buffers. Buffers of the spring, oil, or equivalent type shall be installed under cars and counterweights of passenger and freight elevators. Spring buffers or their equivalent may be used where the rated speed is not in excess of 200 ft/min.
 - 6. Following installation of hydraulic jack in the PVC casing, fill the annular space with Union-guard 160 by Pacific Standard Chemical Co. or (Owner approved substitute). Follow Manufacture's recommended installation procedure.
- C. Arrange equipment in machine room so that elements requiring removal or maintenance are readily accessible without disturbing other components. Arrange for clear passage between components.
- D. Install system components. Connect equipment to building utilities.
- E. Mount motor and pump unit on vibration and acoustic isolators, equal to type ND by Mason Industries. Securely fasten to building supports; prevent lateral displacement.
- F. Install and connect piping between machine and cylinder. The use of Victaulic Couplings is prohibited except where needed for service and repair of equipment.

- G. Install guide rails to compensate for expansion and contraction movement.
- H. Accurately machine and align guide rails. Form smooth joints with machined splice plates.
- I. Install hoistway door thresholds, frames, and headers in hoistway walls. Set entrances in vertical alignment with car openings and plumb hoistway lines.
- J. Grout thresholds.
- K. Adjust equipment for smooth and quiet operation.
- L. Clean field welds; remove oxidation and residue. Apply touch up primer and paint.
- M. Contractor to provide oil containment in machine room to keep any oil spillage/leak from exiting room. (Oil barrier around walls/door)

3.3 ERECTION TOLERANCES

- A. Quality Control: Tolerances.
- B. Guide Rail Alignment: Plumb and parallel to each other in accordance with ASME A17.1 and ASME A17.2.2.
- C. Cab Movement on Aligned Guide Rails: Smooth movement, with no objectionable lateral or oscillating movement or vibration.

3.4 FIELD QUALITY CONTROL

- A. Quality Control: Field inspection, testing, adjusting, and balancing.
- B. Perform tests required by ASME A17.1 and ASME A17.2.2.
- C. Test elevator in presence of Owners Representative to ensure proper operation and compliance with specified requirements; make final adjustments as appropriate.
- D. Obtain inspections and permits and make such tests as are required by governing authorities. Deliver test certificates and permits to Owner.
- E. Provide one week written notice of date and time of tests.
- F. Supply instruments and execute specific tests.

3.5 TESTING

- A. QEI Certified Testing in accordance with ASME A17.1 will be witnessed by Owners Representative, but not as the inspector. **Elevator shall not be QEI certified unless 100% completed. (NO PUNCH LIST) The University shall receive the Inspection report no later than 10 calendar days from the date of the inspection.**
- B. Damage of any kind to the car or the adjoining structure which results from performance of any test shall be repaired at no additional cost to The University.

3.6 ADJUSTING

- A. Contract Closeout: Adjusting installed work.
- B. Adjust for smooth acceleration and deceleration of car so not to cause passenger discomfort.

General riding quality, leveling accuracy and quietness of operation shall be acceptable to The University's representative.

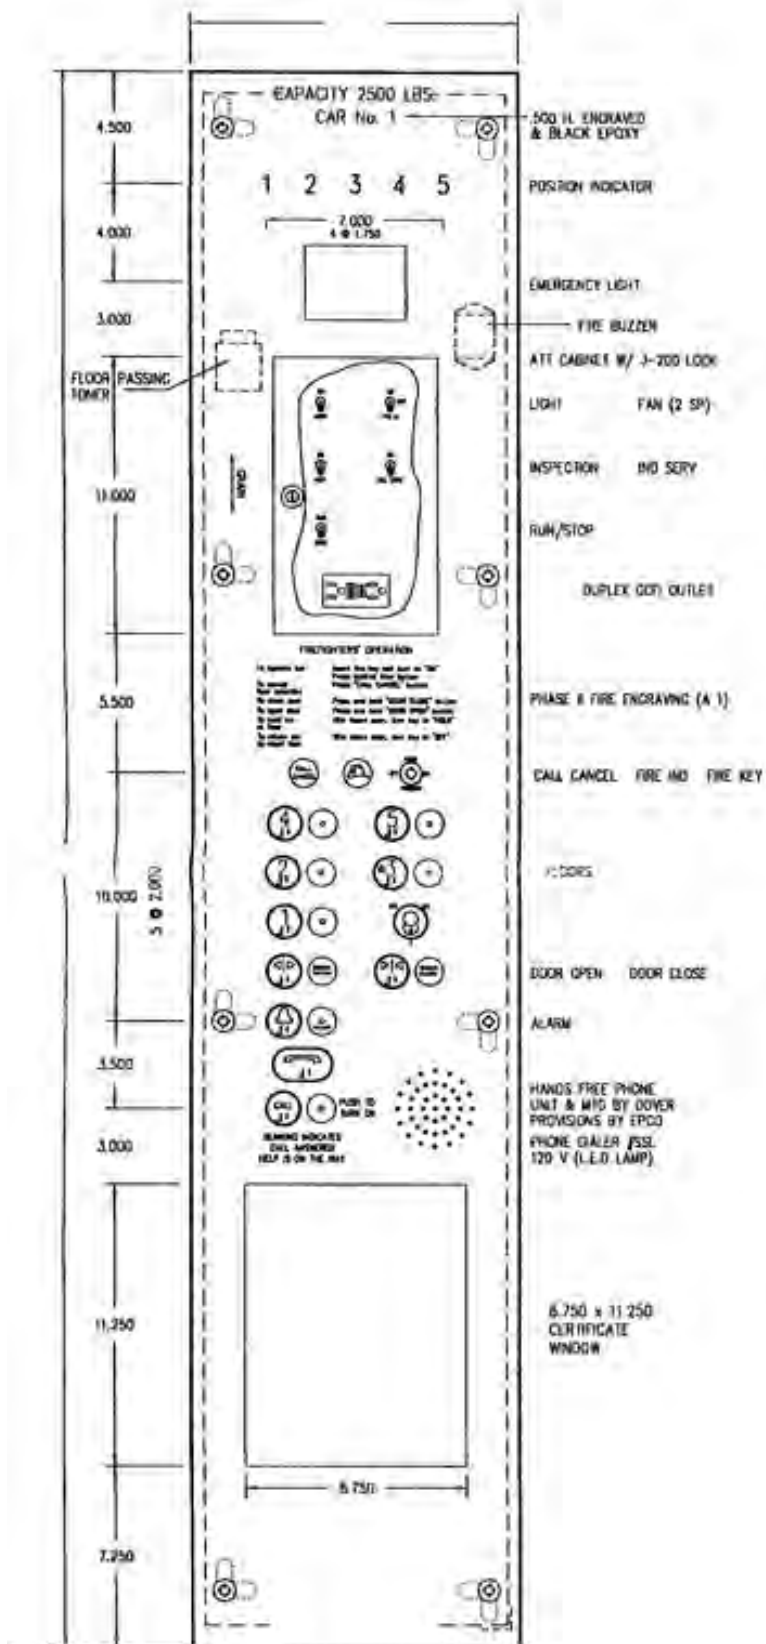

- C. Adjust automatic floor leveling feature at each floor to achieve (+/-)1/4 inch (6mm) from floor level.

3.7 CLEANING

- A. Contract Closeout: Cleaning installed work.
- B. Remove protective coverings from finished surfaces.
- C. Clean surfaces and components ready for inspection.

3.8 PROTECTION OF FINISHED WORK

- A. Contract Closeout: Protecting installed work.
- B. Do not permit construction traffic within cab after cleaning.
- C. Prohibit use of elevators for construction purposes.

END OF SECTION14 24 00 00

Task	Specification	Specification Description
20 00 00 00	20 01 00 00	Basic Fire Suppression, Plumbing and HVAC Requirements
20 00 00 00	20 08 00 00	Fire Supression/Plumbing/HVAC Systems Commissioning

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 20 01 00 00 - BASIC FIRE SUPPRESSION, PLUMBING AND HVAC REQUIREMENTS**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Basic and supplemental requirements common to Fire Suppression, Plumbing and HVAC Work.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the Contract Documents.

1.04 DEFINITIONS

- A. These definitions are included to clarify the direction and intention of these Specifications. For further clarification, contact the Architect/Engineer.
 - 1. Concealed / Exposed: "Concealed" areas are those areas that cannot be seen by the building occupants. "Exposed" areas are all areas, which are exposed to view by the building occupants, including under counters, inside cabinets and closets, plus all mechanical rooms. "Exterior" areas are those that are outside the building exterior envelope and exposed to the outdoors.
 - 2. Furnish: The term "furnish" is used to mean "supply and deliver to the Project Site, ready for unloading, unpacking, assembly, installation, and similar operations.
 - 3. Install: The term "install" is used to describe operations at Project Site including the actual "unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protecting, cleaning, and similar operations.
 - 4. Provide: The term "provide" means "to furnish and install, complete and ready for the intended use.

1.05 QUALITY ASSURANCE

- A. Fire Suppression, Plumbing and HVAC systems shall be coordinated with other systems and trades to include but not be limited to: Electrical systems, fire alarm, security systems, transport systems, telephone and data systems.

- B. Verification of Dimensions: The Contractor shall be responsible for the coordination and proper relation of Contractor's Work to the building structure and to the Work of all trades. The Contractor shall visit the premises and become thoroughly familiar with all details of the Work and working conditions, to verify all dimensions in the field, and to advise the Architect/Engineer of any discrepancy before performing any Work. Adjustments to the Work required in order to facilitate a coordinated installation shall be made at no additional cost to The University or the Architect/Engineer.
- C. All dimensional information related to new structures shall be taken from the appropriate Drawings. All dimensional information related to existing facilities shall be taken from actual measurements made by the Contractor on the Site.
- D. The Drawings are subject to the requirements of Reference Standards, structural and architectural conditions. The Contractor shall carefully investigate structural and finish conditions and shall coordinate the separate trades in order to avoid interference between the various phases of Work. Work shall be organized and laid out so that it will be concealed in furred chases and suspended ceilings, etc., in finished portions of the building, unless specifically noted to be exposed. All exposed Work shall be installed parallel or perpendicular to the lines of the building unless otherwise noted.
- E. When the Drawings do not give exact details as to the elevation of pipe and ducts, the Contractor shall physically arrange the systems to fit in the space available at the elevations intended with proper grades for the functioning of the system involved. Piping and duct systems are generally intended to be installed true and square to the building construction, and located as high as possible against the structure in a neat and workmanlike manner. The Drawings do not show all required offsets, control lines, pilot lines and other location details. Work shall be concealed in all finished areas.
- F. Where core drilling of floor or wall penetrations is required, Work shall be performed in accordance with Division 03 Specifications. Where applicable Division 03 Specifications are not included in the Project, core drilling shall be in accordance with generally accepted standards, and be performed by licensed personnel where applicable.
- G. Certify in writing that neither the Contractor nor any of Contractor's subcontractors or suppliers will supply any materials that contain any asbestos in any form for this Project.

1.06 DELIVERY, STORAGE AND HANDLING

- A. All equipment, ductwork, and materials shall be delivered to the Project Site clean and sealed for protection.
- B. Take particular care not to damage the existing construction in performing Work. All finished floors, step treads and finished surfaces shall be covered to prevent any damage by workers or their tools and equipment during the construction of the Project.
- C. Equipment and materials shall be protected from rust and dust/debris both before and after installation. Any equipment or materials found in a rusty condition at the time of final inspection must be cleaned of rust and repainted as specified elsewhere in these Specifications.
- D. All material affected by weather shall be covered and protected to keep the material free from damage while material is being transported to the Site and while stored at the Project Site.
- E. During the execution of the Work, open ends of all piping and conduit, and all openings in equipment shall be closed when Work is not in progress, and shall be capped and sealed prior to completion of final connections, so as to prevent the entrance of foreign matter.
- F. All equipment shall be protected during the execution of the Work. All ductwork and equipment shall be sealed with heavy plastic and tape to prevent build-up of dust and debris.

- G. All ductwork and air handling equipment shall be wiped down with a damp cloth immediately before installation to ensure complete removal of accumulated dusts and foreign matter.
- H. All plumbing fixtures shall be protected and covered to prohibit usage. All drains shall be covered until placed in service to prevent the entrance of foreign matter.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. All equipment installed shall have local representation, local factory authorized service, and a local stock of repair parts.
- C. Responsibility for furnishing proper equipment and/or material and ensuring that equipment and/or material is installed as intended by the manufacturer, rests entirely upon the Contractor. Contractor shall request advice and supervisory assistance from the representative of specific manufacturers during the installation.
- D. All materials, unless otherwise specified, shall be new, free from all defects, suitable for the intended use and of the best quality of their respective kinds. Materials and equipment shall be installed in accordance with the manufacturer's recommendations and the best standard practice for the type of Work involved. All Work shall be executed by mechanics skilled in their respective trades, and the installations shall provide a neat, precise appearance. Materials and/or equipment damaged in shipment or otherwise damaged prior to installation shall not be repaired at the job Site but shall be replaced with new materials and/or equipment.
- E. Materials and equipment manufactured domestically are preferred when possible. Materials and equipment that are not available from a domestic manufacturer may be by a non-domestic manufacturer provided they fully comply with Contract Documents.
- F. Prevention of Rust: Standard factory finish will be acceptable on equipment specified by model number; otherwise, surfaces of ferrous metal shall be given a rust inhibiting coating.

2.02 NAMEPLATES

- A. Each major component of equipment shall have the manufacturer's name, address, and catalog number on a plate securely attached to the item of equipment. All data on nameplates shall be legible at the time of Final Inspection.
- B. Nameplates shall be black laminated rigid phenolic with white core. Nameplate minimum size shall be 1 inch high by 3 inches long with 3/16-inch-high engraved white letters.
- C. Nameplate Fasteners: Fasten nameplates to the front of equipment only by means of stainless steel self-tapping screws. Stick-ons or adhesives will not be allowed unless the NEMA enclosure rating is compromised, then only epoxy adhesive shall be used to attach nameplates.
- D. Nameplate Information: In general, the following information is to be provided for the types of electrical components or enclosures supplied with equipment.
 - 1. Individual Starters, Contactors, Disconnect Switches, and Similar Equipment: Identify the device, and voltage characteristics source and load served.

2.03 WALL, FLOOR AND CEILING PLATES (ESCUTCHEONS)

- A. Except as otherwise noted, provide stainless steel or chrome plated brass floor and ceiling plates around all pipes, ducts, conduits, etc., passing exposed through walls, floors or ceilings, in any spaces except underfloor and plenum spaces.
- B. Plates shall be sized to fit snugly against the outside of the pipe or against the insulation on lines that are insulated and positively secured to such pipe or insulation.
- C. For finished ceiling installation, secure escutcheons to ceiling with escutcheon fasteners.
- D. Plates will not be required for piping where pipe sleeves extend $\frac{3}{4}$ -inch or more above finished floor.
- E. Round and rectangular ducts shall have closure plates (not chrome plated) made to fit accurately at all floor, wall and ceiling penetrations.

2.04 ROOF PENETRATIONS AND FLASHING

- A. Pipe, conduit and duct sleeves, pitch pockets and flashings compatible with the roofing installation shall be provided and installed for all roof penetrations by a contractor qualified in such Work. Installation shall comply with the Contract Documents and with FM General Data Sheets 1-28, 1-29, 1-31 & 1-49 along with the FM approval guide.

PART 3 - EXECUTION**3.01 PREPARATION**

- A. Cooperate with trades of adjacent, related or affected materials or operations, and with trades performing continuations of this Work in order to effect timely and accurate placing of Work and to coordinate, in proper and correct sequence, the Work of such trades.
- B. The size of equipment indicated on the Drawings is based on the dimensions of a particular manufacturer. While other manufacturers may be acceptable, it is the responsibility of the Contractor to determine that the equipment proposed will fit in the space. Fabrication Drawings shall be prepared when required by the Architect/Engineer or Owner to indicate a suitable arrangement.
- C. All equipment shall be installed in a manner to permit access to all surfaces. All valves, motors, drives, filters, and other accessory items shall be installed in a position to allow removal for service without disassembly of another part.
- D. Space Requirements:
 - 1. Consider space limitations imposed by contiguous Work in location of equipment and material. Do not provide equipment or material which is not suitable in this respect.
 - 2. Make changes in material and equipment locations of up to five (5) feet, to allow for field conditions prior to actual installation, and as approved by the Architect/Engineer at no additional cost to The University.
- E. Contractor shall note that the electrical design and Drawings are based on the equipment scheduled and indicated on the Drawings. Should any equipment be provided requiring changes to the electrical design, the required electrical changes shall be made at no cost to The University.
- F. Connections for equipment other than Divisions 21, 22, 23:

1. Rough-in and provide all gas, air, water, steam, sewer, etc. connections to all fixtures, equipment, machinery, etc., furnished by The University and/or other trades in accordance with detailed rough-in Drawings provided by the equipment suppliers, by actual measurements of the equipment connections, or as detailed.
2. After the equipment is set in place, make all final connections and provide all required pipe, fittings, valves, traps, etc.
3. Provide all backflow preventers and air gap fittings required, using approved devices. In each service line connected to an item of equipment or piece of machinery, provide a shutoff valve. On each drain not provided with a trap, provide a suitable trap.
4. Provide all ductwork, transition pieces, etc., required for a complete installation of vent hoods, fume hoods, etc.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Piping may be run exposed in rooms typically without ceilings such as mechanical rooms, janitor's closets, tight against pan soffits in exposed "tee" structures, or storage spaces, but only where necessary. Shutoff and isolation valves shall be easily accessible.
- D. All pipe, conduits, etc., shall be cut accurately to measurements established at the building and shall be worked into place without springing or forcing. All ducts, pipes and conduits run exposed in machinery and equipment rooms shall be installed parallel to the building lines, except that piping shall be sloped to obtain the proper pitch. Piping and ducts run in furred ceilings, etc., shall be similarly installed, except as otherwise shown. All pipe openings shall be kept closed until the systems are closed with final connections.
- E. Prior to the installation of any ceiling material, gypsum, plaster or acoustical board, the Contractor shall notify Owner's Project Manager so that arrangement can be made for an inspection of the above-ceiling area about to be "sealed" off. The Contractor shall provide written notification to The University at least five (5) calendar days prior to the inspection.
- F. Precedence of Materials:
 1. The Specifications determine the nature and setting of materials and equipment. The Drawings establish quantities, dimensions and details.
 2. If interference is encountered, the following installation precedence of materials shall guide the Contractor to determine which trade shall be given the "Right of Way":
 - a. Building lines
 - b. Structural members
 - c. Structural support frames supporting ceiling equipment
 - d. Electric tracked vehicle system
 - e. Pneumatic trash and linen system
 - f. Pneumatic tube system

- g. Soil and drain piping
 - h. Vent piping
 - i. Supply, return and outside air ductwork
 - j. Exhaust ductwork
 - k. HVAC water and steam piping
 - l. Condensate piping
 - m. Fire protection piping
 - n. Natural gas piping
 - o. Medical/Laboratory gases
 - p. Domestic water (cold and hot, softened, treated)
 - q. Refrigerant piping
 - r. Electrical conduit
3. Coordinate fire suppression, plumbing and HVAC systems with transport systems as required to maintain transport system right-of-way.

3.03 TESTING

- A. When any piece of mechanical equipment is operable and it is to the advantage of the Contractor to operate the equipment, Contractor may do so, provided that Contractor properly supervises the operation, and has The University's written permission to do so. The warranty period shall, however, not commence until such time as the equipment is operated for the beneficial use of The University, or date of Substantial Completion, whichever occurs first.
- B. Regardless of whether or not the equipment has or has not been operated, the Contractor shall properly clean the equipment, install clean filter media, properly adjust, and complete all deficiency list items before final acceptance by The University. The date of acceptance and performance certification will be the same date.
- C. Before the Work is accepted, an authorized representative of the manufacturer of the installed materials and/or equipment shall personally inspect the installation and operation of manufacturer's materials and/or equipment to determine that materials and/or equipment are properly installed and in proper operating order. The qualifications of the manufacturer's representative shall be appropriate to the technical requirements of the installation. The qualifications of the manufacturer's representative shall be submitted to The University for approval. The decision of The University concerning the appropriateness of the manufacturer's representative shall be final. Testing and checking shall be accomplished during the course of the Work where required by Work being concealed, and at the completion of the Work. In addition, the Contractor shall submit to the Architect/Engineer a signed statement from each manufacturer's representative certifying as follows: **"I certify that the materials and/or equipment listed below have been personally inspected by the undersigned authorized manufacturer's representative and is properly installed and operating in accordance with the manufacturer's recommendations."**
- D. Check inspections shall include piping, equipment, heating, air conditioning, insulation, ventilating equipment, controls, mechanical equipment and such other items hereinafter specified or specifically designated by the Architect/Engineer.

- E. The Contractor shall execute, at no additional cost to The University, any tests required by The University or the National Fire Protection Association, ASTM, etc. Standards listed. The Contractor shall provide all equipment, materials and labor for making such tests. The University will pay reasonable amounts of fuel and electrical energy costs for system tests. Fuel and electrical energy costs for system adjustment and tests, which follow Substantial Completion by The University, will be borne by The University.
- F. Notify The University's Project Manager and the Architect/Engineer in writing at least seven (7) calendar days prior to each test and prior to other Specification requirements requiring Owner and Architect/Engineer to observe and/or approve tests.
- G. All tests shall have pertinent data logged by the Contractor at the time of testing. Data shall include date, time, personnel performing, observing and inspecting, description of the test and extent of system tested, test conditions, test results, specified results and other pertinent data. Data shall be delivered to the Architect/Engineer as specified under "Requirements for Final Acceptance." The Contractor or Contractor's authorized job superintendent shall legibly sign all Test Log entries.
- H. Refer to Commissioning Specification Sections for additional Start-up, prefunctional and operational checkout, and for functional performance test procedures.

3.04 TRAINING

- A. Operating and Maintenance Manuals and instruction shall be provided as specified under the Division 01 Section entitled "Project Closeout Procedures."
- B. Specific training and operating instructions for individual equipment components shall be as specified in the individual Specification Sections.
- C. All equipment, piping, conduit, ductwork, grilles, insulation, etc., furnished and installed in exposed areas shall be cleaned, prepared and painted as specified in Division 09.

SECTION 20 05 16 00 - PIPING EXPANSION COMPENSATION**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Perform all Work required to provide and install the following piping expansion compensation equipment indicated by the Contract Documents with supplementary items necessary for their proper installation.
 - 1. Flexible pipe connectors.
 - 2. Expansion joints and compensators.
 - 3. Pipe loops, offsets, and swing joints.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. MIL-E-17814E-Expansion Joints, Pipe, Slip-Type, Packed.

1.04 QUALITY ASSURANCE

- A. Provide structural Work and equipment required to control expansion and contraction of piping. Verify that anchors, guides, and expansion joints provided, adequately protect system.
- B. Expansion Calculations
 - 1. Installation temperature: 50 degrees F.
 - 2. Safety Factor: 30 percent.
 - 3. Hot Water Heating, Domestic Hot Water, Chilled Water and Steam temperature shall be as per system design.

1.05 SUBMITTALS

- A. Flexible Pipe Connectors: Indicate maximum temperature and pressure rating, face-to-face length, live length, hose wall thickness, hose convolutions per foot and per assembly, fundamental frequency of assembly, braid structure, and total number of wires in braid.

- B. Expansion Joints: Indicate maximum temperature and pressure rating, and maximum expansion compensation. Indicate alignment, guide locations, quantities, spacing, etc.
- C. Operation and Maintenance Data: Include adjustment instructions, warranty.
- D. Manufacturer Qualifications: Company specializing in manufacturing the products specified in this Section with minimum three (3) years documented experience.

1.06 EXTRA MATERIALS

- A. Provide two (2) 12-ounce containers of packing coverage for leak-free performance of expansion joints.

1.07 WARRANTY

- A. Provide a five (5) year warranty including coverage for leak-free performance of expansion joints.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

A. Flexible Pipe Connectors:

1. Hyspan Model Series 3505.
2. Pathway Model Xpress FF with anchor foot.

B. Expansion Joints – Steam:

1. Hyspan Model Series 3505.
2. Pathway Model Xpress FF with anchor foot.

C. Expansion Joints – Steel Piping:

1. Hyspan Model 3501 series.
2. Pathway Model Xpress FF with anchor foot.

D. Expansion Joints – External Ring:

1. Hyspan Model Series 5500.
2. Pathway Model Flexway CT.
3. Flexonics Model TCS-R.

E. Pipe Alignment Guides:

1. Anvil Model Fig. 255.
2. Piping Technology & Products Model Fig. 6.
3. Hyspan Model Series 9500.

4. AAA Technology Model Fig. 295.

2.03 FLEXIBLE PIPE CONNECTORS

A. Copper Piping - Domestic Water:

1. Pathway Model Xpress FF with anchor foot.
2. Exterior Sleeve: Braided bronze or stainless.
3. Pressure Rating: 200 psig WOG and 250 degrees F.
4. Joint: As specified for pipe joints.
5. Size: Use pipe-sized units.
6. Maximum offset: 3/4 inch on each side of installed centerline.

2.04 EXPANSION JOINTS

A. Steam - Stainless Steel Bellows (Externally Pressurized Guided Type):

1. Pressure Rating: 300 psig, maximum temperature 850 degrees F.
2. Maximum Compression: 4 inch.
3. Maximum Extension: 1 inch.
4. Joint: As specified for ANSI class.
5. Size: Use pipe-sized units.
6. Application: Steel piping 3 inches and under.

B. Steel Piping - 150 psig Chilled Water, 150 psig Heating Water, and Steam Condensate:

1. Annular Corrugated Inner Core: Steel laminated bellows meeting ASTM A 240.
2. Exterior Sleeve: Steel housing meeting ASTM A 53 GRB.
3. Pressure Rating: 150 psig and 300 psig at 750 degrees F. Refer to Drawings.
4. Joint: Flanged 150 and 300 raised face as required for piping system.
5. Size: Use pipe-sized units.
6. Axial Compression: 4 inches.

C. External Ring Stainless Steel Bellows Restrained (Chilled and Heating Water Pump Connectors) Type:

1. Pressure Rating: 350 psig at 400 degrees F.
2. Maximum Compression: 0.75 to 1.00 inches.
3. Maximum Extension: 0.25 inches.
4. Maximum Offset: 0.13 inches.
5. Joint: Flanged as required by ANSI class.

6. Size: Use pipe-sized units.
7. Bellows: Type 321 stainless steel.
8. Application: Steel piping over 3 inches.

2.05 ACCESSORIES

A. Pipe Alignment Guides:

1. Two (2) piece welded steel with enamel paint, bolted, with spider to fit standard pipe, frame with four mounting holes, clearance for minimum 1 inch thick insulation, minimum 3 inch travel.
2. Provide and install alignment guides at expansion joints per manufacturer's requirements.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
 1. Accomplish structural Work and provide equipment required to control expansion and contraction of piping, loops, pipe offsets, and swing joints, and provide corrugated bellows type expansion joints where indicated on Drawings or required.
 2. Provide pipe anchors as shown on the Drawings and/or as required to facilitate proper operation of pipe guides. Install anchors in compression. Weld anchors to pipe and to building structure
 3. Provide pipe guides so that movement takes place along axis of pipe only. Guide sizes shall be the nominal pipe size with insulation. Guides shall not carry dead weight load on pipe and are not intended to take the place of the required pipe supports and rollers.
 4. Construct spool pieces to exact size of flexible connection for future insertion.
 5. Install flexible pipe connectors on pipes connected to equipment supported by vibration isolation. Provide line size flexible connectors.
 6. Install flexible connectors at right angles to displacement. Install one end immediately adjacent to isolated equipment and anchor the other end. Install in a horizontal plane unless indicated otherwise.
 7. Rigidly anchor pipe to building structure where shown or where necessary. Provide pipe guides so movement is directed along axis of pipe only. Erect piping such that strain and weight is not on cast connections or apparatus.

3.02 TESTING

- A. Prepare and Start-up systems under provisions of Section 20 01 00 and Section 26 01 00.
- B. Provide inspection services by flexible pipe manufacturer's representative for final installation.
- C. Certify that installation is in accordance with manufacturer's recommendations and that connectors are performing satisfactorily. Notify Owner's Project Manager at least five (5) calendar days prior to the inspection.

SECTION 20 05 29 00 - SUPPORTS AND SLEEVES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Perform all Work required to provide and install supports, hangers, anchors, sleeves and bases for all pipe, duct, equipment, system components and accessories, indicated by the Contract Documents with all supplementary items necessary for complete, code compliant and approved installation

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and Workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. International Mechanical Code.
 - 2. International Plumbing Code.
 - 3. International Fuel Gas Code.
 - 4. ASME B31.1 - Power Piping.
 - 5. ASME B31.2 - Fuel Gas Piping.
 - 6. ASME B31.9 - Building Services Piping.
 - 7. ASTM F708 - Design and Installation of Rigid Pipe Hangers.
 - 8. MSS SP58 - Pipe Hangers and Supports - Materials, Design and Manufacturer.
 - 9. MSS SP69 - Pipe Hangers and Supports - Selection and Application.
 - 10. MSS SP89 - Pipe Hangers and Supports - Fabrication and Installation Practices.
 - 11. MSS SP-90 - Guidelines on Terminology for Pipe Hangers and Supports.
 - 12. NFPA 13 - Installation of Sprinkler Systems.
 - 13. NFPA 14 - Installation of Standpipe and Hose Systems.
 - 14. NFPA 99 - Standard for Health Care Facilities.
 - 15. UL 203 - Pipe Hanger Equipment for Fire Protection Service.

16. SMACNA - HVAC Duct Construction Standards.

17. Underwriters Laboratories Standards and Listings.

1.04 QUALITY ASSURANCE

- A. Materials and application of pipe hangers and supports shall be in accordance with MSS-SP-58 and SP-69 unless noted otherwise.
- B. Support and sleeve materials and installation shall not interfere with the proper functioning of equipment.
- C. Contractor shall be responsible for structural integrity of all hangers, supports, anchors, guides, inserts and sleeves. All structural hanging materials shall have a minimum safety factor of five.
- D. Installer Qualifications: Utilize an installer experienced in performing Work of this Section who is experienced in installation of Work similar to that required for this Project and per the minimum requirements of MSS SP-89. Field welding of supports shall be by certified welders qualified in accordance with ASME Boiler and Pressure Vessel Code, Section IX using welding procedures per the minimum requirements of MSS SP-58.

1.05 SUBMITTALS

- A. Product Data: Provide manufacturer's catalog data including code compliance, load capacity, and intended application.
- B. Manufacturer's Installation Instructions: Indicate special procedures and assembly of components.
- C. Shop Drawings: Submit detailed Drawings of all shop or field fabricated supports, anchors and sleeves, signed and sealed by a qualified State of Texas registered professional engineer. Indicate size and characteristics of components and fabrication details and all loads exceeding 250 pounds imposed on the base building structure.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Comply with manufacturer's ordering instructions and lead time requirements to avoid construction delays.
- B. Deliver materials in manufacturer's original, unopened, undamaged containers with identification labels intact. Maintain in place until installation.
- C. Store materials protected from exposure to harmful weather conditions.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Hangers and Supports:
 - 1. Anvil International.
 - 2. Kindorf.
 - 3. Unistrut.

4. B-Line.
5. National Pipe Hanger Corporation.
6. Power Strut.

2.03 HANGERS AND SUPPORTS

A. General:

1. Refer to individual system and equipment Specification Sections for additional support requirements. Comply with MSS SP-69 for support selections and applications that are not addressed within these Specifications.
 2. Utilize hangers and supports to support systems under all conditions of operation, allowing free expansion and contraction, and to prevent excessive stresses from being introduced into the structure, piping or connected equipment.
 3. All pipe supports shall be of the type and arrangement to prevent excessive deflection, to avoid excessive bending stresses between supports, and to eliminate transmission of vibration.
 4. Design hangers to impede disengagement by movement of supported pipe.
 5. Install building attachments within concrete slabs or attach to structural steel. Space attachments within maximum piping span length indicated in MSS SP-69. Install additional attachments at concentrated loads, including valves, flanges, guides, strainers, and expansion joints, and at changes in direction of piping.
 6. Wire or perforated strap iron will not be acceptable as hanger material.
 7. Hanger rods shall be threaded on both ends, threaded one end, or continuous threaded, complete with adjusting and lock nuts.
 8. Hangers and clamps supporting and contacting individual non-insulated brass or copper lines shall be copper or copper plated. Where non-insulated brass or copper lines are supported on trapeze hangers or channels, the pipes shall be isolated from these supports with approved flexible elastomeric/thermoplastic isolation cushion material to completely encircle the piping and avoid contact with the channel or clamp. Plastic tape is not acceptable.
 9. Hangers and clamps supporting and contacting glass piping shall be in accordance with the piping manufacturer's published recommendations and shall be fully lined with minimum 1/4 inch neoprene padding. The padding material and the configuration of its installation shall be submitted for approval.
 10. Hangers and clamps supporting and contacting plastic piping shall be in accordance with the piping manufacturer's published recommendations and shall be factory coated or padded to prevent damage to piping.
 11. Field fabricated supports shall be constructed from ASTM A36/A36M, steel shapes selected for loads being supported. Weld steel according to AWS D-1.1.
- B. Finishes: All ferrous hangers, rods, inserts, clamps, stanchions, and brackets on piping within interior non-corrosive environments, shall be dipped in Zinc Chromate Primer before installation. Rods may be galvanized or cadmium plated after threading, in lieu of dipping zinc chromate. All hangers and supports exposed to the weather, including roofs and building crawl space areas, shall be galvanized or manufactured from materials that will not rust or corrode due to moisture. All hangers and supports located within corrosive environments shall be constructed from or coated with materials manufactured for installation within the particular environment.

- C. Vertical Piping: Supports for vertical riser piping in concealed areas shall utilize double bolt riser clamps, with each end having equal bearing on the building structure at each floor level. Two-hole rigid pipe clamps or four-hole socket clamps with washers may be used to support pipe directly from adequate structural members where floor-to-floor distance exceeds required vertical support spacing and lines are not subject to expansion and contraction. Supports for vertical riser piping at floor levels in exposed areas (such as fire protection standpipe in stairwells) shall be attached to the underside of the penetrated structure utilizing drilled anchors, two hanger rods (sized as specified), and socket clamp with washers.
- D. Trapezes: Where multiple lines are run horizontally at the same elevation and grade, they may be supported on manufactured channel, suspended on rods or pipes. Trapeze members including suspension rods shall be properly sized for the quantity, diameters, and loaded weight of the lines they are to support.
- E. Ductwork: All ductwork shall be supported in accordance with SMACNA recommendations for the service involved. Horizontal ducts supported using galvanized steel bands shall extend up both sides and onto the construction above, where they shall turn over and be secured with bolts and nuts fitted in inserts set in the concrete, bolted to angles secured to the construction above, or secured in another approved manner.
- F. Terminal Units:
 - 1. Terminal units weighing up to 150 pounds shall be supported by four (4) 1 inch wide sheet metal straps with ends turned under bottom of unit at corners.
 - 2. Each band shall be secured by not over 3/4 inch in length, 1/4 inch diameter sheet metal screws – two (2) on bottom of unit and one (1) on each side.
 - 3. The other strap end shall be attached to the structure by 1/4 inch diameter threaded bolt into the concrete insert or into drilled-hole threaded concrete expansion anchor.
 - 4. Where interference occurs, overhead of the box, not allowing direct vertical support by straps, provide trapeze channels suspended by 1/4 inch diameter galvanized threaded rods providing such channels do not block access panels of units.
 - 5. Terminal units weighing more than 150 pounds shall be supported per the terminal unit manufacturer's installation instructions using threaded rod and hanger brackets located per manufacturer's drawing.
- G. Fixture and Equipment Service Piping:
 - 1. Piping at local connections to plumbing fixtures and equipment shall be supported to prevent the weight of the piping from being transmitted to fixtures and equipment.
 - 2. Supports within chases and partitions shall be metal plate, clamps, angles or channels, and aligned with structure in the vertical or horizontal position. Plastic supports are not allowed unless approved by Owner.
 - 3. Pipe clamps shall be attached to supports. Supports shall be attached to wall or floor construction with clip angles, brackets, or other approved method.
 - 4. Supports may be attached to cast iron pipe with pipe clamp, or other approved method.
 - 5. All water piping shall be isolated from building components to prevent the transmission of sound.
 - 6. All copper or brass lines shall be isolated from ferrous metals with dielectric materials to prevent electrolytic action. Plastic tape is not an acceptable isolation material.

- H. Fire Protection Piping: All hangers and supports for fire standpipe systems and fire sprinkler systems shall be Factory Mutual and Underwriters' Laboratories, Inc. listed and labeled.
- I. Inserts:
 - 1. Cast-in-place concrete inserts shall comply with MSS-SP-69, U.L. and F.M. approved, and sized to suit threaded hanger rods.
 - 2. Drilled-hole threaded expansion-type anchor bolts.
 - 3. Manufactured inserts for metal deck construction shall have legs custom fit to rest in form valleys.
 - 4. Shop fabricated inserts shall be submitted and approved by Owner prior to installation.
 - 5. Inserts shall be of a type that will not interfere with structural reinforcing and that will not displace excessive amounts of structural concrete.
 - 6. Fasteners depending on soft lead for holding power or requiring explosive powder actuation will not be accepted.
- J. Pipe Shields: Provide pipe shields in accordance with insulation manufacturer's published recommendations. Install MSS SP-58, Type 39 protection saddles, if insulation without vapor barrier is indicated. Install MSS SP-58, Type 40 protective shields on cold piping with vapor barrier.
- K. Housekeeping Pads:
 - 1. Provide minimum 5 1/2 inch reinforced concrete pads with chamfered corners and equipment bases for all outdoor equipment on grade, floor mounted equipment in main central plant area, mechanical rooms, areas with floors below grade, penthouse equipment rooms, floor mounted air handling units, and where shown on Drawings.
 - 2. Housekeeping pads shall extend minimum of 4 inch on all sides beyond the limits of the mounted equipment unless otherwise noted.
 - 3. Provide galvanized anchor bolts for all equipment placed on concrete pads or on concrete slabs of the size and number recommended by the equipment manufacturer.

2.04 PIPE AND DUCT PENETRATIONS

- A. General:
 - 1. Seal penetrations through all rated partitions, walls and floors with U.L. tested assemblies to provide and maintain a rating equal to or greater than the partition, wall or floor.
 - 2. Inside diameter of all sleeves or cored holes shall provide sufficient annular space between outside diameter of pipe, duct or insulation to allow proper installation of required fire and water proofing materials and allow for movement due to expansion and contraction.
 - 3. Seal penetrations through all floors to provide and maintain a watertight installation.
 - 4. Exposed ceiling, floor and wall pipe penetrations within finished areas (including exterior wall faces) shall be provided with chrome plated, brass or stamped steel, hinged, split-ring escutcheon with set screw or snap-on type. Inside diameter shall closely fit pipe outside diameter or outside of pipe insulation where pipe is insulated. Outside diameter shall completely cover the opening in floors, walls, or ceilings. In exterior, damp, or corrosive environments, use Type 302 stainless steel escutcheons.
- B. Floor Pipe Penetrations:

1. Sleeves cast in the slab for pipe penetrations shall be Schedule 40 steel, ASTM A53, with 2 inch wide annular fin water-stop continuously welded at midpoint. Entire assembly shall be hot-dipped galvanized after fabrication. Water-stop shall be same thickness as sleeve.
2. Cored holes in the slab for pipe penetrations shall be provided with "Link-Seal" mechanical casing seal manufactured by Thunderline Corporation or a Schedule 40 steel, ASTM A53, sleeve with 2 inch wide annular fin water-stop continuously welded at point on sleeve to allow countersinking into slab and waterproofing. Entire sleeve assembly shall be hot-dipped galvanized after fabrication. Water-stop shall be same thickness as sleeve.
3. All sleeves shall extend a minimum of two inches above finished floor or be provided with "Link-Seal" mechanical casing seal manufactured by Thunderline Corporation.

C. Wall Penetrations:

1. Where piping or ductwork passes through non-rated partition, close off space between pipe or duct and construction with gypsum wallboard and repair plaster smoothed and finished to match adjacent wall area.
2. Pipe penetrations through interior rated partitions shall be provided with adjustable prefabricated U.L. listed fire rated galvanized sheet metal sleeves having gauge thickness as required by wall fire rating, 20 gauge minimum.
3. Pipe penetrations through exterior walls and walls below grade shall be provided with "Link-Seal" mechanical casing seal manufactured by Thunderline Corporation.
4. Ductwork penetrations through rated partitions, walls and floors shall be provided with sleeves that are manufactured integral with the damper assembly installed.

D. Flashing:

1. Coordinate flashing material and installation required for pipe and duct roof penetrations with Owner and roofing Contractor.
2. Provide flexible flashing and metal counter-flashing where ductwork penetrates exterior walls. Seal penetration water and air tight.
3. Provide acoustical flashing around ducts and pipes penetrating equipment rooms, with materials and installation in accordance with manufacturer's instructions for sound control.

E. Roof Curbs: Coordinate roof curb material and installation with Owner and roofing Contractor.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Conduct a pre-installation meeting prior to commencing Work of this Section to verify Project requirements, coordinate with other trades, establish condition and completeness of substrate, review manufacturer's installation instructions and manufacturer's warranty requirements.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. Application, sizing and installation of piping, supports, anchors and sleeves shall be in accordance with manufacturer's printed installation instructions.

- C. Provide for vertical adjustments after erection and during commissioning, where feasible, to ensure pipe is at design elevation and slope.
- D. Install hangers and supports to allow controlled thermal movement of piping systems, permitting freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- E. Install hanger so that rod is vertical under operating conditions.
- F. Supports, hangers, anchors, and guides shall be fastened to the structure only at such points where the structure is capable of restraining the forces in the piping system.
- G. The load and spacing on each hanger and/or insert shall not exceed the safe allowable load for any component of the support system, including the concrete that holds the inserts. Reinforcement at inserts shall be provided as required to develop the strength required. Contractor shall be responsible for engaging a structural engineer as required for design and review at support systems.
- H. Do not hang pipe, duct or any mechanical/plumbing item directly from a metal deck or locate on the bottom chord of any truss or joist unless approved by the Structural Engineer of Record.
- I. Drilling anchors into the bottom of concrete beams shall not be allowed without written permission from a Structural Engineer.
- J. All supports shall be designed and installed to avoid interference with other piping, hangers, ducts, electrical conduit, supports, building structures, equipment, etc.
- K. Piping supports shall be independent from ductwork supports. Combining supports is not permitted.
- L. Provide all supporting steel required for the installation of mechanical equipment and materials, including angles, channels, beams, etc. to suspended or floor supported tanks and equipment. All of this steel may not be specifically indicated on the Drawings.
- M. All piping and ductwork supports shall be designed and installed to allow the insulation to be continuous through the hangers.
- N. Adjustable clevis hangers shall be supported at rods with a nut above and below the hanger.
- O. All hanger rods shall be trimmed neatly so that 1 inch of excess hanger rod protrudes beyond the hanger nut. In the event a rod is intentionally but temporarily left excessively long (for sloped or insulated lines for example), the Contractor shall take appropriate measures to protect the pipe or other materials from damage.
- P. Install hangers to provide minimum ½ inch space between finished covering and adjacent structures, materials, etc.
- Q. Horizontal and vertical piping in chases and partitions shall be supported to prevent movement and isolated from the supports to prevent transmission of sound.
- R. Locate hangers within 12 inches of each horizontal elbow.
- S. Where several pipes can be installed in parallel and at same elevation, provide multiple or trapeze hangers.
- T. Support riser piping independently of connected horizontal piping. Riser piping is defined as vertical piping extending through more than one floor level.

- U. Support vertical piping with clamps secured to the piping and resting on the building structure or secured to the building structure below at each floor. Use method of securing the vertical risers to the building structure below in stairwells and exposed locations. Installation of riser clamps and welded steel riser supports shall not allow weight of piping to be transmitted to floor sleeves. Exception: Schedule 40 steel floor sleeves with continuously welded 2 inch minimum water-stop ring.
- V. Steel Bar Joists: Hanger rods shall be secured to angle irons of adequate size; each angle shall span across two or more joists as required to distribute the weight properly and shall be welded or otherwise permanently fixed to the top of joists.
- W. Steel Beams: Where pipes and loads are supported under steel beams, approved type beam clamps shall be used.
- X. Pre-Cast Tee Structural Concrete: Hanger supports, anchors, etc. attached to the precast, double tee, structural concrete system shall be installed in accordance with approved Shop Drawings only. Holes required for hanger rods shall be core drilled in the "flange" of the double tee only; impact type tools are not allowed under any circumstances. Core drilling in the "stem" portions of the double tee is not allowed. Holes core drilled through the "flange" for hanger rods shall be no greater than 1/4 inch larger than the diameter of the hanger rod. Hanger rods shall supported by means of bearing plates of size and shape acceptable to the Architect/Engineer, with welded double nuts on the hanger rod above the bearing plate. Cinch anchors, lead shields, expansion bolts, and studs driven by explosion charges are not allowed under any circumstances in the lower 15 inches of each stem and in the "shadow" of the stem on the top side of the "double tees".
- Y. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
- Z. Inserts:
 - 1. Install inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.
 - 2. Where concrete slabs form finished ceiling, locate inserts flush with slab surface.
 - 3. Install power-actuated drive-pin fasteners shall not be allowed.
- AA. Flashing:
 - 1. Coordinate all roof flashing with requirements of Division 07.
- BB. Pipe Shields:
 - 1. Provide shields at each hanger supporting insulated pipe.
 - 2. Provide shields of the proper length to distribute weight evenly and to prevent compression of insulation at hanger.
 - 3. Install shield so that hanger is located at the center of the shield.
 - 4. Attach shield to insulation with adhesive to prevent slippage or movement.
- CC. Equipment Anchor Bolts:
 - 1. Foundation bolts shall be placed in the forms when the concrete is poured, the bolts being correctly located by means of templates. Each bolt shall be set in a sleeve of sufficient size to provide 1/2 inch clearance around bolt.

SECTION 20 05 48 00 - VIBRATION ISOLATION**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Perform all Work required to provide and install inertia bases and vibration isolation indicated by the Contract Documents with supplementary items necessary for their proper installation.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and Workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. ASHRAE - Guide to Average Noise Criteria Curves.

1.04 QUALITY ASSURANCE

- A. Provide for vibration isolation supports for all equipment, piping and ductwork indicated herein. The transmission of perceptible vibration, structural borne noise or objectionable air borne noise to occupied areas by equipment installed under this Contract will not be permitted. Install vibration isolators as specified herein or shown on the Drawings or otherwise required to prevent the transmission of vibration which would create objectionable noise levels in occupied areas.
- B. The vibration isolation supplier must be a firm capable of dealing effectively with vibration and noise characteristics effects and criteria; and one that can provide facilities and capabilities for measuring and evaluating the aforementioned disturbances.
- C. Maintain ASHRAE criteria for average noise criteria curves for all equipment at full load condition.
- D. Provide vibration isolation devices, from a single manufacturer or supplier who will be responsible for complete coordination of all phases of this Work.

1.05 SUBMITTALS

- A. Product Data:
 - 1. Submit Shop Drawings, installation instructions, and product data.
 - 2. Indicate vibration isolator locations, with static and dynamic load on each, on Shop Drawings and described on product data.
 - 3. Contractor shall furnish complete submittal data, including Shop Drawings, which shall indicate the size, type and deflection of each isolator; and the supported weight, disturbing frequency and efficiency of each isolator proposed; and any calculations and other information as may be required for the Architect/Engineer to check the isolator selection for compliance with the specification.

B. Record Documents:

1. Indicate inertia bases on Shop Drawings, including dimensions.
2. All steel bases and concrete inertia bases shall be completely detailed, and shall show completely any reinforcing steel that may be required to provide a rigid base for the isolated equipment. Further, the submittal data shall clearly indicate outlined procedures for installing and adjusting the isolators and bases mentioned above.
3. Submittals on riser isolation system shall show initial and final loads on the structure at each support point, initial and final deflection of each isolator, amount and direction of each deflection change, total expansion and contraction of each riser and operating temperature of 180 degrees F in the riser.
4. Riser diagrams shall be prepared by the vibration isolation manufacturer and submitted for approval. These diagrams shall show initial and final spring deflections, amount and direction of deflection changes, overall expansion and contraction of the riser, and operating temperature of the medium.
5. Submittal data shall include certification that the riser system has been examined for excessive stresses and that none will exist in the design proposed when installed in accordance with submittal and these Specifications.

C. Operation and Maintenance Data:

1. Provide manufacturer's recommended maintenance procedures.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. All vibration isolators and bases shall be designed for and treated for resistance to corrosion.
- C. Steel components shall be PVC coated or phosphated and painted with industrial grade enamel. All nuts, bolts and washers shall be zinc-electroplated or cadmium plated.
- D. All isolators exposed to the weather shall have steel parts hot-dip galvanized or zinc-electroplated plus coating of Neoprene or Bitumastic paint. Aluminum components for outdoor installation shall be etched and painted with industrial grade enamel.
- E. Required spring deflections for isolators supporting various items of equipment are shown on the Drawings or tabulated elsewhere in these Specifications, but in no case shall be less than one inch. Springs shall be capable of 30 percent over-travel before becoming solid.
- F. Where height-saving brackets for side mounting of isolators are required, the height-saving brackets shall be designed to provide for an operating clearance of 2 inches under the isolated structure and designed so that the isolators can be installed and removed when the operating clearance is 2 inches or less. When used with spring isolators having a deflection of 2-1/2 inches or more, the height-saving brackets shall be of the pre-compression type to limit exposed bolt length between the top of the isolator and the underneath side of the bracket.
- G. All isolators supporting a given piece of equipment shall limit the length of the exposed adjustment bolt between the top and base to a maximum range of 1 inch to 2 inches.
- H. All isolators supporting a given piece of equipment shall be selected for approximately equal spring deflection.

- I. Isolators for equipment installed outdoors shall be designed to provide adequate restraint due to normal wind conditions and to withstand wind load of 55 pounds per square foot applied to any exposed surface of the equipment without failure.

2.02 MANUFACTURERS

- A. Amber Booth.
- B. Korfund Dynamics.
- C. Consolidated Kinetics.
- D. Mason Industries.

2.03 ISOLATION BASES

- A. Type SFB: A structural steel fan and motor base with NEMA standard motor side rails and holes drilled to receive the fan and motor. The steel members shall be adequately sized to prevent distortion and misalignment of the drive.
- B. Type CPF: Concrete inertia base, consisting of full depth perimeter steel pouring form, 3000 psi concrete reinforcing bars welded in place, bolting templates with anchor bolts and height-saving brackets for side mounting of the isolators. The base shall be sized with a minimum overlap of 4 inches around the base of the equipment. Fan bases are to be supplied with NEMA standard motor slide rails.
- C. The bases for pumps shall be sized to support the suction elbow of end suction pumps and both the suction and discharge elbows of horizontal split-case pumps. The bases shall be T-shaped where necessary to conserve space.
- D. Structural bases shall be thoroughly cleaned of welding slag and primed with zinc-chromate or metal etching primer. A finish coat of industrial grade enamel shall be applied over the primer.

2.04 ISOLATOR TYPES

- A. Isolator types and required deflections are specified under "Application." Isolator type designations are Amber Booth designators. The isolators shall comply with the following descriptions for each type required on the Project:
 1. Type XL: Aluminum-housed, adjustable, spring mounting having telescoping top and bottom sections separated by resilient inserts of Neoprene or other suitable material to limit horizontal motion. The inserts shall be permanently lubricated to minimize vertical friction. Steel or cast iron housings may be used if they are hot-dip galvanized after fabrication. A Neoprene pad having a minimum thickness of ¼ inch shall be bonded to the baseplate.
 2. Type SW: Adjustable, freestanding, open-spring mounting with combination leveling bolt and equipment fastening bolt. The spring mounting to baseplate and compression plate must be rigid. The neoprene pad with a minimum thickness of ¼ inch is bonded to the baseplate. A minimum horizontal-to-vertical spring rate of 1.0 is required.
 3. Type BS: Spring hanger consisting of a rectangular steel box, coil spring, spring retainers, neoprene-impregnated fabric washer and steel washer.
 4. Type BSA: Spring hanger consisting of a rectangular steel box capable of 200 percent minimum overload without visible deformation, coil spring, spring retainers, neoprene impregnated fabric washer and steel washer. Incorporate a 30 degree angularity feature that will permit up to a 15 degree misalignment of the hanger rod from the vertical without shorting out to the hanger box.
 5. Type BSR: Combination spring and rubber hanger consisting of a rectangular steel box, coil spring, spring retainers and elastomeric mounting designed for ½ inch deflection.

6. Type BSRA: Combination spring and elastomeric hanger consisting of a rectangular steel box capable of 200 percent minimum overload without visible deformation, coil spring, spring retainers and elastomeric element. Incorporate a 30 degree angularity feature that will permit up to a 15 degree misalignment of the hanger rod from the vertical without shorting out to the hanger box.
7. Type RSW: Adjustable spring isolator as describe for Type SW with the addition of a fabricated steel housing suitable for recessing into a concrete inertia block. The housing has a side access.
8. Type PBS: Spring hanger as described for Type BS with the addition of a load transfer plate to hold the equipment or piping at a fixed elevation during installation and to permit transferring the load to the spring after installation.
9. Type PBSA: Spring hanger consisting of a rectangular steel box capable of 200 percent minimum overload without visible deformation, with the addition of a load transfer plate to hold the equipment or piping at a fixed elevation during installation, and to permit transferring the load to the spring after installation, a coil spring, spring retainers, neoprene impregnated fabric washer and steel washer. Incorporate a 30 degree angularity feature that will permit up to a 15 degree misalignment of the hanger rod from the vertical without shorting out to the hanger box.
10. PBSR: Combination spring and elastomeric hanger as described for Type BSR with the addition of a load transfer plate to hold the equipment or piping at a fixed elevation during installation and to permit transferring the load to the spring after installation.
11. Type PBSRA: Combination spring and elastomeric hanger consisting of a rectangular steel box capable of 200 percent minimum overload without visible deformation, with the addition of a load transfer plate to hold the equipment or piping at a fixed elevation during installation, a coil spring, spring retainers and elastomeric element. Incorporate a 30 degree angularity feature that will permit up to a 15 degree misalignment of the hanger rod from the vertical without shorting out to the hanger box.
12. Type CT: Adjustable, open-spring isolator having one or more coil springs attached to a top compression plate and a base plate. A neoprene pad with a minimum thickness of $\frac{1}{4}$ inch is bonded to the base plate. The spring assembly must fit within a welded steel enclosure consisting of a top plate and rigid lower housing, which serves as a blocking device during installation. The isolator includes restraining bolts for connecting the top plate and lower housing to prevent the isolated equipment from rising when drained of water.
13. Type SP-NRE: Pad-type mounting consisting of two layers of $\frac{3}{8}$ inch thick ribbed or waffled neoprene pads bonded to a 16 gauge galvanized steel separator plate. Size pads for approximately 20 to 40 psi load and a deflection of 0.12 to 0.16 inch.
14. Type BRD: Elastomeric hanger consisting of a rectangular steel box and an elastomeric isolation element of neoprene. A high-quality synthetic rubber may be used if it contains antiozone and antioxidant additives. The elements are designed for approximately $\frac{1}{2}$ inch deflection and loaded so that the deflection does not exceed 15 percent of the free height of the element.
15. Type TRK: For static pressure of 3 inch water or greater, provide a set of spring-loaded thrust resistors (two or more) installed across the flexible duct connection on the fan discharge, designed to limit the movement of the fan. Coil spring static deflection capabilities of thrust resistors shall equal those of the isolators supporting the equipment up to a maximum of 2 inches.
16. Type RVD: An elastomeric mounting having a steel baseplate with mounting holes and a threaded insert at top of the mounting for attaching equipment. All metal parts shall be completely embedded in the elastomeric material. Mountings shall be designed for approximately $\frac{1}{2}$ inch deflection.

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install motor driven equipment with vibration isolators.
- D. Set steel bases for one-inch clearance between housekeeping pad and base. Set concrete inertia bases for 2 inch clearance. Adjust equipment level.
- E. Isolate pumped water-piping systems with spring-type vibration isolators to produce a floating mechanical system. Provide spring isolators on piping connected to isolated equipment as follows: Static deflection for the two supports closest to equipment on each pipe connected to the equipment shall be equal to the deflection of isolated equipment. All other supports for horizontal piping shall have a minimum operating deflection of $\frac{3}{4}$ inch with a capability of an additional 50 percent travel to solid.
- F. All open-type spring isolators shall be restrained as recommended by the manufacturer.
- G. Pumps:
 - 1. Each centrifugal pump and its driving motor shall be mounted on a common inertia base and the base, in turn, shall be mounted on the scheduled vibration isolator type to prevent transmission of vibration and noise to the building structure.
 - 2. In general, all inertia bases shall be formed and poured in place onto a hard, flat surface from which the base can be separated when cured. The base shall be shimmed, using flat material, to the intended final height prior to equipment mounting and piping connection.
 - 3. After piping connections are made and the system filled with water and ready to put into service, the isolator adjustment bolts shall be extended until the shim blocks can be removed. Isolators may then be backed down slightly to restore the intended height. The locknuts should then be tightened on the isolators. Jack bolts shall be trimmed to a length that will allow no more than 1 inch of additional height adjustment. After final adjustment, the inertia base shall not support any piping load. All springs supporting piping that is connected to a piece of isolated equipment shall be sized for static deflection equal to that of the isolated equipment.
- H. Piping (Including Generator Piping):
 - 1. Floor mounted supports shall have the same type of isolator or media as is used for the nearest isolated equipment connected to the piping.
 - 2. The pipe hanger system shall have provisions for all piping to be shimmed or blocked in place until all connections are made and the system filled with water; then, the isolators adjusted to support the weights and the shim blocks removed.
 - 3. The first three support points from a piece of isolated equipment shall be of the positioning type and provide not less than the static deflection of the equipment isolators.
 - 4. All springs supporting piping shall be capable of an additional $\frac{1}{2}$ inch deflection prior to complete compression and springs supporting vertical risers shall have provisions for limit stops.

5. Support risers up through 16 inches at every third floor, and risers 18 inches and over at every second floor. All supports for risers must have a deflection capability at least four times the anticipated expansion and contraction. Install temporary anchors as required to permit preadjustment of springs in the risers. Furnish permanent limit stops to prevent excessive vertical motion of risers in the event risers are drained. Wall sleeves for takeoffs from risers shall be sized for insulation outside diameter plus two times the calculated thermal movement to prevent binding.
6. System operating temperatures (degrees F) are as follows:

<u>Service</u>	<u>Supply</u>	<u>Return</u>
Chilled Water	42-45	56-59
Heating Water	180	160
25-pound Steam and Condensate	318	318
70-pound Steam and Condensate	318	318

- I. Resilient Sleeves: Resilient sleeves shall be provided at all points where equipment room walls, floors or ceilings are penetrated by ducts, piping or refrigerant line, etc.
- J. Fans and Air Handling Units: Such units shall have electrical flexible connections not less than 36 inches long and the flexible duct connections with a free length of not less than 8 inches.
- K. Ductwork: Isolate all high pressure ductwork within each equipment room and to a minimum of 50 feet from fan with Type BS hangers or Type SW floor supports, sized for $\frac{3}{4}$ inch deflection.
- L. To prevent excessive transfer of piping load from floor to floor, all water riser support springs shall have a deflection capability of four times the expansion or contraction to be accommodated by the support with the additional runout capability to absorb the movement. Isolators supporting steam and diesel engine exhaust risers shall be selected for deflections equal to two times the anticipated thermal movement at the support point. Riser isolation system shall be designed such that it supports the riser in tension, eliminating the need for guides; requires no anchors; and has a zero movement point at or near the center to divide thermal movement approximately in half, thus reducing vertical movement of horizontal pipe takeoffs.

3.02 APPLICATION

- A. The following is a schedule of equipment on a typical project that requires vibration isolation and base isolators of the types specified. Refer to Drawings for equipment scheduled for the Project. Any equipment, system or condition that may be altered, added, or changed; or that is not specifically described in the Contract Documents shall be isolated in a manner specified for similar equipment, system or condition in order to comply with these Specifications.

Equipment Type	Isolator Type/ Minimum Deflection (Inches)	Base Type
Air Handling Units		
Floor Mounted – Up to 15 HP	SW 2"	N/A
Floor Mounted – 15 HP and Over	SW2.4"	N/A
Suspended – Up to 15 HP	PBSRA 2"	SFB
Suspended – 15 HP and Over	PBSRA 3.5"	SFB
High pressure Fan Sections	SW 2" with TRK 3.5	CPF
Fan Coil Units – Suspended	PBSRA 1"	N/A
Centrifugal Fans		
Class I and II – Up to 54-¼ inch Diameter Up to 15 HP	SW 2"	SFB (If required)
Class I and II – 60-inch Diameter and Over, 15 HP and Over	SW 4.5"	SFB (If required)
Class III – All sizes	SW 3.5" with TRK 2"	CPF
Arrangement # 3 Fans	SW 4.5"	SFB
Vane Axial Fans	SW 4.5" with TRK 2"	SFB

B. Piping Application:

1. Type PBSRA for hangers in all horizontal piping at equipment; except at connections to risers use BS.
2. Type SW for all floor supports of floor supported piping at equipment or stanchion.

SECTION 20 05 53 00 - PIPING AND EQUIPMENT IDENTIFICATION**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

Perform all Work required to provide and install nameplates, tags, stencils, and pipe markers indicated by the Contract Documents with supplementary items necessary for proper installation.

- A. Contractor shall make it possible for personnel operating and maintaining the equipment and systems in this Project to readily identify the various pieces of equipment, valves, piping, ductwork, etc., by marking them.
- B. All items of equipment such as fans, pumps, etc., shall be clearly marked using engraved nameplates as hereinafter specified. The marked item of equipment shall correspond to the same number as shown on the Drawings.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and Workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. ASME A13.1 - Scheme for the Identification of Piping Systems.
 - 2. NFPA 99 – Standard for Health Care Facilities.
 - 3. NFPA 13 – Installation of Sprinkler Systems.
 - 4. NFPA 14 – Installation of standpipe and Hose Systems.

1.04 SUBMITTALS

- A. Product Data:
 - 1. Provide manufacturer's catalog literature for each product.
- B. Record Documents:
 - 1. Submit valve schedule complete with asset number, building number, room number, valve tag number system, valve function, valve type, area served, year installed, manufacturer, model number, size, rated pressure, temperature rating and normal position. Valve schedule shall be developed utilizing Owner's valve schedule template, refer to Attachment "A". Provide Owner with electronic version (Microsoft Excel 2003) of the final approved valve schedule at or before Project Closeout.

C. Operation and Maintenance Data:

1. Manufacturer's Installation Instructions: Indicate special procedures and installation.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

A. Nameplates, Tags, Markers, and Tacks:

1. Marking Systems, Inc.
2. Seton Name Plate Company.
3. W.H. Brady Company.
4. Graphic Products, Inc.

2.03 NAMEPLATES

- A. Description: Laminated three-layer plastic with engraved white letters on black contrasting background color.

B. General:

1. All items of mechanical equipment shall be identified by the attachment of engraved nameplates constructed from laminated phenolic plastic, at least 1/16 inch thick, 3-ply, with black surfaces and white core using an approved plastic laminate glue. Engraving shall be condensed Gothic, at least ½ inch high, appropriately spaced.
2. Nomenclature on the label shall include the name of the item, its mark number, area, space, or equipment served and other pertinent information.
3. Motor nameplate information shall include manufacturer, horsepower, amperage, voltage, rpm and service factor.
4. All fans shall have manufacturer's name, flow (cfm) and static pressure, and pumps shall have manufacturer's name, flow (gpm), head (feet TDH) and impeller diameter.
5. All scheduled equipment shall be labeled.

2.04 VALVE TAGS

- A. Valve tags shall conform to ANSI A13.1-1981 "Scheme for the Identification of Piping Systems", refer to Attachment "B" for abbreviation and label color designations.
- B. ABS Plastic Tags: Injected molded ABS plastic, 3.375" X 4.75" with self adhesive vinyl label, similar to DuraLabel Pro, affixed to valve tag.
- C. Vinyl Label: 3.0 Mil self adhesive vinyl similar to Dura Label Pro. Label color shall be as per the standard designated colors listed in the attachment to this specification. The label shall contain the following information as per template, refer to Attachment "C":

- D. Valve name: refer to Attachment "D" for valve tag naming convention
- E. Function
- F. Area served
- G. Asset number
- H. Asset number bar code
- I. Valve Tag Fasteners: Single ABS plastic tie strap
- J. Each valve shall be named as per attached valve tag naming convention, refer to Attachment "D".

2.05 PIPE AND DUCT MARKERS

- A. Round Pipe and Duct Markers shall conform to ANSI A13.1-2007 "Scheme for the Identification of Piping Systems", refer to Attachment "B" for abbreviation and label color designations. Arrow markers must have same ANSI background colors as their companion pipe markers, or be incorporated into the pipe identification marker.
- B. Rectangular Duct Stencils shall conform to ANSI A13.1-2007 "Scheme for the Identification of Piping Systems", refer to Attachment "B" for abbreviation and label color designations. Letter height shall be a minimum of 1-1/4". Stencil material shall be fiber board; Stencil paint shall be exterior, gloss, acrylic enamel. The following rectangular duct systems shall be stenciled:
 - 1. Chemical Fume Hood Exhaust.
 - 2. Biosafety Cabinet Exhaust.
 - 3. Radioisotope Exhaust.
 - 4. ETO Exhaust.
- C. Plastic Pipe Markers: Factory fabricated, flexible, semi-rigid plastic, preformed to fit around pipe or pipe covering; minimum information indicating flow direction arrow and identification of fluid being conveyed. Verify with Drawings for all HVAC and plumbing systems for sizes.
- D. Plastic Tape Pipe Markers: Heat sealed or heat shrink, spring fasteners, clips or snap-on, are acceptable.
- E. Underground Plastic Pipe markers: Bright colored continuously printed plastic ribbon tape, minimum 6 inches wide by 4 mil thick, manufactured for direct burial service.
- F. All medical gas piping shall have minimum information per NFPA 99, plus operating pressure.
- G. Pipe markers and arrow markers also shall be provided for all piping systems.
- H. Use Seton Setmark Type SNA or Brady snap-on type identification for all piping systems, ¾ inch through 6 inch. For piping systems larger than 6 inches, use Seton or Brady strap-on markers or similar by Marking Services, Inc.

2.06 LOCATER TACKS FOR EQUIPMENT LOCATED ABOVE LAY-IN CEILING

- A. Description: Steel with ¾-inch diameter color-coded head.
- B. Color code as follows:
 - 1. Yellow - HVAC equipment fan-coil units, exhaust fans and terminal units.

2. Red - Fire dampers/smoke dampers.
3. Green - Plumbing valves, medical gas/vacuum valves.
4. Blue - Heating/cooling valves.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install plastic nameplates with corrosive-resistant mechanical fasteners, or adhesive. Apply with sufficient adhesive to ensure permanent adhesion and seal with clear lacquer.
- D. Install tags with corrosion resistant chain.
- E. Install plastic tape, and pipe markers completely around pipe in accordance with manufacturer's instructions.
- F. Locate markers on the two (2) lower quarters of the pipe where view is unobstructed.
- G. Locate tacks on the ceiling grid.

3.02 VALVE TAGS

- A. Contractor(s) shall provide and install valve tags on all valves installed within this Project, except check valves; valves within fabricated equipment units; faucets; hose connections; needle valves; gauge cocks; HVAC terminal devices and similar roughing-in connections of end-use fixtures and units.
- B. Existing valve tags shall not be attached to new valves. When removing and/or replacing existing tagged valves, give The University all existing tags that are attached to the valves that are removed. New tags with new asset numbers shall be provided for new valves.
- C. Tags shall be 1/8 inch thick injected molded ABS plastic, 3.375" X 4.75" with self adhesive vinyl label on each side of tag. Each tag shall be attached to its valve with one tie strap.
- D. In addition to valve tags, valves at water headers and steam PRV stations, valves associated with condensate, gas, water meters and other valves as specified shall also be tagged with standardized color coded plastic tags. These tags shall be 2-½ inches wide by 1-½ inches high with these color codings:
 1. Red = normally closed.
 2. Green = normally open.
 3. Blue = open in winter, closed in summer.
 4. Yellow = closed in winter, open in summer.
 5. Tags should be engraved on both sides.

3.03 APPLICATION OF MARKERS AND STENCILS

- A. Piping runs throughout the Project including those above lift-out ceilings, under floor and those exposed to view when access doors or access panels are opened shall be identified by means of pipe markers and stencils. Concealed areas, for purposes of this identification section, are those areas that cannot be seen except by demolition of the building elements. In addition to pipe markers and stencils, arrow markers shall be used to indicate direction of flow.
- B. As a minimum, locate pipe markers and stencils as follows:
 - 1. Provide a pipe marker at each valve to indicate proper identification of pipe contents. Where several valves exist on one (1) header, it is necessary to mark only the header.
 - 2. Every 20 feet in exposed and concealed areas on all piping systems. Provide at least one (1) pipe marker in each room on all piping systems.
 - 3. At each branch or riser take off on piping systems, excluding short takeoffs for fixtures and terminal units.
 - 4. Provide a pipe marker or stencil and an arrow marker at every point of pipe entry or exit where the pipe penetrates a wall, floor, service column or enclosure.
 - 5. At access doors, manholes and similar access points that permit view of concealed piping.
 - 6. Near major equipment items and other points of origination and termination.
- C. Provide an arrow marker with each pipe marker pointing away from the pipe marker to indicate direction of flow.
- D. Provide a double-ended arrow marker when flow can be in either or both directions.
- E. Indicate delivered water temperature on domestic hot water supply and return lines.
- F. Install underground plastic pipe markers 6 to 8 inches below finished grade, directly above buried pipe.
- G. Identify control panels and major control components outside panels with plastic nameplates.
- H. Identify valves in main and branch piping with tags.
- I. Identify air terminal units and radiator valves with plastic nameplates.
- J. Tag automatic controls, instruments and relays. Key to control schematic.
- K. Provide ceiling tacks to locate valves, fan coil units, dampers or other concealed equipment above T-bar type panel ceilings. Locate in corner of panel closest to equipment.
- L. Identify pipe utilizing copper press fittings with markers stating, "Press-Fit" adjacent to each content identification marker.
- M. Identify medium pressure gas piping (14 inches WC to 5psi) with the statement, "WARNING – ½ to 5psi NATURAL GAS".

ATTACHMENTS:

“A” - Valve Schedule

“B” - Label Abbreviations, Background and Text colors

“C” – Label example with dimensions, font type and height

“D” – Valve tag naming convention

CONTRACTOR : _____

MDACC PROJECT NO. : _____

DATE SUBMITTED : _____

[illegible]

Asset Number - Seven digit number provided by MDACC Property Manager upon request.
Building Number - Number provided by MDACC Project Manager upon request.
Room Number - Number provided by MDACC Project Manager upon request.
Valve Tag Number - Assigned by contractor using MDACC valve tag naming convention.
System - The piping system the valve is installed in i.e. chilled water supply, hot water return, etc.
Function - Valve use, i.e. isolation, shut off, bypass, etc.
Area Served - Building area effected if the valve is opened or closed.
Normal Position - Valve position during normal operation. (NO = Normally Open; NC = Normally Closed)

Mechanical/Plumbing Piping System Abbreviations and Letter/Label Coloring

Pipe Contents	Label Abbreviation	Label Colors (Background/Text)
Chilled Water Return	CHWR	Green/White
Chilled Water Supply	CHWS	Green/White
Condenser Water Return	CWR	Green/White
Condenser Water Supply	CWS	Green/White
Fuel Oil Return	FOR	Yellow/Black
Fuel Oil Supply	FOS	Yellow/Black
High Pressure Condensate	HPC	Blue/White
High Pressure Steam (above 125#)	HPS	Blue/White
Hot Water Heating Return	HWR	Green/White
Hot Water Heating Supply	HWS	Green/White
Low Pressure Condensate	LPC	Blue/White
Low Pressure Steam (below 25#)	LPS	Blue/White
Medium Pressure Condensate	MPC	Blue/White
Medium Pressure Steam (above 25# - below 125#)	MPS	Blue/White
Pumped Condensate Return	PCR	Blue/White
Acid Waste	ACID	Orange/Black
Brine Water	BR	Orange/Black
Fire Suppression Water	FIRE	Red/White
Hazardous Waste	HAZ	Orange/Black
High Purity Water	DI or RO	Green/White
Potable Cold Water	DCW	Green/White
Potable Hot Water Supply	DHW	Green/White
Potable Hot Water Return	DHWR	Green/White
Natural Gas	NG	Yellow/Black
Nitrogen (liquid)	LN2	Black/White
Medical air	Med Air	Yellow/black
Carbon dioxide	CO ₂	Gray/white
Helium	He	Brown/white
Nitrogen	N ₂	Black/white
Nitrous oxide	N ₂ O	Blue/white
Oxygen	O ₂	Green/white
Medical–surgical vacuum	Med Vac	White/black
Waste anesthetic gas disposal	WAGD	Violet/white
Laboratory air	Lab Air	Yellow and white checkerboard/black
Laboratory vacuum	Lab Vac	White and black checkerboard/black boxed
Instrument air	IA	Red/white
Chemical Fume Hood Exhaust	CFHE	Purple/white
Biosafety Cabinet Exhaust	BCE	Purple/white
Radioisotope Exhaust	RE	Yellow/magenta
ETO Exhaust	ETOE	Purple/white

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 20 07 00 00 - EQUIPMENT INSULATION

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Perform all Work required to provide and install equipment insulation and covering indicated by the Contract Documents with supplementary items necessary for proper installation.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and Workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. ASTM B209 - Aluminum and Aluminum-Alloy Sheet and Plate.
 - 2. ASTM C168 - Terminology Relating to Thermal Insulation Materials.
 - 3. ASTM C177 - Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded- Hot-Plate Apparatus.
 - 4. ASTM C195 - Mineral Fiber Thermal Insulating Cement.
 - 5. ASTM C335 - Steady-State Heat Transfer Properties of Horizontal Pipe Insulation.
 - 6. ASTM C449 - Mineral Fiber Hydraulic-Setting Thermal Insulating and Finishing Cement.
 - 7. ASTM C518 - Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus.
 - 8. ASTM C534 - Preformed Flexible Elastomeric Cellular Thermal Insulation in Sheet and Tubular Form.
 - 9. ASTM C547 - Mineral Fiber Pipe Insulation.
 - 10. ASTM C552 - Cellular Glass Thermal Insulation.
 - 11. ASTM C553 - Mineral Fiber Blanket and Felt Insulation.
 - 12. ASTM C578 - Rigid, Cellular Polystyrene Thermal Insulation.
 - 13. ASTM C591 - Unfaced Preformed Rigid Cellular Polyisocyanurate Thermal Insulation.
 - 14. ASTM C612 - Mineral Fiber Block and Board Thermal Insulation.

15. ASTM C921 - Jackets for Thermal Insulation.
16. ASTM C1126 – Faced or Unfaced Rigid Cellular Phenolic Thermal Insulation.
17. ASTM D1056 - Flexible Cellular Materials - Sponge or Expanded Rubber.
18. ASTM D1667 - Flexible Cellular Materials - Vinyl Chloride Polymers and Copolymers (Closed Cell Foam).
19. ASTM D2842 - Water Absorption of Rigid Cellular Plastics.
20. ASTM E96 - Water Vapor Transmission of Materials.
21. NFPA 90 – Air Conditioning and Ventilation Systems.
22. NFPA 255 - Surface Burning Characteristics of Building Materials.
23. UL 723 - Surface Burning Characteristics of Building Materials.

1.04 QUALITY ASSURANCE

- A. All equipment requiring insulation shall be insulated as specified herein and as required for a complete system. In each case, the insulation shall be equivalent to that specified and materials applied and finished as described in these Specifications.
- B. All insulation, jacket, adhesives, mastics, sealers, etc., utilized in the fabrication of these systems shall meet NFPA for fire resistant ratings (maximum of 25 flame spread and 50 smoke developed ratings) and shall be approved by the insulation manufacturer for guaranteed performances when incorporated into their insulation system, unless a specific product is specified for a specific application and is stated as an exception to this requirement. Certificates to this effect shall be submitted along with Contractor's submittal data for this section of the Specifications. No material shall be used that, when tested by the ASTM E84-89 test method, is found to melt, drip or delaminate to such a degree that the continuity of the flame front is destroyed, thereby resulting in an artificially low flame spread rating.
- C. Application Company Qualifications: Company performing the Work of this Section must have minimum three (3) years experience specializing in the trade.
- D. All insulation shall be applied by mechanics skilled in this particular Work and regularly engaged in such occupation.
- E. All insulation shall be applied in strict accordance with these Specifications and with factory printed recommendations on items not herein mentioned. Unsightly, inadequate, or sloppy Work will not be acceptable.

1.05 SUBMITTALS

- A. Product Data:
 1. Provide product description, service application, list of materials, "k" value, "R" value, mean temperature range, and thickness for each service and location.
 2. Manufacturer's Installation Instructions: Indicate procedures that ensure acceptable standards will be achieved. Submit certificates to this effect.
 3. Samples: When requested, submit three (3) samples of any representative size illustrating each insulation type.
- B. Operation and Maintenance Data:

1. Provide manufacturer's recommendations for care and protection.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to the Project Site in original factory packaging, labeled with manufacturer's identification including product thermal ratings and thickness.
- B. Store insulation in original wrapping and protect from weather and construction traffic. Protect insulation against dirt, water, chemical, and mechanical damage.
- C. Maintain ambient temperatures and conditions required by manufacturers of adhesives, mastics and insulation cements.
- D. Maintain required ambient temperature during and after installation for minimum period of 24 hours.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Owens-Corning (Type E1/Type E2).
- B. Certainteed Corporation (Type E1 / Type E2).
- C. Knauf Corporation (Type E1 / Type E2).
- D. Dow Chemical Company (Type E3).
- E. Johns Manville Corporation (Type E1 / Type E2).
- F. Armstrong/Armacell (Type E5).
- G. Koolphen Products Company (Type E6).
- H. Resolco International bv (Insul-Phen) (Type E6).
- I. Pittsburgh Corning (Type E7).
- J. Aluminum Jacket: Fosters/Childers or acceptable substitution.

2.03 INSULATION MATERIALS

- A. Type E1: Flexible fiberglass or mineral fiber blanket; ASTM C553; 'k' value of 0.24 at 75 degrees F; 2.0 lb/cu ft density.
- B. Type E2: Rigid fiberglass or mineral fiber board; ASTM C612; 'k' value of 0.24 at 75 degrees F; 6.0 lb/cu ft density.
- C. Type E3: Molded closed cell polyisocyanurate insulation; ASTM E96, ASTM C177, 'k' value of 0.18 at 75 degrees F; ASTM D2842, maximum water absorption value of 0.05 lb/ft².
- D. Type E4: Mineral Wool; ASTM C 547; preformed insulation high temperature insulation; 'k' value of 0.35 at 300 degrees F.

- E. Type E5: Closed cell, chemically neutral, neoprene insulation, 'k' value of 0.27 at 75 degrees F; sheet form.
- F. Type E6: Phenolic closed cell, ASTM C1126 rigid foam, 2.2 lbs. nominal density, CFC free; ASTM C518, 'k' value of 0.13 at 75 degrees F.
- G. Type E7: Rigid cellular glass; ASTM C552; 'k' value of 0.29 at 75 degrees F; 7.5 lb/cu ft density. 0 permeability (Wet Cup Method) ASTM E96.

2.04 ACCESSORIES

- A. Adhesives: Non-shrinking, permanently flexible, compatible with insulation. Use Childers CP-82 adhesive for general purpose. For calcium silicate, use Childers CP-97 fibrous adhesive.
- B. Sealants: For general purpose to seal the end of insulation, use Childers CP-30 L.O. sealant.
- C. Insulating Cement: ASTM C195; hydraulic setting mineral wool; Ryder one-coat.
- D. Wire Mesh: Corrosive-resistant metal; 1 inch hexagonal pattern.
- E. Primer: Use Childers CP-50 diluted 50 percent with water primer to seal over insulating cements and fibrous adhesives prior to finish coating.
- F. Finish Coats: For general purpose, use Childers CP-30 L.O., reinforce with glass cloth. For calcium silicate, use Childers CP-50 finish coat reinforced with canvas jacket. For finish coat over closed cell elastomeric, use Childers CP-17 or Armstrong "Finish" acrylic finish.

PART 3 - PREPARATION

3.01 PREPARATION

- A. Verify that surfaces are clean, foreign material removed, and dry.
- B. Maintain required ambient temperature during and after installation for minimum period of 24 hours.
- C. Maintain ambient temperatures and conditions required by manufacturers of adhesives, mastics and insulation cements.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Do not insulate factory insulated equipment.
- D. On exposed equipment, locate insulation and cover seams in least visible locations.
- E. Apply insulation close to equipment by grooving, scoring and beveling insulation. Secure insulation to equipment with studs, pins, clips, adhesive, wires or bands.
- F. Fill joints, cracks, seams and depressions with bedding compound to form smooth surface. On cold equipment, use vapor barrier cement.
- G. For insulated cold equipment containing fluids below ambient temperature:
 - 1. Provide vapor barrier jackets, factory applied or field applied.

2. Finish with glass cloth and vapor barrier adhesive.
 3. Insulate entire system.
- H. For insulated equipment containing fluids above ambient temperature:
1. Provide standard jackets, with or without vapor barrier, factory applied or field applied.
 2. Finish with glass cloth and adhesive.
 3. For hot equipment containing fluids 140 degrees F or less, do not insulate flanges or unions, but bevel and seal ends of insulation.
 4. For hot equipment conveying fluids over 140 degrees F, insulate flanges and unions, including those at equipment, but label the insulation to indicate a concealed flange or union.
- I. Inserts and shields:
1. Application: Equipment 2 inches in diameter or larger.
 2. Shields: Galvanized steel between hangers and inserts.
 3. Insert location: Between support shield and equipment and under the finish jacket.
 4. Insert configuration: Minimum 6 inches long, of same thickness and contour as adjoining insulation; may be factory fabricated.
 5. Insert material: Heavy density insulating material suitable for the planned temperature range.
 6. Manufacturer shall be responsible to size the length of shield required to prevent insulation from breaking.
- J. Finish insulation at supports, protrusions and interruptions.
- K. For equipment in mechanical equipment rooms or in finished spaces, finish with aluminum jacket. The longitudinal joint of the jacketing shall be placed with overlap directed to bottom of pipe. The jacketing shall be overlapped a minimum of 3 inches, and it shall be held in place using $\frac{3}{4}$ inch bands applied at 12 inches on center. Securing of the jacket shall be made by the use of 1-inch x 0.016-inch aluminum or stainless steel bands and seals. The shields at support points shall be secured with 1/2-inch or 0.020 inch stainless steel bands and seals. Ferrous metal surfaces shall be primed with a red lead oxide primer. The metal jacketing and fitting covers shall be fabricated of 9.016 inch aluminum or stainless steel with a smooth finish.
- L. For exterior applications, provide vapor barrier jacket or finish with glass mesh reinforced vapor barrier cement. Cover with aluminum jacket with seams located on bottom side of horizontal equipment.
- M. Each chilled water pump shall be insulated up to the face of the flanges on the piping connection to the pump and any bare metal that Projects over the bed plate of the pump and from which condensation might drip onto the floor. Heating hot water pumps and condensate return pumps shall not be insulated but the insulation of the connecting piping shall be beveled to the face of the pipe flange connection to the pump flange

3.03 TESTING

- A. Verify that equipment has been tested before applying insulation materials.

3.04 EQUIPMENT INSULATION APPLICATION AND THICKNESS SCHEDULE

Equipment	Application	Insulation Type	Insulation Thickness
Domestic Hot Water Storage Tanks	All	E2, E3 or E7	1-½"
Domestic Cold Water Storage Tanks	All	E2, E3 or E7	1-½"
Domestic Cold Water Pressure Tanks	All	E2, E3 or E7	1-½"
Hot Thermal Storage Tanks	All	E4	2"
Boiler Feed Water Storage Tanks	All	E4	2"
Steam Condensate Receivers	All	E4	1-½"
Condensate Tanks	All	E1, E2, E3 or E7	1"
Hot Water Expansion Tanks	All	E6 or E7	1"
Heat Exchangers/Converters	35-75 Deg F	E7	2"
	75-150 Deg F	E2	2"
	151-300 Deg F	E3	2-½"
	Above 300 Deg F	E4	3"
Chilled Water Expansion Tanks	All	E6 or E7	1"
Air Separators	All	E6 or E7	1"
Deaerators	All	E4	2"
Flue Gas Breeching	All	E4	3"
Induced Draft Fan Scrolls	All	E4	3"
Flue Stacks to Roof	All	E4	3"
Boiler and Flue Boxes	All	E4	3"
Boiler Drum Heads	All	E4	3"
Chiller Cold Surfaces (Not Factory Insulated)	All	E5 or E7	1-½"
Chilled and Hot Water Pump Bodies	All	E6 or E7	1-½"
Chemical Feed (Chilled/Hot Water)	All	E5	¾"
Muffler	All	E4	4"

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 20 07 19 00 - PIPING INSULATION**PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.2 SUMMARY

- A. Perform all Work required to provide and install piping insulation, jackets and accessories indicated by the Contract Documents with supplementary items necessary for proper installation.

1.3 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and Workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. ASTM B209 - Aluminum and Aluminum-Alloy Sheet and Plate.

2. ASTM C168 - Terminology Relating to Thermal Insulation Materials.
3. ASTM C177 - Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded- Hot-Plate Apparatus.
4. ASTM C195 - Mineral Fiber Thermal Insulating Cement.
5. ASTM C335 - Steady-State Heat Transfer Properties of Horizontal Pipe Insulation.
6. ASTM C449 - Mineral Fiber Hydraulic-Setting Thermal Insulating and Finishing Cement.
7. ASTM C518 - Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus.
8. ASTM C534 - Preformed Flexible Elastomeric Cellular Thermal Insulation in Sheet and Tubular Form.
9. ASTM C547 - Mineral Fiber Pipe Insulation.
10. ASTM C552 - Cellular Glass Thermal Insulation.
11. ASTM C578 - Rigid, Cellular Polystyrene Thermal Insulation.
12. ASTM C585 - Inner and Outer Diameters of Rigid Thermal Insulation for Nominal Sizes of Pipe and Tubing (NPS System).
13. ASTM C591 - Unfaced Preformed Rigid Cellular Polyisocyanurate Thermal Insulation.
14. ASTM C610 - Molded Expanded Perlite Block and Pipe Thermal Insulation.
15. ASTM C921 - Jackets for Thermal Insulation.
16. ASTM C1126 - Faced or Unfaced Rigid Cellular Phenolic Thermal Insulation.
17. ASTM D1056 - Flexible Cellular Materials - Sponge or Expanded Rubber.
18. ASTM D1667 - Flexible Cellular Materials - Vinyl Chloride Polymers and Copolymers (Closed Cell Foam).
19. ASTM D2842 - Water Absorption of Rigid Cellular Plastics.
20. ASTM C795 - Insulation For Use Over Austenitic Steel.
21. ASTM E84 - Surface Burning Characteristics of Building Materials.
22. ASTM E96 - Water Vapor Transmission of Materials.

23. NFPA 255 - Surface Burning Characteristics of Building Materials.

24. UL 723 - Surface Burning Characteristics of Building Materials.

1.4 definitions

- A. Concealed: Areas that cannot be seen by the building occupants.
- B. Interior Exposed: Areas that are exposed to view by the building occupants, including underneath countertops, inside cabinets and closets, and in mechanical, electrical and plumbing chases.
- C. Interior: Areas inside the building exterior envelope that are not exposed to the outdoors.
- D. Exterior: Areas outside the building exterior envelope that are exposed to the outdoors, including building crawl spaces and loading dock areas.
- E. Mechanical and Electrical rooms: Areas inside the building that house pumps, fans, heat exchangers, water heaters and boilers, chillers, switchgear, transformers, and other equipment for the HVAC, plumbing and electrical systems.

1.5 QUALITY ASSURANCE

- A. All piping requiring insulation shall be insulated as specified herein and as required for a complete system. In each case, the insulation shall be equivalent to that specified and materials applied and finished as described in these Specifications.
- B. All insulation, jacket, adhesives, mastics, sealers, etc., utilized in the fabrication of these systems shall meet NFPA for fire resistant ratings (maximum of 25 flame spread and 50 smoke developed ratings) and shall be approved by the insulation manufacturer for guaranteed performances when incorporated into their insulation system, unless a specific product is specified for a specific application and is stated as an exception to this requirement.
 - 1. Certificates to this effect shall be submitted along with Contractor's submittal data for this Section of the Specifications.

2. No material shall be used that, when tested by the ASTM E84-89 test method, is found to melt, drip or delaminate to such a degree that the continuity of the flame front is destroyed, thereby resulting in an artificially low flame spread rating.

- C. Application Company Qualifications: Company performing the Work of this Section must have minimum three (3) years experience specializing in the trade.
- D. All insulation shall be applied by mechanics skilled in this particular Work and regularly engaged in such occupation.
- E. All insulation shall be applied in strict accordance with these Specifications and with factory printed recommendations on items not herein mentioned. Unsightly, inadequate, or sloppy Work will not be acceptable.

1.6 SUBMITTALS

- A. Product Data:
 1. Provide product description, list of materials, “k” value, “R” value, mean temperature range, and thickness for each service and location.
 2. Samples: When requested, submit three (3) samples of any representative size illustrating each insulation type
- B. Operation and Maintenance Data:
 1. Indicate procedures that ensure acceptable standards will be achieved. Submit certificates to this effect.

1.7 DELIVERY, STORAGE and HANDLING

- A. Deliver materials to the Project Site in original factory packaging, labeled with manufacturer’s identification including product thermal ratings and thickness.

- B. Store insulation in original wrapping and protect from weather and construction traffic. Protect insulation against dirt, water, chemical, and mechanical damage.
- C. Maintain ambient temperatures and conditions required by manufacturers of adhesives, mastics and insulation cements.

PART 2 - PRODUCTS

2.1 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.2 manufacturers

- A. Insulation:

1. Owens-Corning (Type P1).
2. Certainteed Corporation (Type P1).
3. Johns Manville Corporation (Type P1).
4. Knauf Corporation (Type P1).
5. Dow Chemical Company (Type P2).
6. Armstrong/Armacell (Armaflex) (Type P3).
7. RBX Industries/Rubatex (Type P3).
8. Mineral Products of Texas (Type P4).
9. Resolco International by (Insul-Phen) (Type P5).
10. FOAMGLAS (Cellular Glass) by Pittsburgh Corning (Type P6).

- B. Jackets:

1. Childers Products Company.
2. PABCO.
3. RPR Products, Inc.
4. Alpha.
5. Venture Tape Corporation
6. Foamglas

2.3 Insulation

- A. Type P1: Fiberglass preformed insulation; ASTM C 547; minimum 3.0 lb/cu ft density, ASTM C335, 'k' value of 0.23 at 75 degrees F; noncombustible.
- B. Type P2: Molded closed cell polyisocyanurate insulation; ASTM E96, maximum water vapor transmission rating of 0.005 Perm-In; ASTM C518, 'k' value of 0.20 at 75 degrees F; ASTM D2842, water absorption value of 0.05 lb/ft².
- C. Type P3: Elastomer, closed cell, flexible, insulation; ASTM E96; maximum vapor transmission rating of 0.20 perms; ASTM C 518; 'k' value of 0.27 at 75 degrees F.
- D. Type P4: Mineral Wool; ASTM C 547; preformed insulation high temperature insulation; 'k' value of 0.35 at 300 degrees F.
- E. Type P5: Phenolic closed cell, ASTM C1126 rigid foam, 2.2 lbs. nominal density, CFC free; ASTM C518, 'k' value of 0.13 at 75 degrees F. (Note material thickness limit is 3 inches as tested in accordance with ASTM E84).
- F. Type P5A: Phenolic closed cell insulation; ASTM E96, maximum water vapor transmission rating of 0.02 Perm-In; ASTM C1126 rigid foam, 3.75 lbs. nominal density, CFC free; ASTM C518, 'k' value of 0.16 at 75 degrees F. (Note material thickness limit is 3 inches as tested in accordance with ASTM E84).

- G. Type P5B: Phenolic closed cell insulation; ASTM E96, maximum water vapor transmission rating of 0.02 Perm-In; ASTM C1126 rigid foam, 5.0 lbs. nominal density, CFC free; ASTM C518, 'k' value of 0.21 at 75 degrees F. (Note material thickness limit is 3 inches as tested in accordance with ASTM E84).
- H. Type P6: Cellular Glass, ASTM C552, 7.5 lbs./cu.ft, density, ASTM E96 (Wet Cup Method) 0.00 water vapor perm , ASTM C518 'k' value of 0.29 at 75 degrees F.
- I. Type P8: Ceramic Blanket

2.4 Jackets

A. Jacket Materials:

1. Factory Applied Jackets: White kraft bonded to reinforced foil vapor barrier with self-sealing adhesive joints.
2. PVC Jackets: UL listed 25/50 rated per ASTM E 84, UV resistant, minimum insulation thickness 0.020 inches for piping outside diameters up to 18 inches and 0.030 inches for i piping outside diameters above 18 inches.. Standard manufactured PVC cover fittings cover system consisting of one-piece, pre-molded, PVC covers with fiberglass inserts manufactured from 20-mils thick, high-impact, ultraviolet-resistant. Use ultraviolet resistant adhesive as recommended by the manufacturer.
3. Fiberglass Cloth Reinforcing Mesh: #10 glass cloth with minimum weight of 3.9 ounces per square yard.
4. Aluminum Jackets: ASTM B 209; 0.020 inch thick; smooth finish with factory applied moisture barrier.
5. Stainless Steel Jackets: Type 304 stainless steel; 0.010 inch thick; smooth finish.
6. Factory Applied Jacket (like Alpha Style: VR-RHD): Provide factory applied ASJ White triple ply laminate polypropylene, mold resistant, metallized polyester vapor barrier film backing.
7. Venture 1577 W/U, 0 perm and mold resistant jacket material, 5 ply laminate with 6 mil film on with adhesive on one side.. This mold resistant jacket is to be used with Phenolic closed cell insulation used for applications where Type 5A and 5B insulation is used on existing chilled piping being repaired or being modified.

B. Interior Concealed Applications:

1. Type P1 Insulation: Provide factory applied ASJ white kraft foil vapor barrier.
2. Type P3 Insulation: Finish coat is not required.
3. Type P4 Insulation: Cover with a canvas jacket, Adhesive Prime Coat # CP-52 and Childers #CP-50A HV2 lagging adhesive.
4. Type P5 and P5A, 5B Insulation: Provide Venture jacketing material on piping where condensation can occur or where it is used on existing chilled water piping, equipment drain piping transporting chilled condensate from cooling coils, and roof storm drain piping transporting cold rain water from the building roof.
5. Type P5 Jacketing material is not required when insulation is used on hot water piping.
6. Type P6 Insulation: Provide Pittcoat 404 or pre-molded PVC covers per manufacturer's recommendations.

C. Interior - Exposed Applications:

1. Type P1, and P2 Insulation: Provide factory applied ASJ white kraft foil vapor barrier. Also finish with canvas jacket or #10 glass membrane with Childers CP-50 or approved equal finish. Apply sizing for finish painting. Verify jacket is suitable for applications.
2. Type P3 Insulation: Finish coat is not required.
3. Type P4 Insulation: Cover with a canvas jacket and Childers CP-50 lagging adhesive.
4. Type P5 Insulation is used on hot water piping: Provide factory applied ASJ white kraft foil vapor barrier
5. Type P5 and P5A Insulation: Provide Venture jacketing material on piping where it is used on existing chilled water piping, equipment drain piping transporting chilled condensate from cooling coils, and roof storm drain piping transporting cold rain water from the building roof where condensation can occur.
6. Type P6 Insulation: Provide triple ply laminate polypropylene, mold resistant with a metal foil and polyester vapor barrier film backing.
7. All exposed insulated piping within six feet of the floor shall be protected with an aluminum or stainless jacket material to protect the insulation jacketing material from being torn or punctured.

D. Exterior Applications:

1. Insulate piping system as indicated under Interior - Exposed Applications, prior to final jacket installation.
2. Provide electric heat tracing for all exterior small bore piping 2 inch and smaller where water may be susceptible to freezing due to intermittent flow conditions. **(Note Engineer needs to show location heat trace piping on piping and capacity and size on electrical drawings,)**
3. Final jacket cover shall be aluminum or stainless steel jacket having integral moisture barrier with seams located at 2 or 10 o'clock position of horizontal piping. All laps must be minimum 2 inches.
4. Type P1 Insulation: Finish with #10 glass membrane and Childers CP-11, prior to the final jacket installation.
5. P6 Insulation for above ground installations: Provide (50 mil thickness) self sealing non-metallic bituminous compound reinforced with glass fiber membrane with 1 mil aluminum top film jacketing for both chilled water and hot water piping (PITWRAP CW Plus). Metal jacketing is required where the film jacketing material is exposed to ultraviolet rays.
6. P6 Insulation for underground installations: Provide factory applied (50 mil thicknesses) self sealing membrane bituminous compound reinforce with glass fiber for chilled water piping (PITWRAP IW 50). Metal jacketing material is not required for buried pipe.

E. Mechanical and Electrical rooms

1. Type P1, and P2 Insulation: Provide factory applied ASJ white kraft foil vapor barrier. Also finish with canvas jacket or #10 glass membrane with Childers CP-50 or approved equal finish. Apply sizing for finish painting. Verify jacket is suitable for applications.
2. Type P3 Insulation: Finish coat is not required.
3. Type P4 Insulation: Cover with a canvas jacket and Childers CP-50 lagging adhesive.
4. Type P5 Insulation is used on hot water piping: Provide factory applied ASJ white kraft foil vapor barrier.
5. Type P5 and P5A Insulation: Provide Venture jacketing material on piping where it is used on existing chilled water piping, equipment drain piping transporting chilled condensate from cooling coils, and roof storm drain piping transporting cold rain water from building roof where condensation can occur.

6. Type P6 Insulation: provide triple ply laminate polypropylene, mold resistant with a metal foil and polyester vapor barrier film backing
7. All exposed insulated piping within eight feet of the floor shall be protected with an aluminum or stainless jacket material to protect the insulation jacketing material from being torn or punctured.

2.5 Inserts supports and shields

- A. Application: Piping 2 inches diameter or larger for all systems except direct buried.
- B. Shields shall be made of galvanized steel or made of black iron painted on both sides with a minimum two coats of aluminum paint. Required metal shield sizes are as follows:

Nominal IPS (inches)	Metal Thickness (gage)	Minimum Lengths of Shield (inches)
2	14	12
2-½ to 6	12	16
8 and above	10	20

- C. Depending on the type of pipe support design, stainless steel bands or aluminum bands may be required to keep shield material next to the jacketing material.
- D. Inserts for shields shall be manufactured of 7.5 lb/cu. ft. density cellular glass or 5.0 lb/cu. ft. density cellular phenolic insulating material suitable for the planned temperature range. Provide factory fabricated inserts with integral galvanized pipe saddles. Inserts shall be the same thickness as the adjacent insulation.

2.6 Insulation accessories

- A. Insulation Bands: 3/4 inch wide; 0.007 inch thick galvanized steel when exposed to interior environment, .010 inch thick stainless steel or 0.015 inch thick aluminum when exposed to harsh humid interior environment or outside environment.
- B. Metal Jacket Bands: 3/8 inch wide; 0.015 inch thick aluminum or 0.010 inch thick stainless steel to match jacket.
- C. Insulating Cement: ASTM C 195; hydraulic setting mineral wool; Ryder One-Coat.
- D. Sealants: Use at valves, fittings and where insulation is terminated. Brush apply sealant to end of insulation and continue along pipe surface. Provide Childers CP-70/CP-76 or equivalent sealant.
- E. Adhesives: Use to adhere the longitudinal lap seam of vapor barrier jackets and at butt joints between insulation or fitting covers. Provide Childers CP-82 or approved equal as general purpose adhesive. Use Childers CP-97 fibrous adhesive for calcium silicate or when adhering pipe saddles and shields to the insulation.
- F. Primers: Provide Childers CP-50 diluted 50 percent with water or Pittcoat 300 primer thinned with mineral spirits to cover insulating cements prior to finish coating.
- G. Finish: Provide Childers CP-30 L.O. as a general purpose finish to coat the longitudinal seams and butt joints of vapor barrier jackets or glass cloth jackets. Use Childers CP-50 reinforced with glass cloth as an adhesive and sizing for canvas and in other locations as indicated.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Verify that piping has been pressure tested before applying paint and insulation materials.
- B. Thoroughly clean all surfaces to be insulated as required to remove all oil, grease, loose scale, rust, and foreign matter. Piping must be completely dry at the time of application of primer paint. Painting on piping where condensation is occurring on the pipe surface is strictly prohibited.

- C. Provide primer coat on all piping, to include field welds and over factory applied paint/coating, in total compliance with Contract Documents and compatible with and approved by the insulation manufacturer. Painting must be completed and approved prior to installation of insulation. Paint shall be applied in accordance with the paint manufactures instructions, environment, and pipe surface temperatures.

3.2 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. Installation of insulation and jacket materials shall be in accordance with manufacturer's published instructions.
- C. Handle and install materials in accordance with manufacturer's instructions in the absence of specific instructions herein.
- D. On exposed piping, locate insulation cover seams with the ridge of the lap joint is directed down.
- E. Exposed Insulated piping within six feet of the floor shall be protected with an aluminum or stainless jacket material to protect the insulation.
- F. Insulate fittings, joints and valves with molded insulation of the same material and thickness as adjoining pipe. Open voids and cracks insulation shall be kept at a minimum when placing insulation on abnormal or irregular shapes. Use closed cell or recommended fill material as instructed by the insulation manufacturer to close openings. Fiberglass insulation shall not be used as a fill material on chilled water piping or fittings.
- G. Continue insulation through walls, sleeves, pipe hangers, floors, and other pipe penetrations.
- H. Provide dams in insulation at intervals not to exceed 20 feet on cold piping systems to prevent migration of condensation or fluid leaks. Indicate visually where the dams are located for maintenance personnel to identify and also provide dams at butt joints of insulation at fittings, flanges, valves, and hangers.

- I. Insulate entire system including fittings, valves, flanges and strainers. Use closed cell insulation on cold piping system flexible connections, expansion joints and unions, bevel and seal ends of insulation and continue sealant a minimum of 4 inches along the piping, unless stated otherwise.
- J. For hot piping conveying fluids 140 degrees F or less, do not insulate flanges and unions at equipment, but bevel and seal ends of insulation. Continue sealant a minimum of 4 inches along the piping.
- K. For hot piping conveying fluids over 140 degrees F, insulate flanges and unions, including those at equipment, and place plastic tape labels on insulation to indicate location of concealed flange or union connections.
- L. All sections of molded pipe covering shall be firmly butted together. Where an insulation covering is applied, it shall lap the adjoining section of insulation by at least three inches (3 inches). Where insulation terminates, it shall be neatly beveled and finished. All materials used shall be fire retardant or nonflammable.
- M. Where vapor barriers are required, the vapor barrier shall be on the outside. Extreme care shall be taken that the vapor barrier is unbroken. Joints, etc., shall be sealed. Where insulation with a vapor barrier terminates, seal off with vapor barrier continuous to the surface being insulated. Ends shall not be left raw.
- N. Where pipe chases are tight, adequate provision shall be made at the rough-in stage using offset fittings or other means (except springing the pipe) to ensure that insulation can be applied throughout the length of the pipe.
- O. Paint exposed pipe insulation per Specification 09 91 00.
- P. Where canvas finish is specified, use lagging adhesive to prevent mildew in securing canvas. Do not use wheat paste. In addition, cover all canvas insulation with a fire retardant coating. Where canvas finish is specified, use lagging adhesive to prevent mildew in securing canvas. Do not use wheat paste. In addition, cover all canvas insulation with a fire retardant coating.
 - 1. On canvas jacketed systems where seam joints at fittings are rough, they shall be covered with an application of insulating cement and smoothed with a trowel before the canvas is applied with adhesive. The canvas must be free of wrinkles and have a smooth, neat appearance.
- Q. INSERTS, SUPPORTS, AND SHIELDS

1. Shields

- a. Install between pipe hangers or pipe hanger rolls and inserts. Curved metal shields shall be used between the hangers or support points and at the bottom of insulated pipe 2 inches and larger.
- b. Hangers shall support the load of the insulated pipe section on the outside of the insulation and shall not be in direct contact with the pipe.
- c. Manufacturer shall be responsible to size the length of shield required to prevent insulation from breaking.
- d. Provide rigid insulation at each support point, a minimum of 4 inches longer than shield length.
- e. Curved metal shields shall be designed to limit the bearing stress on the insulation to 35 psi and shall be curved to fit up to mid-perimeter of the insulated pipe.

2. When installing phenolic insulation provide a 5 lb. density insert of same thickness and contour as adjoining 3.75 lb. density insulation, between the support shield and piping, and under the finish jacket, on piping 1½ inch diameter or larger, to prevent insulation from sagging at support points. Provide inserts for 180-degree arc and not less than 2 inches more than the length of the pipe support shield or minimum 12 inches long (whichever is greater). Adhere the pipe support shield to insulation with a UL approved adhesive that meets E-84 requirements.

3. Seal all insulation at supports, protrusions and interruptions. Maintain vapor barrier with finish coat.

3.3 MAINTENANCE AND Modifications TO existing CHILLED WATER SYSTEM PIPING INSULATED WITH PHENOLIC FOAM INSULATION

- A. Reinsulate existing piping systems after repairs have been performed in the same manner as the original installation unless:

1. The nature of damage to the insulation indicates that the system was not insulated properly, and that installation of flashing will be necessary where leaks occur.
 - a. Increasing the thickness of the insulation may be required when condensation occurs.
 - b. Provide insulation expansion joints where large cracks or gaps occur.

B. Materials:

1. When possible carefully remove existing insulation material so it can be reapplied, and provide temporary protection to adjacent insulation material to prevent damage while repairs are underway.
2. When performing a hot tap, maintenance to a strainer, or adding a mechanical component or similar to an operating chilled water system, apply temporary insulation to prevent moisture damage to exposed insulation material. Qualified insulation subcontractor personnel shall assist in the following:
 - a. Strainers; dry the strainer body prior to installing the insulating cap. Ensure that the exposed insulation and insulating cap is dry and free of any contamination. Tape in place then finish with fab cloth and vapor barrier mastic.
 - b. Hot tap: to eliminate the possibility of moisture migration into the existing insulation, remove the complete section of the pipe covering where the operation will occur. Apply duct wrap on the raw ends of the adjacent insulation in both directions at a 12 inch length. Use FSK tape to secure the wrap. After completion of the hot tap, remove the temporary insulation and inspect the protected sections to ensure the sections are dry and free from contaminants. Re-insulate and seal the circumferential joints with Foster Product joint sealant 30-45 Foam Seal or equivalent. Apply FSK tape at the seams to match the existing facing system.
 - c. Use freezing blankets to install new mechanical components to an existing chilled water piping section. Remove enough insulation to install the freezing blankets plus one additional section in either direction. To eliminate the possibility of moisture migration, remove the complete section of the pipe covering where the operation will occur. Apply duct wrap on the raw ends of the adjacent insulation in both directions at a 12 inch length. Use FSK tape to secure the wrap. After completion of the procedure, remove the temporary insulation and inspect the protected sections to ensure that the insulation sections are dry and free from contaminants. Re-insulate and seal the circumferential joints with a Foster Product joint sealant 30-45 Foam Seal or equivalent. Apply tape at the seams to match the existing facing system.

C. MAINTENANCE AND INSPECTION METHODS

1. Conduct periodic inspections as determined by The University, to address the following :
 - a. Replace missing insulation and protect adjacent insulation which can become burned or wet after maintenance has been performed to the system.
 - b. Repair leaks or spills and remove and replace damaged insulation.

- c. Repair breaks, tears, cracks, or punctures of the vapor barrier or protective covering. Verify that the existing insulation is dry and if wet replace the entire affected section as described in this section.
- d. On piping exposed to the outdoor environment, replace the affected section of insulation as described in this section and use galvanized steel, aluminum or stainless steel to protect the insulation from being crushed due to foot traffic or maintenance equipment. PVC is appropriate for interior areas not subject to foot traffic.

3.4 PIPING INSULATION APPLICATION AND THICKNESS SCHEDULE

- A. In no case shall installed piping insulation have insulation thicknesses that are less than what is required by local energy codes and ASHRAE 90.1 (whichever is more stringent), based on comparable insulation conductivity values at the specified mean rating temperature.
- B. Type 5A and 5B insulation is only used where it is being replaced on existing pipe and thickness of the replacement insulation shall match the existing insulation thickness.

Piping Systems	Location	Type	Pipe Size	Insulation Thickness
Domestic Cold Water, Soft Water, Make-Up Water	Interior Concealed	P1	1-1/2" & Smaller	1/2"
			2" to 4"	1/2"
			5" & Larger	1/2"
	Interior Exposed	P5	1-1/2" & Smaller	3/4"
			2" to 4"	3/4"
			5" & Larger	1"

Piping Systems	Location	Type	Pipe Size	Insulation Thickness
	Interior Exposed	P6		
			1-1/2" & Smaller	1"
			2" to 4	1"
			5" & Larger	1-1/2"
	Exterior	P5	All Sizes	1"
		P6	4" and Smaller	1"
			5" & Larger	1-1/2"
Domestic Hot Water, Tempered Water (Maximum 200 Degrees F)	Interior Concealed	P1	2" & Smaller	1"
			2-1/2" & Larger	1-1/2"
	Interior Exposed	P5	1-1/2" & Smaller	3/4"
			2" to 4"	1"
			5" & Larger	1-1/2"
		P6	4" and Smaller	1"

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 20 08 00 00 - FIRE SUPPRESSION/PLUMBING/HVAC SYSTEMS COMMISSIONING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. The purpose of this Section is to define responsibilities in the Commissioning process. Additional system testing is required within individual Specification Sections.
- B. Ensure that all systems are operating in a manner consistent with the Contract Documents. General Commissioning requirements and coordination are detailed in Division 01. Execute all Commissioning responsibilities assigned and include the cost of Commissioning in the Contract price.
- C. HVAC systems to be commissioned include the following: [Edit or add to the following scope as appropriate to the Project.]
 - 1. Chilled Water Systems
 - 2. Cooling Tower
 - 3. Hot Water and Steam PRV Station
 - 4. Steam Boiler System
 - 5. Pumps
 - 6. Heat Exchangers
 - 7. Air Handling Units
 - 8. Fans
 - 9. Piping Systems
 - 10. Ductwork Systems
 - 11. Fire, Fire/Smoke and Volume Dampers
 - 12. Chemical Treatment
 - 13. Roof Top Packaged DX Units
 - 14. Split Systems
 - 15. Fan Coil Units
 - 16. Terminal Units
 - 17. Unit Heaters
 - 18. Building Automation System

D. Plumbing Systems to be commissioned include the following:

1. Sanitary Waste and Vent
2. Roof and Storm Drainage
3. Laboratory (Chemical) Waste and Vent
4. Grease/Oil Laden Waste and Vent
5. Sump/Ejector Pumps
6. Domestic Water Booster Pumps
7. Domestic Water Storage/Break Tank
8. Water Softeners
9. Pure Water Production Equipment (R.O., D.I., etc.)
10. Domestic Water Heaters
11. Domestic Hot Water Circulating Pumps
12. Domestic Cold Water Distribution
13. Domestic Hot Water Distribution
14. Natural Gas Distribution
15. Medical Air Compressors and Vacuum Pumps
16. Laboratory Air Compressors And Vacuum Pumps
17. Medical Compressed Gas Cylinder Manifolds
18. Laboratory Compressed Gas Manifolds
19. Medical Gas and Vacuum System Alarms
20. Laboratory Gas and Vacuum System Alarms
21. Medical Gas and Vacuum Distribution
22. Laboratory Gas and Vacuum Distribution
23. Plumbing Fixtures
24. Plumbing Systems/Emergency Power Source Integration
25. Plumbing Systems/Building Automation System Integration

E. Fire Protection Systems to be commissioned include the following:

1. Fire Pump
2. Wet Standpipe
3. Wet Fire Sprinkler

4. Dry Fire Sprinkler
5. Pre-Action Fire Sprinkler
6. Chemical Fire Suppression
7. FACP
8. Fire Protection Systems/Emergency Power Source Integration
9. Fire Protection Systems/Fire Alarm System Integration
10. Fire Water Tank and piping system including valves, high/low level, over flow, metering, basin and circulation loop.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.04 DEFINITIONS

- A. Commissioning: A systematic process confirming that building systems have been installed, properly started, and consistently operated in strict accordance with the Contract Documents, that all systems are complete and functioning in accordance with the Contract Documents at Substantial Completion, and that Contractor has provided Owner adequate system documentation and training. Commissioning includes deferred and/or seasonal tests as approved by Owner.
- B. Commissioning Plan: Document prepared by Contractor and approved by Owner that provides the structure, schedule, and coordination plan for the Commissioning process from the construction phase through the warranty period. The Commissioning Plan must satisfy The University's test requirements.
- C. Commissioning Team: Working group made up of representative(s) from the Architect/Engineer (A/E), Contractor, Test, Adjust, and Balance (TAB) Firm, Building Automation System (BAS) provider, specialty manufacturers and suppliers, and Owner. Contractor will provide ad-hoc representation of subcontractors on the Commissioning Team as required for implementation of the Commissioning Plan.
- D. Deferred Tests: Functional Performance or Integrated System Tests performed after Substantial Completion due to partial occupancy, partial equipment acceptance, seasonal requirements, design, or other Site conditions that prohibit the test from being performed prior to Substantial Completion.
- E. Deficiency: Condition of a component, piece of equipment or system that is not in compliance with Contract Documents.
- F. Factory Testing: Testing of equipment at the factory, by factory personnel with an Owner's representative present if deemed necessary by Owner.
- G. Functional Performance Test Procedures: Commissioning protocols and detailed test procedures and instructions in tabular and script-type format that fully describe system configuration and steps required to determine if the system is performing and functioning properly. Contractor prepares these procedures to document Functional Performance Tests.

- H. **Functional Performance Test (FPT):** Test of dynamic function and operation of equipment and systems executed by Contractor. Systems are tested under various modes, such as during low cooling or heating loads, high loads, component failures, unoccupied, varying outside air temperatures, life safety conditions, power failure, etc. Systems are run through all specified sequences of operation. Components are verified to be responding in accordance with Contract Documents. Functional Performance Tests are executed after Start-ups and Prefunctional Checklists are complete.
- I. **Integrated System Test:** Test of dynamic interactive function and operation of multiple systems. Integrated System Tests are tested under various modes, such as fire alarm and emergency situations, life safety conditions, power failure, etc. Systems are integrally operated through all specified sequences of operation. Components are verified to be responding in accordance with Contract Documents. Integrated System Tests are executed after Functional Performance Tests are complete and prior to Substantial Completion. Integrated System Tests provide verification that the integrated systems will properly function according to the Contract Documents.
- J. **Integrated System Test Procedures:** Commissioning protocols and detailed test procedures and instructions in tabular and script-type format fully describe system configurations and steps required to determine if the interacting systems are performing and functioning properly. Contractor prepares these procedures to document Integrated System Tests.
- K. **Prefunctional Checklist:** A list of static inspections and material or component tests that verify proper installation of equipment (e.g., belt tension, oil levels, labels affixed, gages in place, sensors calibrated, etc.). The word Prefunctional refers to before Functional tests. Prefunctional Checklists must include the manufacturer's Start-up checklist(s). Contractor shall sign Prefunctional Checklists as complete and submit with the Request for Start-up/Functional Performance Test Form.
- L. **Start-up:** The activities where equipment is initially energized, tested, and operated. Start-up is completed prior to Functional Performance Tests.
- M. **Test Requirements:** Requirements specifying what systems, modes and functions, etc. must be tested. Test requirements are not detailed test procedures. Test requirements and acceptance criteria are specified in the Contract Documents.

1.05 SUBMITTALS

- A. Contractor shall prepare Prefunctional Checklists and Functional Performance Test (FPT) procedures and execute and document results. All Prefunctional Checklists and tests must be documented using specific, procedural forms in Microsoft Word or Excel software developed for that purpose. Prior to testing, Contractor shall submit those forms to The University for review and approval.
- B. Contractor shall provide Owner with documentation required for Commissioning Work. At minimum, documentation shall include: Detailed Start-up procedures, full sequences of operation, Operating and Maintenance data, performance data, Functional Performance Test Procedures, control drawings, and details of Owner-contracted tests.
- C. Contractor shall submit to Owner installation and checkout materials actually shipped inside equipment and actual field checkout sheet forms used by factory or field technicians.
- D. Contractor shall review and approve other relative documentation for impact on FPT's of the systems:
 - 1. Shop drawings and product submittal data related to systems or equipment to be commissioned. The Subcontractor responsible for the FPT shall review and incorporate comments from The University and A/E via the Contractor.
 - 2. Incorporate manufacturer's Start-up procedures with Prefunctional checklists.

3. Draft Test, Adjust and Balance (TAB) Reports: Review and provide comments to Owner.
4. Factory Performance Test Reports: Review and compile all factory performance data to assure that the data is complete prior to executing the FPT's.
5. Completed equipment Start-up certification forms along with the manufacturer's field or factory performance and Start-up test documentation: Subcontractor performing the test will review the documentation prior to commencing with the scheduled FPT's. Owner may require that system one-line diagrams and applicable Specification Section(s) be attached to the FPT documentation.
6. Final TAB Reports: Subcontractor performing the test will review the documentation prior to commencing with the scheduled FPT's.
7. Operating and Maintenance (O&M) information per requirements of the Technical Specifications and Division 01 requirements: To validate adequacy and completeness of the FPT, the Contractor shall ensure that the O&M manual content, marked-up record Drawings and Specifications, component submittal drawings, and other pertinent documents are available at the Project Site for review.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 TEST EQUIPMENT

- A. Provide all specialized tools, test equipment and instruments required to execute Start-up, checkout, and testing of equipment.
- B. All specialized tools, test equipment, and instruments required to execute Start-up, checkout, and testing of equipment shall be of sufficient quality and accuracy to test and/or measure system performance within specified tolerances. A testing laboratory must have calibrated test equipment within the previous twelve (12) months. Calibration shall be NIST traceable. Contractor must calibrate test equipment and instruments according to manufacturer's recommended intervals and whenever the test equipment is dropped or damaged. Calibration tags must be affixed to the test equipment or certificates readily available.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Construction Phase:
 1. In each purchase order or subcontract that is written for changes in scope, include the following requirements for submittal data, Commissioning documentation, testing assistance, Operating and Maintenance (O&M) data, and training, as a minimum.
 2. Attend Pre-Commissioning Meeting(s), Pre-Installation Meeting(s), and other Project meetings scheduled by the Contractor to facilitate the Commissioning process.
 3. Provide manufacturer's data sheets and shop drawing submittals of equipment.
 4. Provide additional requested documentation to the Contractor, prior to O&M manual submittals, for development of Prefunctional Checklist and Functional Performance Tests procedures.

- a. Typically, this will include detailed manufacturer's installation and Start-up, operating, troubleshooting and maintenance procedures, full details of any Owner-contracted tests, full factory testing reports, if any, and full warranty information, including all responsibilities of The University to keep the warranty in force clearly identified.
 - b. In addition, the installation, Start-up, and checkout materials that are actually shipped inside the equipment and the actual field checkout sheet forms to be used by the factory or field technicians shall be submitted to the Contractor.
 - c. This information and data request may be made prior to normal submittals.
5. With input from the BAS Provider and A/E, Clarify the operation and control of commissioned equipment in areas where the Specifications, BAS control drawings, or equipment documentation are not sufficient for writing detailed test procedures.
 6. Prepare the specific Functional Performance Test procedures specified in Section 20 08 16. Ensure that Functional Performance Test procedures address feasibility, safety, and equipment protection and provide necessary written alarm limits to be used during the tests.
 7. Develop the Commissioning Plan using manufacturer's Start-up procedures and the Prefunctional Checklists. Submit manufacturer's detailed Start-up procedures and the Commissioning Plan and procedures and other requested equipment documentation to Owner for review.
 8. During the Start-up and initial checkout process, execute and document related portions of the Prefunctional Checklists for all commissioned equipment.
 9. Perform and clearly document all completed Prefunctional Checklists and Start-up procedures. Provide a copy to The University prior to the Functional Performance Test.
 10. Address current A/E and Owner punch list items before Functional Performance Tests. Air and water test, adjust and balance shall be completed with discrepancies and problems remedied before Functional Performance Tests of the respective air or water related systems are executed.
 11. Provide skilled technicians to execute starting of equipment and to assist in execution of Functional Performance Tests. Ensure that they are available and present during the agreed-upon schedules and for a sufficient duration to complete the necessary tests, adjustments, and problem solving.
 12. Correct deficiencies (differences between specified and observed performance) as interpreted by The University's Project Manager and A/E and retest the system and equipment.
 13. Compile all Commissioning records and documentation to be included in a Commissioning and Closeout Manual.
 14. Prepare O&M manuals according to the Contract Documents, including clarifying and updating the original sequences of operation to as-built conditions.
 15. During construction, maintain as-built marked-up Drawings and Specifications of all Contract Documents and Contractor-generated coordination Drawings. Update after completion of Commissioning activities (include deferred tests). The as-built drawings and specifications shall be delivered to The University both in electronic format and hard copies as required by The University.
 16. Provide training of The University's operating personnel as specified.
 17. Coordinate with equipment manufacturers to determine specific requirements to maintain the validity of the warranty.

B. Warranty Phase:

1. Execute seasonal or deferred tests, witnessed by The University, according to the Specifications.
 - a. Complete deferred tests as part of this Contract during the Warranty Period. Schedule this activity with Owner. Perform tests and document and correct deficiencies. Owner may observe the tests and review and approve test documentation and deficiency corrections.
 - b. If any check or test cannot be completed prior to Substantial Completion due to the building structure, required occupancy condition, or other condition, execution of such test may be delayed to later in the Warranty Period, upon approval of The University. Contractor shall reschedule and conduct these unforeseen deferred tests in the same manner as deferred tests.
2. Correct deficiencies and make necessary adjustments to O&M manuals, Commissioning documentation, and as-built drawings for applicable issues identified in any seasonal testing.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

3.03 TESTING**A. Prefunctional Checklists and Start-up:**

1. Follow the Start-up and initial checkout procedures listed in this Section and in Division 01. Start-up and complete systems and sub-systems so they are fully functional, meeting the requirements of the Contract Documents.
2. Prefunctional Checklists shall be complete prior to commencement of a Functional Performance test.

B. Functional Performance Tests:

1. Functional Performance Tests are conducted after system Start-up and checkout is satisfactorily completed. Air balancing and water balancing shall be completed before Functional Performance Tests.

C. Coordination Between Testing Parties:

1. Factory Start-ups: Factory Start-ups are specified for certain equipment. Factory Start-ups generally are Start-up related activities that will be reviewed and checked prior to Functional Performance Tests. All costs associated with factory Start-ups shall be included with the contract price unless otherwise noted. Notify the Commissioning Team of the factory Start-up schedule and coordinate these factory Start-ups with witnessing parties. The Commissioning Team members may witness these Start-ups at their discretion.
2. Independent Testing Agencies: For systems that specify testing by an independent testing agency, the cost of the test shall be included in the Contract price unless otherwise noted. Testing performed by independent agencies may cover aspects required in the Prefunctional Checklists, Start-ups, and Functional Performance Tests. Coordinate with the independent testing agency so that Owner and/or A/E can witness the test to ensure that applicable aspects of the test meet requirements.

3.04 TRAINING

- A. Submit a written training plan to The University and Architect/Engineer for review and approval. Contractor's training plan shall cover the following elements:
1. Equipment included in training.
 2. Intended audience.
 3. Location of training.
 4. Objectives.
 5. Subjects covered.
 6. Duration of training on each subject.
 7. Instructor for each subject.
 8. Methods (classroom lecture, video, Site walk-through, actual operational demonstrations, written handouts, etc.).
 9. Instructors and qualifications.
- B. Contractor shall have the following training responsibilities:
1. Provide a training plan ten (10) calendar days prior to the scheduled training, in accordance with Division 01.
 2. Provide Owner personnel with comprehensive training in the understanding of the systems and the operation and maintenance of each major piece of commissioned mechanical equipment or system.
 3. Training shall start with classroom sessions, if necessary, followed by hands-on training on each piece of equipment, which shall illustrate the various modes of operation, including Start-up, shutdown, fire/smoke alarm, power failure, etc.
 4. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
 5. The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This representative may be the Start-up technician for the piece of equipment, the installing contractor, or manufacturer's representative. Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment are required. More than one party may be required to execute the training.
 6. The training sessions shall follow the outline in the Table of Contents of the O&M manual and illustrate whenever possible the use of the O&M manuals for reference.
 7. Training shall include:
 - a. Usage of the printed installation, operation and maintenance instruction material included in the O&M manuals.

- b. Review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include Start-up, operation in all modes possible, shutdown, seasonal changeover and any emergency procedures.
 - c. Discussion of relevant health and safety issues and concerns.
 - d. Discussion of warranties and guarantees.
 - e. Common troubleshooting problems and solutions.
 - f. Explanation of information included in the O&M manuals and the location of all plans and manuals in the facility.
 - g. Discussion of any peculiarities of equipment installation or operation.
8. Hands-on training shall include Start-up, operation in all modes possible, including manual, shutdown, and any emergency procedures and maintenance of all pieces of equipment
9. Training shall occur after Functional Performance Tests are complete and shall be scheduled with The University's Project Manager.
- C. Contractor shall cooperate with Owner and Owner's Test, Adjust, and Balance Firm for verification testing and final adjustments and balancing as may be indicated in the Contract Documents or as approved by Owner.
- D. Provide training on each system/piece of equipment according to the following schedule: [Edit the following as appropriate for the Project].

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 20 08 13 00 - FIRE SUPPRESSION/PLUMBING/HVAC SYSTEMS PREFUNCTIONAL CHECKLIST AND START-UPS**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the contract, including general and supplementary conditions and division 01 specification sections, apply to this section.
- B. Specifications throughout all divisions of the project manual are directly applicable to this section, and this section is directly applicable to them.

1.02 SUMMARY

- A. This Section expands on and defines responsibilities of the Contractor regarding Prefunctional Checklists and Start-up portions of the Commissioning process and addresses validation of proper and thorough installation of mechanical, plumbing and fire protection systems.
- B. Contractor shall oversee the Commissioning activities with the Contractor's Subcontractors and the Architect/Engineer (A/E).
- C. Contractor shall completely install, thoroughly inspect, Start-up, test, adjust and integrate air and water balance by Owner's TAB firm on systems and equipment. All activities shall be documented on specific, procedural forms developed for that purpose. Contractor shall notify A/E and Owner in writing that systems are complete and ready for verification and Functional Performance Tests.
- D. Completed Prefunctional Checklists for all pieces of equipment shall be submitted to The University prior to Functional Performance Tests.
- E. Responsibilities of the various parties involved in the Commissioning process are defined in Section 20 08 00.
- F. Refer to Attachments A, B, C, and D at the end of this Section for example forms that indicate level of documentation required for the Commissioning process.

1.03 REFERENCE STANDARDS

- G. A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- H. B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- I. C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.04 SUBMITTALS

- J. Prefunctional Checklists, Prefunctional Tests, and Start-up documents are the normal procedure of ensuring that the mechanical, plumbing, and fire protection system components are properly installed.
- K. The Subcontractor in cooperation with the A/E and Contractor shall develop Prefunctional Checklists and Prefunctional Tests during the Construction Phase.

- L. Completeness of Prefunctional Checklists: This Section summarizes the minimum standard for systems and equipment checkout. A record of testing and acknowledgement that a procedure has been completed and that it checks out acceptably must be included in the Prefunctional Checklists. The Prefunctional Checklist shall identify in columnar format each device, location, test method, control sequence of operation reference, device code reported, and other data as appropriate.
- M. Equipment Data Documentation: Provide completed, as-installed, specific product nameplate data, product numbers, serial numbers, etc. to fully define the asset for Owner's use in maintenance management and asset tracking. This data may be incorporated within the Equipment List/Matrix as described in Division 01 as a spreadsheet format or electronic database. In addition to specific manufacturer's name and specific product identifiers such as model number, serial numbers, date of manufacture, etc, the following information shall be included with the equipment data documentation:
 - 1. Capacity data: Where applicable, use equipment schedules on the Drawings as a guideline for fields to be used.
 - 2. Location identifier field for each of the three dimensions (Floor Level, X axis, and Y axis) using the Drawing column grids as the basis for location.
- N. Submit the equipment data documentation with the draft Prefunctional Checklists to The University for approval. A/E and Owner will review the Prefunctional Checklists and request any additional information required to meet the Commissioning Plan criteria.
- O. Written Certification: The Contractor shall certify that the installation, Start-up, Prefunctional Checklist, and initial operation of the system or component is in accordance with the Contract Documents, Commissioning Plan, and manufacturer's requirements, and that the system is ready for Functional Performance Tests. Any outstanding items or non-conformance shall be clearly indicated and highlighted on the Prefunctional Checklist and an action item shall have been initiated. Refer to Division 01 for specific details on non-conformance issues relating to Prefunctional Checklists.
- P. Refer to Section 20 08 00 for additional documentation requirements.

PART 2 - PRODUCTS

2.01 GENERAL

- Q. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- R. The Prefunctional Checklist procedures described in this Section provide minimum guidelines for development of Prefunctional Checklists; Start-up procedures, and Prefunctional Tests. Contractor shall prepare the Prefunctional Checklists using these procedures and that of the manufacturer's and/or applicable codes and standards.
- S. The Prefunctional Checklist form shall acknowledge that installation and Start-up procedures were successfully adhered to and completely performed and shall document relevant parameters (panel and equipment connections, measured values, ground faults, trip settings, etc.). When indicated as performing a checkout on multiple items or multiple procedure items, Prefunctional Checklist forms shall itemize each individual item.

2.02 Test Equipment

- T. Refer to Section 20 08 00 – HVAC/Plumbing/Fire Suppression System Commissioning.

PART 3 - EXECUTION**3.01 PREFUNCTIONAL CHECKLIST PROCEDURES****[Edit the following as appropriate for the Project:]**

- A. Valves:
1. Operate all manual and automatic valves through their full stroke. Ensure smooth operation through full stroke and appropriate sealing or shutoff.
 2. Verify that actuators are properly installed with adequate clearance.
 3. For automatic, pneumatically-operated valves, verify spring range and adjust pilot positioners where applicable.
- B. Meters and Gauges:
1. Adjust faces of meters and gauges to proper angle for best visibility.
 2. Clean windows of meters and gauges, including factory-finished surfaces. Replace cracked and broken windows and repair scratched and marred surfaces with manufacturer's touch-up paint. For meters and gauges that require temporary manual connection of read-out device such as pressure taps on a flow measuring device, ensure that threads are clean and that connection can be easily made.
 3. Meters and gauges requiring manual connection of readout device shall be installed with adequate access to allow connection of device with normal tools.
- C. Mechanical Identification:
1. Verify that all valve tags, piping, duct, and equipment labeling corresponds with the Drawings and indexes and meets requirements specified. Correct any deficiencies for all piping and duct systems.
 2. Adjusting: Relocate any mechanical identification device which has become visually blocked by Work of this Division or other Divisions.
 3. Cleaning: Clean the face of identification devices and glass frames of valve charts.
- D. Mechanical Insulation:
1. Examine all systems and equipment specified to be insulated.
 2. Patch and repair all insulation that has been damaged after installation.
 3. Ensure the integrity of the vapor barrier around all cold surfaces.
- E. Fire Suppression Systems:
1. Additional procedures required for Testing and inspection of Fire Protection Systems are specified within individual Specification Sections. Testing of fire protection systems will generally be conducted by the Fire Protection Subcontractor with Contractor and Owner witnessing.
 - a. Check operation prior to, during, and after a power outage to ensure required sequences and system restart.

2. Fire Protection Subcontractor shall submit forms to the Contractor for approval in concert with the appropriate mechanical system Prefunctional Checklist forms. All procedures and results shall be documented in the approved forms.

F. Piping:

1. The following applies to all installed piping systems including underground Site utilities. Responsibility for preparation of the Prefunctional Checklist and testing of the piping systems generally lies with the installing Subcontractor.
 - a. Inspect all piping for proper installation, adequate support with appropriate vibration isolation where applicable, and adequate isolation valves for required service.
 - b. Flush and treat all piping as appropriate to the application and clean all strainers.
 - c. Ensure that adequate drainage is provided at low points and venting is provided at high points. Ensure that air is thoroughly removed from the system as applicable.
 - d. Ensure that all piping is adequately supported and anchored to allow expansion. As applicable, bump across the line pumps and inspect for excessive pipe movement.
 - e. Pressure and/or leak test all applicable systems in accordance with requirements in the applicable Specification Sections. Record pressure testing results and certification that piping meets the Specification and submit with the Prefunctional Checklist.
 - f. Sterilize applicable piping systems as specified in the individual Specification Sections and as required by regulatory authorities. Record the results of sterilization and all parameters during this process and certify that the piping meets the Specification. Include results with Prefunctional Checklist.
 - g. Submit test reports that document testing results and certification of results with the Prefunctional Checklist.
 - h. Verify the operation of applicable safety relief valves, operating controls, safety controls, etc. to ensure a safe installation. Document setting and actual trip points of all such controls.
 - i. Set and adjust fill, pressure, or level controls to the required setting.
 - j. Compare installation with mark-up as-built Drawings to ensure the drawing accuracy.

G. AC Motors:

1. The following applies to all AC motors serving equipment.
 - a. Verify proper alignment, installation, and rotation.
 - b. Measure the insulation resistance, phase balance, and resistance to ground. These measurements will generally be the responsibility of the mechanical Subcontractor who is connecting the motor. The motor manufacturer will be responsible to correct any deficiencies. When electrical Subcontractor wires to a single point of a packaged device that is shipped with multiple motors, electrical Subcontractor shall check all motors in the package.
 - c. Verify that properly sized overloads are in place.
 - d. Measure voltage available to all phases at the time of initial connection and after the motor has been placed in operation under load measure amps and RPM.

e. Record all motor nameplate data.

H. Variable Frequency Drives:

1. General: Provide the services of a factory-authorized service representative to inspect unit installation, provide Start-up service, and demonstrate and train Owner's personnel. Contractor shall also provide the services of an independent harmonic testing agency as specified.
2. Start-up Checks: Perform the following checks before Start-up and as specified in manufacturer's Start-up instructions:
3. Check unit for shipping damage.
4. Perform a point-to-point continuity test for all field-installed wiring interconnections. Verify terminations of field-installed wiring.
5. Check for proper torque on connections.
6. Verify use of shielded cable where specified and check that shields have been terminated properly.
7. Verify grounding.
8. Check motor nameplate against drive input rating.
9. Manually rotate motor shaft to ensure free rotation.
10. Check that motor leads are not grounded.
11. Verify that factory test documentation is on file at the Project Site.
12. Starting procedures: Follow the manufacturer's printed procedures with the following as a minimum:
 - a. Ensure device and system that the drive is serving, is configured to withstand the device operation specified as follows.
 - 1) Verify, test and document safety circuits are active. Tag the safety circuit termination at the VFD and safety device with the trip value.
 - 2) Set all parameters required and verify all parameters have been programmed consistently for all VFDs on the project. Coordinate with the BAS relative to the interfaces (hard wired or software) and failure restart, status interfaces, acceleration rates, feedback, alarm states etc.
 - 3) Adjust the minimum voltage adjustment to enable starting but not to draw excessive power at start.
 - 4) Adjust the Volts/Hz adjustment to the proper setting.
 - 5) Adjust the accel and decel rates to the specified times.
 - 6) Adjust current limiting to coordinate with the overcorrect device and protect the motor.
 - 7) Set the maximum and minimum speed points.

- 8) Manually ramp fan speed from minimum to maximum and check for excessive noise and vibration.
- 9) Identify any critical speeds to avoid and set these in the drive.
- 10) With the independent harmonic testing agency, check for acceptable voltage and current distortion on the power system. Record the input and output voltages and currents showing the harmonic content as a percentage of the base frequency.
- 11) Measure and record overall efficiency at 50 percent, 75 percent, and 100 percent.
- 12) Record the motor terminal voltage.
- 13) Check operation prior to, during, and after a power outage to ensure required sequences and system restart.

I. Laboratory Gas Piping Systems:

1. Contractor shall provide the services of a gas testing laboratory (GTL) to test the system in strict accordance with NFPA-45 and 99. GTL shall be routinely engaged in the certification of the type and extent of the systems installed for this Project. Testing shall include at a minimum: pressure, flow at outlets, purity, and cross contamination as applicable.
2. Clean and disinfect piping per Contract Documents.
3. Provide a draft test report for approval in concert with Prefunctional Checklist draft process. Provide full completed test reports at the completion of testing.

J. Laboratory Air Compressors and Vacuum Pumps:

1. General: Provide the services of a factory authorized representative to inspect equipment installation, Start-up equipment, and train Owner's personnel.
2. Operate and adjust safety controls. Replace damaged and malfunctioning controls and equipment.
3. Refer to AC Motors in this Section.
4. Start-up Checks: Perform the following checks before Start-up:
 - a. Verify that pressure tests of piping systems are complete.
 - b. Check that laboratory air compressor inlets are properly located for clean air supply and that laboratory vacuum exhausts are properly located to prevent contamination of public spaces.
 - c. Check that laboratory air compressor inlet filters and piping and laboratory vacuum pump filters and discharge piping are clear.
 - d. Check for lubricating oil for lubricated-type equipment.
 - e. Check V-belts for proper tension. Record belt tension parameters.
 - f. Check equipment vibration control supports and flexible pipe connectors and that equipment is properly attached to substrate.

- g. Check that safety (pressure relief) valves are properly set.
 - h. Adjust vacuum relief valves.
 - i. Drain laboratory air and vacuum receiver tanks.
 - j. Check for proper seismic restraints.
 - k. Check for adequate room ventilation.
 - l. Check that all factory tests are filed at the Project Site.
 - m. Check that all documentation required for O&M and Start-up are filed at the Project Site.
5. Starting Procedures: Follow the manufacturer's printed procedures as a minimum:
- a. Energize circuits.
 - b. Start and run equipment through complete sequence of operations. Check for lead-lag operation, compressor minimum run and off times, sequencing etc. per the Specification and manufacturer's recommendations.
 - c. Check for excessive vibration and noise.
 - d. Check air and vacuum pressures.
 - e. Manually operate safety valves and vacuum relief valves.
 - f. Adjust operating controls including pressure and vacuum settings per direction of Owner.
 - g. Check operation prior to, during, and after a power outage to ensure required sequences and system restart.

K. High Purity Water System

- 1. General: Provide the services of a factory authorized representative to inspect equipment installation, Start-up equipment, and train The University's personnel.
- 2. Start-up Checks: Perform the following checks before Start-up:
 - a. Ensure piping is properly installed, sterilized, and tested.
 - b. Fill brine tank.
 - c. Ensure three (3) valve bypass, pressure gauges, and sample valve are installed on the UV sterilizer and Pre and Final Filters.
 - d. Ensure isolation valves are installed throughout the system as required by the Specifications.
 - e. Ensure that proper power source is provided and connected to the UV sterilizer. Verify the BAS interface for on/off, high temperature alarm, and no flow alarm.

- f. At the DI Columns, ensure that each can be isolated for service, that each column is properly secured to the frame, that the manual isolation valve is installed on the common discharge header, that the resistivity monitor is installed and connected to the BAS, and that the sample valve is provided.
 - g. Verify that storage tank fill and level controls are installed and functional.
- 3. Starting Procedures: Follow the manufacturer's printed procedures as a minimum:
 - a. Start-up and check out booster pumps.
 - b. Run pretreatment through all regeneration and backwash cycles.
 - c. Demonstrate that blending valve is operational.
 - d. Test the storage tank make-up and fill and associated alarming function.
 - e. Calibrate all sensors including resistivity meters.
 - f. Run system through all modes of operation and ensure that the controls, alarms, and safeties are functional and properly adjusted.
 - g. Perform bacteria and Total Organic Content test as per applicable Specification Section.
 - h. Test operation of system prior to, during, and after power outage to ensure proper operation and system restart.

L. Storage Tanks:

1. Inspect the tank for proper installation and support in conformance with the manufacturer's recommendations.
2. Verify that all required instrumentation is provided and installed in accordance with the Contract Documents.
3. For pressurized tanks, pressure test the tanks per the requirements in the applicable Specification Section and per the ASME Code where applicable.
4. Non-pressure Testing: Fill non-pressure water storage tanks to water operating level to ensure structural integrity and freedom from leaks. Hold water level for 2 hours with no drop in water level.
5. Repair leaks and defects with new materials and retest system until satisfactory results are obtained.
6. Clean and disinfect water storage tanks for use with potable water systems as specified in the respective Section.
7. Prepare and submit reports for all testing, purging, and disinfecting activities.
8. Check that pressure relief valves have correct setting.
9. Test operation of tank accessories and devices.
10. Adjust vacuum relief valves.
11. Manually operate relief valves.
12. Adjust pressure and vacuum settings.

M. Water Heaters:

1. General: Provide the services of a factory-authorized service representative to test and inspect unit installation, provide Start-up service, and demonstrate and train Owner's personnel as specified below.
 - a. Check for adequate steam supply and piping per manufacturer's direction.
 - b. Check for leaks at piping connections.
 - c. Check that recirculation and control requirements are per manufacturer's recommendations.
 - d. Check adequate condensate removal and venting of steam.
 - e. Verify that steam traps are working properly.
 - f. Verify that modulated steam is not being lifted.
 - g. Set and test relief valves and record test parameters.
 - h. Test and adjust operating and safety controls. Replace damaged and malfunctioning controls and equipment.
 - i. Record all Start-up procedures and parameters in Prefunctional Checklists.

N. Compressed Air Systems:

1. General: Provide the services of a factory-authorized service representative or qualified technician to test and inspect unit installation, provide Start-up service, and to demonstrate and train Owner's personnel as specified below.
2. Refer to AC Motors in this Section.
3. Preparation: Perform the following final checks before Start-up.
4. Piping System Tests: Complete system test in accordance with the respective Section.
 - a. Inspect the installation and access/clearance for service and maintenance to ensure it meets the Contract Document and manufacturer's requirements.
 - b. Check for leaks at piping connections.
 - c. Check lubricating oil for lubricated-type equipment.
 - d. Check V-belts for proper tension.
 - e. Check that compressor inlet filters and piping are clear.
 - f. Check equipment vibration-control supports and flexible pipe connectors and that equipment is properly attached to substrate.
 - g. Check for proper seismic restraints.
 - h. Check that safety valves have correct setting; greater than compressor discharge pressure, but less than the pressure rating of system components.
 - i. Test operation of equipment safety controls and devices.
 - j. Check water supply to water-cooled equipment.
 - k. Check water supply to liquid-ring air compressors.
 - l. Drain receiver tanks.
 - m. Check for adequate room ventilation.
5. Starting Procedures: Follow the manufacturer's written procedures and the following as a minimum:
 - a. Energize circuits.
 - b. Check for proper rotation of 3-phase motors.
 - c. Start and run equipment through complete sequence of operations.
 - d. Verify air dryer is hardwired interlocked to prevent the compressor from running unless the dryer is running.
 - e. Check for excessive vibration and noise. Correct deficiencies.
 - f. Check air pressures.
 - g. Manually operate safety valves.
 - h. Adjust operating controls including pressure settings.

O. Hydronic Piping:

1. Refer to Piping Section.
2. Prepare hydronic and test piping in accordance with applicable Specification Section and ASME B 31.9 and/or B 31.1.
3. Flush system with clean water. Clean strainers.
4. Chemical Treatment: Provide a water analysis prepared by the chemical treatment supplier to determine the type and level of chemicals required for prevention of scale and corrosion. Perform initial treatment after completion of system testing.
5. Check expansion tanks to verify that tanks are not air bound and that the system is completely full of water.
6. Set automatic fill valves for required system pressure.
7. Check air vents at high points of systems and determine if air vents are installed and operating freely (automatic type) or to bleed air completely (manual type).
8. Set and coordinate automatic fill pressure and relief valve settings.

P. Steam and Condensate Piping:

1. Refer to Piping Section.
2. Prepare and test steam and condensate piping in accordance with applicable Section and ASME B 31.9 and or B31.1 as applicable.
3. Flush the system with clean water. Remove, clean, and replace strainer screens.
4. Gradually warm-up piping and connected equipment. Introduce steam to piping system by throttling valves.
5. Take precautions to prevent water hammer or slugging in piping.
6. Vent air and non-condensable gases from system.
7. Supervise condensate removal at system traps. Temporarily bypass traps, if required.
8. Verify complete condensate removal from piping and equipment and that traps are functioning properly.

Q. Pumps:

1. Check suction line connections for tightness to avoid inducing air into the pump.
2. Clean and lubricate all bearings.
3. Refer to AC Motors in this Section.
4. Check motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
5. Check that pump is free to rotate by hand. For pumps handling hot liquids, pump shall be free to rotate with the pump hot and cold. If the pump is bound or even drags slightly, do not operate the pump until the cause of the trouble is determined and corrected.
6. Clean associated strainers.

7. Verify that OSHA approved coupling guards are in place.
8. Check that the proper overloads have been installed in the starter and that overloads are the correct size.
9. Verify that the integrity of the vibration isolation is maintained throughout the support and the piping connections.
10. Align pump within manufacturer's recommended tolerances.
11. Ensure that all associated piping has been cleaned, tested and deaired.
12. Start the pump and check that all seal piping/installation is per manufacturer's instructions.
13. Check the general mechanical operation of the pump and motor.
14. Verify that all thermometers and gauges are installed, are clean and undamaged, and are functional.
15. Verify that the check valve seal is appropriate for the application.
16. Check noise and vibration levels and ensure that they are within the manufacturer's recommended tolerances.
17. Check that the NPSH is within the allowable parameters for the operating condition.

R. Steam To Hot Water Converters:

1. Verify clearances for maintenance.
2. Flush and clean converters upon completion of installation in accordance with manufacturer's Start-up instructions.
3. Hydrostatically test assembled converter and piping in accordance with applicable Sections of the ASME Boiler and Pressure Vessel Code.
4. Check that the heat exchanger is properly supported and restrained and that it is installed with sufficient slope to the condensate outlet.
5. Check for adequate steam removal. Verify that modulated steam is not being lifted.
6. Check that vents and vacuum breakers are installed as required by the Contract Documents and that they are clear.
7. Verify sequencing, stroke, and range of valves. Coordinate ranges with the Building Automation System (BAS).
8. Start-up converters in accordance with manufacturer's Start-up instructions. Verify high temperature cut out switch is set and hardwired interlocked to close all valves on a trip. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.
9. Record all parameters (flow, temperatures, pressures, etc.) and tests and submit with Prefunctional Checklist **Test form**.

S. Steam Condensate Pumps:

1. General: Start-up condensate pumping equipment in accordance with manufacturer's start-up instructions. Test controls and demonstrate compliance with requirements.
2. Check for free and adequate inlet flow of condensate. Validate that condensate pressure/temperature does not cause pump cavitation.
3. Check for adequate venting of the receiver.
4. Refer to AC Motors in this Section.
5. Set and test level controls and alarm contacts as applicable.
6. Validate lead/lag and back-up of pumps and control for multiple pump systems.
7. Validate that overflows are piped safely as applicable.

T. Factory-Fabricated Cooling Towers:

1. Cleaning: Clean inside of cooling tower thoroughly before filling for Start-up. Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint.
2. Start-up: Comply with manufacturer's instructions for filling and Start-up of operation, including, but not limited to, the following:
3. Inspect the installation and access/clearance for service and maintenance to ensure it meets the Contract Documents and manufacturer's requirements.
4. Check manufacturer's required clearances for airflow.
5. Check that all required O&M documentation has been provided and that the documentation is filed at the Project Site.
6. Verify that fill is not damaged.
7. Check that the tower is installed level and plumb.
8. Verify that the tower is properly supported.
9. Check any vibration isolation and ensure that it is not compromised.
10. Verify lubrication of rotating parts; lubricate as needed.
11. Verify fan rotation direction.
12. Verify that motor amperage is in accordance with manufacturer's data. Verify that vibration and/or all required safety hardwired interlock are functioning correctly.
13. Refer to AC Motors of this Section.
14. Refer to Fans of this Section.
15. Check that make-up is of adequate capacity and properly protected from freezing.
16. Balance condenser water flow to each tower and to each inlet for multiple inlet towers.
17. Adjust water level control for proper operating level.
18. Ensure water outlet does not have entrained air.

19. Adjust temperature controls and verify operation.
20. Check sumps and basins to ensure they are clean and free of debris.

U. Terminal Units:

1. General: After construction and painting is completed, clean exposed surfaces of the terminal unit and vacuum clean terminal coils and inside of cabinets.
2. Retouch any marred or scratched surfaces of factory-finished cabinets using finish materials furnished by the manufacturer.
3. Ensure that the unit is properly supported.
4. Verify adequate access for maintenance.
5. Verify that the unit is installed per manufacturer's instructions and details.
6. Install new filters for terminal units that require filters.
7. Open vents to ensure that the coil is properly vented.
8. Check that the unit is properly labeled and/or a ceiling marker has been provided for concealed terminal units.
9. Check power and control voltages.
10. Check for proper condensate drainage as applicable.
11. Check rotation of fan where applicable.
12. Check calibration and operation of the controlling elements.
13. Check control valves for required close off and fail position.
14. Temporary Closure: Verify terminal units which are not scheduled to operate are provided temporary closure of polyethylene film or other covering that will prevent entrance of dust and debris unit is scheduled to operate.
15. Verify that thermostats or temperature sensors are in a proper location to adequately represent space temperature. Verify temperature sensors not scheduled to be installed are secured properly on the top of the unit

V. VAV Terminal Units:

1. General: After construction and painting is completed, clean exposed surfaces of terminal units and vacuum clean terminal coils and inside of cabinets.
2. Retouch any marred or scratched surfaces of factory-finished cabinets using finish materials furnished by the manufacturer.
3. Ensure unit is properly supported and that integrity of vibration isolation has been maintained where applicable.
4. Verify that proper access has been provided to the airflow control devices and any heat exchange surfaces.
5. Ensure that the air velocity sensor is correctly installed and that inlet/outlet restrictions for accurate measurements have been met.

6. Check all dampers and linkages and wiring and tubing as applicable for tightness of the connections and terminations.
7. Refer to associated zone checkout procedures when applicable.
8. Ensure air inlet is free of obstructions. Start fans and ensure proper rotation (as applicable). Measure and record motor amperage and voltage.
9. Install new filters where required.
10. Calibrate and adjust the airflow control parameters. Set applicable minimum and maximum setpoints. Coordinate with the BAS provider as necessary to obtain required flow parameters.
11. Check the heating device and control to ensure functionality and proper installation. Check stroke and range on the valve and ensure that it closes and seals tightly. Ensure the coils are undamaged, combed, and vented.
12. Ensure any hydronic heating elements are properly vented and that any associated strainers are clean.
13. Verify the integrity of any vibration isolation devices.
14. Verify that thermostats or temperature sensors are in a proper location to adequately represent space temperature. Verify temperature sensors not scheduled to be installed are secured properly on the top of the unit
15. Temporary Closure: Verify VAV terminal units which are not scheduled to operate are provided temporary closure of polyethylene film or other covering that will prevent entrance of dust and debris unit is scheduled to **operate**

W. Air Handling Units:

1. Manufacturer's Field Inspection or Custom Units: Arrange and pay for a factory-authorized service representative to inspect the field assembly of components and installation of custom air-handling units including piping, ductwork, and electrical connections.
2. Ensure that all O&M data for all components is provided and available at the Project Site.
3. Ensure that all access doors are provided and that they swing against pressure.
4. Check that all required service receptacles and light fixtures are installed and operating.
5. Clean unit cabinet interiors to remove foreign material and construction dirt and dust. Ensure that volatile irritants are contained and kept out of occupied spaces.
6. Vacuum clean the fan wheel, fan cabinet, and entering air face of coils.
7. Adjust and lubricate dampers and linkages for proper damper operation.
8. For field fabricated units, ensure the components are properly connected within acceptable tolerances.
9. Check that all sound attenuating devices are clean and properly installed.
10. Verify temperature sensing elements are secured properly with correct support devices as recommended by manufacturer.

11. Verify any high static cut out switches are properly installed with copper tubing, calibrated, tagged with trip set point, and wired.
12. Verify low temperature detection switches are hard wired interlocked to turn off fan and close OA damper.
13. Seal all penetrations air tight and ensure access doors seat tightly. Pressure tests the units to verify that they meet specified leakage.
14. Verify that the unit is secure on mountings and supporting devices and that connections for piping, ductwork, and electrical are complete. Verify that proper thermal overload protection is installed in motors, starters, and disconnects.
15. Ensure vibration isolation integrity is maintained throughout the air handling unit installation and the connections to it.
16. Refer to AC Motors in this Section.
17. Refer to Fans in this Section.
18. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align belts, and install belt guards.
19. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
20. Comb coil fins.
21. Inspect coil piping connections and ensure that they are per the Contract Documents. Validate that all thermometers, pressure gauges, test ports, and balancing device connections are provided, accessible, and not plugged.
22. Install clean filters. Provide new filters at completion of Functional Performance Tests.
23. Ensure that condensate drains properly and that the trap is adequate.
24. Stroke all valves and dampers to ensure free and full travel.
25. Pressure test units as required in the air handling unit Specification.
26. Refer to Division 25, BAS Commissioning, for procedures on starting controls related to air handling units.

X. Fans – General Across Systems:

1. Manufacturer's Field Inspection: Arrange and pay for a factory-authorized service representative to inspect the field assembly of components and installation of fans including ductwork, and electrical connections.
2. Clean unit cabinet interiors to remove foreign material and construction dirt and dust. Ensure that volatile irritants are contained and kept out of occupied spaces.
3. Vacuum clean the fan wheel, fan cabinet, and entering air face of coils.
4. Adjust and lubricate dampers and linkages for proper damper operation.

5. Verify that the unit is secure on mountings and supporting devices and that connections for ductwork and electrical are complete. Verify that proper thermal overload protection is installed in motors, starters, and disconnects.
6. Ensure that vibration isolation integrity is maintained with the fan installation and connections to the fan.
7. Refer to AC Motors in this Section.
8. Properly align and tension all belts. Record tensioning parameters in the Prefunctional Checklists.
9. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align belts, and install belt guards.
10. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
11. Stroke all dampers to ensure free and full travel.
12. Refer to Division 25, BAS Commissioning, for procedures on starting controls related to fans.

Y. Energy Recovery Wheels:

1. Manufacturer's Start-up: Arrange and pay for a factory-authorized service representative to inspect the field assembly of components and installation of wheel, drive, controls, and electrical connections.
2. Start-up Checks: Perform the following checks before Start-up and as specified in manufacturer's Start-up instructions.
 - a. Check for damage to the wheel and that media and ensure media is evenly/thoroughly impregnated.
 - b. Ensure that the wheel rotates freely.
 - c. Ensure that all drive components are correctly installed, aligned, and lubricated.
 - d. Ensure that air seals are tight and properly installed and that purge angles are set per the manufacturer's recommendations.
 - e. Meet and coordinate with the BAS Provider to review the application for proper control of the wheel and interface of hardware.
 - f. Verify that all controls are in place and that they are properly interfaced.
 - g. Energize circuits:
 - 1) Check belt installation, tension, and alignment.
 - 2) Check for proper rotation in all modes of operation.
 - 3) Start and run the wheel through complete sequence of operations.
 - 4) Measure and record the sensible and latent recovery efficiency.
 - 5) Measure and record air pressure drop.
 - 6) Estimate purge volume.

- 7) Check all interfaces to the BAS.
- 8) Adjust operating controls.
- 9) Provide services of an independent testing agency to test the cross contamination. Document all procedures and results.

Z. Air Cleaning:

1. Inspect installation and check for air leakage of unfiltered air while system is operating.
2. Check access for filter installation.
3. Check that filter efficiencies are per the Specifications.
4. Validate that airflow is adequately even across the face.
5. Provide new filters as required throughout construction and provide new filters at the completion of functional **testing**.

AA. Metal Ductwork:

1. Inspect all ductwork for damage and dents and correct any deficiencies.
2. Check ductwork system to ensure that all required dampers, vanes, access doors, testing ports, and other appurtenances are required per the Contract Documents.
3. Check all penetrations through building elements and ensure tightness and integrity of fire ratings.
4. Leakage Tests: After each ductwork system that is constructed for ductwork pressure classification over 3 inches is completed, test for ductwork leakage in accordance with Section 23 31 00.
5. Clean ductwork internally of dust and debris, unit by unit as it is installed. Clean external surfaces of foreign substances which might cause corrosive deterioration of metal or, where ductwork is to be painted, might interfere with painting or cause paint deterioration.
6. Strip protective paper from stainless steel ductwork surfaces and repair finish wherever the finish has been damaged.
7. Temporary Closure: At ends of ductwork which are not connected to equipment or air distribution devices at the time of ductwork installation, provide temporary closure of polyethylene film or other covering that will prevent entrance of dust and debris until final ductwork connections are to be completed.
8. Check pressure class of ductwork against fan dead head to verify adequacy.

BB. Ductwork Accessories:

1. Inspect and operate installed ductwork accessories to demonstrate compliance with requirements. Test for air leakage while system is operating. Repair or replace faulty accessories, as required to obtain proper operation and leak proof performance.
2. Develop a checkout sheet for all fire dampers. Physically inspect and operate every fire damper.
3. Install fusible links in fire dampers and adjust for proper action.
4. Label access doors in accordance with Contract Documents.

5. Fire Damper Testing: Coordinate with the local authority. For every fire damper, remove the fusible link and verify that the damper operates freely and closes tightly. Reinstall the fusible link.
6. Cleaning: Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's **touch-up paint**.

CC. Building Automation System:

1. Start-Up: Refer to Division 25, BAS Commissioning. This Division requires the manufacturer's authorized representative to Start-up, test, adjust, and calibrate DDC control systems and to demonstrate compliance with Contract Document requirements. This will include verification of sequences, normal and emergency operations, calibration, interfaces, and interlocks, etc.
2. Inspect installation for conformance to manufacturer's requirements.
3. Verify controls for seasonal isolation and for modulation.
4. Verify discharge high limit controls are installed and functioning. Record limit setpoint and operating parameters.

DD. Plate And Frame Heat Exchangers:

1. Inspect installation for conformance to the manufacturer's requirements.
2. Check piping connections to ensure that connections are per the Contract Documents.
3. Verify that all labeling is affixed and that all appurtenances are install and accessible.
4. Confirm that all required O&M documentation is at the Project Site.
5. Verify that plates are tight and that bolts are evenly torqued.
6. Check inlet and outlet terminations to verify that piping is properly connected.

3.02 acceptance criteria

- A. Acceptance criteria for tests are indicated in the Specification Sections applicable to the systems being tested. Unless indicated otherwise, acceptance criteria will be specified with the individual system, equipment, component, or device.

3.03 Training

- A. Training requirements are specified in Division 01 Specifications and in Section 20 08 00 – HVAC/Plumbing/Fire Suppression System Commissioning.

Request for Start-up/FUNCTIONAL PERFORMANCE TEST

(Check applicable request below)

Request for Initial Startup _____

Request for Owner's Demonstration _____

Project: _____ **Project #:** _____**Identification of Equipment or System:** _____

Fire Suppression/Plumbing/HVAC systems Prefunctional
 Checklist and Start-Ups

May 2013

**EXAMPLE - PREFUNCTIONAL CHECKLIST
HVAC Pumps****Project:** _____ **Project #:** _____**Identification of Equipment or System:** _____

Location of Equipment or System: _____

Specification Section: _____ Detail/Drawing Number: _____

Manufacturer / Supplier: _____

This Date: _____ Inspection Requested for (Date): _____

PREFUNCTIONAL CHECKLIST NUMBER: _____

Components Included:

___ Valves, ___ Gauges, ___ Strainer, ___ Vibration isolators, ___ Base

Associated Prefunctional Checklists:

___ Piping, ___ Tubing, ___ Other _____

1. General:

- a. Submittal. The above systems and components integral to this equipment are complete and ready for Functional Performance Tests. The Prefunctional Checklist items are complete and have been checked off only by parties having direct knowledge of the event, as indicated below, respective to each responsible contractor. This Prefunctional Checklist is submitted for approval and is subject to the attached list of outstanding items not completed successfully. Submit a Deficiency Form upon completion of any outstanding or deficient items. None of the outstanding items preclude safe and reliable functional tests being performed.
- b. ___ Deficiency Form attached.
- c. This Prefunctional Checklist does not take the place of the manufacturer's recommended checkout and start-up procedures or report.
- d. Contractors assigned responsibility for sections of the Prefunctional Checklist shall be responsible to ensure that their subcontractors complete and check off their Checklist items.
- e. Prefunctional Checklist items shall be completed as part of start-up & initial checkout, preparatory to functional testing.

Contractor/Entity	Company	Abbreviation
M.D. Anderson Staff		MDACC
Architect/Engineer		A/E
General Contractor / Construction Manager		GC
Mechanical Contractor		MC
Electrical Contractor		EC
Building Automation System Provider		BAS
Test, Adjust, and Balance Firm		TAB
Commissioning Consultant		CA

2.Requested Documentation Submitted:

Specified Requirement		Yes	No	Date to be Submitted
a)	Manufacturer's Product Data including Performance Data and Shop Drawings, as approved by Architect/Engineer			
b)	Required Test Reports and/or Certifications			
c)	Installation and Start-up Manual and Plan			
d)	Wiring Diagrams, Control Schematics and Sequences			
e)	Operating and Maintenance Manual Content for Applicable System			
f)	Equipment List/Matrix			

3.Equipment Verification:

Item	Specified	Submitted	Installed
Manufacturer			
Model Number			
Serial Number			
Service			
GPM			
Head (Ft)			
Motor Horsepower (hp)			
Voltage/Phase			

4. Installation Checks:

a) Unit and General Installation		Yes	No	Comments
1.	Permanent labels affixed			
2.	Housing condition good – no leaks			
3.	Pumps mounted on base			
4.	Alignment appears correct			
5.	Vibration isolation equipment installed and active			
6.	Maintenance access acceptable			
7.	Coupling guard(s) installed			
8.	Pump lubricated			
9.	Instrumentation installed correctly per Contract Documents (thermowells, thermometers, pressure gages, flow meters, transmitters, sensors)			
10.	Equipment clean			

b) Valves and Piping (immediately around pump)		Yes	No	Comments
1.	Pipe fittings complete and pipes properly supported			
2.	Pipe pressure test complete and acceptable			
3.	Flexible pipe installed at pump connections			
4.	Pipes properly insulated			
5.	Pipes properly labeled			
6.	Piping system properly flushed			
7.	Piping system charged			
8.	No leaking evident around fittings or components			
9.	Strainer(s) installed			
10.	Strainer(s) clean			
11.	Valves properly labeled			
12.	Valves installed in proper direction			
13.	Isolation valves open and close			

c) Electrical and Controls		Yes	No	Comments
1.	HOA switch installed and functioning			
2.	Panel power source identified			
3.	Panel labeled with permanent label			
4.	Power disconnect in place and labeled			
5.	Low voltage wiring in separate conduit as 120 vac			
6.	120 vac lightning protection installed			
7.	Low voltage lightning protection installed (underground only)			
8.	Pneumatic devices separated from controller and electronics			
9.	End-of-line devices labeled and wiring tagged per Contract Documents			
10.	Panel devices labeled and wiring tagged per Contract Documents			
11.	I/O devices labeled and wiring tagged per Contract Documents			
12.	Digital inputs and outputs operational			
13.	Controller drawing and point summary log in panel			
14.	All electric connections tight			
15.	Proper grounding installed for components and unit			
16.	Safeties in place and operable			
17.	Starter overload breakers installed and correct size			
18.	Sensors calibrated (see below)			
19.	Control system interlocks hooked up and functional			
20.	All control devices, pneumatic tubing and wiring complete			

d) Variable Frequency Drive		Yes	No	Comments
1.	VFD Prefunctional Checklist complete and approved			

e) Final		Yes	No	Comments
1.	Start-up report completed and attached with this Prefunctional Checklist			
2.	Safeties and safe operating ranges for this equipment have been reviewed and accepted			
3.	Sequence of operation adequately indicates all information			
4.	System is ready for Functional Performance Test			

5. Operational Checks:

a. These checks supplement the manufacturer's list. This is not the Functional Performance Test.

Operational Checks		Yes	No	Comments
1.	Pump(s) rotation correct			
2.	Pump Phase Checks (%Imbalance = $100 \times (\text{avg.} - \text{lowest}) / \text{avg.}$). Imbalance less than 2%?			
3.	All pumps running less than maximum FL amps			
4.	Pump noise and vibration acceptable			
5.	Cavitation exists			
6.	Valves stroke fully and easily			
7.	Specified sequences of operation and operating schedules have been implemented with all variations documented			
8.	Specified point-to-point checks have been completed and documentation record submitted for this system			
9.	Record full load running amps for each pump. Pump No. ____: ____ rated FL amps x ____ svc factor = ____ (Max amps) Pump No. ____: ____ rated FL amps x ____ svc factor = ____ (Max amps) Pump No. ____: ____ rated FL amps x ____ svc factor = ____ (Max amps) Pump No. ____: ____ rated FL amps x ____ svc factor = ____ (Max amps) Pump No. ____: ____ rated FL amps x ____ svc factor = ____ (Max amps) Pump No. ____: ____ rated FL amps x ____ svc factor = ____ (Max amps)			

6. Sensor and/or Actuator Calibration:

a. All field-installed temperature sensors, pressure sensors, and gages, and all actuators and valves on this piece of equipment shall be calibrated. Sensors installed in the unit at the factory with calibration certification provided are not required to be field calibrated.

b. All test instruments have had a certified calibration within the last 12-months: Y / N

c. Sensor/Actuator Verification Table

Sensor or Actuator	Correct Location (Y/N) (1)	Thermometer or Gage Value	BAS Value (2)	Instrument Measured Value (3)	Pass (Y/N)
Discharge Pressure					
Suction Pressure					
Differential Pressure					

- 1) Thermometer/Gage reading is the reading of the permanently mounted instrument on the equipment.
- 2) BAS is the Building Automation System. Instrument = testing instrument.
- 3) 3. All sensors are calibrated within required tolerances ____ YES ____ NO

FINAL SIGN-OFF

Contractors attest that the above items have been verified and meet the requirements of the Contract Documents except as noted on the attached Deficiency form.

EXAMPLE - PREFUNCTIONAL CHECKLIST**Air Handling Units - Modular****Project:** _____ **Project #:** _____**Identification of Equipment or System:** _____

Location of Equipment or System: _____

Specification Section: _____ Detail/Drawing Number: _____

Manufacturer / Supplier: _____

This Date: _____ Inspection Requested for (Date): _____

PREFUNCTIONAL CHECKLIST NUMBER: _____

Components Included:

___ Supply Fan, ___ Return Fan, ___ Cooling Coil(s), ___ Valves, ___ Control Dampers

Associated Prefunctional Checklists:

___ Chilled Water Piping, ___ Hot Water Piping, ___ Exhaust Fans, ___ Terminal Units, ___ VFD, ___ Smoke Dampers, ___ Fire Dampers, ___ Other _____

1. General:

a. Submittal. The above systems and components integral to this equipment are complete and ready for Functional Performance Tests. The Prefunctional Checklist items are complete and have been checked off only by parties having direct knowledge of the event, as indicted below, respective to each responsible contractor. This Prefunctional Checklist is submitted for approval and is subject to the attached list of outstanding items not completed successfully. Submit a Deficiency Form upon completion of any outstanding or deficient items. None of the outstanding items preclude safe and reliable functional tests being performed.

b. ___ Deficiency Form attached.

c. This Prefunctional Checklist does not take the place of the manufacturer's recommended checkout and start-up procedures or report.

d. Contractors assigned responsibility for sections of the Prefunctional Checklist shall be responsible to ensure that their subcontractors complete and check off their Checklist items.

e. Prefunctional Checklist items shall be completed as part of start-up & initial checkout, preparatory to functional testing.

Contractor/Entity	Company	Abbreviation
M.D. Anderson Staff		MDACC
Architect/Engineer		A/E
General Contractor / Construction Manager		GC
Mechanical Contractor		MC
Electrical Contractor		EC
Building Automation System Provider		BAS
Test, Adjust, and Balance Firm		TAB
Commissioning Consultant		CA

2. Requested Documentation Submitted

Specified Requirement		Yes	No	Date to be Submitted
a)	Manufacturer's Product Data including Performance Data and Shop Drawings, as approved by Architect/Engineer			
b)	Required Test Reports and/or Certifications			
c)	Installation and Start-up Manual and Plan			
d)	Wiring Diagrams, Control Schematics and Sequences			
e)	Operating and Maintenance Manual Content for Applicable System			
f)	Equipment List/Matrix			

3. Equipment Verification

Item	Specified	Submitted	Installed
Manufacturer			
Model Number			
Serial Number			
Service			
Sensible Capacity (BTU/hr)			
Total Capacity (BTU/hr)			
Fan CFM (Total)			
Fan Motor Horsepower (hp)			
Voltage/Phase			

4. Installation Checks

a) Unit and General Installation		Yes	No	Comments
1.	Permanent labels affixed			
2.	Casing condition good – no dents, leaks; door gaskets installed			
3.	Access doors close tightly – no apparent leaks			
4.	Flexible duct between unit and rigid duct tight; in good condition			
5.	Vibration isolation equipment installed and active			
6.	Maintenance access acceptable			
7.	Thermal insulation installed properly			
8.	Instrumentation installed correctly per Contract Documents (thermowells, thermometers, pressure gages, flow meters, transmitters, sensors)			
9.	Equipment clean			
10.	Filters clean with correct efficiency or MERV installed			
11.	Filter frame housing installation allows for easy filter replacement			
12.	Filter pressure differential measuring device installed and functional (magnahelic etc.)			
13.	Electronic filtration installed			
14.	Electronic filtration operational			

b) Valves, Piping, and Coils		Yes	No	Comments
1.	Pipe fittings complete and pipes properly supported			
2.	Pipes properly labeled			
3.	Pipes properly insulated			
4.	Piping system properly flushed			
5.	Piping system charged			
6.	No leaking evident around fittings or components			
7.	Coils are clean, fins are in good condition			
8.	Condensate drain pan(s) installed, clean, sloped properly			
9.	Condensate drain line(s) installed and supported correctly			
10.	Control valve and isolation valves installed			
11.	Valves properly labeled			
12.	Valves installed in proper direction			
13.	Isolation valves open and close			
14.	Outside air (OA) temperature, mixed air temperature, supply air temperature, return air temperature, chilled water supply/return sensors properly located and secure (related OA temperature sensor shielded)			
15.	Sensors calibrated (see calibration section below)			
16.	Pressure/temperature plugs and isolation valves installed per Contract Documents			

F

c) Fans and Dampers		Yes	No	Comments
1.	Supply fan and motor alignment correct			
2.	Supply fan belt tension and condition good			
3.	Supply fan protective shrouds for belts in place and secure			
4.	Supply fan area clean			
5.	Supply fan and motor lube lines installed and lubed			
6.	Return fan and motor alignment correct			
7.	Return fan belt tension and condition good			
8.	Return fan protective shrouds for belts in place and secure			
9.	Return fan area clean			
10.	Return fan and motor lube lines installed and lubed			
11.	Exhaust fan Checklists for service area complete			
12.	Smoke and fire dampers installed properly per Contract Documents (proper location, access doors, appropriate ratings verified)			
13.	All isolation and smoke dampers close and seal properly			
14.	All dampers (outside air, return air, supply air) stroke fully without binding			
15.	All damper linkages have minimum play			

d) Duct		Yes	No	Comments
1.	Sound attenuators installed			
2.	Duct joint sealant properly installed			
3.	No apparent severe duct restrictions			
4.	Turning vanes in square elbows as per Contract Documents			
5.	Outside air intakes located away from pollutant sources and exhaust outlets			
6.	Pressure leakage tests completed			
7.	Branch duct control dampers operable			
8.	Ducts cleaned as per Contract documents			
9.	Terminal units installed, Checklist complete			
10.	Balancing dampers installed per Contract Documents and TAB Firm's direction			
11.	Supply and return air devices installed			

e) Electrical and Controls		Yes	No	Comments
1.	HOA switch installed and functioning			
2.	Panel power source identified			
3.	Panel labeled with permanent label			
4.	Power disconnect in place and labeled			
5.	Low voltage wiring in separate conduit as 120 vac			
6.	120 vac lightning protection installed			
7.	Low voltage lightning protection installed (underground only)			
8.	Pneumatic devices separated from controller and electronics			
9.	End-of-line devices labeled and wiring tagged per Contract Documents			
10.	Panel devices labeled and wiring tagged per Contract			

e) Electrical and Controls		Yes	No	Comments
11.	I/O devices labeled and wiring tagged per Contract Documents			
12.	Digital inputs and outputs operational			
13.	Controller drawing and point summary log in panel			
14.	All electric connections tight			
15.	Proper grounding installed for components and unit			
16.	Safeties in place and operable			
17.	Starter overload breakers installed and correct size			
18.	Sensors calibrated (see below)			
19.	Control system interlocks hooked up and functional			
20.	Smoke detectors in place			
21.	All control devices, pneumatic tubing and wiring complete			
22.	All casing wall penetrations including control wiring are properly sealed			

f) Variable Frequency Drive		Yes	No	Comments
1.	VFD Prefunctional Checklist complete and approved			

h) Final		Yes	No	Comments
1.	Start-up report completed and attached with this Prefunctional Checklist			
2.	Safeties and safe operating ranges for this equipment have been reviewed and accepted			
3.	Sequence of operation adequately indicates all information			
4.	Fire/smoke dampers and terminal units are open			
5.	Construction filters installed on return air devices to minimize dirt in ductwork and coils and in any finished areas			
6.	Verification of potential moisture migration has been performed via inspection of wall/building construction and review of operating sequences for all make-up air, outside air, supply, return, and exhaust fans			
7.	System is ready for Functional Performance Test			

5. Operational Checks:

- a. These checks supplement the manufacturer's list. This is not the Functional Performance Test.

Operational Checks		Yes	No	Comments
1.	Supply fan rotation correct			
2.	Fans > 5 Hp Phase Checks (%Imbalance = 100 x (avg. – lowest) / avg.). Imbalance less than 2%?			
3.	All fans running less than maximum FL amps			
4.	Return fan noise and vibration acceptable			
5.	Supply fan has no unusual noise or vibration			
6.	Valves stroke fully and easily			
7.	Valves verified not to leak through coils when closed at normal operating pressure			
8.	The HOA switch properly activates and deactivates the unit			
9.	Specified sequences of operation and operating schedules have been implemented with all variations documented			
10.	Specified point-to-point checks have been completed and documentation record submitted for this system			
11.	Record full load running amps for each pump. SF Fan No. ____: ____ rated FL amps x ____ srvc factor = ____ (Max amps) SF Fan No. ____: ____ rated FL amps x ____ srvc factor = ____ (Max amps) SF Fan No. ____: ____ rated FL amps x ____ srvc factor = ____ (Max amps) RF Fan No. ____: ____ rated FL amps x ____ srvc factor = ____ (Max amps) RF Fan No. ____: ____ rated FL amps x ____ srvc factor = ____ (Max amps) RF Fan No. ____: ____ rated FL amps x ____ srvc factor = ____ (Max amps)			

6. Sensor and/or Actuator Calibration:

- a. All field-installed temperature sensors, pressure sensors, and gages, and all actuators and valves on this piece of equipment shall be calibrated. Sensors installed in the unit at the factory with calibration certification provided are not required to be field calibrated.
- b. All test instruments have had a certified calibration within the last 12-months: Y / N
- c. Sensor/Actuator Verification Table (AHU in Operation)

Sensor or Actuator	Correct Location (Y/N) (1)	Thermometer or Gage Value	BAS Value (2)	Instrument Measured Value (3)	Pass (Y/N)
Supply air discharge					
Return air					
Outside air					
CHWR (at AHU)					
CHWS (at AHU)					
Duct SP (at SA discharge)					
CHW Control Valve Position					
HWR (at AHU)					
HWS (at AHU)					
HW Control Valve Position					

1. Thermometer/Gage reading is the reading of the permanently mounted instrument on the equipment.
2. BAS is the Building Automation System. Instrument = testing instrument.
3. All sensors are calibrated within required tolerances ____ YES ____ NO

Service			
Capacity (CFM)			
Maximum CFM			
Minimum CFM			
Fan Motor Horsepower (hp)			
Fan Voltage/Phase			
Electric Heat (kW) if applicable			

4. Installation Checks

a) Unit and General Installation		Yes	No	Comments
1.	Permanent labels affixed			
2.	Permanent label affixed within building space identifying location			
3.	Casing condition good – no dents, leaks; door gaskets installed			
4.	Access doors close tightly – no apparent leaks			
5.	Hard duct connecting high/medium pressure duct to unit			
6.	Vibration isolation equipment installed and active			
7.	Maintenance access acceptable			
8.	Sound attenuation installed properly			
9.	Instrumentation installed correctly per Contract Documents			
10.	Equipment clean			

b) Heating Coil		Yes	No	Comments
1.	Pipe fittings complete and pipes properly supported			
2.	Pipes properly labeled			
3.	Pipes properly insulated			
4.	No leaking evident around fittings or components			
5.	Coils are clean, fins are in good condition			
6.	Valves properly labeled			
7.	Control valve installed and wired properly			
8.	Valves installed in proper direction			

c) Fans and Dampers		Yes	No	Comments
1.	Fan and motor alignment correct			
2.	Fan area clean			
3.	Fan responds to temperature sensor settings			
4.	Damper installed properly			
5.	Damper closes and opens properly			
6.	Damper linkages have minimum play			

d) Electrical and Controls		Yes	No	Comments
1.	Temperature sensor location accessible for maintenance			
2.	Temperature sensor not damaged			
3.	Temperature sensor labeled with respect to terminal unit and air handler			
4.	Panel power source identified			
5.	Power disconnect for electric heating coil and/or fan in place and labeled			
6.	Panel devices labeled and wiring tagged per Contract Documents			
7.	I/O devices labeled and wiring tagged per Contract Documents			
8.	Digital inputs and outputs operational			
9.	Controller drawing and point summary log in panel			
10.	All electric connections tight			
11.	Proper grounding installed for components and unit			
12.	Safeties in place and operable			

13.	Sensors calibrated (see below)			
14.	Control system interlocks hooked up and functional			
15.	All control devices and wiring complete			
16.	All control devices, pneumatic tubing and wiring complete			

f) Variable Frequency Drive		Yes	No	Comments
1.	VFD Prefunctional Checklist complete and approved			

h) Final		Yes	No	Comments
1.	Start-up report completed and attached with this Prefunctional Checklist			
2.	Safeties and safe operating ranges for this equipment have been reviewed and accepted			
3.	Sequence of operation adequately indicates all information			
4.	Terminal unit damper open			
5.	System is ready for Functional Performance Test			

5. Operational Checks

a. These checks supplement the manufacturer's list. This is not the Functional Performance Test.

Operational Checks		Yes	No	Comments
1.	Actuated damper(s) responds to sensor temperature settings			
	Fan rotation correct			
2.	Record full load running amps for fan:			
	Fan No. ____: ____ rated FL amps x ____ srvc factor = ____ (Max amps)			
3.	Fan running less than maximum FL amps			
4.	Fan noise and vibration acceptable			
5.	Fan responds to temperature sensor settings			
6.	Heating coil responds to temperature sensor settings			
8.	Disconnected switch properly activates and deactivates the heating coil			
9.	Specified sequences of operation and operating schedules have been implemented with all variations documented			
10.	Specified point-to-point checks have been completed and documentation record submitted for this system			

6. Sensor and/or Actuator Calibration:

All field-installed temperature sensors, pressure sensors, and gages, and all actuators and valves on this piece of equipment shall be calibrated. Sensors installed in the unit at the factory with calibration certification provided are not required to be field calibrated.

B .All test instruments have had a certified calibration within the last 12-months: Y / N

c. Sensor/Actuator Verification Table

Sensor or Actuator	Correct Location (Y/N) (1)	Thermometer or Gage Value	BAS Value (2)	Instrument Measured Value (3)	Pass (Y/N)

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 20 08 16 00 - HVAC/ PLUMBING/FIRE SUPPRESSION SYSTEMS FUNCTIONAL PERFORMANCE TESTS**GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. This Section expands on and defines responsibilities of the Contractor in regards to Functional Performance Tests (FPT's) of the Commissioning process.
- B. Contractor shall oversee the Commissioning activities with the Contractor's Subcontractors and the Architect/Engineer (A/E).
- C. Prefunctional Checklists, tests and Start-ups are to be completed and documented for the record prior to commencing with FPT's. Refer to Section 20 08 00 and 20 08 13 for additional requirements.
- D. Completed FPT Forms for all pieces of equipment and systems shall be submitted to The University prior to Substantial Completion.
- E. Refer to Attachments A and B at the end of this Section for example forms that indicate level of documentation required for the Commissioning process.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.04 SUBMITTALS

- A. Maintain and use an action item tracking system, "Action Item List," that indicates as a minimum, required information, identified deficiencies, work required, etc.). Each item shall be tracked with the initiator, the parties responsible, due date, the date of closure, and a description of the resolution. Each item shall be categorized for sorting and tracking and for documentation on applicable forms. Action Item List shall be distributed and documented using Microsoft Excel or a database format approved by Owner.
- B. Disseminate this list as appropriate to keep all parties involved with the FPT informed.
- C. Functional Performance Test procedure forms must include the following:
 - 1. System and equipment or component name(s).

2. Equipment location and identification number as identified in the Equipment List/Matrix described in Division 01.
3. Unique test identification number and reference to unique Prefunctional Checklist and Start-up Documentation Identification Numbers for the equipment.
4. Date and time of test.
5. Project name.
6. Participating parties.
7. Specific sequence of operation or other specified parameters, including performance data being verified.
8. Instructions for setting up a Functional Performance Test.
9. Specific script-type, step-by-step procedures to perform a Functional Performance Test, in a clear, sequential and repeatable format that is customized for the system being tested.
10. A Yes/No checkbox (or data entry box as appropriate) for clearly indicating whether or not proper performance of each part of a Functional Performance Test was achieved with space for actual readings.
11. Section for comments.
12. Signatures and date block for participants and Owner approvals.

D. Refer to Division 01 and 20 08 00 for additional documentation requirements.

PRODUCTS

1.05 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

1.06 TEST EQUIPMENT

- A. Refer to Section 20 08 00 – HVAC/Plumbing/Fire Suppression System Commissioning.

EXECUTION

1.07 PREPARATION

- A. The objective of FPT's is to demonstrate that each system operates according to the Contract Documents through all specified modes of operation.
- B. Contractor shall operate each system through all modes of operation (occupied, unoccupied, warm-up, cool-down, etc.) where there is a specified system response. Verification of each sequence in the sequences of operation is required.
- C. All equipment, components and devices applicable to the FPT must be started and this Start-up must be documented. This documentation includes completion of the Prefunctional Checklists, pressure testing of equipment, duct, pipe, etc., flushing/cleaning of applicable systems, completed labeling and identification, completed insulation of applicable systems, etc. Refer to Section 20 08 13 for additional Prefunctional Checklist and Start-up requirements.

- D. Unless specifically agreed to by the Commissioning Team, all support systems shall be complete prior to FPT.
 - 1. The electrical system serving it is completed and tested.
 - 2. The hydronic systems serving it have been balanced and FPT completed.
 - 3. Balancing has been accomplished on the air and water sides.
 - 4. The building automation system (BAS) has been started and calibrated.
- E. Commissioning Team members shall assist in development and review of the optimal sequence of testing.

1.08 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

1.09 FUNCTIONAL PERFORMANCE TEST PROCEDURES

- A. The purpose of a Functional Performance Test is to verify and document compliance with the stated criteria of acceptance. Contractor shall develop specific script-type test procedures and associated test forms to verify and document proper operation of each piece of equipment and system.
- B. Contractor shall operate, or cause to be operated, each system, device, or equipment item, both intermittently and continuously, for a duration period as indicated in the Specification Section(s) for such item and/or in accordance with the manufacturer's written recommendations, the Contract Documents, and the Commissioning Plan.
- C. Contractor shall operate each component device and each building system to the full extent of its capability, from minimum to maximum, and under automatic control and manual control.
- D. Contractor and manufacturer's representatives shall supervise and coordinate adjustments and balancing of all devices and systems for proper operation prior to requesting the Functional Performance Test(s).
- E. Where final balancing of a system is to be performed by Owner or Owner's consultants, such as final air balancing, Contractor shall provide all services indicated in the applicable Technical Sections and under this Section, including the following prior to Owner's final balancing:
 - 1. Operational verification of all component devices and the total system, including automatic controls when applicable. Operational verification includes verification that all motors, fans, dampers, and other operable devices are performing in compliance with Specifications throughout their operable range and that all devices are controlled as described in the specified sequence of operation.
 - 2. All tabulated data, motor amperage readings, valve tag verifications, and other data required by Technical Specifications.
- F. Where final balancing of a system or particular components of a system are not specifically indicated to be performed by Owner or Owner's consultants, Contractor shall provide final balancing and adjustments for operation within specified tolerances prior to Functional Performance Test of such system.

- G. Sampling: Some types of identical equipment (such as terminal devices) will be tested using a sampling strategy. The sample percentage is indicated below. [Insert equipment list and sampling percentage.]
- H. Failure Limit on Sample Tests: With the sampling percentages is listed a failure limit. This limit indicates the maximum percentage of the tested devices that may have any test that fails before an entirely new sample must be tested. When the maximum number of failures is reached, testing on that sample will be terminated and re-testing will be scheduled.
 - 1. Where sample tests involve multiple systems (i.e.: Checking strainers on different hydronic systems) the maximum failure limit will apply per system.
- I. Deferred Tests: Contractor shall schedule with The University and complete Deferred Tests as part of this Contract during the Warranty Period. Testing procedures shall be repeated and/or conducted as necessary during appropriate seasons. Deferred or "Opposite season" tests will be required where scheduling prohibits thorough testing in all modes of operation. Air Handler and central heating system testing for heating related modes of operation and control loops shall be tested during outside air temperatures below 50 degrees F. Air handler and central cooling system testing for cooling related modes of operation and control loops shall be tested during outside air temperatures above 85 degrees F.
- J. Provide and deliver the required submitted documentation convenient to testing area. Validate that all required documentation has been submitted to The University and is per the Contract Document requirements.
- K. Review the Start-up documentation at the start of FPT's. Ensure that any items indicated as outstanding in the Prefunctional Checklist is entered as an Action Item and enter one if it is not. The Prefunctional Checklists and Start-up tests/measurements shall be spot checked at the beginning of FPT's to ensure accuracy. Complete a test that indicates Contractor has reviewed the Prefunctional Checklists and finds the Prefunctional Checklists acceptable and notes any outstanding items.
- L. Check for and as applicable direct the Subcontractor to demonstrate that access is sufficient to perform required maintenance.
- M. Validate that all prerequisite work is complete and confirm this validation via a test record for documentation.
- N. Specifically check labeling and ensure conformance to the Contract Documents.
- O. Analyze trends of the system operating parameters to evaluate normal system functionality. The trending requirements are specified in the BAS Commissioning Specification, however all systems must be trended and reviewed prior to and as part of functional performance trending. Subcontractor shall establish these trends, ensure they are being stored properly, and forward the data in electronic format to the Contractor. Analyzed trends shall be organized and/or grouped in a manner that clearly demonstrates the individual components of a piece of equipment is under total control and display this information together. The trend group data shall be labeled with the system name or the purpose of the trend group or data and submitted in a Microsoft Excel spreadsheet.
- P. Check proof indication, alarming on failure and restart/acknowledgement as applicable.
- Q. Observe operating conditions encountered at the start of the FPT. Contractor shall examine for normal functionality and record parameters as a test.
- R. All dynamic systems powered by electricity shall be tested to simulate a power outage to ensure proper sequencing. Those on emergency power or uninterruptible power shall be tested on all sources. This test shall generally be coordinated with electrical power systems testing addressed in the Contract Documents.

1. Emergency power tests for mechanical systems will be conducted in concert with the testing of the emergency power systems. Testing Contractor shall be available for the power outage test to test their systems under a power outage. This is in addition to the requirement specified by system.
- S. Inspect the installation and compare it to the Contract Documents. Record the inspection as a test.
- T. Capacities and adjusted and balanced conditions as applicable will generally be checked.
- U. Verify all sequence modes and sequences of operation. Contractor must initiate all modes and may not refer to or rely on a Prefunctional Test done by the building automation system. Some examples of generic modes that apply to most systems include:
 1. Off mode.
 2. Failed mode: Proof, safeties, power outage etc. See below for crash testing.
 3. Start sequence in various modes.
 4. Stop sequences in various modes.
- V. All adjusted, balanced, controlled systems shall be assessed to determine the optimal setting for the system as applicable. The optimal settings should be determined to establish reliable, efficient, safe and stable operation. The Contractor is responsible for placing systems in optimal condition for occupancy and not simply relying on initial design estimated settings.
- W. Dynamic Graphics: The graphic for all components, systems, and areas sampled and required to be represented by a graphic shall be checked for adequacy and accuracy. Furthermore, when setpoints are required to be adjustable, verify that they can be adjusted directly from the graphic screen.
- X. All interfaces between two systems or equipment of different manufacturers must be checked for accuracy and functionality.
- Y. Contractor shall to the extent possible, load the heating and cooling systems during initial FPT's to check the capacity of the building central systems and initially optimize system settings. This will typically be done using the preheat system to false load the cooling system. This test will incorporate varying the load to check central systems response.
- Z. "Crash Testing": Contractor shall analyze systems to identify possible conditions where functionality may be compromised. Contractor shall design non-destructive tests that will demonstrate either the automated response to the conditions or so that team can identify the best method for responding or fixing the condition. All tests and their findings shall be documented in a Microsoft Excel spreadsheet.

1.10 PARTICIPATION

- A. Required participating parties are indicated with the individual tests. Typically, multiple parties are required for any given test, yet participation for any given party is only required for the respective portion of the test for which the party is responsible. In many cases, the maximum required time in hours is indicated in parenthesis for any given test. The time is typically per unit system unless indicated otherwise. If no time is indicated, participation is required throughout the entire test.
- B. Frequently, on multiple samples where a given party does not directly conduct the test, the participation of that party will only be required for an initial quantity of systems/equipment. It is required that the parties be available on-site throughout the testing of any given system for which they are required participants. Therefore time for which they are not directly involved can be spent performing other work (typically addressing identified punch list items or failed test).

- C. No party involved with the Project is prohibited from participation in or witnessing of any tests. Any Subcontractor may elect to witness all tests on their systems even if their involvement is not directly required.
- D. Coordinate effectively with the individual Subcontractors throughout the development and execution of FPT's and maximize Subcontractors' involvement.

1.11 NON-CONFORMANCE

- A. Record results of Functional Performance Tests. Contractor shall report all deficiencies and non-conformance issues to Owner on the Functional Performance Test report form and in a Commissioning deficiency report.
- B. At the sole discretion of Owner, Owner may permit the Contractor to make corrections of minor deficiencies observed during a Functional Performance Test. However, the Contractor must document the deficiency and resolution on the appropriate report form.
- C. Contractor and Owner will attempt to resolve deficiencies in the following manner:
 - 1. When there is no dispute about a deficiency and Contractor accepts responsibility for correction.
 - a. Contractor documents the deficiency and the corrective actions, and then proceeds to another test or sequence. Contractor submits a deficiency report to Owner. Contractor corrects the deficiency, completes the statement of correction form certifying that the equipment or system is ready for retesting, and sends the certification to Owner.
 - b. Contractor reschedules test with Owner.
 - 2. When there is a dispute about whether or not the test indicates a Deficiency, or the Contractor's responsibility for the correction of the apparent Deficiency.
 - a. Contractor documents the apparent Deficiency and proceeds to another test or sequence. Contractor submits a Deficiency report to Owner, including the apparent Deficiency.
 - b. Contractor facilitates resolution of Deficiency and provides recommendations to The University. Contractor and Owner may bring other parties into the discussions as needed. Final technical interpretive authority is with the Architect/Engineer. Final acceptance authority is with The University.
 - c. Contractor documents resolution process.
 - d. If Owner agrees with Contractor's interpretation and proposed resolution, Contractor forwards response to Owner. Contractor reschedules test with Owner. Contractor must repeat this process until satisfactory performance and Owner's approval is obtained.

1.12 ACCEPTANCE CRITERIA

- A. Acceptance criteria for tests are indicated in the Specification Sections applicable to the systems being tested. Unless indicated otherwise, acceptance criteria will be specified with the individual system, equipment, component, or device.

**EXAMPLE – FUNCTIONAL PERFORMANCE TEST
HVAC Pumps**

Project: _____ **Project #:** _____

Identification of Equipment or System: _____

Location of Equipment or System: _____

Specification Section: _____ **Detail/Drawing Number:** _____

Manufacturer / Supplier: _____

This Date: _____ **Time of Test:** _____

FUNCTIONAL PERFORMANCE TEST PROCEDURE NUMBER: _____

PREFUNCTIONAL CHECKLIST NUMBER: _____

Components Included:

___ VFD for pump, ___ Heat Exchanger, ___ Other _____

Other Related Functional Performance Tests: _____

1. General:

- a. This Functional Performance Test is submitted for approval and is subject to the attached list of outstanding items not completed successfully. Submit a Commissioning Deficiency Report upon completion of any outstanding or deficient items. None of the outstanding items preclude safe and reliable functional tests being performed.
- b. ___ Commissioning Deficiency Report attached.

2. Participants:

Name	Company	Role/Participation

3. Functional Performance Test Prerequisites:

Specified Requirement		Yes	No	Date to be Submitted
a)	The Prefunctional Checklist for this system is complete and approved			
b)	The Prefunctional Checklist for the pump variable frequency drive system is complete and approved			
c)	The Prefunctional Checklist for the air handling unit related to this pump variable frequency drive system is complete and approved			
d)	All Architect/Engineer punchlist items for this system and related equipment have been addressed and corrected			
e)	Sequence of operation is attached			
f)	Test, adjust, and balance (TAB) completed and approved for the associated systems			
g)	TAB report provided			
h)	Design setpoint information included on forms			
	Controls:			
	i) DDC loops operational, temperature/pressure setpoints met without hunting			
	ii) Master transmission diagram is updated on device graph			
	iii) Graphic programming is complete and operational			
	iv) System communicates with main controller			
	v) Pump is set to design/final setpoints			
i)	vi) Local reading of setpoints agree with remote readings			
	These Functional Performance Test procedures have been reviewed and approved by installing contractor and applicable subcontractors			

4. Functional Performance Test Procedure:

Step	Mode	Test Procedure	Expected Response	Pass	
				Yes	No
1	Pump Off	Standby check. HOA in Auto position. Unit commanded Off by BAS.	Verify by visual inspection that: a) Discharge gauge pressure equals suction gauge pressure. b) No rotation of pump shaft. c) Pump light indication shows pump is off. Pump indication shows pump as being Off at the BAS.		
2	Pump Start-up	HOA in Auto position. Unit commanded On by BAS.	Verify by visual inspection that: a) Discharge gauge pressure greater than suction gauge pressure. b) Rotation of pump shaft. c) Pump light indication shows pump is on. Pump indication shows pump as being On at the BAS.		
3	Pump Operation	HOA in Auto position. Test results are recorded in table.	Verify by local and remote reading that test results correspond with TAB report and sequence of operation as described in the Contract Documents.		
4	Simulate Pump Overload Trip	HOA in Auto position. Test results are recorded in table.	BAS indicates an alarm for Pump Trip condition.		
5	Simulate Loss of Pump Flow	HOA in Auto position. Test results are recorded in table. Isolate DP switch across suction and discharge of pump and open sensing line vent valves to relieve pressure across DP switch.	BAS indicates an alarm condition for Loss of Pump condition.		

5. Comments:

FINAL SIGN-OFF

Contractors attest that the above items have been verified and meet the requirements of the Contract Documents except as noted on the attached Commissioning Deficiency Report.

EXAMPLE – FUNCTIONAL PERFORMANCE TEST
Air Handling Units - Modular

Project: _____ **Project #:** _____

Identification of Equipment or System: _____

Location of Equipment or System: _____

Specification Section: _____ **Detail/Drawing Number:** _____

Manufacturer / Supplier: _____

This Date: _____ **Time of Test:** _____

FUNCTIONAL PERFORMANCE TEST PROCEDURE NUMBER: _____

PREFUNCTIONAL CHECKLIST NUMBER: _____

Components Included:

___ VFD for AHU, ___ Return Fans (RF), ___ Outside Air Handling Unit, AHU _____,
 Other _____

Other Related Functional Performance Tests: _____

1. General:

- a. This Functional Performance Test is submitted for approval and is subject to the attached list of outstanding items not completed successfully. Submit a Commissioning Deficiency Report upon completion of any outstanding or deficient items. None of the outstanding items preclude safe and reliable functional tests being performed.
- b. ___ Commissioning Deficiency Report attached.

2. Participants:

Name	Company	Role/Participation

3. Functional Performance Test Prerequisites:

Specified Requirement		Yes	No	Date to be Submitted
a)	The Prefunctional Checklist for this system is complete and approved			
b)	The Prefunctional Checklist for the following systems and components are complete and approved:			
	i) Chilled water system			
	ii) Chilled water piping and valves			
	iii) Condenser water pumps			
	iv) Cooling towers			
	iii) Associated terminal units			
	iv) Variable frequency drives for associated pumps			
c)	All control system functions for this and all interlocking systems are programmed and operable per the Contract Documents including final setpoints and schedules with debugging, loop tuning, and sensor calibrations completed.			
d)	Piping system flushing complete and required test reports approved			
e)	Water treatment system complete and operational			
f)	Vibration control report approved			
g)	Test, adjust, and balance (TAB) completed and approved for the hydronic systems and associated terminal units.			
h)	TAB report provided			
i)	All Architect/Engineer punchlist items for this system and related equipment have been addressed and corrected			
j)	Safeties and operating ranges reviewed			
k)	Sequences of operation is attached			
l)	Schedules and setpoints attached			
m)	False loading equipment, system, and procedures ready (boilers, preheat or reheat coils, control loops, override on outside air (OSA) dampers, etc.)			
n)	Have all energy savings control strategies, setpoints, and schedules been incorporated that this equipment and control system are capable of? If not, list recommendations below:			
o)	Control Program Review: Review the software control program(s) for this equipment. Parameters, setpoints, and logic sequences appear to follow the specified written sequences.			
p)	These Functional Performance Test procedures have been reviewed and approved by installing contractor and applicable subcontractors			

4.

5. Current Setpoints for Functional Performance Test Procedure:

- c. Record all values for current setpoints (SP), control parameters, limits, delays, lockouts, schedules, etc., changed to accommodate testing.

Parameter	Pre-Test Values	Returned to Pre-Test Values ¹	Parameter	Pre-Test Values	Returned to Pre-Test Values ¹
Discharge air static pressure (SP)			Building static pressure		
Discharge air temp.			Dirty filter D.P.		
Static P. reset schedule			OSA CFM		
Discharge air reset schedule					

6. Sensor Calibration Checks:

- d. Check the sensors listed below for calibration and adequate location. This is a sampling check of calibrations done during Prefunctional Checklist.
- e. "In calibration" means making a reading with a calibrated test instrument within 6 inches of the site sensor. Verify that the sensor reading (via the permanent thermostat, gage, or building automation system (BAS)) compared to the test instrument-measured value is within the tolerances specified in the Prefunctional Checklist requirements (_____). If not, install offset in BAS, calibrate or replace sensor. Use the same test instruments as used for the original calibration, if possible.

Sensor & Location	Location OK ¹	1st Gage or BAS Value	Instr. Meas'd Value	Final Gage or BAS Value	Pass Y/N?
DAT					
RAT					
OSAT					

Sensor & Location	Location OK ¹	1st Gage or BAS Value	Instr. Meas'd Value	Final Gage or BAS Value	Pass Y/N?
Dis-charge SP					

¹Sensor location is appropriate and away from causes of erratic operation.

7. Device Calibration Checks:

- f. The actuators or devices listed below checked for calibration. This is a spot check on a sample of calibrations done during Prefunctional Checklist and start-up.
- g. "In calibration" means observing a readout in the BAS and going to the actuator or controlled device and verifying that the BAS reading is correct. Fix items out of calibration or adjustment, via an offset in the BAS, or a mechanical fix.

Device or Actuator & Location	Procedure / State	1st BAS Value	Site Observation	Final BAS Reading	Pass Y/N
Cooling coil valve (CCV) position or command and stroke*	1. Intermediate positions				
	2. Full open				
	3. Increase pressure (open)				
	4. Closed				
	5. Remove power or air (closed)				
Relief damper position **	1. Closed				
	2. Full open				
Mixed air damper position **	1. Closed				
	2. Full open				
Main OSA damper position**	1. Closed				
	2. Full open				
Min. OSA damper position**	1. Closed				
	2. Full open				
Variable frequency drive speed (VFD)***	1. Min.: _____ %				
	2. Max.: _____ %				

* Set pumps to normal mode. Procedure 1. Command valve to a few intermediate positions. Verify that readings in BAS reasonably correspond to the actual positions. For cooling coil valves (NO): Procedure 2. Lower space setpoint to 20 deg. F. below space temperature. Verify BAS reading says CCV is 100% open. Visually verify valve is 100% open. Procedure 3. For pneumatic actuators, by override in the BAS, increase pressure to valve by ____ psi (do not exceed actuator rating). Verify valve stem and actuator position does not change. Restore to normal. Procedure 4. Set space setpoint to 20F above space temperature. Verify BAS reading says CCV is closed. Visually verify valve is closed. Procedure 5. Remove control air or electricity from the valve and verify that the valve stem and actuator position do not change.

** 1. Command damper closed and verify that damper is shut and BAS reads shut.
 2. Do the same, commanding damper fully open.

*** VFD: Procedure 1. Lower the controlling static pressure setpoint (duct or discharge) to be 1/4 of its current value. Verify that the vanes are shut, or fan speed is at minimum for VFD and packaged controller reads the same. Return the static pressure setpoint to normal. Procedure 2. Lower the space temperature setpoint to be 20F below space temperature and cause TU dampers to go to full cooling. Raise the static pressure setpoint as necessary to cause the setpoint to not be met. Verify that the inlet vanes are fully open or the fan speed is at its maximum and verify that the packaged controller reads the same. Return all to normal.

NOTES:

8. Functional Performance Test Procedure:

Step¹	Mode²	Test Procedure³	Expected Response⁴	Pass	
				Yes	No
1	Fan Off	Standby check with units commanded Off by BAS.	Verify by visual inspection that: 1. Return Air Dampers to AHU- are Open. 2. Outside Air Dampers in AHU- are Closed. 3. Isolation Dampers on AHU- are Closed. 4. Relief Dampers in RF- are Closed. 5. Cooling Coil Valve on Cooling Coil of AHU- is Closed.		
2	Unit Start-up	With units commanded on by BAS.	1. Supply Fan Isolation Dampers Open in AHU- 2. Supply Fan start through VFDs 3. Supply Fan Isolation Dampers in AHU- Open 4. AHU- Fans Start 5. RF- Isolation Dampers Open 6. RF- Fans start through VFDs 7. Exhaust Fans EF- start.		
3	RF Volume Control	1. Verify RF Volume, utilizing airflow meters in Return Fans RF____, Supply Fans in AHU-____and Garage ExhaustFan EF-1, and TAB established CFMs for Exhaust Fans EF-__, and ___, TAB established Fixed Differential, make the following calculation: (Return Air Flow=Supply Air Flow, -EF-1and2 Flow, -SF1 Flow-Fixed Differential} 2. Trend Log RF____, AHU____, and SF-1 airflow rates at 5 min. intervals. Command off EF-1 and 2 sequentially at 5 min. Intervals.	Verify that RF airflow meter readings correspond to calculation. Verify that RF airflow meter readings continue to correspond to calculation		
4	Duct	Disable Duct Static Pressure	Verify that VFD's modulate as		

Step ¹	Mode ²	Test Procedure ³	Expected Response ⁴	Pass	
				Yes	No
	Static Pressure Control	Reset utilizing BAS Software. Adjust space temperature setpoint on significant quantity of zones to be well below observed reading.	required to maintain SP setpoint without hunting or overshooting setpoint.		
5	High Static Pressure Alarm and Shutdown	With units running at low flow condition, utilizing a squeeze bulb, simulate an increase in discharge air static pressure.	Verify that BAS indicates an alarm condition at ____ °WG and shuts fans down at ____ °WG		
6	Static Pressure Reset	1. For Perimeter Terminal Units on floors 9-16, Reset space temperature setpoints to be below space temperatures. Utilizing BAS trend logging capabilities, Record at 5 min. intervals, Discharge Air SP Spt, Perimeter TU Units in saturation. 2. Reset space temperature setpoints to be above space temperatures. Utilizing the same Trending as above, Record the same data points.	Verify that DA SP Spts increase by ____ °WG at ____ min intervals until only one Perimeter TU remains in saturation. Verify that setpoints are met and maintained without excessive hunting. Verify that DA SP Spt decreases by ____ °WG at ____ min intervals until one Perimeter TU reaches saturation.		
7	Discharge Temp. Reset	1. For Perimeter Terminal Units Floors 1-2, Reset space sensor setpoints to be above space temperatures. Utilizing BAS Trend Logging, at 6 min intervals, record DAT setpoint, DAT, and perimeter TU cooling Flow rates. 2. For Perimeter Terminal Units Floors 1-2, Reset space sensor setpoints to be below space temperatures. Utilizing BAS Trend Logging, at 6 min intervals, record DAT setpoint, DAT, and perimeter TU cooling Flow rates.	Verify that Discharge Air Temperature Setpoint is reset upwards at 2 deg increments every 6 min to maintain design cooling CFM at 5 perimeter TU's to maintain design cooling CFM Verify that Discharge Air Temperature Setpoint is reset downwards at 2 deg increments every 6 min to reach design cooling CFM at only 5 perimeter TU's. Both should happen without excessive hunting.		
8	Smoke Conditions	Interfacing with EC, simulate a fire mode with the Fire Alarm System.	Verify that AHU System returns to FAN OFF Status, with OSA and Relief Dampers in a Closed Position.		
9	Warm-up Control	Place Unit's BAS Control Mode into Warmup. Overwrite RAT Sensor Reading to be 65 Deg.	Verify that dampers assume a 100% Return Air Mode.		

9.

Step ¹	Mode ²	Test Procedure ³	Expected Response ⁴	Pass	
				Yes	No
		F.			
10	Warm-up Control	Place Unit's BAS Control Mode in Warmup. Overwrite RAT Sensor Reading to be ____ Deg. F.	Verify that unit returns to Normal Operation Mode.		
11	Freeze Condition	Overwrite Low Limit Detection Thermostat reading to be ____ Deg. F.	Verify that system alarms, fans stop, OSA Dampers close, Relief Dampers Close, and RA dampers open.		
12	Return Fan Static Pressure	With AHU Unit ____ running at low air flow condition, Overwrite RF ____ return air fan inlet SP to a reading below - ____ "W.G.	Verify that system alarms and that all Fans are shut down.		
13	Manual Smoke Pressuriz. System	With Fire Alarm System in alarm, utilizing control panel in Fireman Control Center, select a floor and place floor into purge mode.	Verify that Single Fan operates, Isolation dampers open only on selected Fans, Return Fans are off, Outside Air Handling Units are off, OSA dampers open, and return air dampers close.		
14	Minimum OSA Unit Fan Off	Command AHU-1&2 System off.	Verify that AHU ____ isolation dampers are closed, and if OSA temperature is above ____ Deg. F, heating coil control valve is closed.		
15	Minimum OSA Unit Fan Off	Simulate a OSA temperature below 35 Deg. F.	Verify that heating coil control valve opens.		
16	Minimum OSA Unit Temp. Control	Utilizing BAS software, reset discharge air setpoint to 80 Deg. F.	Verify that Face and Bypass Dampers and Heating Coil Control Valves modulate in sequence to maintain ____ Deg. F. Setpoint.		
17	Minimum OSA Unit Freeze Condition	Simulate a condition at low limit detection thermostat of below 40 Deg. F.	Verify that BAS system goes into alarm, AHU- ____ Fans Shut Down, AHU- ____ Isolation Dampers Close, and Heating Valve Opens.		
18	On-Floor Return Fan Operation	Place AHU- ____ in normal operating mode.	Verify that RAF ____ - ____ Start and Run.		
19	Building Static Pressure	Trend log the supply fan speed, the relief fan speed, relief damper position and the building static pressure for 12 hrs at 20 min. intervals. During	Observe in the trends that the building static pressure is maintained within +/- 0.05" of setpoint without excessive hunting. Carefully examine		

Step ¹	Mode ²	Test Procedure ³	Expected Response ⁴	Pass	
				Yes	No
		the trend, force, if necessary, the economizer damper to be full open and at minimum. Document these times.	during the extreme economizer damper positions. Observe that any relief dampers modulate as expected relative to relief fan operation and static pressure.		
20	AHU Filter Drop	Reset the Filter Differential Pressure to exceed the setting recommended by the filter manufacturer.	Verify that the BAS reports an alarm.		
21	Chilled Water Valve Closing Efficiency	1. Utilizing BAS, place AHU Units in WARMUP Mode. 2. Manually close isolation Valve in Chilled Water Supply to AHU Coil. 3. Place thermometer in Chilled Water Return Piping adjacent to AHU. Record temp. at 1 min. intervals for 15 min. 4. Manually open isolation Valve in Chilled Water Supply to AHU Coil. 5. Repeat Step 3. 6. Graph Results on Temperature-Time Basis.	Chilled Water Return Temperature should approach RAT. If significant divergence is noted, review specified performance requirements of Chilled Water Control Valves.		
22	Supply Fan Isolation Damper	Utilizing BAS, Command AHU-1, SF-1 into the off position.	Verify that AHU-1, SF-1 Isolation Dampers Close.		
23	Review	Review schedules, current setpoints and sequences with Specification Section 15____ and Control Drawings prepared by BAS Provider.	Submit approved differences to be incorporated into as-built record documentation.		

Record Footnotes:
¹Sequences of operation specified in Contract Documents (attached).

²Mode or function ID being tested from testing requirements of the Contract Documents.

³Step-by-step procedures for manual testing, trend logging, or data-logger monitoring.

⁴Include tolerances for a passing condition.

⁵Record any permanently changed parameter values and submit to Owner.

10. Comments:

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 21 12 00 00 - FIRE-SUPPRESSION STANDPIPES**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for fire-suppression standpipes. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Pipes, fittings, and specialties.
 - b. Fire-protection valves.
 - c. Hose connections.
 - d. Hose stations.
 - e. Monitors.
 - f. Fire-department connections.
 - g. Alarm devices.
 - h. Manual control stations.
 - i. Control panels.
 - j. Pressure gages.

C. Definitions

1. High-Pressure Standpipe Piping: Fire-suppression standpipe piping designed to operate at working pressure higher than standard 175 psig (1200 kPa), but not higher than 250 psig (1725 kPa) **OR** 300 psig (2070 kPa), **as directed**.
2. Standard-Pressure Standpipe Piping: Fire-suppression standpipe piping designed to operate at working pressure 175 psig (1200 kPa) maximum.

D. System Descriptions

1. Automatic Wet-Type, Class I Standpipe System: Includes NPS 2-1/2 (DN 65) hose connections. Has open water-supply valve with pressure maintained and is capable of supplying water demand.
2. Automatic Wet-Type, Class II Standpipe System: Includes NPS 1-1/2 (DN 40) hose stations. Has open water-supply valve with pressure maintained and is capable of supplying water demand.
3. Automatic Wet-Type, Class III Standpipe System: Includes NPS 1-1/2 (DN 40) hose stations and NPS 2-1/2 (DN 65) hose connections. Has open water-supply valve with pressure maintained and is capable of supplying water demand.
4. Automatic Dry-Type, Class I Standpipe System: Includes NPS 2-1/2 (DN 65) hose connections. Has open water-supply valve and dry-pipe valve with standpipes containing compressed air. Opening fire-hose valve releases compressed air and permits water pressure to open dry-pipe valve. Water then flows into standpipes.
5. Automatic Dry-Type, Class II Standpipe System: Includes NPS 1-1/2 (DN 40) hose stations. Has open water-supply valve and dry-pipe valve with standpipes containing compressed air. Opening fire-hose valve releases compressed air and permits water pressure to open dry-pipe valve. Water then flows into standpipes.
6. Automatic Dry-Type, Class III Standpipe System: Includes NPS 1-1/2 (DN 40) hose stations and NPS 2-1/2 (DN 65) hose connections. Has open water-supply valve and dry-pipe valve with standpipes containing compressed air. Opening fire-hose valve releases compressed air and permits water pressure to open dry-pipe valve. Water then flows into standpipes.
7. Semiautomatic Dry-Type, Class I Standpipe System: Includes NPS 2-1/2 (DN 65) hose connections. Has open water-supply valve and deluge valve with standpipes containing air.

Actuation of detection device permits water pressure to open deluge valve. Water then flows into standpipes.

8. Semiautomatic Dry-Type, Class II Standpipe System: Includes NPS 1-1/2 (DN 40) hose stations. Has open water-supply valve and deluge valve with standpipes containing air. Actuation of detection device permits water pressure to open deluge valve. Water then flows into standpipes.
9. Semiautomatic Dry-Type, Class III Standpipe System: Includes NPS 1-1/2 (DN 40) hose stations and NPS 2-1/2 (DN 65) hose connections. Has open water-supply valve and deluge valve with standpipes containing air. Actuation of detection device permits water pressure to open deluge valve. Water then flows into standpipes.
10. Manual Wet-Type, Class I Standpipe System: Includes NPS 2-1/2 (DN 65) hose connections. Has small water supply to maintain water in standpipes. Piping is wet, but water must be pumped into standpipes to satisfy demand.
11. Manual Dry-Type, Class I Standpipe System: Includes NPS 2-1/2 (DN 65) hose connections. Does not have permanent water supply. Piping is dry. Water must be pumped into standpipes to satisfy demand.

E. Performance Requirements

1. Standard-Pressure, Fire-Suppression Standpipe System Component: Listed for 175-psig (1200-kPa) minimum working pressure.
2. High-Pressure, Fire-Suppression Standpipe System Component: Listed for 250-psig (1725-kPa) minimum **OR** 300-psig (2070-kPa), **as directed**, working pressure.
3. Delegated Design: Design fire-suppression standpipes, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
4. Fire-suppression standpipe design shall be approved by authorities having jurisdiction.
 - a. Minimum residual pressure at each hose-connection outlet is as follows:
 - 1) NPS 1-1/2 (DN 40) Hose Connections: 65 psig (450 kPa).
 - 2) NPS 2-1/2 (DN 65) Hose Connections: 100 psig (690 kPa).
 - b. Maximum residual pressure at required flow at each hose-connection outlet is as follows unless otherwise indicated:
 - 1) NPS 1-1/2 (DN 40) Hose Connections: 100 psig (690 kPa).
 - 2) NPS 2-1/2 (DN 65) Hose Connections: 175 psig (1200 kPa).
5. Seismic Performance: Fire-suppression standpipes shall withstand the effects of earthquake motions determined according to NFPA 13 and ASCE/SEI 7.

F. Submittals

1. Product Data: For each type of product indicated.
2. Shop Drawings: For fire-suppression standpipes. Include plans, elevations, sections, details, and attachments to other work.
 - a. Wiring Diagrams: For power, signal, and control wiring.
3. Delegated-Design Submittal: For standpipe systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
4. Qualification Data: For qualified Installer and professional engineer.
5. Approved Standpipe Drawings: Working plans, prepared according to NFPA 14, that have been approved by authorities having jurisdiction, including hydraulic calculations if applicable.
6. Welding certificates.
7. Fire-hydrant flow test report.
8. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 14. Include "Contractor's Material and Test Certificate for Aboveground Piping" and "Contractor's Material and Test Certificate for Underground Piping."
9. Field quality-control reports.
10. Operation and Maintenance Data: For fire-suppression standpipes specialties to include in emergency, operation, and maintenance manuals.

G. Quality Assurance

1. Installer Qualifications:
 - a. Installer's responsibilities include designing, fabricating, and installing fire-suppression standpipes and providing professional engineering services needed to assume engineering responsibility. Base calculations on results of fire-hydrant flow test.
 - 1) Engineering Responsibility: Preparation of working plans, calculations, and field test reports by a qualified professional engineer.
2. Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.
3. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
4. NFPA Standards: Fire-suppression standpipe equipment, specialties, accessories, installation, and testing shall comply with NFPA 14, "Installation of Standpipe and Hose Systems."

H. Project Conditions

1. Interruption of Existing Fire-Suppression Standpipe Service: Do not interrupt fire-suppression standpipe service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary fire-suppression standpipe service according to requirements indicated:
 - a. Notify The University no fewer than two days in advance of proposed interruption of fire-suppression standpipe service.
 - b. Do not proceed with interruption of fire-suppression standpipe service without The University's written permission.

1.2 PRODUCTS

A. Piping Materials

1. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, and fitting materials, and for joining methods for specific services, service locations, and pipe sizes.

B. Steel Pipe And Fittings

1. Standard Weight, Galvanized- and Black-Steel Pipe: ASTM A 53/A 53M, Type E, Grade B. Pipe ends may be factory or field formed to match joining method.
2. Schedule 30, Galvanized- and Black-Steel Pipe: ASTM A 135; ASTM A 795/A 795M, Type E; or ASME B36.10M, wrought steel; with wall thickness not less than Schedule 30 and not more than Schedule 40. Pipe ends may be factory or field formed to match joining method.
3. Thinwall Galvanized- and Black-Steel Pipe: ASTM A 135 or ASTM A 795/A 795M, threadable, with wall thickness less than Schedule 30 and equal to or greater than Schedule 10. Pipe ends may be factory or field formed to match joining method.
4. Schedule 10, Black-Steel Pipe: ASTM A 135 or ASTM A 795/A 795M, Schedule 10 in NPS 5 (DN 125) and smaller; and NFPA 13-specified wall thickness in NPS 6 to NPS 10 (DN 150 to DN 250), plain end.
5. Nonstandard OD, Thinwall Black-Steel Pipe: ASTM A 135 or ASTM A 795/A 795M, thinwall, with plain ends and wall thickness less than Schedule 10.
6. Hybrid Black-Steel Pipe: ASTM A 135 or ASTM A 795/A 795M, lightwall, with wall thickness less than Schedule 10 and greater than Schedule 5.
7. Standard-Weight, Galvanized- and Black-Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, seamless steel pipe with threaded ends.
8. Galvanized and Uncoated, Steel Couplings: ASTM A 865, threaded.
9. Galvanized and Uncoated, Gray-Iron Threaded Fittings: ASME B16.4, Class 125, standard pattern.
10. Malleable- or Ductile-Iron Unions: UL 860.
11. Cast-Iron Flanges: ASME B16.1, Class 125.
12. Steel Flanges and Flanged Fittings: ASME B16.5, Class 150.
13. Steel Welding Fittings: ASTM A 234/A 234M and ASME B16.9.
14. Grooved-Joint, Steel-Pipe Appurtenances:

- a. Pressure Rating: 175 psig (1200 kPa) **OR** 250 psig (1725 kPa) **OR** 300 psig (2070 kPa), **as directed**, minimum.
 - b. Galvanized and Uncoated, Grooved-End Fittings for Steel Piping: ASTM A 47/A 47M, malleable-iron casting or ASTM A 536, ductile-iron casting; with dimensions matching steel pipe.
 - c. Grooved-End-Pipe Couplings for Steel Piping: AWWA C606 and UL 213, rigid pattern, unless otherwise indicated, for steel-pipe dimensions. Include ferrous housing sections, EPDM-rubber gasket, and bolts and nuts.
- C. Copper Tube And Fittings
1. Hard Copper Tube: ASTM B 88, Type L (ASTM B 88M, Type B) and ASTM B 88, Type M (ASTM B 88M, Type C) water tube, drawn temper.
 2. Cast-Copper, Solder-Joint Fittings: ASME B16.18, pressure fittings.
 3. Wrought-Copper, Solder-Joint Fittings: ASME B16.22, pressure fittings.
 4. Bronze Flanges: ASME B16.24, Class 150, with solder-joint ends.
 5. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.
 6. Grooved-Joint, Copper-Tube Appurtenances:
 - a. Grooved-End, Copper Fittings: ASTM B 75 (ASTM B 75M), copper tube or ASTM B 584, bronze castings.
 - b. Grooved-End-Tube Couplings: To fit copper tube dimensions, with design similar to AWWA C606. Include ferrous housing sections, EPDM-rubber gasket suitable for hot and cold water, and bolts and nuts.
- D. Piping Joining Materials
1. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 1/8 inch (3.2 mm) thick or ASME B16.21, nonmetallic and asbestos free.
 - a. Class 125, Cast-Iron Flanges and Class 150, Bronze Flat-Face Flanges: Full-face gaskets.
 - b. Class 250, Cast-Iron Flanges and Class 300, Steel Raised-Face Flanges: Ring-type gaskets.
 2. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.
 3. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for general-duty brazing unless otherwise indicated.
 4. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.
- E. Listed Fire-Protection Valves
1. General Requirements:
 - a. Valves shall be UL listed or FM approved.
 - b. Minimum Pressure Rating for Standard-Pressure Piping: 175 psig (1200 kPa).
 - c. Minimum Pressure Rating for High-Pressure Piping: 250 psig (1725 kPa) **OR** 300 psig (2070 kPa), **as directed**.
 2. Ball Valves:
 - a. Standard: UL 1091 except with ball instead of disc.
 - b. Valves NPS 1-1/2 (DN 40) and Smaller: Bronze body with threaded ends.
 - c. Valves NPS 2 and NPS 2-1/2 (DN 50 and DN 65): Bronze body with threaded ends or ductile-iron body with grooved ends.
 - d. Valves NPS 3 (DN 80): Ductile-iron body with grooved ends.
 3. Bronze Butterfly Valves:
 - a. Standard: UL 1091.
 - b. Pressure Rating: 175 psig (1200 kPa).
 - c. Body Material: Bronze.
 - d. End Connections: Threaded.
 4. Iron Butterfly Valves:
 - a. Standard: UL 1091.
 - b. Pressure Rating: 175 psig (1200 kPa).

- c. Body Material: Cast or ductile iron.
- d. Style: Lug or wafer.
- OR**
- End Connections: Grooved.
- 5. Check Valves:
 - a. Standard: UL 312.
 - b. Pressure Rating: 250 psig (1725 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - c. Type: Swing check.
 - d. Body Material: Cast iron.
 - e. End Connections: Flanged or grooved.
- 6. Bronze OS&Y Gate Valves:
 - a. Standard: UL 262.
 - b. Pressure Rating: 175 psig (1200 kPa).
 - c. Body Material: Bronze.
 - d. End Connections: Threaded.
- 7. Iron OS&Y Gate Valves:
 - a. Standard: UL 262.
 - b. Pressure Rating: 250 psig (1725 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - c. Body Material: Cast or ductile iron.
 - d. End Connections: Flanged or grooved.
- 8. Indicating-Type Butterfly Valves:
 - a. Standard: UL 1091.
 - b. Pressure Rating: 175 psig (1200 kPa) minimum.
 - c. Valves NPS 2 (DN 50) and Smaller:
 - 1) Valve Type: Ball or butterfly.
 - 2) Body Material: Bronze.
 - 3) End Connections: Threaded.
 - d. Valves NPS 2-1/2 (DN 65) and Larger:
 - 1) Valve Type: Butterfly.
 - 2) Body Material: Cast or ductile iron.
 - 3) End Connections: Flanged, grooved, or wafer.
 - e. Valve Operation: Integral electrical, 115-V ac, prewired, single-circuit, supervisory switch **OR** electrical, 115-V ac, prewired, two-circuit, supervisory switch **OR** visual, **as directed**, indicating device.
- 9. NRS Gate Valves:
 - a. Standard: UL 262.
 - b. Pressure Rating: 250 psig (1725 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - c. Body Material: Cast iron with indicator post flange.
 - d. Stem: Nonrising.
 - e. End Connections: Flanged or grooved.
- 10. Indicator Posts:
 - a. Standard: UL 789.
 - b. Type: Horizontal for wall mounting.
 - c. Body Material: Cast iron with extension rod and locking device.
 - d. Operation: Wrench **OR** Hand wheel, **as directed**.
- F. Trim And Drain Valves
 - 1. General Requirements:
 - a. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
 - b. Pressure Rating: 175 psig (1200 kPa) minimum.
 - 2. Angle Valves.
 - 3. Ball Valves.
 - 4. Globe Valves.
 - 5. Plug Valves.
- G. Specialty Valves

1. General Requirements:
 - a. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
 - b. Pressure Rating:
 - 1) Standard-Pressure Piping Specialty Valves: 175 psig (1200 kPa) minimum.
 - 2) High-Pressure Piping Specialty Valves: 250 psig (1725 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - c. Body Material: Cast or ductile iron.
 - d. Size: Same as connected piping.
 - e. End Connections: Flanged or grooved.
2. Alarm Valves:
 - a. Standard: UL 193.
 - b. Design: For horizontal or vertical installation.
 - c. Include trim sets for bypass, drain, electrical sprinkler alarm switch, pressure gages, retarding chamber, **as directed**, and fill-line attachment with strainer.
 - d. Drip Cup Assembly (if retarding chamber is required): Pipe drain without valves and separate from main drain piping.
 - e. Drip Cup Assembly (if retarding chamber is not required): Pipe drain with check valve to main drain piping.
3. Dry-Pipe Valves:
 - a. Standard: UL 260.
 - b. Design: Differential-pressure type.
 - c. Include UL 1486, quick-opening devices, trim sets for air supply, drain, priming level, alarm connections, ball drip valves, pressure gages, priming chamber attachment, and fill-line attachment.
 - d. Air-Pressure Maintenance Device:
 - 1) Standard: UL 260.
 - 2) Type: Automatic device to maintain minimum air pressure in piping.
 - 3) Include shutoff valves to permit servicing without shutting down sprinkler piping, bypass valve for quick filling, pressure regulator or switch to maintain pressure, strainer, pressure ratings with 14- to 60-psig (95- to 410-kPa) adjustable range, and 175-psig (1200-kPa) **OR** 300-psig (2070-kPa), **as directed**, outlet pressure.
 - e. Air Compressor:
 - 1) Standard: UL's "Fire Protection Equipment Directory" listing.
 - 2) Motor Horsepower: Fractional.
 - 3) Power: 120-V ac, 60 Hz, single phase.
4. Deluge Valves:
 - a. Standard: UL 260.
 - b. Design: Hydraulically operated, differential-pressure type.
 - c. Include trim sets for bypass, drain, electrical sprinkler alarm switch, pressure gages, drip cup assembly piped without valves and separate from main drain line, fill-line attachment with strainer, and push-rod chamber supply connection.
 - d. Wet, Pilot-Line Trim Set: Include gage to read push-rod chamber pressure, globe valve for manual operation of deluge valve, and connection for actuation device.
 - e. Dry, Pilot-Line Trim Set: Include dry, pilot-line actuator; air- and water-pressure gages; low-air-pressure warning switch; air relief valve; and actuation device. Dry, pilot-line actuator includes cast-iron, operated, diaphragm-type valve with resilient facing plate, resilient diaphragm, and replaceable bronze seat. Valve includes threaded water and air inlets and water outlet. Loss of air pressure on dry, pilot-line side allows pilot-line actuator to open and causes deluge valve to open immediately.
 - f. Air-Pressure Maintenance Device:
 - 1) Standard: UL 260.
 - 2) Type: Automatic device to maintain minimum air pressure in piping.
 - 3) Include shutoff valves to permit servicing without shutting down sprinkler piping, bypass valve for quick filling, pressure regulator, or switch to maintain pressure, strainer, pressure ratings with 14- to 60-psig (95- to 410-kPa) adjustable range, and 175-psig (1200-kPa) **OR** 300-psig (2070-kPa), **as directed**, outlet pressure.

- g. Air Compressor:
 - 1) Standard: UL's "Fire Protection Equipment Directory" listing.
 - 2) Motor Horsepower: Fractional.
 - 3) Power: 120-V ac, 60 Hz, single phase.
- 5. Pressure-Reducing Valves:
 - a. UL 668 hose valve, with integral UL 1468 reducing device.
 - b. Pressure Rating: 300 psig (2070 kPa) minimum.
 - c. Material: Brass or bronze.
 - d. Inlet: Female pipe threads.
 - e. Outlet: Threaded with or without adapter having male hose threads.
 - f. Pattern: Angle or gate.
 - g. Finish: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
- 6. Automatic (Ball Drip) Drain Valves:
 - a. Standard: UL 1726.
 - b. Pressure Rating: 175 psig (1200 kPa) minimum.
 - c. Type: Automatic draining, ball check.
 - d. Size: NPS 3/4 (DN 20).
 - e. End Connections: Threaded.
- H. Hose Connections
 - 1. Adjustable-Valve Hose Connections:
 - a. Standard: UL 668 hose valve, with integral UL 1468 reducing or restricting pressure-control device, for connecting fire hose.
 - b. Pressure Rating: 300 psig (2070 kPa) minimum.
 - c. Material: Brass or bronze.
 - d. Size: NPS 1-1/2 or NPS 2-1/2 (DN 40 or DN 65), as indicated.
 - e. Inlet: Female pipe threads.
 - f. Outlet: Male hose threads with lugged cap, gasket, and chain. Include hose valve threads according to NFPA 1963 and matching local fire-department threads.
 - g. Pattern: Angle or gate.
 - h. Pressure-Control Device Type: Pressure reducing **OR** restricting, **as directed**.
 - i. Design Outlet Pressure Setting: as approved by The University.
 - j. Finish: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
 - 2. Nonadjustable-Valve Hose Connections:
 - a. Standard: UL 668 hose valve for connecting fire hose.
 - b. Pressure Rating: 300 psig (2070 kPa) minimum.
 - c. Material: Brass or bronze.
 - d. Size: NPS 1-1/2 or NPS 2-1/2 (DN 40 or DN 65), as indicated.
 - e. Inlet: Female pipe threads.
 - f. Outlet: Male hose threads with lugged cap, gasket, and chain. Include hose valve threads according to NFPA 1963 and matching local fire-department threads.
 - g. Pattern: Angle or gate.
 - h. Finish: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
- I. NPS 1-1/2 (DN 40) Rack-Type Hose Stations
 - 1. Hose Rack:
 - a. Standard: UL 47.
 - b. Material: Brass or bronze with polished chrome-plated **OR** Steel with red-enamel, **as directed**, finish.
 - c. Type: Hose-rack assembly. Include hose valve, hose rack, water-retention device, hose pins, and hose.
 - d. Operation: Semiautomatic.
 - e. Sized to hold fire hose.
 - 2. Hose Valve:

- a. Standard: UL 668 NPS 1-1/2 (DN 40), for connecting fire hose.
 - b. Type: Adjustable **OR** Nonadjustable, **as directed**.
 - c. Pressure-Control Device: Not required **OR** Pressure reducing **OR** Pressure restricting, **as directed**.
 - d. Design Outlet Pressure Setting: Not applicable **OR as directed**.
 - e. Hose Valve and Trim Finish: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
 - f. Pressure Rating: 300 psig (2070 kPa) minimum.
 - g. Pattern: Angle.
 - h. Material: Brass or bronze.
 - i. Pressure-Control Device: UL 1468 integral or for field installation if indicated.
 - j. Size: NPS 1-1/2 (DN 40).
 - k. Inlet: Female pipe threads.
 - l. Outlet: Male hose threads according to NFPA 1963 and matching local fire-department threads.
3. Hose:
- a. Standards: NFPA 1961 and UL 219 lined fire hose with swivel inlet, coupling, gaskets, and nozzle.
 - b. Size: NPS 1-1/2 (DN 40).
 - c. Length: 50 feet (15 m) **OR** 75 feet (23 m) **OR** 100 feet (30 m), **as directed**.
 - d. Jacket: Combination of natural and synthetic threads **OR** Natural thread **OR** Synthetic thread, **as directed**.
 - e. Lining: Combination of rubber and plastic compounds **OR** Rubber compound **OR** Plastic compound, **as directed**.
 - f. Cover: Rubber, plastic, or combination of rubber and plastic compounds.
 - g. Nozzle: UL 401.
 - 1) Material: Brass **OR** Polished brass **OR** Rough chrome-plated brass **OR** Polished chrome-plated brass **OR** Polycarbonate plastic, **as directed**.
 - 2) Type: Plain, for nonadjustable water stream **OR** Spray, adjustable from shutoff to fog spray or straight stream **OR** Spray, adjustable from shutoff to full fog; for use on electrical fires, **as directed**.
- J. NPS 1-1/2 BY NPS 2-1/2 (DN 40 BY DN 65) Rack-Type Hose Stations
- 1. Hose Rack:
 - a. Standard: UL 47.
 - b. Material: Brass or bronze with polished chrome-plated **OR** Steel with red-enamel, **as directed**, finish.
 - c. Type: Hose-rack assembly. Include hose valve, reducer adapter, hose rack, water-retention device, hose pins, and hose.
 - d. Operation: Semiautomatic.
 - e. Sized to hold fire hose.
 - 2. Hose Valve:
 - a. Standard: UL 668, NPS 2-1/2 (DN 65), for connecting fire hose.
 - b. Type: Adjustable **OR** Nonadjustable, **as directed**.
 - c. Pressure-Control Device: Not required **OR** Pressure reducing **OR** Pressure restricting, **as directed**.
 - d. Design Outlet Pressure Setting: Not applicable **OR as directed**.
 - e. Hose Valve and Trim Finish: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
 - f. Pressure Rating: 300 psig (2070 kPa) minimum.
 - g. Pattern: Angle.
 - h. Material: Brass or bronze.
 - i. Pressure-Control Device: UL 1468, integral or for field installation if indicated.
 - j. Size: NPS 2-1/2 (DN 65).
 - k. Inlet: Female pipe threads.
 - l. Outlet: Male hose threads according to NFPA 1963 and matching local fire-department threads.

- m. Reducer Adapter: NPS 2-1/2 by NPS 1-1/2 (DN 65 by DN 40).
 3. Hose:
 - a. Standards: NFPA 1961 and UL 219, lined fire hose with swivel inlet, coupling, gaskets, and nozzle.
 - b. Size: NPS 1-1/2 (DN 40).
 - c. Length: 50 feet (15 m) **OR** 75 feet (23 m) **OR** 100 feet (30 m), **as directed**.
 - d. Jacket: Combination of natural and synthetic threads **OR** Natural thread **OR** Synthetic thread, **as directed**.
 - e. Lining: Combination of rubber and plastic compounds **OR** Rubber compound **OR** Plastic compound, **as directed**.
 - f. Cover: Rubber, plastic, or combination of rubber and plastic compounds.
 - g. Nozzle: UL 401 spray nozzle unless plain nozzle is indicated.
 - 1) Material: Brass **OR** Polished brass **OR** Rough chrome-plated brass **OR** Polished chrome-plated brass **OR** Polycarbonate plastic, **as directed**.
 - 2) Type: Plain, for nonadjustable water stream **OR** Spray, adjustable from shutoff to fog spray or straight stream **OR** Spray, adjustable from shutoff to full fog; for use on electrical fires, **as directed**.
- K. NPS 1-1/2 (DN 40) Reel-Type Hose Stations
 1. Hose Reel:
 - a. Standard: UL 47.
 - b. Hose Reel and Bracket Material: Steel.
 - c. Type: Hose-reel assembly. Include hose valve, wall bracket, hose reel, water-retention device, hose pins, and hose.
 - d. Operation: Semiautomatic.
 - e. Sized to hold fire hose.
 - f. Finish: Red enamel.
 2. Hose Valve:
 - a. Standard: UL 668, NPS 1-1/2 (DN 40), for connecting fire hose.
 - b. Type: Adjustable **OR** Nonadjustable, **as directed**.
 - c. Pressure-Control Device: Not required **OR** Pressure reducing **OR** Pressure restricting, **as directed**.
 - d. Design Outlet Pressure Setting: Not applicable **OR as directed**.
 - e. Hose Valve and Trim Finish: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
 - f. Pressure Rating: 300 psig (2070 kPa) minimum.
 - g. Pattern: Angle.
 - h. Material: Brass or bronze.
 - i. Pressure-Control Device: UL 1468, integral or for field installation if indicated.
 - j. Size: NPS 1-1/2 (DN 40).
 - k. Inlet: Female pipe threads.
 - l. Outlet: Male hose threads according to NFPA 1963 and matching local fire-department threads.
 3. Hose:
 - a. Standards: NFPA 1961 and UL 219 lined fire hose with swivel inlet, coupling, gaskets, and nozzle.
 - b. Size: NPS 1-1/2 (DN 40).
 - c. Length: 50 feet (15 m) **OR** 75 feet (23 m) **OR** 100 feet (30 m), **as directed**.
 - d. Jacket: Combination of natural and synthetic threads **OR** Natural thread **OR** Synthetic thread, **as directed**.
 - e. Lining: Combination of rubber and plastic compounds **OR** Rubber compound **OR** Plastic compound, **as directed**.
 - f. Cover: Rubber, plastic, or combination of rubber and plastic compounds.
 - g. Nozzle: UL 401.
 - 1) Material: Brass **OR** Polished brass **OR** Rough chrome-plated brass **OR** Polished chrome-plated brass **OR** Polycarbonate plastic, **as directed**.

- 2) Type: Spray, adjustable from shutoff to fog spray or straight stream **OR** full fog; for use on electrical fires, **as directed**.

L. Monitors

1. Type: Stationary.
2. Nozzle: UL 401, NPS 2-1/2 (DN 65), brass, adjustable from fog spray to straight stream to shutoff.
3. Horizontal Rotation: 360 degrees with locking device.
4. Vertical Rotation: 80-degree elevation and 60-degree depression with locking device.
5. Waterway: Double **OR** Single, **as directed**, brass or stainless-steel tube.
6. Waterway Size: NPS 2-1/2 (DN 65) minimum.
7. Water Stream Flow: 500 gpm (31.5 L/s) **OR** 750 gpm (47.3 L/s) **OR** 1000 gpm (63 L/s), **as directed**.
8. Operation: Lever **OR** Wheel, **as directed**.
9. Base Inlet Size: NPS 2-1/2 (DN 65) **OR** NPS 3 (DN 80) **OR** NPS 4 (DN 100), **as directed**.
10. Finish: Red-painted body with brass trim.

M. Fire-Department Connections

1. Exposed-Type, Fire-Department Connection:
 - a. Standard: UL 405.
 - b. Type: Exposed, projecting, for wall mounting.
 - c. Pressure Rating: 175 psig (1200 kPa) minimum.
 - d. Body Material: Corrosion-resistant metal.
 - e. Inlets: Brass with threads according to NFPA 1963 and matching local fire-department sizes and threads. Include extension pipe nipples, brass lugged swivel connections, and check devices or clappers.
 - f. Caps: Brass, lugged type, with gasket and chain.
 - g. Escutcheon Plate: Round, brass, wall type.
 - h. Outlet: Back, with pipe threads.
 - i. Number of Inlets: Two **OR** Three, **as directed**.
 - j. Escutcheon Plate Marking: Similar to "AUTO SPKR & STANDPIPE" **OR** "STANDPIPE", **as directed**.
 - k. Finish: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
 - l. Outlet Size: NPS 4 (DN 100) **OR** NPS 5 (DN 125) **OR** NPS 6 (DN 150), **as directed**.
2. Flush-Type, Fire-Department Connection:
 - a. Standard: UL 405.
 - b. Type: Flush, for wall mounting.
 - c. Pressure Rating: 175 psig (1200 kPa) minimum.
 - d. Body Material: Corrosion-resistant metal.
 - e. Inlets: Brass with threads according to NFPA 1963 and matching local fire-department sizes and threads. Include extension pipe nipples, brass lugged swivel connections, and check devices or clappers.
 - f. Caps: Brass, lugged type, with gasket and chain.
 - g. Escutcheon Plate: Rectangular, brass, wall type.
 - h. Outlet: With pipe threads.
 - i. Body Style: Horizontal **OR** Square **OR** Vertical, **as directed**.
 - j. Number of Inlets: Two **OR** Three **OR** Four **OR** Six, **as directed**.
 - k. Outlet Location: Back **OR** Bottom **OR** Left side **OR** Right side **OR** Top, **as directed**.
 - l. Escutcheon Plate Marking: Similar to "AUTO SPKR & STANDPIPE" **OR** "STANDPIPE", **as directed**.
 - m. Finish: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
 - n. Outlet Size: NPS 4 (DN 100) **OR** NPS 5 (DN 125) **OR** NPS 6 (DN 150) **OR** NPS 8 (DN 200), **as directed**.
3. Yard-Type, Fire-Department Connection:
 - a. Standard: UL 405.

- b. Type: Exposed, freestanding.
- c. Pressure Rating: 175 psig (1200 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
- d. Body Material: Corrosion-resistant metal.
- e. Inlets: Brass with threads according to NFPA 1963 and matching local fire-department sizes and threads. Include extension pipe nipples, brass lugged swivel connections, and check devices or clappers.
- f. Caps: Brass, lugged type, with gasket and chain.
- g. Escutcheon Plate: Round, brass, floor type.
- h. Outlet: Bottom, with pipe threads.
- i. Number of Inlets: Two **OR** Three **OR** Four, **as directed**.
- j. Sleeve: Brass **OR** Not required, **as directed**.
- k. Sleeve Height: 18 inches (460 mm).
- l. Escutcheon Plate Marking: Similar to "AUTO SPKR & STANDPIPE" **OR** "STANDPIPE", **as directed**.
- m. Finish, Including Sleeve: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
- n. Outlet Size: NPS 4 (DN 100) **OR** NPS 5 (DN 125) **OR** NPS 6 (DN 150), **as directed**.

N. Alarm Devices

- 1. Alarm-device types shall match piping and equipment connections.
- 2. Water-Motor-Operated Alarm:
 - a. Standard: UL 753.
 - b. Type: Mechanically operated, with Pelton wheel.
 - c. Alarm Gong: Cast aluminum with red-enamel factory finish.
 - d. Size: 10-inch (250-mm) diameter.
 - e. Components: Shaft length, bearings, and sleeve to suit wall construction.
 - f. Inlet: NPS 3/4 (DN 20).
 - g. Outlet: NPS 1 (DN 25) drain connection.
- 3. Electrically Operated Alarm Bell:
 - a. Standard: UL 464.
 - b. Type: Vibrating, metal alarm bell.
 - c. Size: 6-inch (150-mm) minimum **OR** 8-inch (200-mm) minimum **OR** 10-inch (250-mm), **as directed**, diameter.
 - d. Finish: Red-enamel factory finish, suitable for outdoor use.
- 4. Water-Flow Indicators:
 - a. Standard: UL 346.
 - b. Water-Flow Detector: Electrically supervised.
 - c. Components: Two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-V ac and 0.25 A, 24-V dc; complete with factory-set, field-adjustable retard element to prevent false signals and tamperproof cover that sends signal if removed.
 - d. Type: Paddle operated.
 - e. Pressure Rating: 250 psig (1725 kPa).
 - f. Design Installation: Horizontal or vertical.
- 5. Pressure Switches:
 - a. Standard: UL 346.
 - b. Type: Electrically supervised water-flow switch with retard feature.
 - c. Components: Single-pole, double-throw switch with normally closed contacts.
 - d. Design Operation: Rising pressure signals water flow.
- 6. Valve Supervisory Switches:
 - a. Standard: UL 346.
 - b. Type: Electrically supervised.
 - c. Components: Single-pole, double-throw switch with normally closed contacts.
 - d. Design: Signals that controlled valve is in other than fully open position.
- 7. Indicator-Post Supervisory Switches:
 - a. Standard: UL 346.
 - b. Type: Electrically supervised.

- c. Components: Single-pole, double-throw switch with normally closed contacts.
 - d. Design: Signals that controlled indicator-post valve is in other than fully open position.
- O. Manual Control Stations
- 1. Description: UL listed or FM approved, hydraulic operation, with union, NPS 1/2 (DN 15) pipe nipple, and bronze ball valve. Include metal enclosure labeled "MANUAL CONTROL STATION" with operating instructions and cover held closed by breakable strut to prevent accidental opening.
- P. Control Panels
- 1. Description: Single-area, two-area, or single-area cross-zoned control panel as indicated, including NEMA ICS 6, Type 1 enclosure, detector, alarm, and solenoid-valve circuitry for operation of deluge valves. Panels contain power supply; battery charger; standby batteries; field-wiring terminal strip; electrically supervised solenoid valves and polarized fire-alarm bell; lamp test facility; single-pole, double-throw auxiliary alarm contacts; and rectifier.
 - a. Panels: UL listed and FM approved when used with thermal detectors and Class A detector circuit wiring. Electrical characteristics are 120-V ac, 60 Hz, with 24-V dc rechargeable batteries.
 - b. Manual Control Stations: Electric operation, metal enclosure, labeled "MANUAL CONTROL STATION" with operating instructions and cover held closed by breakable strut to prevent accidental opening.
OR
Manual Control Stations: Hydraulic operation, with union, NPS 1/2 (DN 15) pipe nipple, and bronze ball valve. Include metal enclosure labeled "MANUAL CONTROL STATION" with operating instructions and cover held closed by breakable strut to prevent accidental opening.
- Q. Pressure Gages
- 1. Standard: UL 393.
 - 2. Dial Size: 3-1/2- to 4-1/2-inch (90- to 115-mm) diameter.
 - 3. Pressure Gage Range: 0 to 250 psig (0 to 1725 kPa) minimum **OR** 0 to 300 psig (0 to 2070 kPa), **as directed**.
 - 4. Water System Piping Gage: Include "WATER" or "AIR/WATER" label on dial face.
 - 5. Air System Piping Gage: Include retard feature, **as directed**, and "AIR" or "AIR/WATER" label on dial face.
- R. Escutcheons
- 1. General: Manufactured ceiling, floor, and wall escutcheons and floor plates.
 - 2. One-Piece, Cast-Brass Escutcheons: Polished chrome-plated or rough-brass finish with set-screws.
 - 3. One-Piece, Deep-Pattern Escutcheons: Deep-drawn, box-shaped brass with chrome-plated finish.
 - 4. One-Piece, Stamped-Steel Escutcheons: Chrome-plated finish with set-screw or spring clips.
 - 5. Split-Casting, Cast-Brass Escutcheons: Polished chrome-plated or rough-brass finish with concealed hinge and set-screw.
 - 6. Split-Plate, Stamped-Steel Escutcheons: Chrome-plated finish with concealed **OR** exposed-rivet, **as directed**, hinge, set-screw or spring clips.
 - 7. One-Piece Floor Plates: Cast-iron flange with holes for fasteners, **as directed**.
 - 8. Split-Casting Floor Plates: Cast brass with concealed hinge.
- S. Sleeves
- 1. Cast-Iron Wall-Pipe Sleeves: Cast or fabricated of cast iron and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.
 - 2. Galvanized-Steel-Sheet Sleeves: 0.0239-inch (0.6-mm) minimum thickness; round tube closed with welded longitudinal joint.
 - 3. Molded-PE Sleeves: Reusable, PE, tapered-cup shaped, and smooth outer surface with nailing flange for attaching to wooden forms.

4. Molded-PVC Sleeves: Permanent, with nailing flange for attaching to wooden forms.
5. PVC-Pipe Sleeves: ASTM D 1785, Schedule 40.
6. Galvanized-Steel-Pipe Sleeves: ASTM A 53/A 53M, Type E, standard weight, zinc coated, plain ends.
7. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
 - a. Underdeck Clamp: Clamping ring with set-screws.

T. Sleeve Seals

1. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
 - a. Sealing Elements: EPDM-rubber or NBR interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
 - b. Pressure Plates: Carbon steel **OR** Plastic **OR** Stainless steel, **as directed**.
 - c. Connecting Bolts and Nuts: Carbon steel with corrosion-resistant coating **OR** Stainless steel, **as directed**, of length required to secure pressure plates to sealing elements.

U. Grout

1. Standard: ASTM C 1107, Grade B, posthardening and volume adjusting, dry, hydraulic-cement grout.
2. Characteristics: Nonshrink, and recommended for interior and exterior applications.
3. Design Mix: 5000-psi (34-MPa), 28-day compressive strength.
4. Packaging: Premixed and factory packaged.

1.3 EXECUTION

A. Preparation

1. Perform fire-hydrant flow test according to NFPA 14 and NFPA 291. Use results for system design calculations required in "Quality Assurance" Article.
2. Report test results promptly and in writing.

B. Service-Entrance Piping

1. Connect fire-suppression standpipe piping to water-service piping at service entrance into building. Comply with requirements for exterior piping in Division 21 Section "Facility Fire-suppression Water-service Piping".
2. Install shutoff valve, backflow preventer, **as directed**, pressure gage, drain, and other accessories at connection to fire-suppression water-service piping. Comply with requirements for backflow preventers in Division 21 Section "Facility Fire-suppression Water-service Piping", **as directed**.
3. Install shutoff valve, check valve, pressure gage, and drain at connection to water service.

C. Water-Supply Connections

1. Connect fire-suppression standpipe piping to building's interior water-distribution piping. Comply with requirements for interior piping in Division 22 Section "Domestic Water Piping".
2. Install shutoff valve, backflow preventer, **as directed**, pressure gage, drain, and other accessories at connection to water-distribution piping. Comply with requirements for backflow preventers in Division 22 Section "Domestic Water Piping Specialties", **as directed**.
OR
Install shutoff valve, check valve, pressure gage, and drain at connection to water supply.

D. Piping Installation

1. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated, as far as practical.

- a. Deviations from approved working plans for piping require written approval from authorities having jurisdiction. File written approval with The University before deviating from approved working plans.
2. Piping Standard: Comply with requirements in NFPA 14 for installation of fire-suppression standpipe piping.
3. Install seismic restraints on piping. Comply with requirements in NFPA 13 for seismic-restraint device materials and installation.
4. Install listed fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.
5. Install drain valves on standpipes. Extend drain piping to outside of building.
6. Install automatic (ball drip) drain valves to drain piping between fire-department connections and check valves. Drain to floor drain or outside building.
7. Install alarm devices in piping systems.
8. Install hangers and supports for standpipe system piping according to NFPA 14. Comply with requirements in NFPA 13 for hanger materials.
9. Install pressure gages on riser or feed main and at top of each standpipe. Include pressure gages with connection not less than NPS 1/4 (DN 8) and with soft-metal seated globe valve, arranged for draining pipe between gage and valve. Install gages to permit removal, and install where they will not be subject to freezing.
10. Drain dry-type standpipe system piping.
11. Pressurize and check dry-type standpipe system piping and air-pressure maintenance devices **OR** air compressors, **as directed**.
12. Fill wet-type standpipe system piping with water.
13. Install electric heating cables and pipe insulation on wet-type, fire-suppression standpipe piping in areas subject to freezing. Comply with requirements for heating cables in Division 21 Section "Heat Tracing For Fire-suppression Piping" and for piping insulation in Division 21 Section "Fire-suppression Systems Insulation".
14. Connect compressed-air supply to dry-pipe sprinkler piping.
OR
Connect air compressor to the following piping and wiring:
 - a. Pressure gages and controls.
 - b. Electrical power system.
 - c. Fire-alarm devices, including low-pressure alarm.

E. Joint Construction

1. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure ratings same as or higher than system's pressure rating for aboveground applications unless otherwise indicated.
2. Install unions adjacent to each valve in pipes NPS 2 (DN 50) and smaller.
3. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having NPS 2-1/2 (DN 65) and larger end connections.
4. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
5. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.
6. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with gasket and bolts according to ASME B31.9.
7. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
 - a. Apply appropriate tape or thread compound to external pipe threads.
 - b. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.
8. Steel-Piping, Cut-Grooved Joints: Cut square-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe joints.

9. Steel-Piping, Roll-Grooved Joints: Roll rounded-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe grooved joints.
 10. Welded Joints: Construct joints according to AWS D10.12M/D10.12, using qualified processes and welding operators according to "Quality Assurance" Article.
 - a. Shop weld pipe joints where welded piping is indicated. Do not use welded joints for galvanized-steel pipe.
 11. Brazed Joints: Join copper tube and fittings according to CDA's "Copper Tube Handbook," "Brazed Joints" Chapter.
 12. Copper-Tubing Grooved Joints: Roll rounded-edge groove in end of tube according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join copper tube and grooved-end fittings according to AWWA C606 for steel-pipe grooved joints.
 13. Dissimilar-Material Piping Joints: Make joints using adapters compatible with materials of both piping systems.
- F. Valve And Specialties Installation
1. Install listed fire-protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 14 and authorities having jurisdiction.
 2. Install listed fire-protection shutoff valves supervised-open, located to control sources of water supply except from fire-department connections. Install permanent identification signs indicating portion of system controlled by each valve.
 3. Install check valve in each water-supply connection. Install backflow preventers instead of check valves in potable-water-supply sources.
 4. Specialty Valves:
 - a. General Requirements: Install in vertical position for proper direction of flow, in main supply to system.
 - b. Alarm Valves: Install bypass check valve and retarding chamber drain-line connection.
 - c. Dry-Pipe and Deluge Valves: Install trim sets for air supply, drain, priming level, alarm connections, ball drip valves, pressure gages, priming chamber attachment, and fill-line attachment.
 - 1) Install air compressor and compressed-air supply piping.
 - OR**
Air-Pressure Maintenance Device: Install shutoff valves to permit servicing without shutting down sprinkler system; bypass valve for quick system filling; pressure regulator or switch to maintain system pressure; strainer; pressure ratings with 14- to 60-psig (95- to 410-kPa) adjustable range; and 175-psig (1200-kPa) maximum inlet pressure.
 - 2) Install compressed-air supply piping from building's compressed-air piping system.
- G. Hose-Connection Installation
1. Install hose connections adjacent to standpipes.
 2. Install freestanding hose connections for access and minimum passage restriction.
 3. Install NPS 1-1/2 (DN 40) hose-connection valves with flow-restricting device.
 4. Install NPS 2-1/2 (DN 65) hose connections with quick-disconnect NPS 2-1/2 by NPS 1-1/2 (DN 65 by DN 40) reducer adapter and flow-restricting device.
 5. Install wall-mounted-type hose connections in cabinets. Include pipe escutcheons, with finish matching valves, inside cabinet where water-supply piping penetrates cabinet. Install valves at angle required for connection of fire hose. Comply with requirements for cabinets in Division 10 Section "Fire Extinguisher Cabinets".
- H. Hose-Station Installation
1. Install freestanding hose stations for access and minimum passage restriction.
 2. Install NPS 1-1/2 (DN 40) hose-station valves with flow-restricting device unless otherwise indicated.
 3. Install NPS 2-1/2 (DN 65) hose connections with quick-disconnect NPS 2-1/2 by NPS 1-1/2 (DN 65 by DN 40) reducer adapter and flow-restricting device unless otherwise indicated.
 4. Install freestanding hose stations with support or bracket attached to standpipe.

5. Install wall-mounted, rack hose stations in cabinets. Include pipe escutcheons, with finish matching valves, inside cabinet where water-supply piping penetrates cabinet. Install valves at angle required for connection of fire hose. Comply with requirements for cabinets in Division 10 Section "Fire Extinguisher Cabinets".
 6. Install hose-reel hose stations on wall with bracket.
- I. Monitor Installation
1. Install monitors on standpipe piping.
- J. Fire-Department Connection Installation
1. Install wall-type, fire-department connections.
 2. Install yard-type, fire-department connections in concrete slab support. Comply with requirements for concrete in Division 03 Section "Cast-in-place Concrete".
 - a. Install two **OR** three, **as directed**, protective pipe bollards around **OR** on sides of, **as directed**, each fire-department connection. Comply with requirements for bollards in Division 05 Section "Metal Fabrications".
 3. Install automatic (ball drip) drain valve at each check valve for fire-department connection.
- K. Escutcheon Installation
1. Install escutcheons for penetrations of walls, ceilings, and floors.
 2. Escutcheons for New Piping:
 - a. Piping with Fitting or Sleeve Protruding from Wall: One piece, deep pattern.
 - b. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One piece, cast brass with polished chrome-plated finish **OR** stamped steel with set-screw **OR** stamped steel with set-screw or spring clips **OR** stamped steel with spring clips, **as directed**.
 - c. Bare Piping at Ceiling Penetrations in Finished Spaces: One piece, cast brass with polished chrome-plated finish **OR** One piece or split casting, cast brass with polished chrome-plated finish **OR** One piece, stamped steel with set-screw **OR** One piece or split plate, stamped steel with set-screw **OR** Split plate, stamped steel with set-screw, **as directed**.
 - d. Bare Piping in Unfinished Service Spaces: One piece, cast brass with polished chrome-plated finish **OR** cast brass with rough-brass finish **OR** stamped steel with set-screw **OR** stamped steel with spring clips **OR** stamped steel with set-screw or spring clips, **as directed**.
 - e. Bare Piping in Equipment Rooms: One piece, cast brass **OR** stamped steel with set-screw **OR** stamped steel with spring clips **OR** stamped steel with set-screw or spring clips, **as directed**.
 - f. Bare Piping at Floor Penetrations in Equipment Rooms: One-piece floor plate.
 3. Escutcheons for Existing Piping:
 - a. Chrome-Plated Piping: Split casting, cast brass with chrome-plated finish.
 - b. Insulated Piping: Split plate, stamped steel with concealed or exposed-rivet hinge and spring clips.
 - c. Bare Piping at Wall and Floor Penetrations in Finished Spaces: Split casting, cast brass with chrome-plated finish **OR** plate, stamped steel with concealed hinge and spring clips, **as directed**.
 - d. Bare Piping at Ceiling Penetrations in Finished Spaces: Split casting, cast brass with chrome-plated finish **OR** plate, stamped steel with concealed hinge and set-screw, **as directed**.
 - e. Bare Piping in Unfinished Service Spaces: Split casting, cast brass with polished chrome-plated finish **OR** casting, cast brass with rough-brass finish **OR** plate, stamped steel with concealed hinge and set-screw or spring clips **OR** plate, stamped steel with concealed or exposed-rivet hinge and set-screw or spring clips **OR** plate, stamped steel with exposed-rivet hinge and set-screw or spring clips, **as directed**.
 - f. Bare Piping in Equipment Rooms: Split casting, cast brass **OR** plate, stamped steel with set-screw or spring clips, **as directed**.
 - g. Bare Piping at Floor Penetrations in Equipment Rooms: Split-casting floor plate.

L. Sleeve Installation

1. General Requirements: Install sleeves for pipes and tubes passing through penetrations in floors, partitions, roofs, and walls.
2. Sleeves are not required for core-drilled holes.
3. Permanent sleeves are not required for holes formed by removable PE sleeves.
4. Cut sleeves to length for mounting flush with both surfaces unless otherwise indicated.
5. Install sleeves in new partitions, slabs, and walls as they are built.
6. For interior wall penetrations, seal annular space between sleeve and pipe or pipe insulation using joint sealants appropriate for size, depth, and location of joint. Comply with requirements for joint sealants in Division 07 Section "Joint Sealants".
7. For exterior wall penetrations above grade, seal annular space between sleeve and pipe using joint sealants appropriate for size, depth, and location of joint. Comply with requirements for joint sealants in Division 07 Section "Joint Sealants".
8. For exterior wall penetrations below grade, seal annular space between sleeve and pipe using sleeve seals.
9. Seal space outside of sleeves in concrete slabs and walls with grout.
10. Install sleeves that are large enough to provide 1/4-inch (6.4-mm) annular clear space between sleeve and pipe or pipe insulation unless otherwise indicated.
11. Install sleeve materials according to the following applications:
 - a. Sleeves for Piping Passing through Concrete Floor Slabs: Molded PE **OR** Molded PVC **OR** Galvanized-steel pipe, **as directed**.
 - b. Sleeves for Piping Passing through Concrete Floor Slabs of Mechanical Equipment Areas or Other Wet Areas: Galvanized-steel pipe **OR** Stack sleeve fittings, **as directed**.
 - 1) Extend sleeves 2 inches (50 mm) above finished floor level.
 - 2) For pipes penetrating floors with membrane waterproofing, extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches (50 mm) above finished floor level. Comply with requirements for flashing in Division 07 Section "Sheet Metal Flashing And Trim".
 - c. Sleeves for Piping Passing through Gypsum-Board Partitions:
 - 1) PVC-pipe **OR** Galvanized-steel-pipe, **as directed**, sleeves for pipes smaller than NPS 6 (DN 150).
 - 2) Galvanized-steel-sheet sleeves for pipes NPS 6 (DN 150) and larger.
 - 3) Exception: Sleeves are not required for water-supply tubes and waste pipes for individual plumbing fixtures if escutcheons will cover openings.
 - d. Sleeves for Piping Passing through Concrete Roof Slabs: Molded PE **OR** Molded PVC **OR** Galvanized-steel pipe, **as directed**.
 - e. Sleeves for Piping Passing through Exterior Concrete Walls:
 - 1) Galvanized-steel-pipe sleeves for pipes smaller than NPS 6 (DN 150).
 - 2) Cast-iron wall pipe sleeves for pipes NPS 6 (DN 150) and larger.
 - 3) Install sleeves that are large enough to provide 1-inch (25-mm) annular clear space between sleeve and pipe or pipe insulation when sleeve seals are used.
 - f. Sleeves for Piping Passing through Interior Concrete Walls:
 - 1) PVC-pipe **OR** Galvanized-steel-pipe, **as directed**, sleeves for pipes smaller than NPS 6 (DN 150).
 - 2) Galvanized-steel-sheet sleeves for pipes NPS 6 (DN 150) and larger.
12. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestop materials and installations in Division 07 Section "Penetration Firestopping".

M. Sleeve Seal Installation

1. Install sleeve seals in sleeves in exterior concrete walls at water-service piping entries into building.
2. Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble sleeve seal components and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

- N. Identification
1. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 14.
 2. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Division 26 Section "Identification For Electrical Systems".
- O. Field Quality Control
1. Perform tests and inspections.
 2. Tests and Inspections:
 - a. Leak Test: After installation, charge systems and test for leaks. Repair leaks and retest until no leaks exist.
 - b. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - c. Flush, test, and inspect standpipe systems according to NFPA 14, "System Acceptance" Chapter.
 - d. Energize circuits to electrical equipment and devices.
 - e. Start and run air compressors.
 - f. Coordinate with fire-alarm tests. Operate as required.
 - g. Coordinate with fire-pump tests. Operate as required.
 - h. Verify that equipment hose threads are same as local fire-department equipment.
 3. Fire-suppression standpipe system will be considered defective if it does not pass tests and inspections.
 4. Prepare test and inspection reports.
- P. Demonstration
1. Train Owner's maintenance personnel to adjust, operate, and maintain specialty valves.
- Q. Piping Schedule
1. Piping between Fire-Department Connections and Check Valves: Galvanized, standard-weight steel pipe with threaded ends; cast-iron threaded fittings; and threaded **OR** grooved ends; grooved-end fittings; grooved-end-pipe couplings; and grooved, **as directed**, joints.
 2. Standard-pressure, wet-type, fire-suppression standpipe piping, NPS 4 (DN 100) and smaller, shall be one of the following:
 - a. Standard-weight or Schedule 30, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
 - b. Standard-weight **OR** Schedule 30 or thinwall, **as directed**, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.
 - c. Standard-weight or Schedule 30, black-steel pipe with cut- or roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - d. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - e. Standard-weight or Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
 - f. Thinwall **OR** Schedule 10, **as directed**, **OR** nonstandard OD, thinwall or hybrid, **as directed**, black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - g. Thinwall **OR** Schedule 10, **as directed**, **OR** nonstandard OD, thinwall or hybrid, **as directed**, black-steel pipe with plain ends; welding fittings; and welded joints.
 - h. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with plain ends; cast- or wrought-copper solder-joint fittings; and brazed joints.
 - i. Type L (Type B) **OR** Type M (Type B), **as directed**, hard copper tube with roll-grooved ends; copper, grooved-end fittings; grooved-end-tube couplings; and grooved joints.
 3. Standard-pressure, wet-type, fire-suppression standpipe piping, NPS 5 to NPS 8 (DN 125 to DN 200), shall be one of the following:
 - a. Standard-weight **OR** Schedule 30, **as directed**, or thinwall, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.

- b. Standard-weight or Schedule 30, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.
 - c. Standard-weight or Schedule 30, black-steel pipe with cut- or roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - d. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - e. Standard-weight or Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
 - f. Thinwall **OR** Schedule 10, **as directed**, or hybrid black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - g. Thinwall **OR** Schedule 10, **as directed**, or hybrid black-steel pipe with plain ends; welding fittings; and welded joints.
 - h. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with plain ends; cast- or wrought-copper solder-joint fittings; and brazed joints.
 - i. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with roll-grooved ends; copper, grooved-end fittings; grooved-end-tube couplings; and grooved joints.
4. Standard-pressure, wet-type, fire-suppression standpipe piping, NPS 10 and NPS 12 (DN 250 and DN 300), shall be one of the following:
- a. Standard-weight or Schedule 30, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
 - b. Standard-weight or Schedule 30, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.
 - c. Standard-weight or Schedule 30, black-steel pipe with cut- or roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - d. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - e. Standard-weight or Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
 - f. Thinwall **OR** Schedule 10, **as directed**, **OR** nonstandard OD, thinwall or hybrid, **as directed**, black-steel pipe with plain ends; welding fittings; and welded joints.
5. High-pressure, wet-type, fire-suppression standpipe piping, NPS 4 (DN 100) and smaller, shall be one of the following:
- a. Standard-weight or Schedule 30, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
 - b. Standard-weight or Schedule 30, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.
 - c. Standard-weight or Schedule 30, black-steel pipe with cut-grooved **OR** roll-grooved, **as directed**, ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - d. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - e. Standard-weight or Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
 - f. Thinwall **OR** Schedule 10, **as directed**, **OR** nonstandard OD, thinwall or hybrid, **as directed**, black-steel pipe with plain ends; welding fittings; and welded joints.
6. High-pressure, wet-type, fire-suppression standpipe piping, NPS 5 (DN 125) and larger, shall be one of the following:
- a. Standard-weight or Schedule 30, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
 - b. Standard-weight or Schedule 30, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.

- c. Standard-weight or Schedule 30, black-steel pipe with cut- or roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - d. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - e. Standard-weight or Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
 - f. Thinwall **OR** Schedule 10, **as directed**, **OR** nonstandard OD, thinwall or hybrid, **as directed**, black-steel pipe with plain ends; welding fittings; and welded joints.
7. Standard-pressure, dry-type, fire-suppression standpipe piping, NPS 4 (DN 100) and smaller, shall be one of the following:
- a. Standard-weight or Schedule 30, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.
 - b. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - c. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with plain ends; cast- or wrought-copper solder-joint fittings; and brazed joints.
 - d. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with roll-grooved ends; copper, grooved-end fittings; grooved-end-tube couplings; and grooved joints.
8. Standard-pressure, dry-type, fire-suppression standpipe piping, NPS 5 and NPS 6 (DN 125 and DN 150), shall be one of the following:
- a. Standard-weight or Schedule 30, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.
 - b. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - c. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with plain ends; cast- or wrought-copper solder-joint fittings; and brazed joints.
 - d. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with roll-grooved ends; copper, grooved-end fittings; grooved-end-tube couplings; and grooved joints.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 21 12 23 00 - WET STANDPIPE AND SPRINKLER SYSTEMS RENOVATION**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Perform all Work required to provide and install pipe, fittings, valves, hangers, supports, sleeves and appurtenances for reworking and/or expanding existing wet combination sprinkler and standpipe systems with all supplementary items necessary for complete, code compliant and approved installation.
- B. Contractor shall include within his bid all materials and Work to provide standpipe and 100% sprinkler protection for entire smoke compartment(s) affected by the renovation Work associated with this Project.
- C. Size all branches and mains by hydraulic calculations. Contractor shall obtain water supply information from the UTHSCSA Fire Protection Engineer to determine actual available volume and pressures as a design basis. Provide a 10 psi cushion for all hydraulic designs. This Contractor shall verify that the affected existing systems are configured and functioning properly according to NFPA-13. Hazard classifications for fire protection system design, installation and water supplies shall be in accordance with NFPA Standards. EXCEPTION: All pipe sizes and water flow demand for Light Hazard Occupancies shall be based upon Ordinary Hazard (Group 1) as the minimum system design. Sprinkler head locations and spacing for Light Hazard Occupancies shall be in accordance with NFPA 13 requirements.
- D. Interface all new flow and valve supervisory switches with building fire and smoke alarm systems.
- E. Provide temporary fire protection during the construction phase of Project. Inform and obtain approval from The University and General Contractor for any interruptions of existing fire protection, domestic water or fire alarm systems. Provide advance written notice at least 14 days prior to each and every shutdown.
- F. The Environmental Health and Safety Department (EH&S) of UTHSCSA is the Local Authority Having Jurisdiction (AHJ) for fire protection system equipment, materials, installation and applicable Code interpretations.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and Workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. NFPA 13 - Installation of Sprinkler Systems.

2. NFPA 14 - Installation of Standpipe and Hose Systems.
3. State of Texas, State Fire Marshal Rules.
4. City of Houston, Texas, Fire Department Standards.

1.04 QUALITY ASSURANCE

- A. Standpipe and sprinkler system design, testing, cleaning, certification, materials, equipment and installation shall meet the requirements of the latest editions of Referenced Standards.
- B. Obtain and become familiar with requirements of Owner's insurance underwriter, currently Factory Mutual Insurance Company (FM Global), and incorporate all applicable provisions for compliance.
- C. Thoroughly and clearly document all Project related communications with code and regulatory agents and expediently forward communication documentation to the UTHSCSA Project Manager.
- D. Equipment and components shall bear FM label or marking. Provide manufacturer's name and pressure rating marked on valve body.
- E. All hose threads, coupling types, etc., utilized in the fire protection systems shall conform to the standards and requirements of the UTHSCSA, Texas Fire Department.
- F. Maintain at least one copy of all system related documents on Site.
- G. Design sprinkler system under direct supervision of a R.M.E.'s (Responsible Managing Employee) experienced in design of this Work and licensed in the State of Texas. All design submittal documents and Shop Drawings shall bear the R.M.E.'s signed and dated registrations number. The system shall be installed by a firm having minimum three years experience regularly engaged in the design and installation of automatic fire protection systems in accordance with requirements of the National Fire Protection Association and the State of Texas Fire Marshal's office. Evidence to support the above requirements shall be submitted with Shop Drawings. Working plans shall be sealed by an engineer registered by the Texas State Board for Professional Engineers in fire protection specialty.

1.05 SUBMITTALS

A. General:

1. All new applications employing six (6) or more sprinklers and all reWork applications employing twenty (20) or more sprinklers shall be submitted for approval as described herein. Product data shall be submitted for all size Projects as described herein.
2. No Work shall be performed until the Shop Drawings, calculations and product data have been approved by UTHSCSA EH&S and The University's insurance underwriter, currently Factory Mutual Insurance Company (FM Global). This will require early processing of all submittals. The Contractor is solely liable for any Work performed or material purchases made prior to this approval.

B. Product Data:

1. Provide data on sprinkler heads, piping materials, joining methods, supports, valves, flow switches, tamper switches and all other components and accessories intended to be installed. Include manufacturers' catalog information, Code and Standards compliance, performance ratings, rough-in details, weights, finishes, support and connection requirements.
2. Submit one of each style of sprinkler head proposed.

C. Record Documents:

1. Submit preliminary layout showing head locations within coordinated ceiling grid and inspector's test station locations for review by Architect/Engineer/UTHSCSA Project Manager and EH&S.
 2. Shop Drawings: Submit detailed and accurate Shop Drawings of entire systems prior to fabrication. Indicate system controls, hydraulic reference points, detailed pipe layout, valves, hangers and supports, components and accessories. Indicate system controls.
 3. Where expanding existing systems, the submitted design Drawings shall show sufficient amount of the existing system as required to clearly identify how the new Work connects to the existing system. Where re-working existing systems, show the existing system in detail on the Drawings.
 4. Hydraulic calculations: Submit comprehensive hydraulic data sheets complying with NFPA 13. Verification of the adequacy of water pressure and other pertinent water supply data shall be the responsibility of the design engineer.
 5. As-Built Drawings: Provide three sets of As-Built Record Drawings indicating actual installed locations, sizes and types of sprinkler heads, piping, valves, supports, equipment and all other system components. Identify all deviations from approved submittal Drawings. Provide two sets of final hydraulic calculations and ACAD, version 13 or later, discs of As-Built Drawings.
 6. Submit certification letter by engineer of record stating that the fire protection systems design complies with Referenced Standards.
 7. Submit verification of Contractor's design and installation qualifications.
 8. Provide full written description of manufacturer's warranty.
 9. Provide certificate of compliance from authority having jurisdiction indicating approval of field acceptance tests. Refer to paragraph 3.04 B, within this specification section.
- D. Operation and Maintenance Data:
1. Include components of system, servicing requirements, inspection data, replacement part numbers, location and numbers of service depot. Provide a preventive maintenance schedule for all applicable equipment and systems.

1.06 DELIVERY, STORAGE AND HANDLING

- A. All materials shall be new, undamaged, and free of rust. Protect installed piping, valves and associated materials during progression of the construction period to avoid clogging with dirt, and debris and to prevent damage, rust, etc.
- B. Accept valves on Site in shipping containers and maintain in place until installation. Provide temporary protective coating and end plugs on valves not packaged within containers. Maintain in place until installation.
- C. Protect all materials that are to be installed within this Project from exposure to rain, freezing temperatures and direct sunlight.

1.07 EXTRA MATERIALS

- A. The Contractor shall provide supply of spare heads of each type installed under the Contract in quantities as required by National Fire Protection Association Standard No. 13. The heads shall be packed in a suitable wall mounted sprinkler cabinet and shall be representative of and in proportion to, the number of each type and temperature rating installed. In addition to the spare heads, the Contractor shall provide not less than three special sprinkler head wrenches for each type of head. The cabinet shall be located where directed by The University.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. All piping, materials and equipment used in the installation of sprinkler and standpipe systems shall be compatible with the existing installation, new, and listed as approved by the Underwriters' Laboratories, Inc., List of Inspected Fire Protection Equipment and Materials and the Factory Mutual Testing Laboratories List of Approved Equipment, Fire Protection Devices and Devices Involving Fire Hazard and shall be the latest design of the manufacturer.
- C. Pressure ratings of pipe, fittings, valves, gauges and all other water carrying appurtenances shall be suitable for the anticipated system pressures in which they are installed.
- D. The installing Contractor shall identify piping, valves and hydraulic design information in accordance with applicable NFPA Standards.

2.02 ACCEPTABLE MANUFACTURERS

- A. Sprinkler Heads: Reliable, Grinnell, Viking.
- B. Flow Switches: Notifier, Potter-Roemer.
- C. Tamper Switches: Notifier, Potter-Roemer.
- D. Gate Valves: Mueller, Nibco, Stockham, Kennedy.
- E. Butterfly Valves: Milwaukee, Nibco, Victaulic, Kennedy.
- F. Ball Valves: Milwaukee, Nibco, Stockham, Grinnell, Victaulic.
- G. Check Valves: Mueller, Nibco, Stockham, Grinnell, Victaulic.
- H. Hose Valves: Elkhart, Larsen, Potter-Roemer.
- I. Grooved Fittings and Couplings: Grinnell, Anvil, Victaulic.

2.03 SPRINKLER HEADS

- A. Unless otherwise specified or indicated on the Drawings, sprinkler heads shall be regular automatic closed type spray heads with temperature ratings as required by National Fire Protection Association Standard No. 13.
 - 1. Heads within smoke compartments containing patient sleeping rooms shall be quick-response type.
 - 2. Finished Ceilings: Provide concealed ceiling sprinklers with factory finished (no field painting) cover plate, color to match ceiling finish. [Exception: Provide chrome plated cover plates where directed by Architect].
 - 3. Unfinished Areas Without Ceilings: Provide bronze upright. Protect sprinkler heads susceptible to mechanical injury with standard guards
 - 4. Cold Rooms ($\leq 42^{\circ}\text{F.}$) and Areas Below Heated Ceiling/Soffit Spaces Susceptible to Freezing: Provide dry pendant type with chrome finish and two-piece escutcheon. (Areas include but not limited to; walk-in freezers, exterior overhangs, canopies...).

5. Elevator Equipment Rooms: Provide 212°F intermediate temperature classified heads.
6. MRI Rooms: Provide non-ferrous semi-recessed chrome plated head and escutcheon.

2.04 PIPING MATERIAL

- A. Unburied pipe shall be schedule 40 black steel. Fittings shall be threaded malleable iron, welded black steel, grooved malleable or ductile iron with gaskets and mechanical fasteners. (Exception: All piping within MRI rooms and ceiling spaces shall be Type "K" hard drawn copper with wrought copper or bronze pressure fittings and brazed joints).
- B. Mechanical tee assemblies (saddles) shall only be used to connect new branch lines and hose valve supplies to existing standpipes. Hole cutting tools approved by the mechanical tee assembly manufacture shall be used for all tapping procedures.

2.05 VALVES

- A. Similar types of valves shall be the product of one manufacturer; i.e., all butterfly valves shall be of the same manufacture, all ball valves shall be of the same manufacture, etc.
- B. All valves used to control the flow of water to and within standpipe and sprinkler systems shall be listed indicating type complete with electric supervisory switches. Coordinate wiring with the electrical Contractor.
- C. Hose valves shall have bronze finish, 2-1/2" hose thread connections with cast brass pin lug cap and chain.
- D. All 1-1/2" hose valves shall be provided with adjustable regulators where required to limit static and residual pressures to 100 psi. All 2-1/2" hose valves shall be provided with adjustable regulators where required to limit static and residual pressures to 175 psi. 2-1/2" hose valves shall be initially set for an outlet pressure of between 125 to 150 psi where allowed by system design.

2.06 FIRE VALVE CABINETS

- A. Provided within Architectural Division 10 of these Specifications.
- B. Coordinate with General Contractor prior to ordering hose valves for compatibility assurance.

PART 3 - EXECUTION

3.01 ELEVATOR SPRINKLER PROTECTION

- A. Elevator fire protection shall comply with NFPA 13, NFPA 70, NFPA 72, and ANSI/ASME A17.1 or A17.3 as applicable.
- B. When sprinklers are installed in elevator equipment rooms, the electrical power to the elevator controller must shut down prior to sprinkler activation. A heat detector shall activate an independently controlled shunt trip circuit breaker when the temperature in the machine room exceeds the setting of the heat detector. The detector shall have both a lower temperature rating and a higher sensitivity (lower Response Time Index) as compared to the sprinkler. Sprinkler heads shall be rated at 212°F and heat detectors shall be rated at 135°F. Heat detectors used to shut down elevator power prior to sprinkler operation shall be placed within two feet of each sprinkler head and connected to the fire alarm control panel.
- C. A smoke detector shall be provided to initiate phase one elevator recall, sending cars to the appropriate level prior to electrical power shut-down.

- D. No sprinkler risers shall be permitted inside any hoistway. Sprinkler branch lines shall enter hoistways only where a sprinkler is required.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Sprinkler heads shall be located in a symmetrical pattern related to ceiling features such as grid, beams, light fixtures, diffusers, etc. and where applicable, heads shall be located symmetrically with the ceiling grid, centered in two directions.
- D. Locate sprinkler heads to provide code required distances away from lights, exit signs, lab benches, library stacks, shelving systems, partitions, etc., and all other items that could interfere or effect sprinkler discharge.
- E. Apply temporary protective covers during construction to ensure that sprinkler heads and escutcheons do not receive field paint.
- F. Inspector's test valves shall be installed for each flow switch and located accessibly from a standing position in areas non-accessible by the public, patients or unauthorized personnel and as approved by Owner. Discharge water shall be piped to the building exterior or a drain capable of handling full flow without backup or splatter.
- G. Provide hangers for horizontal piping at intervals not exceeding twelve feet for pipe sizes 1-1/4" and smaller or fifteen feet for pipe sizes 1-1/2" and larger, and as recommended within NFPA.
- H. Route piping in orderly manner, plumb and parallel to building structure and concealed above ceilings where possible. Locate concealed valves, switches and alarm connections in accessible location, and coordinate size and location of access panels/doors with General Contractor.
- I. Install piping to conserve building space and not interfere with use of space and other Work. Coordinate with other trades to avoid conflicts and provide all required offsets, piping, auxiliary drains, etc. to properly install system.
- J. Group piping whenever practical at common elevations.
- K. Install piping to allow for expansion and Contraction without stressing pipe, joints or connected equipment.
- L. Slope piping and arrange systems to drain at low points. Use eccentric reducers to maintain top of pipe level.
- M. Provide drain valves at main shutoff valves, low points of piping and apparatus.
- N. Provide an approved splash block at the point of drain or system test discharge outside of the building, where the ground may be disturbed by the flow of water.
- O. Prepare pipe, fittings, supports and accessories for finish painting where required.
- P. Do not penetrate building structural members unless indicated otherwise on Contract Drawings.

- Q. Install valves with stems upright, not inverted. All valves shall be located such that the removal of their bonnets is possible. Valves placed in horizontal lines shall be installed with their valve stems inclined at an angle of a minimum of 30 degrees above the horizontal position. Valves shall be installed as nearly as possible to the locations indicated in the Construction Drawings. Any change in valve location must be so indicated on the Record Drawings. Remove protective coatings after installation.
- R. All shutoff and test valves shall be located on the floor they serve, unless the AHJ permits a different arrangement.
- S. Locate and secure hose cabinets plumb and level. Locate angle valve in cabinet at 60 inches above floor.
- T. Provide two hour enclosure around all fire standpipe piping routed outside fire stairwell.
- U. All piping shall be clean when it is installed. Before installation it shall be checked, upended, swabbed, if necessary and all rust or dirt from storage or lying on the ground shall be removed. Flush entire system of foreign matter.
- V. All screw joints shall be made with taper threads, properly cut. Joints shall be made tight with Teflon tape or non-toxic joint compound applied to the pipe threads only and not to fittings. When threads are cut on pipes, the ends shall be carefully reamed to remove any burrs. Before installing pipe that has been cut and threaded, the lengths of pipe shall be upended and hammered to remove all shavings and foreign material.

3.03 WELDED PIPING

- A. (NOTE: Welding of pipe/fittings in normally occupied buildings is prohibited. OffSite welding is acceptable. Should welding be required in a normally occupied building for connecting to an existing welded system, obtain written approval from the Resident Construction Manager and comply with NFPA 51 B and UTHSCSA Environmental Health and Safety requirements).
- B. All welding materials, procedures, qualifications and records shall comply with applicable NFPA requirements.

3.04 TESTING AND FLUSHING

- A. Testing, cleaning, flushing and inspection shall be done in accordance with NFPA requirements.
- B. The installing Contractor shall complete and sign the appropriate Contractor's Material and Test Certificates included within NFPA 13 and 14. Tests and signing of test certificates shall be witnessed by UTHSCSA Environmental Health and Safety Department representative or designee.

3.05 ZONING

- A. All flow switches and tamper switches shall relay their activation to each annunciator panel and the main fire alarm panel.
- B. Sprinkler system zoning shall coincide with building smoke compartmentalization unless noted otherwise on Contract Drawings. As a minimum, each floor level shall be a separate zone.

21 12 29 00	21 12 23 00	Wet Standpipe And Sprinkler Systems Renovation

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 21 13 13 00 - WET-PIPE FIRE-SUPPRESSION SPRINKLERS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for wet-pipe fire-suppression sprinklers. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Pipes, fittings, and specialties.
 - b. Fire-protection valves.
 - c. Fire-department connections.
 - d. Sprinklers.
 - e. Excess-pressure pumps.
 - f. Alarm devices.
 - g. Manual control stations.
 - h. Control panels.
 - i. Pressure gages.

C. Definitions

1. High-Pressure Sprinkler Piping: Wet-pipe sprinkler system piping designed to operate at working pressure higher than standard 175 psig (1200 kPa), but not higher than 250 psig (1725 kPa) **OR** 300 psig (2070 kPa), **as directed**.
2. Standard-Pressure Sprinkler Piping: Wet-pipe sprinkler system piping designed to operate at working pressure of 175 psig (1200 kPa) maximum.

D. System Descriptions

1. Wet-Pipe Sprinkler System: Automatic sprinklers are attached to piping containing water and that is connected to water supply through alarm valve. Water discharges immediately from sprinklers when they are opened. Sprinklers open when heat melts fusible link or destroys frangible device. Hose connections are included if indicated.
2. Deluge Sprinkler System: Open sprinklers are attached to piping connected to water supply through deluge valve. Fire-detection system, in same area as sprinklers, opens valve. Water flows into piping system and discharges from attached sprinklers when valve opens.

E. Performance Requirements

1. Standard-Pressure Piping System Component: Listed for 175-psig (1200-kPa) minimum working pressure.
2. High-Pressure Piping System Component: Listed for 250-psig (1725-kPa) minimum **OR** 300-psig (2070-kPa), **as directed**, working pressure.
3. Delegated Design: Design sprinkler system(s), including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
4. Sprinkler system design shall be approved by authorities having jurisdiction.
 - a. Margin of Safety for Available Water Flow and Pressure: 10 **OR** 20, **as directed**, percent, including losses through water-service piping, valves, and backflow preventers.
 - b. Sprinkler Occupancy Hazard Classifications:
 - 1) Automobile Parking Areas: Ordinary Hazard, Group 1.
 - 2) Building Service Areas: Ordinary Hazard, Group 1.
 - 3) Churches: Light Hazard.
 - 4) Electrical Equipment Rooms: Ordinary Hazard, Group 1.
 - 5) Dry Cleaners: Ordinary Hazard, Group 2.

- 6) General Storage Areas: Ordinary Hazard, Group 1.
- 7) Laundries: Ordinary Hazard, Group 1.
- 8) Libraries except Stack Areas: Light Hazard.
- 9) Library Stack Areas: Ordinary Hazard, Group 2.
- 10) Machine Shops: Ordinary Hazard, Group 2.
- 11) Mechanical Equipment Rooms: Ordinary Hazard, Group 1.
- 12) Office and Public Areas: Light Hazard.
- 13) Plastics Processing Areas: Extra Hazard, Group 2.
- 14) Printing Plants: Extra Hazard, Group 1.
- 15) Repair Garages: Ordinary Hazard, Group 2.
- 16) Residential Living Areas: Light Hazard.
- 17) Restaurant Service Areas: Ordinary Hazard, Group 1.
- 18) Solvent Cleaning Areas: Extra Hazard, Group 2.
- 19) Upholstering Plants: Extra Hazard, Group 1.
- c. Minimum Density for Automatic-Sprinkler Piping Design:
 - 1) Residential (Dwelling) Occupancy: 0.05 gpm over 400-sq. ft. (2.04 mm/min. over 37.2-sq. m) area.
 - 2) Light-Hazard Occupancy: 0.10 gpm over 1500-sq. ft. (4.1 mm/min. over 139-sq. m) area.
 - 3) Ordinary-Hazard, Group 1 Occupancy: 0.15 gpm over 1500-sq. ft. (6.1 mm/min. over 139-sq. m) area.
 - 4) Ordinary-Hazard, Group 2 Occupancy: 0.20 gpm over 1500-sq. ft. (8.1 mm/min. over 139-sq. m) area.
 - 5) Extra-Hazard, Group 1 Occupancy: 0.30 gpm over 2500-sq. ft. (12.2 mm/min. over 232-sq. m) area.
 - 6) Extra-Hazard, Group 2 Occupancy: 0.40 gpm over 2500-sq. ft. (16.3 mm/min. over 232-sq. m) area.
 - 7) Special Occupancy Hazard: As determined by authorities having jurisdiction.
- d. Minimum Density for Deluge-Sprinkler Piping Design:
 - 1) Ordinary-Hazard, Group 1 Occupancy: 0.15 gpm (6.1 mm/min.) over entire area.
 - 2) Ordinary-Hazard, Group 2 Occupancy: 0.20 gpm (8.1 mm/min.) over entire area.
 - 3) Extra-Hazard, Group 1 Occupancy: 0.30 gpm (12.2 mm/min.) over entire area.
 - 4) Extra-Hazard, Group 2 Occupancy: 0.40 gpm (16.3 mm/min.) over entire area.
 - 5) Special Occupancy Hazard: As determined by authorities having jurisdiction.
- e. Maximum Protection Area per Sprinkler: Per UL listing.
OR
 Maximum Protection Area per Sprinkler:
 - 1) Residential Areas: 400 sq. ft. (37 sq. m).
 - 2) Office Spaces: 120 sq. ft. (11.1 sq. m) **OR** 225 sq. ft. (20.9 sq. m), **as directed**.
 - 3) Storage Areas: 130 sq. ft. (12.1 sq. m).
 - 4) Mechanical Equipment Rooms: 130 sq. ft. (12.1 sq. m).
 - 5) Electrical Equipment Rooms: 130 sq. ft. (12.1 sq. m).
 - 6) Other Areas: According to NFPA 13 recommendations unless otherwise indicated.
- f. Total Combined Hose-Stream Demand Requirement: According to NFPA 13 unless otherwise indicated:
 - 1) Light-Hazard Occupancies: 100 gpm (6.3 L/s) for 30 minutes.
 - 2) Ordinary-Hazard Occupancies: 250 gpm (15.75 L/s) for 60 to 90 minutes.
 - 3) Extra-Hazard Occupancies: 500 gpm (31.5 L/s) for 90 to 120 minutes.
5. Seismic Performance: Sprinkler piping shall withstand the effects of earthquake motions determined according to NFPA 13 and ASCE/SEI 7.

F. Submittals

1. Product Data: For each type of product indicated.
2. LEED Submittal:
 - a. Product Data for Credit EQ 4.1: For solvent cements and adhesive primers, including printed statement of VOC content and chemical components.

3. Shop Drawings: For wet-pipe sprinkler systems. Include plans, elevations, sections, details, and attachments to other work.
 - a. Wiring Diagrams: For power, signal, and control wiring.
4. Delegated-Design Submittal: For sprinkler systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
5. Qualification Data: For qualified Installer and professional engineer, **as directed**.
6. Approved Sprinkler Piping Drawings: Working plans, prepared according to NFPA 13, that have been approved by authorities having jurisdiction, including hydraulic calculations if applicable.
7. Welding certificates.
8. Fire-hydrant flow test report.
9. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 13. Include "Contractor's Material and Test Certificate for Aboveground Piping."
10. Field quality-control reports.
11. Operation and maintenance data.

G. Quality Assurance

1. Installer Qualifications:
 - a. Installer's responsibilities include designing, fabricating, and installing sprinkler systems and providing professional engineering services needed to assume engineering responsibility. Base calculations on results of fire-hydrant flow test.
 - 1) Engineering Responsibility: Preparation of working plans, calculations, and field test reports by a qualified professional engineer.
2. Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.
3. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
4. NFPA Standards: Sprinkler system equipment, specialties, accessories, installation, and testing shall comply with the following:
 - a. NFPA 13, "Installation of Sprinkler Systems."
 - b. NFPA 13R, "Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height."
 - c. NFPA 24, "Installation of Private Fire Service Mains and Their Appurtenances."

H. Project Conditions

1. Interruption of Existing Sprinkler Service: Do not interrupt sprinkler service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary sprinkler service according to requirements indicated:
 - a. Notify The University no fewer than two days in advance of proposed interruption of sprinkler service.
 - b. Do not proceed with interruption of sprinkler service without The University's written permission.

1.2 PRODUCTS

A. Piping Materials

1. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, and fitting materials, and for joining methods for specific services, service locations, and pipe sizes.

B. Steel Pipe And Fittings

1. Standard Weight, Galvanized- and Black-Steel Pipe: ASTM A 53/A 53M, Type E, Grade B. Pipe ends may be factory or field formed to match joining method.

2. Schedule 30, Galvanized- and Black-Steel Pipe: ASTM A 135; ASTM A 795/A 795M, Type E; or ASME B36.10M, wrought steel; with wall thickness not less than Schedule 30 and not more than Schedule 40. Pipe ends may be factory or field formed to match joining method.
3. Thinwall Galvanized- and Black-Steel Pipe: ASTM A 135 or ASTM A 795/A 795M, threadable, with wall thickness less than Schedule 30 and equal to or greater than Schedule 10. Pipe ends may be factory or field formed to match joining method.
4. Schedule 10, Black-Steel Pipe: ASTM A 135 or ASTM A 795/A 795M, Schedule 10 in NPS 5 (DN 125) and smaller; and NFPA 13-specified wall thickness in NPS 6 to NPS 10 (DN 150 to DN 250), plain end.
5. Nonstandard OD, Thinwall Black-Steel Pipe: ASTM A 135 or ASTM A 795/A 795M, thinwall, with plain ends and wall thickness less than Schedule 10.
6. Hybrid Black-Steel Pipe: ASTM A 135 or ASTM A 795/A 795M, lightwall, with wall thickness less than Schedule 10 and greater than Schedule 5.
7. Schedule 5 Steel Pipe: ASTM A 135 or ASTM A 795/A 795M, lightwall, with plain ends.
8. Galvanized- and Black-Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, standard-weight, seamless steel pipe with threaded ends.
9. Galvanized and Uncoated, Steel Couplings: ASTM A 865, threaded.
10. Galvanized and Uncoated, Gray-Iron Threaded Fittings: ASME B16.4, Class 125, standard pattern.
11. Malleable- or Ductile-Iron Unions: UL 860.
12. Cast-Iron Flanges: ASME 16.1, Class 125.
13. Steel Flanges and Flanged Fittings: ASME B16.5, Class 150.
14. Steel Welding Fittings: ASTM A 234/A 234M and ASME B16.9.
15. Grooved-Joint, Steel-Pipe Appurtenances:
 - a. Pressure Rating: 175 psig (1200 kPa) **OR** 250 psig (1725 kPa) **OR** 300 psig (2070 kPa), **as directed**, minimum.
 - b. Galvanized and Uncoated, Grooved-End Fittings for Steel Piping: ASTM A 47/A 47M, malleable-iron casting or ASTM A 536, ductile-iron casting; with dimensions matching steel pipe.
 - c. Grooved-End-Pipe Couplings for Steel Piping: AWWA C606 and UL 213, rigid pattern, unless otherwise indicated, for steel-pipe dimensions. Include ferrous housing sections, EPDM-rubber gasket, and bolts and nuts.
16. Steel Pressure-Seal Fittings: UL 213, FM-approved, 175-psig (1200-kPa) pressure rating with steel housing, rubber O-rings, and pipe stop; for use with fitting manufacturers' pressure-seal tools.

C. Copper Tube And Fittings

1. Hard Copper Tube: ASTM B 88, Type L (ASTM B 88M, Type B) and ASTM B 88, Type M (ASTM B 88M, Type C) water tube, drawn temper.
2. Cast-Copper, Solder-Joint Fittings: ASME B16.18, pressure fittings.
3. Wrought-Copper, Solder-Joint Fittings: ASME B16.22, pressure fittings.
4. Bronze Flanges: ASME B16.24, Class 150, with solder-joint ends.
5. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.
6. Copper Pressure-Seal Fittings:
 - a. Standard: UL 213.
 - b. NPS 2 (DN 50) and Smaller: Wrought-copper fitting with EPDM-rubber O-ring seal in each end.
 - c. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Cast-bronze fitting with EPDM-rubber O-ring seal in each end.
7. Grooved-Joint, Copper-Tube Appurtenances:
 - a. Grooved-End, Copper Fittings: ASTM B 75 (ASTM B 75M), copper tube or ASTM B 584, bronze castings.
 - b. Grooved-End-Tube Couplings: To fit copper-tube dimensions, with design similar to AWWA C606. Include ferrous housing sections, EPDM-rubber gasket suitable for hot and cold water, and bolts and nuts.
8. Copper-Tube, Extruded-Tee Connections:

- a. Description: Tee formed in copper tube according to ASTM F 2014.
- D. CPVC Pipe And Fittings
1. CPVC Pipe: ASTM F 442/F 442M and UL 1821, SDR 13.5, for 175-psig (1200-kPa) rated pressure at 150 deg F (62 deg C), with plain ends. Include "LISTED" and "CPVC SPRINKLER PIPE" markings.
 2. CPVC Fittings: UL listed or FM approved, for 175-psig (1200-kPa) rated pressure at 150 deg F (62 deg C), socket type. Include "LISTED" and "CPVC SPRINKLER FITTING" markings.
 - a. NPS 3/4 to NPS 1-1/2 (DN 20 to DN 40): ASTM F 438 and UL 1821, Schedule 40, socket type.
 - b. NPS 2 to NPS 3 (DN 50 to DN 80): ASTM F 439 and UL 1821, Schedule 80, socket type.
 - c. CPVC-to-Metal Transition Fittings: CPVC, one piece, with dimensions equivalent to pipe; one end with threaded brass insert, and one socket end.
 - d. CPVC-to-Metal Transition Unions: CPVC, with dimensions equivalent to pipe; one end with threaded brass insert, and one socket end.
 - e. Flanges: CPVC, one or two pieces.
- E. Piping Joining Materials
1. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 1/8 inch (3.2 mm) thick or ASME B16.21, nonmetallic and asbestos free.
 - a. Class 125, Cast-Iron Flanges and Class 150, Bronze Flat-Face Flanges: Full-face gaskets.
 - b. Class 250, Cast-Iron Flanges and Class 300, Steel Raised-Face Flanges: Ring-type gaskets.
 2. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.
 3. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for general-duty brazing unless otherwise indicated.
 4. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.
 5. Solvent Cements for Joining CPVC Piping and Tubing: ASTM F 493, solvent cement recommended by pipe and fitting manufacturer, and made for joining CPVC sprinkler pipe and fittings. Include cleaner or primer recommended by pipe and fitting manufacturer.
 - a. Use solvent cement that has a VOC content of 490 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - b. Use adhesive primer that has a VOC content of 650 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 6. Plastic, Pipe-Flange Gasket, and Bolts and Nuts: Type and material recommended by piping system manufacturer unless otherwise indicated.
- F. Cover System For Sprinkler Piping
1. Description: System of support brackets and covers made to protect sprinkler piping.
 2. Brackets: Glass-reinforced nylon.
 3. Covers: Extruded PVC sections of length, shape, and size required for size and routing of CPVC piping.
- G. Listed Fire-Protection Valves
1. General Requirements:
 - a. Valves shall be UL listed or FM approved.
 - b. Minimum Pressure Rating for Standard-Pressure Piping: 175 psig (1200 kPa).
 - c. Minimum Pressure Rating for High-Pressure Piping: 250 psig (1725 kPa) **OR** 300 psig (2070 kPa), **as directed**.
 2. Ball Valves:
 - a. Standard: UL 1091 except with ball instead of disc.
 - b. Valves NPS 1-1/2 (DN 40) and Smaller: Bronze body with threaded ends.
 - c. Valves NPS 2 and NPS 2-1/2 (DN 50 and DN 65): Bronze body with threaded ends or ductile-iron body with grooved ends.

- d. Valves NPS 3 (DN 80): Ductile-iron body with grooved ends.
- 3. Bronze Butterfly Valves:
 - a. Standard: UL 1091.
 - b. Pressure Rating: 175 psig (1200 kPa).
 - c. Body Material: Bronze.
 - d. End Connections: Threaded.
- 4. Iron Butterfly Valves:
 - a. Standard: UL 1091.
 - b. Pressure Rating: 175 psig (1200 kPa).
 - c. Body Material: Cast or ductile iron.
 - d. Style: Lug or wafer.

OR

End Connections: Grooved.
- 5. Check Valves:
 - a. Standard: UL 312.
 - b. Pressure Rating: 250 psig (1725 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - c. Type: Swing check.
 - d. Body Material: Cast iron.
 - e. End Connections: Flanged or grooved.
- 6. Bronze OS&Y Gate Valves:
 - a. Standard: UL 262.
 - b. Pressure Rating: 175 psig (1200 kPa).
 - c. Body Material: Bronze.
 - d. End Connections: Threaded.
- 7. Iron OS&Y Gate Valves:
 - a. Standard: UL 262.
 - b. Pressure Rating: 250 psig (1725 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - c. Body Material: Cast or ductile iron.
 - d. End Connections: Flanged or grooved.
- 8. Indicating-Type Butterfly Valves:
 - a. Standard: UL 1091.
 - b. Pressure Rating: 175 psig (1200 kPa) minimum.
 - c. Valves NPS 2 (DN 50) and Smaller:
 - 1) Valve Type: Ball or butterfly.
 - 2) Body Material: Bronze.
 - 3) End Connections: Threaded.
 - d. Valves NPS 2-1/2 (DN 65) and Larger:
 - 1) Valve Type: Butterfly.
 - 2) Body Material: Cast or ductile iron.
 - 3) End Connections: Flanged, grooved, or wafer.
 - e. Valve Operation: Integral electrical, 115-V ac, prewired, single-circuit, supervisory switch **OR** electrical, 115-V ac, prewired, two-circuit, supervisory switch **OR** visual, **as directed**, indicating device.
- 9. NRS Gate Valves:
 - a. Standard: UL 262.
 - b. Pressure Rating: 250 psig (1725 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - c. Body Material: Cast iron with indicator post flange.
 - d. Stem: Nonrising.
 - e. End Connections: Flanged or grooved.
- 10. Indicator Posts:
 - a. Standard: UL 789.
 - b. Type: Horizontal for wall mounting.
 - c. Body Material: Cast iron with extension rod and locking device.
 - d. Operation: Wrench **OR** Hand wheel, **as directed**.

H. Trim And Drain Valves

- 1. General Requirements:

- a. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
 - b. Pressure Rating: 175 psig (1200 kPa) minimum.
 2. Angle Valves.
 3. Ball Valves.
 4. Globe Valves.
 5. Plug Valves.
- I. Specialty Valves
 1. General Requirements:
 - a. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
 - b. Pressure Rating:
 - 1) Standard-Pressure Piping Specialty Valves: 175 psig (1200 kPa) minimum.
 - 2) High-Pressure Piping Specialty Valves: 250 psig (1725 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - c. Body Material: Cast or ductile iron.
 - d. Size: Same as connected piping.
 - e. End Connections: Flanged or grooved.
 2. Alarm Valves:
 - a. Standard: UL 193.
 - b. Design: For horizontal or vertical installation.
 - c. Include trim sets for bypass, drain, electrical sprinkler alarm switch, pressure gages, retarding chamber, **as directed**, and fill-line attachment with strainer.
 - d. Drip Cup Assembly: Pipe drain without valves and separate from main drain piping.
OR
Drip Cup Assembly: Pipe drain with check valve to main drain piping.
 3. Deluge Valves:
 - a. Standard: UL 260.
 - b. Design: Hydraulically operated, differential-pressure type.
 - c. Include trim sets for bypass, drain, electrical sprinkler alarm switch, pressure gages, drip cup assembly piped without valves and separate from main drain line, fill-line attachment with strainer, and push-rod chamber supply connection.
 - d. Wet, Pilot-Line Trim Set: Include gage to read push-rod chamber pressure, globe valve for manual operation of deluge valve, and connection for actuation device.
 4. Automatic (Ball Drip) Drain Valves:
 - a. Standard: UL 1726.
 - b. Pressure Rating: 175 psig (1200 kPa) minimum.
 - c. Type: Automatic draining, ball check.
 - d. Size: NPS 3/4 (DN 20).
 - e. End Connections: Threaded.
- J. Fire-Department Connections
 1. Exposed-Type, Fire-Department Connection:
 - a. Standard: UL 405.
 - b. Type: Exposed, projecting, for wall mounting.
 - c. Pressure Rating: 175 psig (1200 kPa) minimum.
 - d. Body Material: Corrosion-resistant metal.
 - e. Inlets: Brass with threads according to NFPA 1963 and matching local fire-department sizes and threads. Include extension pipe nipples, brass lugged swivel connections, and check devices or clappers.
 - f. Caps: Brass, lugged type, with gasket and chain.
 - g. Escutcheon Plate: Round, brass, wall type.
 - h. Outlet: Back, with pipe threads.
 - i. Number of Inlets: Two **OR** Three, **as directed**.
 - j. Escutcheon Plate Marking: Similar to "AUTO SPKR & STANDPIPE" **OR** "AUTO SPKR", **as directed**.

- k. Finish: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
 - l. Outlet Size: NPS 4 (DN 100) **OR** NPS 5 (DN 125) **OR** NPS 6 (DN 150), **as directed**.
 - 2. Flush-Type, Fire-Department Connection:
 - a. Standard: UL 405.
 - b. Type: Flush, for wall mounting.
 - c. Pressure Rating: 175 psig (1200 kPa) minimum.
 - d. Body Material: Corrosion-resistant metal.
 - e. Inlets: Brass with threads according to NFPA 1963 and matching local fire-department sizes and threads. Include extension pipe nipples, brass lugged swivel connections, and check devices or clappers.
 - f. Caps: Brass, lugged type, with gasket and chain.
 - g. Escutcheon Plate: Rectangular, brass, wall type.
 - h. Outlet: With pipe threads.
 - i. Body Style: Horizontal **OR** Square **OR** Vertical, **as directed**.
 - j. Number of Inlets: Two **OR** Three **OR** Four **OR** Six, **as directed**.
 - k. Outlet Location: Back **OR** Bottom **OR** Left side **OR** Right side **OR** Top, **as directed**.
 - l. Escutcheon Plate Marking: Similar to "AUTO SPKR & STANDPIPE" **OR** "AUTO SPKR", **as directed**.
 - m. Finish: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
 - n. Outlet Size: NPS 4 (DN 100) **OR** NPS 5 (DN 125) **OR** NPS 6 (DN 150) **OR** NPS 8 (DN 200), **as directed**.
 - 3. Yard-Type, Fire-Department Connection:
 - a. Standard: UL 405.
 - b. Type: Exposed, freestanding.
 - c. Pressure Rating: 175 psig (1200 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - d. Body Material: Corrosion-resistant metal.
 - e. Inlets: Brass with threads according to NFPA 1963 and matching local fire-department sizes and threads. Include extension pipe nipples, brass lugged swivel connections, and check devices or clappers.
 - f. Caps: Brass, lugged type, with gasket and chain.
 - g. Escutcheon Plate: Round, brass, floor type.
 - h. Outlet: Bottom, with pipe threads.
 - i. Number of Inlets: Two **OR** Three **OR** Four, **as directed**.
 - j. Sleeve: Brass **OR** Not required, **as directed**.
 - k. Sleeve Height: 18 inches (460 mm).
 - l. Escutcheon Plate Marking: Similar to "AUTO SPKR & STANDPIPE" **OR** "AUTO SPKR", **as directed**.
 - m. Finish, Including Sleeve: Polished chrome plated **OR** Rough brass or bronze **OR** Rough chrome plated, **as directed**.
 - n. Outlet Size: NPS 4 (DN 100) **OR** NPS 5 (DN 125) **OR** NPS 6 (DN 150), **as directed**.
- K. Sprinkler Specialty Pipe Fittings
 - 1. Branch Outlet Fittings:
 - a. Standard: UL 213.
 - b. Pressure Rating: 175 psig (1200 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - c. Body Material: Ductile-iron housing with EPDM seals and bolts and nuts.
 - d. Type: Mechanical-T and -cross fittings.
 - e. Configurations: Snap-on and strapless, ductile-iron housing with branch outlets.
 - f. Size: Of dimension to fit onto sprinkler main and with outlet connections as required to match connected branch piping.
 - g. Branch Outlets: Grooved, plain-end pipe, or threaded.
 - 2. Flow Detection and Test Assemblies:
 - a. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
 - b. Pressure Rating: 175 psig (1200 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.

- c. Body Material: Cast- or ductile-iron housing with orifice, sight glass, and integral test valve.
 - d. Size: Same as connected piping.
 - e. Inlet and Outlet: Threaded.
- 3. Branch Line Testers:
 - a. Standard: UL 199.
 - b. Pressure Rating: 175 psig (1200 kPa).
 - c. Body Material: Brass.
 - d. Size: Same as connected piping.
 - e. Inlet: Threaded.
 - f. Drain Outlet: Threaded and capped.
 - g. Branch Outlet: Threaded, for sprinkler.
- 4. Sprinkler Inspector's Test Fittings:
 - a. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
 - b. Pressure Rating: 175 psig (1200 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - c. Body Material: Cast- or ductile-iron housing with sight glass.
 - d. Size: Same as connected piping.
 - e. Inlet and Outlet: Threaded.
- 5. Adjustable Drop Nipples:
 - a. Standard: UL 1474.
 - b. Pressure Rating: 250 psig (1725 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - c. Body Material: Steel pipe with EPDM-rubber O-ring seals.
 - d. Size: Same as connected piping.
 - e. Length: Adjustable.
 - f. Inlet and Outlet: Threaded.
- 6. Flexible, Sprinkler Hose Fittings:
 - a. Standard: UL 1474.
 - b. Type: Flexible hose for connection to sprinkler, and with bracket for connection to ceiling grid.
 - c. Pressure Rating: 175 psig (1200 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - d. Size: Same as connected piping, for sprinkler.

L. Sprinklers

- 1. General Requirements:
 - a. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
 - b. Pressure Rating for Residential Sprinklers: 175 psig (1200 kPa) maximum.
 - c. Pressure Rating for Automatic Sprinklers: 175 psig (1200 kPa) minimum.
 - d. Pressure Rating for High-Pressure Automatic Sprinklers: 250 psig (1725 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
- 2. Automatic Sprinklers with Heat-Responsive Element:
 - a. Early-Suppression, Fast-Response Applications: UL 1767.
 - b. Nonresidential Applications: UL 199.
 - c. Residential Applications: UL 1626.
 - d. Characteristics: Nominal 1/2-inch (12.7-mm) orifice with Discharge Coefficient K of 5.6, and for "Ordinary" temperature classification rating unless otherwise indicated or required by application.
- 3. Open Sprinklers with Heat-Responsive Element Removed: UL 199.
 - a. Characteristics:
 - 1) Nominal 1/2-inch (12.7-mm) Orifice: With Discharge Coefficient K between 5.3 and 5.8.
 - 2) Nominal 17/32-inch (13.5-mm) Orifice: With Discharge Coefficient K between 7.4 and 8.2.
- 4. Sprinkler Finishes:
 - a. Chrome plated.
 - b. Bronze.
 - c. Painted.

5. Special Coatings:
 - a. Wax.
 - b. Lead.
 - c. Corrosion-resistant paint.
6. Sprinkler Escutcheons: Materials, types, and finishes for the following sprinkler mounting applications. Escutcheons for concealed, flush, and recessed-type sprinklers are specified with sprinklers.
 - a. Ceiling Mounting: Chrome-plated steel, one piece, flat **OR** Chrome-plated steel, two piece, with 1-inch (25-mm) vertical adjustment **OR** Plastic, white finish, one piece, flat, **as directed**.
 - b. Sidewall Mounting: Chrome-plated steel **OR** Plastic, white finish, **as directed**, one piece, flat.
7. Sprinkler Guards:
 - a. Standard: UL 199.
 - b. Type: Wire cage with fastening device for attaching to sprinkler.

M. Excess-Pressure Pumps

1. Pump: Factory-fabricated, positive-displacement, gear type.
 - a. Pump and Motor: Directly connected.
 - b. Motor: Comply with requirements in Division 21 Section "Common Work Results For Fire Suppression".
2. Miscellaneous Components: Wet-pipe kit of switches, fittings, valves, mounting brackets, and connections for power, hydraulic piping, and wiring from alarm devices.
3. Motor Control: Differential-pressure switch.
4. Lights: To indicate sprinkler system's operating condition.
 - a. White Light: Pressure is normal.
 - b. Red Light: Pressure is low.
5. Capacity: 2.0 gpm at 75-psig (0.13 L/s at 520-kPa) differential pressure and 1/3 hp **OR** 1.85 gpm at 100-psig (0.12 L/s at 690-kPa) differential pressure and 1/2 hp **OR** 3.5 gpm at 100-psig (0.22 L/s at 690-kPa) differential pressure and 1/2 hp, **as directed**.

N. Alarm Devices

1. Alarm-device types shall match piping and equipment connections.
2. Water-Motor-Operated Alarm:
 - a. Standard: UL 753.
 - b. Type: Mechanically operated, with Pelton wheel.
 - c. Alarm Gong: Cast aluminum with red-enamel factory finish.
 - d. Size: 10-inch (250-mm) diameter.
 - e. Components: Shaft length, bearings, and sleeve to suit wall construction.
 - f. Inlet: NPS 3/4 (DN 20).
 - g. Outlet: NPS 1 (DN 25) drain connection.
3. Electrically Operated Alarm Bell:
 - a. Standard: UL 464.
 - b. Type: Vibrating, metal alarm bell.
 - c. Size: 6-inch (150-mm) minimum-diameter **OR** 8-inch (200-mm) minimum-diameter **OR** 10-inch (250-mm) diameter, **as directed**.
 - d. Finish: Red-enamel factory finish, suitable for outdoor use.
4. Water-Flow Indicators:
 - a. Standard: UL 346.
 - b. Water-Flow Detector: Electrically supervised.
 - c. Components: Two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-V ac and 0.25 A, 24-V dc; complete with factory-set, field-adjustable retard element to prevent false signals and tamperproof cover that sends signal if removed.
 - d. Type: Paddle operated.
 - e. Pressure Rating: 250 psig (1725 kPa).
 - f. Design Installation: Horizontal or vertical.

5. Pressure Switches:
 - a. Standard: UL 346.
 - b. Type: Electrically supervised water-flow switch with retard feature.
 - c. Components: Single-pole, double-throw switch with normally closed contacts.
 - d. Design Operation: Rising pressure signals water flow.
 6. Valve Supervisory Switches:
 - a. Standard: UL 346.
 - b. Type: Electrically supervised.
 - c. Components: Single-pole, double-throw switch with normally closed contacts.
 - d. Design: Signals that controlled valve is in other than fully open position.
 7. Indicator-Post Supervisory Switches:
 - a. Standard: UL 346.
 - b. Type: Electrically supervised.
 - c. Components: Single-pole, double-throw switch with normally closed contacts.
 - d. Design: Signals that controlled indicator-post valve is in other than fully open position.
- O. Manual Control Stations
1. Description: UL listed or FM approved, hydraulic operation, with union, NPS 1/2 (DN 15) pipe nipple, and bronze ball valve. Include metal enclosure labeled "MANUAL CONTROL STATION" with operating instructions and cover held closed by breakable strut to prevent accidental opening.
- P. Control Panels
1. Description: Single-area, two-area, or single-area cross-zoned control panel as indicated, including NEMA ICS 6, Type 1 enclosure, detector, alarm, and solenoid-valve circuitry for operation of deluge valves. Panels contain power supply; battery charger; standby batteries; field-wiring terminal strip; electrically supervised solenoid valves and polarized fire-alarm bell; lamp test facility; single-pole, double-throw auxiliary alarm contacts; and rectifier.
 - a. Panels: UL listed and FM approved when used with thermal detectors and Class A detector circuit wiring. Electrical characteristics are 120-V ac, 60 Hz, with 24-V dc rechargeable batteries.
 - b. Manual Control Stations: Electric operation, metal enclosure, labeled "MANUAL CONTROL STATION" with operating instructions and cover held closed by breakable strut to prevent accidental opening.
OR
Manual Control Stations: Hydraulic operation, with union, NPS 1/2 (DN 15) pipe nipple, and bronze ball valve. Include metal enclosure labeled "MANUAL CONTROL STATION" with operating instructions and cover held closed by breakable strut to prevent accidental opening.
- Q. Pressure Gages
1. Standard: UL 393.
 2. Dial Size: 3-1/2- to 4-1/2-inch (90- to 115-mm) diameter.
 3. Pressure Gage Range: 0 to 250 psig (0 to 1725 kPa) minimum **OR** 0 to 300 psig (0 to 2070 kPa), **as directed**.
 4. Water System Piping Gage: Include "WATER" or "AIR/WATER" label on dial face.
 5. Air System Piping Gage: Include retard feature, **directed**, and "AIR" or "AIR/WATER" label on dial face.
- R. Escutcheons
1. General: Manufactured ceiling, floor, and wall escutcheons and floor plates.
 2. One-Piece, Cast-Brass Escutcheons: Polished chrome-plated **OR** rough-brass, **as directed**, finish with set-screws.
 3. One-Piece, Deep-Pattern Escutcheons: Deep-drawn, box-shaped brass with chrome-plated finish.

4. One-Piece, Stamped-Steel Escutcheons: Chrome-plated finish with set-screw **OR** spring clips, **as directed**.
5. Split-Casting, Cast-Brass Escutcheons: Polished chrome-plated **OR** rough-brass, **as directed**, finish with concealed hinge and set-screw.
6. Split-Plate, Stamped-Steel Escutcheons: Chrome-plated finish with concealed **OR** exposed-rivet, **as directed**, hinge, set-screw **OR** spring clips, **as directed**.
7. One-Piece Floor Plates: Cast-iron flange with holes for fasteners, **as directed**.
8. Split-Casting Floor Plates: Cast brass with concealed hinge.

S. Sleeves

1. Cast-Iron Wall Pipe Sleeves: Cast or fabricated of cast iron and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.
2. Galvanized-Steel-Sheet Sleeves: 0.0239-inch (0.6-mm) minimum thickness; round tube closed with welded longitudinal joint.
3. Molded-PE Sleeves: Reusable, PE, tapered-cup shaped, and smooth outer surface with nailing flange for attaching to wooden forms.
4. Molded-PVC Sleeves: Permanent, with nailing flange for attaching to wooden forms.
5. PVC-Pipe Sleeves: ASTM D 1785, Schedule 40.
6. Galvanized-Steel-Pipe Sleeves: ASTM A 53/A 53M, Type E, standard weight, zinc coated, plain ends.
7. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
 - a. Underdeck Clamp: Clamping ring with set-screws.

T. Sleeve Seals

1. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
 - a. Sealing Elements: EPDM-rubber or NBR interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
 - b. Pressure Plates: Carbon steel **OR** Plastic **OR** Stainless steel, **as directed**.
 - c. Connecting Bolts and Nuts: Carbon steel with corrosion-resistant coating **OR** Stainless steel, **as directed**, of length required to secure pressure plates to sealing elements.

U. Grout

1. Standard: ASTM C 1107, Grade B, posthardening and volume adjusting, dry, hydraulic-cement grout.
2. Characteristics: Nonshrink, and recommended for interior and exterior applications.
3. Design Mix: 5000-psi (34-MPa), 28-day compressive strength.
4. Packaging: Premixed and factory packaged.

1.3 EXECUTION

A. Preparation

1. Perform fire-hydrant flow test according to NFPA 13 and NFPA 291. Use results for system design calculations required in "Quality Assurance" Article.
2. Report test results promptly and in writing.

B. Service-Entrance Piping

1. Connect sprinkler piping to water-service piping for service entrance to building. Comply with requirements for exterior piping in Division 21 Section "Facility Fire-suppression Water-service Piping".
2. Install shutoff valve, backflow preventer, **as directed**, pressure gage, drain, and other accessories indicated at connection to water-service piping. Comply with requirements for backflow preventers in Division 21 Section "Facility Fire-suppression Water-service Piping", **as directed**.

OR

Install shutoff valve, check valve, pressure gage, and drain at connection to water service.

C. Water-Supply Connections

1. Connect sprinkler piping to building's interior water-distribution piping. Comply with requirements for interior piping in Division 22 Section "Domestic Water Piping".
2. Install shutoff valve, backflow preventer, **as directed**, pressure gage, drain, and other accessories indicated at connection to water-distribution piping. Comply with requirements for backflow preventers in Division 22 Section "Domestic Water Piping Specialties", **as directed**.

OR

Install shutoff valve, check valve, pressure gage, and drain at connection to water supply.

D. Piping Installation

1. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated, as far as practical.
 - a. Deviations from approved working plans for piping require written approval from authorities having jurisdiction. File written approval with The University before deviating from approved working plans.
2. Piping Standard: Comply with requirements for installation of sprinkler piping in NFPA 13.
3. Install seismic restraints on piping. Comply with requirements for seismic-restraint device materials and installation in NFPA 13.
4. Use listed fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.
5. Install unions adjacent to each valve in pipes NPS 2 (DN 50) and smaller.
6. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having NPS 2-1/2 (DN 65) and larger end connections.
7. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, and sized and located according to NFPA 13.
8. Install sprinkler piping with drains for complete system drainage.
9. Install sprinkler control valves, test assemblies, and drain risers adjacent to standpipes when sprinkler piping is connected to standpipes.
10. Install automatic (ball drip) drain valve at each check valve for fire-department connection, to drain piping between fire-department connection and check valve. Install drain piping to and spill over floor drain or to outside building.
11. Install alarm devices in piping systems.
12. Install hangers and supports for sprinkler system piping according to NFPA 13. Comply with requirements for hanger materials in NFPA 13.
13. Install pressure gages on riser or feed main, at each sprinkler test connection, and at top of each standpipe. Include pressure gages with connection not less than NPS 1/4 (DN 8) and with soft metal seated globe valve, arranged for draining pipe between gage and valve. Install gages to permit removal, and install where they will not be subject to freezing.
14. Pressurize and check preaction sprinkler system piping and air-pressure maintenance devices **OR** air compressors, **as directed**.
15. Fill sprinkler system piping with water.
16. Install electric heating cables and pipe insulation on sprinkler piping in areas subject to freezing. Comply with requirements for heating cables in Division 21 Section "Heat Tracing For Fire-suppression Piping" and for piping insulation in Division 21 Section "Fire-suppression Systems Insulation".

E. Joint Construction

1. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure ratings same as or higher than system's pressure rating for aboveground applications unless otherwise indicated.
2. Install unions adjacent to each valve in pipes NPS 2 (DN 50) and smaller.
3. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having NPS 2-1/2 (DN 65) and larger end connections.
4. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

5. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.
 6. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with gasket and bolts according to ASME B31.9.
 7. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
 - a. Apply appropriate tape or thread compound to external pipe threads.
 - b. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.
 8. Twist-Locked Joints: Insert plain end of steel pipe into plain-end-pipe fitting. Rotate retainer lugs one-quarter turn or tighten retainer pin.
 9. Steel-Piping, Pressure-Sealed Joints: Join lightwall steel pipe and steel pressure-seal fittings with tools recommended by fitting manufacturer.
 10. Welded Joints: Construct joints according to AWS D10.12M/D10.12, using qualified processes and welding operators according to "Quality Assurance" Article.
 - a. Shop weld pipe joints where welded piping is indicated. Do not use welded joints for galvanized-steel pipe.
 11. Steel-Piping, Cut-Grooved Joints: Cut square-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe joints.
 12. Steel-Piping, Roll-Grooved Joints: Roll rounded-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe grooved joints.
 13. Steel-Piping, Pressure-Sealed Joints: Join Schedule 5 steel pipe and steel pressure-seal fittings with tools recommended by fitting manufacturer.
 14. Brazed Joints: Join copper tube and fittings according to CDA's "Copper Tube Handbook," "Brazed Joints" Chapter.
 15. Copper-Tubing Grooved Joints: Roll rounded-edge groove in end of tube according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join copper tube and grooved-end fittings according to AWWA C606 for steel-pipe grooved joints.
 16. Copper-Tubing, Pressure-Sealed Joints: Join copper tube and copper pressure-seal fittings with tools recommended by fitting manufacturer.
 17. Extruded-Tee Connections: Form tee in copper tube according to ASTM F 2014. Use tool designed for copper tube; drill pilot hole, form collar for outlet, dimple tube to form seating stop, and braze branch tube into collar.
 18. Dissimilar-Material Piping Joints: Make joints using adapters compatible with materials of both piping systems.
 19. Plastic-Piping, Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
 - a. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements. Apply primer.
 - b. CPVC Piping: Join according to ASTM D 2846/D 2846M Appendix.
- F. Installation Of Cover System For Sprinkler Piping
1. Install cover system, brackets, and cover components for sprinkler piping according to manufacturer's "Installation Manual" and with NFPA 13 or NFPA 13R for supports.
- G. Valve And Specialties Installation
1. Install listed fire-protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 13 and authorities having jurisdiction.
 2. Install listed fire-protection shutoff valves supervised open, located to control sources of water supply except from fire-department connections. Install permanent identification signs indicating portion of system controlled by each valve.
 3. Install check valve in each water-supply connection. Install backflow preventers instead of check valves in potable-water-supply sources.
 4. Specialty Valves:

- a. General Requirements: Install in vertical position for proper direction of flow, in main supply to system.
 - b. Alarm Valves: Include bypass check valve and retarding chamber drain-line connection.
 - c. Deluge Valves: Install in vertical position, in proper direction of flow, and in main supply to deluge system. Install trim sets for drain, priming level, alarm connections, ball drip valves, pressure gages, priming chamber attachment, and fill-line attachment.
- H. Excess-Pressure Pump Installation
1. Assemble components and mount on wood backing. Comply with requirements in Division 06 Section "Rough Carpentry" for wood backing material and installation.
 2. Install excess-pressure pumps, controls, devices, and supports for sprinkler piping application.
 - a. Mounting: Install on wall, where indicated **OR** attached to water-supply pipe, **as directed**.
- I. Sprinkler Installation
1. Install sprinklers in suspended ceilings in center of narrow dimension of, **as directed**, acoustical ceiling panels.
 2. Install dry-type sprinklers with water supply from heated space. Do not install pendent or sidewall, wet-type sprinklers in areas subject to freezing.
 3. Install sprinklers into flexible, sprinkler hose fittings and install hose into bracket on ceiling grid.
- J. Fire-Department Connection Installation
1. Install wall-type, fire-department connections.
 2. Install yard-type, fire-department connections in concrete slab support. Comply with requirements for concrete in Division 03 Section "Cast-in-place Concrete".
 - a. Install two **OR** three, **as directed**, protective pipe bollards around **OR** on sides of, **as directed**, each fire-department connection. Comply with requirements for bollards in Division 05 Section "Metal Fabrications".
 3. Install automatic (ball drip) drain valve at each check valve for fire-department connection.
- K. Escutcheon Installation
1. Install escutcheons for penetrations of walls, ceilings, and floors.
 2. Escutcheons for New Piping:
 - a. Piping with Fitting or Sleeve Protruding from Wall: One piece, deep pattern.
 - b. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One piece, cast brass with polished chrome-plated finish **OR** stamped steel with set-screw **OR** stamped steel with set-screw or spring clips **OR** stamped steel with spring clips, **as directed**.
 - c. Bare Piping at Ceiling Penetrations in Finished Spaces: One piece, cast brass with polished chrome-plated finish **OR** One piece or split casting, cast brass with polished chrome-plated finish **OR** Split casting, cast brass with polished chrome-plated finish **OR** One piece, stamped steel with set-screw **OR** One piece or split plate, stamped steel with set-screw **OR** Split plate, stamped steel with set-screw, **as directed**.
 - d. Bare Piping in Unfinished Service Spaces: One piece, cast brass with polished chrome-plated finish **OR** cast brass with rough-brass finish **OR** stamped steel with set-screw **OR** stamped steel with spring clips **OR** stamped steel with set-screw or spring clips, **as directed**.
 - e. Bare Piping in Equipment Rooms: One piece, cast brass **OR** stamped steel with set-screw **OR** stamped steel with spring clips **OR** stamped steel with set-screw or spring clips, **as directed**.
 - f. Bare Piping at Floor Penetrations in Equipment Rooms: One-piece floor plate.
 3. Escutcheons for Existing Piping:
 - a. Chrome-Plated Piping: Split casting, cast brass with chrome-plated finish.
 - b. Insulated Piping: Split plate, stamped steel with concealed or exposed-rivet hinge and spring clips.
 - c. Bare Piping at Wall and Floor Penetrations in Finished Spaces: Split casting, cast brass with chrome-plated finish **OR** plate, stamped steel with concealed hinge and spring clips, **as directed**.

- d. Bare Piping at Ceiling Penetrations in Finished Spaces: Split casting, cast brass with chrome-plated finish **OR** plate, stamped steel with concealed hinge and set-screw, **as directed**.
- e. Bare Piping in Unfinished Service Spaces: Split casting, cast brass with polished chrome-plated finish **OR** casting, cast brass with rough-brass finish **OR** plate, stamped steel with concealed hinge and set-screw or spring clips **OR** plate, stamped steel with concealed or exposed-rivet hinge and set-screw or spring clips **OR** plate, stamped steel with exposed-rivet hinge and set-screw or spring clips, **as directed**.
- f. Bare Piping in Equipment Rooms: Split casting, cast brass **OR** plate, stamped steel with set-screw or spring clips, **as directed**.
- g. Bare Piping at Floor Penetrations in Equipment Rooms: Split-casting floor plate.

L. Sleeve Installation

- 1. General Requirements: Install sleeves for pipes and tubes passing through penetrations in floors, partitions, roofs, and walls.
- 2. Sleeves are not required for core-drilled holes.
- 3. Permanent sleeves are not required for holes formed by removable PE sleeves.
- 4. Cut sleeves to length for mounting flush with both surfaces unless otherwise indicated.
- 5. Install sleeves in new partitions, slabs, and walls as they are built.
- 6. For interior wall penetrations, seal annular space between sleeve and pipe or pipe insulation using joint sealants appropriate for size, depth, and location of joint. Comply with requirements for joint sealants in Division 07 Section "Joint Sealants".
- 7. For exterior wall penetrations above grade, seal annular space between sleeve and pipe using joint sealants appropriate for size, depth, and location of joint. Comply with requirements for joint sealants in Division 07 Section "Joint Sealants".
- 8. For exterior wall penetrations below grade, seal annular space between sleeve and pipe using sleeve seals.
- 9. Seal space outside of sleeves in concrete slabs and walls with grout.
- 10. Install sleeves that are large enough to provide 1/4-inch (6.4-mm) annular clear space between sleeve and pipe or pipe insulation unless otherwise indicated.
- 11. Install sleeve materials according to the following applications:
 - a. Sleeves for Piping Passing through Concrete Floor Slabs: Molded PE **OR** Molded PVC **OR** Galvanized-steel pipe, **as directed**.
 - b. Sleeves for Piping Passing through Concrete Floor Slabs of Mechanical Equipment Areas or Other Wet Areas: Galvanized-steel pipe **OR** Stack sleeve fittings, **as directed**.
 - 1) Extend sleeves 2 inches (50 mm) above finished floor level.
 - 2) For pipes penetrating floors with membrane waterproofing, extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches (50 mm) above finished floor level. Comply with requirements for flashing in Division 07 Section "Sheet Metal Flashing And Trim".
 - c. Sleeves for Piping Passing through Gypsum-Board Partitions:
 - 1) PVC-pipe **OR** Galvanized-steel-pipe, **as directed**, sleeves for pipes smaller than NPS 6 (DN 150).
 - 2) Galvanized-steel-sheet sleeves for pipes NPS 6 (DN 150) and larger.
 - 3) Exception: Sleeves are not required for water-supply tubes and waste pipes for individual plumbing fixtures if escutcheons will cover openings.
 - d. Sleeves for Piping Passing through Concrete Roof Slabs: Molded PE **OR** Molded PVC **OR** Galvanized-steel pipe, **as directed**.
 - e. Sleeves for Piping Passing through Exterior Concrete Walls:
 - 1) Galvanized-steel-pipe sleeves for pipes smaller than NPS 6 (DN 150).
 - 2) Cast-iron wall-pipe sleeves for pipes NPS 6 (DN 150) and larger.
 - 3) Install sleeves that are large enough to provide 1-inch (25-mm) annular clear space between sleeve and pipe or pipe insulation when sleeve seals are used.
 - f. Sleeves for Piping Passing through Interior Concrete Walls:
 - 1) PVC-pipe **OR** Galvanized-steel-pipe, **as directed**, sleeves for pipes smaller than NPS 6 (DN 150).

- 2) Galvanized-steel-sheet sleeves for pipes NPS 6 (DN 150) and larger.
12. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestop materials and installations in Division 07 Section "Penetration Firestopping".
- M. Sleeve Seal Installation
 1. Install sleeve seals in sleeves in exterior concrete walls at water-service piping entries into building.
 2. Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble sleeve seal components and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
- N. Identification
 1. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 13.
 2. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Division 26 Section "Identification For Electrical Systems".
- O. Field Quality Control
 1. Perform tests and inspections.
 2. Tests and Inspections:
 - a. Leak Test: After installation, charge systems and test for leaks. Repair leaks and retest until no leaks exist.
 - b. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - c. Flush, test, and inspect sprinkler systems according to NFPA 13, "Systems Acceptance" Chapter.
 - d. Energize circuits to electrical equipment and devices.
 - e. Start and run excess-pressure pumps.
 - f. Coordinate with fire-alarm tests. Operate as required.
 - g. Coordinate with fire-pump tests. Operate as required.
 - h. Verify that equipment hose threads are same as local fire-department equipment.
 3. Sprinkler piping system will be considered defective if it does not pass tests and inspections.
 4. Prepare test and inspection reports.
- P. Cleaning
 1. Clean dirt and debris from sprinklers.
 2. Remove and replace sprinklers with paint other than factory finish.
- Q. Piping Schedule
 1. Piping between Fire-Department Connections and Check Valves: Galvanized, standard-weight steel pipe with threaded ends; cast-iron threaded fittings; and threaded **OR** grooved ends; grooved-end fittings; grooved-end-pipe couplings; and grooved, **as directed**, joints.
 2. Sprinkler specialty fittings may be used, downstream of control valves, instead of specified fittings.
 3. Copper-tube, extruded-tee connections may be used for tee branches in copper tubing instead of specified copper fittings. Branch-connection joints must be brazed.
 4. CPVC pipe; Schedule 40 **OR** Schedule 80, **as directed**, CPVC fittings; and solvent-cemented joints may be used for light-hazard and residential occupancies.
 5. Standard-pressure, wet-pipe sprinkler system, NPS 2 (DN 50) and smaller, shall be one of the following:
 - a. Standard-weight or Schedule 30, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
 - b. Standard-weight or Schedule 30, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.
 - c. Standard-weight or Schedule 30, black-steel pipe with plain ends; uncoated, plain-end-pipe fittings; and twist-locked joints.

- d. Standard-weight or Schedule 30, galvanized-steel pipe with plain ends; galvanized, plain-end-pipe fittings; and twist-locked joints.
 - e. Standard-weight or Schedule 30, black-steel pipe with cut- or roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - f. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - g. Standard-weight or Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
 - h. Thinwall **OR** Schedule 10, **as directed**, nonstandard OD, thinwall or hybrid black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - i. Thinwall **OR** Schedule 10, **as directed**, or hybrid black-steel pipe with plain ends; uncoated, plain-end-pipe fittings; and twist-locked joints.
 - j. Thinwall **OR** Schedule 10, **as directed**, nonstandard OD, thinwall or hybrid black-steel pipe with plain ends; welding fittings; and welded joints.
 - k. Schedule 5 steel pipe; steel pressure-seal fittings; and pressure-sealed joints.
 - l. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with plain ends; cast- or wrought-copper solder-joint fittings; and brazed joints.
 - m. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with plain ends; copper pressure-seal fittings; and pressure-sealed joints.
 - n. NPS 2 (DN 50), Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with roll-grooved ends; copper, grooved-end fittings; grooved-end-tube couplings; and grooved joints.
6. Standard-pressure, wet-pipe sprinkler system, NPS 2-1/2 to NPS 4 (DN 65 to DN 100), shall be one of the following:
- a. Standard-weight or Schedule 30, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
 - b. Standard-weight or Schedule 30, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.
 - c. Standard-weight or Schedule 30, black-steel pipe with cut- or roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - d. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - e. Standard-weight or Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
 - f. Thinwall **OR** Schedule 10, **as directed**, nonstandard OD, thinwall or hybrid black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - g. Thinwall **OR** Schedule 10, **as directed**, nonstandard OD, thinwall or hybrid black-steel pipe with plain ends; welding fittings; and welded joints.
 - h. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with plain ends; cast- or wrought-copper solder-joint fittings; and brazed joints.
 - i. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with plain ends; copper pressure-seal fittings; and pressure-sealed joints.
 - j. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with roll-grooved ends; copper, grooved-end fittings; grooved-end-tube couplings; and grooved joints.
7. Standard-pressure, wet-pipe sprinkler system, NPS 5 (DN 125) and larger, shall be one of the following:
- a. Standard-weight or Schedule 30, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
 - b. Standard-weight or Schedule 30, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.

- c. Standard-weight or Schedule 30, black-steel pipe with cut- or roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
- d. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
- e. Standard-weight or Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
- f. Thinwall **OR** Schedule 10, **as directed**, or hybrid black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
- g. Thinwall **OR** Schedule 10, **as directed**, or hybrid black-steel pipe with plain ends; welding fittings; and welded joints.
- h. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with plain ends; cast- or wrought-copper solder-joint fittings; and brazed joints.
- i. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube with roll-grooved ends; copper, grooved-end fittings; grooved-end-tube couplings; and grooved joints.
- 8. High-pressure, wet-pipe sprinkler system, NPS 4 (DN 100) and smaller, shall be one of the following:
 - a. Standard-weight or Schedule 30, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.
 - b. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - c. Standard-weight or Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
 - d. Thinwall **OR** Schedule 10, **as directed**, or hybrid black-steel pipe with plain ends; welding fittings; and welded joints.
- 9. High-pressure, wet-pipe sprinkler system, NPS 5 (DN 125) and larger, shall be one of the following:
 - a. Standard-weight or Schedule 30, galvanized-steel pipe with threaded ends; galvanized, gray-iron threaded fittings; and threaded joints.
 - b. Standard-weight or Schedule 30, galvanized-steel pipe with cut-grooved ends; galvanized, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - c. Standard-weight or Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
 - d. Thinwall **OR** Schedule 10, **as directed**, or hybrid black-steel pipe with plain ends; welding fittings; and welded joints.

R. Sprinkler Schedule

- 1. Use sprinkler types in subparagraphs below for the following applications:
 - a. Rooms without Ceilings: Upright sprinklers.
 - b. Rooms with Suspended Ceilings: Pendent sprinklers **OR** Recessed sprinklers **OR** Flush sprinklers **OR** Concealed sprinklers, **as directed**.
 - c. Wall Mounting: Sidewall sprinklers.
 - d. Spaces Subject to Freezing: Upright sprinklers **OR** Pendent, dry sprinklers **OR** Sidewall, dry sprinklers, **as directed**.
 - e. Deluge-Sprinkler Systems: Upright and pendent, open sprinklers.
 - f. Special Applications: Extended-coverage, flow-control, and quick-response sprinklers where indicated.
- 2. Provide sprinkler types in subparagraphs below with finishes indicated.
 - a. Concealed Sprinklers: Rough brass, with factory-painted white cover plate.
 - b. Flush Sprinklers: Bright chrome, with painted white escutcheon.
 - c. Recessed Sprinklers: Bright chrome, with bright chrome escutcheon.
 - d. Residential Sprinklers: Dull chrome.

- e. Upright, Pendent, and Sidewall Sprinklers: Chrome plated in finished spaces exposed to view; rough bronze in unfinished spaces not exposed to view; wax coated where exposed to acids, chemicals, or other corrosive fumes.

END OF SECTION 21 13 13 00

SECTION 22 00 00 00 - PLUMBING SPECIALTIES**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Provide all materials and installation for plumbing specialties within building domestic water, sanitary waste and storm drainage systems; floor drains, floor sinks, hub drains, roof drains, cleanouts, backflow preventers, vacuum breakers, pressure regulating valves, water hammer arrestors, wall hydrants, hose bibbs, trap primer units, strainers, temperature gauges, pressure gauges and other normal parts that make the systems complete, operable, code compliant and acceptable to the authorities having jurisdiction.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. 2006 Edition of the International Plumbing Code.
 - 2. NOTE: MDACC takes various exceptions to the International Plumbing Code and has adopted the more stringent requirements within the Uniform Plumbing Code. These exceptions are included within Project Specifications and/or Project Design Drawings.
 - 3. ANSI/NSF Standard 61 - Drinking Water System Components - Health Effects.

1.04 QUALITY ASSURANCE

- 1. Manufacturer's name and pressure rating shall be permanently marked on valve body.
- 2. All materials shall be new, undamaged, and free of rust. Protect installed products and associated materials during progression of the construction period to avoid clogging with dirt, and debris and to prevent damage, rust, etc. Remove dirt and debris as work progresses.
- 3. Manufacturer Qualifications: Company shall have minimum three years documented experience specializing in manufacturing the products specified in this section.

4. Installer Qualifications: Company shall have minimum three years documented experience specializing in performing the work of this section. Installation of plumbing systems shall be performed by individuals licensed by the Texas State Board of Plumbing Examiners as a Journeyman or Master Plumber. Installation may be performed by Apprentice Plumbers provided they are registered with the Texas State Board of Plumbing examiners and under direct supervision of a licensed plumber. All installation shall be supervised by a licensed Master Plumber.

1.05 SUBMITTALS

A. Product Data:

1. Provide Code and Standards compliance, component dimensions, service sizes and finishes.

B. Record Documents:

1. Manufacturer's certification documentation for backflow preventers.
2. Submit proposed location of access panels which vary from quantities or locations indicated on Contract Drawings.
3. Provide full written description of manufacturer's warranty.
4. Record actual locations of plumbing specialties installed.

C. Operation and Maintenance Data:

1. Include testing procedures for backflow preventers, adjustment procedures for water pressure regulating valves.
2. Include installation instructions, exploded assembly views, servicing requirements, inspection data, installation instructions, spare parts lists, replacement part numbers and availability, location and contact numbers of service depot, for all plumbing specialties installed

1.06 DELIVERY, STORAGE AND HANDLING

- A. Accept specialties on site in shipping containers and maintain in place until installation.
- B. Provide temporary protective coating and end plugs on valves not packaged within containers. Maintain in place until installation.
- C. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the work and isolating parts of completed system.
- D. Protect all materials before and after installation from exposure to rain, freezing temperatures and direct sunlight. EXCEPTION: Materials manufactured for installation within exterior environments.

1.07 EXTRA MATERIALS

- A. Provide two loose keys for each type of wall hydrant box.
- B. Provide manufacturer's standard test kit for each type of backflow preventer installed.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Provide plumbing specialties as indicated and scheduled on the Contract Drawings and as specified herein. All materials and work shall meet or exceed all applicable Federal and State requirements and conform to adopted codes and ordinances of authorities having jurisdiction.
- C. Pressure ratings of plumbing specialties shall be suitable for the anticipated system pressures in which they are installed.
- D. All materials within domestic water distribution systems that may come in contact with the potable water delivered shall comply with ANSI/NSF Standard 61.
- E. All brass and bronze plumbing specialties within domestic water distribution systems that may come in contact with the potable water delivered shall have no more than 15% zinc content.
- F. Specialties of same type shall be product of one manufacturer.

2.02 ACCEPTABLE MANUFACTURERS

- A. Floor Drains: Josam or approved equal.
- B. Floor Sinks: Josam. or approved equal
- C. Roof Drains: Josam or approved equal.
- D. Wall/Floor Cleanouts: Josam or approved equal.
- E. Backflow Preventers: Conbraco or approved equal.
- F. Water Pressure Regulating Valves: Watts Regulator or approved equal
- G. Water Hammer Arrestors: Josam or approved equal.
- H. Wall Hydrants: Josam or approved equal.
- I. Hose Bibbs: Chicago or approved equal
- J. Trap Primer Units: As Specified Herein or approved equal
- K. Stainers: Conbraco, Wilkins, Watts
- L. Temperature Gauges: Ashcroft, Terice, Weksler
- M. Pressure Gauges: Ashcroft, Terice, Weksler

2.03 FLOOR DRAINS (FD)

- A. All floor drains shall be furnished and installed with all options and accessories required for a waterproof installation within the particular construction in which they are to be mounted.
- B. Each floor drain shall be provided with a deep-seal p-trap unless noted otherwise.

- C. Floor drains installed for general floor area drainage within toilet rooms and other finished spaces shall have cast iron body with flange, adjustable top and sediment bucket, integral reversible clamping collar, seepage openings, 1/2" plugged primer tap, and 6" diameter nickel bronze or stainless steel strainer with vandal proof screws.
- D. Floor drains installed for general floor area drainage and light to medium flow indirect equipment discharge within mechanical rooms shall have cast iron body with plugged 1/2" primer tap, integral clamping collar, seepage openings, adjustable top and 11-1/2" diameter ductile iron loose set tractor grate.
- E. Floor drains installed for non-monolithic shower stall floors shall have cast iron body with flange, adjustable top and sediment bucket, integral reversible clamping collar, seepage openings and 5" diameter nickel bronze or stainless steel strainer with vandal proof screws.
- F. All floor drains shall be as sized and scheduled on Contract Drawings.

2.04 FLOOR SINKS (FS)

- A. All floor sinks shall be furnished and installed with all options and accessories required for a waterproof installation within the particular construction in which they are to be mounted.
- B. Each floor sink shall be provided with a deep-seal p-trap unless noted otherwise.
- C. Floor sinks installed for general floor area drainage shall have 8" round cast iron body with 3" sump, acid resistant enamel interior, aluminum dome strainer, seepage flange, membrane clamping device and 7-3/8" diameter stainless steel or nickel bronze top.
- D. Floor sinks installed to receive indirect equipment discharge shall have cast iron 12" square body with 8" sump, acid resistant enamel interior, aluminum dome strainer, seepage flange, membrane clamping device and stainless steel top. Top shall be 1/2" or 3/4" grate as scheduled on Drawings.
- E. All floor sinks shall be as sized and scheduled on Contract Drawings.

2.05 HUB DRAINS (HD)

- A. Hub drains shall be cast iron soil pipe hubs or hub adapters set with top of hub one-half inch (1/2") above finished floor. Each hub drain shall be provided with a deep-seal P-trap.

2.06 ROOF DRAINS (RD)

- A. Primary roof drains shall be furnished and installed with all options and accessories required for a waterproof installation within the particular construction in which they are to be mounted and have lacquered cast iron body with sump, removable cast iron or bronze dome strainer, flashing flange and clamp, gravel stop, deck clamp and drain receiver. Provide extension where required.
- B. Roof drains shall be sized as indicated on Contract Drawings.

2.07 CLEANOUTS:

- A. Cleanouts shall be the same nominal size as the pipe they serve up to four inches. For pipes larger than four inches nominal size, the size of cleanouts shall be six inches.
- B. Cleanouts shall have cast iron body with tapered cast brass or bronze plug providing gas and watertight seal.
- C. Interior floor cleanouts shall have stainless steel or nickel bronze scoriated top. Provide carpet marker when installed in areas to be covered by carpet.

- D. Exterior cleanouts at grade shall have scoriated cast iron top.
- E. Wall cleanouts shall be provided with stainless steel access covers of adequate size to allow rodding of drainage system. Wall cleanouts incorporating cover screws that extend completely through the access plug are not acceptable.

2.08 BACKFLOW PREVENTERS

A. Reduced Pressure Zone Type (Not For Use In Fire Protection Water Supply):

- 1. The assembly shall meet the requirements of ASSE 1013, AWWA C511.
- 2. The assembly shall consist of a pressure differential relief valve located in a zone between two positive seating check valves and captured springs. Backsiphonage protection shall include provision to admit air directly into the reduced pressure zone via a separate channel from the water discharge channel. The assembly shall include two tightly closing shutoff valves before and after the valve and test cocks.
- 3. Test cocks
- 4. Seats: Bronze, removable and replaceable without removing valve from the line.
- 5. Checks: Independently operating.
- 6. Relief Valve: Independently operating, located between the two check valves.
- 7. Rated 175 psi maximum working pressure with continuous temperature range of 33 to 110°F.
- 8. Unit to be complete with vent-port funnel to maintain the air gap and to provide a drain connection point.
- 9. Sizes 1/4" and 1/2" - Bronze body, bronze strainer, upstream and downstream quarter-turn ball valves, union connections: Watts Regulator Company Series 009.
- 10. Sizes 3/4" through 2" - Bronze body, bronze strainer, upstream and downstream quarter-turn ball valves, union connections: Watts Regulator Company Series 919.
- 11. Sizes 2-1/2" through 10" - FDA epoxy coated cast iron body, FDA epoxy coated strainer, upstream and downstream OSY – UL/FM outside stem and yoke resilient seated gate valves, flange connections: Watts Regulator Company Series 909.

B. Reduced Pressure Zone Type (For Use In Fire Protection Water Supply):

- 1. The assembly shall meet the requirements of ASSE 1013, be U.L. classified and FM Approved.
- 2. The assembly shall consist of a pressure differential relief valve located in a zone between two positive seating check valves and captured springs. Backsiphonage protection shall include provision to admit air directly into the reduced pressure zone via a separate channel from the water discharge channel. The assembly shall include two tightly closing shutoff valves before and after the valve and test cocks.
- 3. Test cocks
- 4. Replaceable seats
- 5. Checks: Independently operating.
- 6. Relief Valve: Independently operating, located between the two check valves.
- 7. Rated 175 psi maximum working pressure with continuous temperature range of 33 to 110°F.

8. Unit to be complete with vent-port funnel to maintain the air gap and to provide a drain connection point.
 9. Sizes 2-1/2" through 10" - Schedule 40 stainless steel body, upstream and downstream UL/FM outside stem and yoke resilient seated gate valves or UL/FM grooved gear operated butterfly valves with tamper switches: Watts Regulator Company Series 957.
- C. Double Check Valve Assembly (Not for Fire Protection Water Supply):
1. The assembly shall meet the requirements of ASSE 1015, AWWA C510
 2. Top entry access points for each check assembly
 3. Replaceable seats
 4. Test cocks
 5. Rated 175 psi maximum working pressure with continuous temperature range of 33 to 110°F.
 6. Sizes 1/2" through 2" - Bronze alloy body, bronze strainer, upstream and downstream quarter-turn ball valves, union connections: Watts Regulator Company Series 719.
 7. Sizes 2-1/2" through 10" - FDA epoxy coated cast iron body, FDA epoxy coated strainer, upstream and downstream OSY – UL/FM outside stem and yoke resilient seated gate valves, flange connections: Watts Regulator Company Series 709.
- D. Double Check Valve Assembly (For Use In Fire Protection Water Supply):
1. The assembly shall meet the requirements of ASSE 1015, be U.L. classified and FM Approved.
 2. Two independent tri-link check modules within a single housing
 3. Sleeve access port
 4. Four test cocks
 5. Rated 175 psi maximum working pressure with continuous temperature range of 33 to 110°F.
 6. Sizes 2-1/2" through 10" - Schedule 40 stainless steel body, upstream and downstream UL/FM outside stem and yoke resilient seated gate valves or UL/FM grooved gear operated butterfly valves with tamper switches: Watts Regulator Company Series 757.
- E. Continuous Pressure Vacuum Breaker (Not For Use In Fire Protection Water Supply):
1. Tested and certified under ASSE Standard 1020 and CSA Standard B64.1.2.
 2. Suitable for continuous pressure hot and cold water.
 3. Brass body and seat with silicon rubber discs.
 4. Rated maximum pressure 150 psi and working temperature 33 to 140 degrees F.
 5. Complete with quarter turn ball valves and test cocks.
 6. Sizes 3/8" through 1" - Spill-resistant, Watts Regulator Company Series 008PCQT.
 7. Sizes 1-1/4" through 2" - Watts Regulator Company Series 800M4QT.

2.09 WATER PRESSURE REGULATING VALVES

- A. All bronze body, integral Monel strainer screen, built-in bypass, nylon reinforced Neoprene diaphragm, renewable seat and union end connection, rated for water temperature up to 180°F and 300 psi inlet pressure, manufactured by Wilkins Series 600 or approved equal by Watts.

2.10 WATER HAMMER ARRESTORS (SHOCK ABSORBERS):

- A. Nesting type bellows operated water hammer arrestor with male N.P.T. connection. Bellows and body casing made of Type 304 stainless steel. Water hammer arrestors shall be certified to the PDI WH-201 Standard and ASSE Standard 1010.
- B. Arrestors shall be designed and manufactured for a maximum working temperature of 250F and maximum operating pressure of 125 P.S.I.G.
- C. All arrestors shall be designed and approved for sealed wall installation without an access panel.
- D. Water hammer arrestors shall be sized according to water hammer arresters standard PDI-WH-201 and as indicated on Contract Drawings.

2.11 WALL HYDRANTS

- A. Provide antisiphon, non-freeze wall hydrant with brass casing, integral backflow preventer, vandalproof box with loose-key handle and finish as scheduled on Drawings.
- B. Hose Bibbs (HB): Provide Chicago Faucet No. 387 chrome plated brass hose bibb with ¾-inch female inlet, wall flange and No. E27 vacuum breaker.

2.12 FLOOR DRAIN TRAP SEAL GUARDS

- A. Floor drain trap seal protection insert shall provide watertight seal inside the floor drain and prevent emission of sewer gas and backup of sewage.
- B. Insert material shall be resistant to common cleaning solutions, lime scale and microbiological growth and incorporate a Elastomeric flexible tube that closes when water is not passing through and opens to permit water flow from an intermittent drip. Insert shall provide no restriction on water flow up to 30 gallons per minute.
- C. Insert shall properly functions despite lodging of common debris such as mop strings, food residue, etc.
- D. Trap seal protection insert shall not be installed in floor drains receiving waste that may have a temperature greater than 140 degrees F.
- E. Trap seal protection insert shall not be installed in floor drains receiving waste discharge flow of greater than 30 gallons per minute.
- F. Trap seal protection insert shall not be installed in floor drains receiving corrosive or chemical waste.
- G. Trap seal protection insert shall be manufactured by ProSet "Trap Guard", model to suit installation.

2.13 TRAP PRIMER UNITS (TP)

- A. Automatic Pressure Activated Trap Primers:
 - 1. Pressure drop activated brass trap seal primer, with o-ring seals, inlet opening of 1/2" male N.P.T. and outlet opening of female 1/2" N.P.T. Complete with four view holes and removable filter screen.

2. ASSE 1018 tested and certified, IAPMO listed, Activate by line pressure drop of 3 psi at an operating range of 20 to 125 psi.
 3. Provide each trap primer unit with a copper air gap fitting complete with a 1/2" male N.P.T. fitting at the inlet supply incorporating a stream directing nozzle, a 1/2" N.P.T. female outlet, and a 1" vertical air gap. Manufactured in accordance with ANSI/ASME A112.1.2 air gap in plumbing systems standard.
 4. Provide distribution unit as required.
- B. Vacuum Breaker Trap Primer for use with exposed Flushometers:
1. One Piece, Chrome Plated Flush Connection.
 2. Water Deflector to control the amount of water diverted from the flush.
 3. 3/8" Elbow and Flex-bend Tube connection from Vacuum Breaker to wall.
 4. Diverter Wall Flange and Fittings
 5. Chrome Plated Wall Flange and Fitting to connect 1/2" NPT pipe.
 6. High Back Pressure Vacuum Breaker.
 7. One-piece Bottom Hex Coupling Nut.
 8. Sloan Model VBF-72-A1
- C. Trap Primer for use with Lavatory or Sink Drain Tailpiece:
1. Polished Chrome Plated Cast Bronze P-trap with Ground Joint Outlet.
 2. Threaded Wall Tube, Slip Joint Nuts, Washers and Escutcheons.
 3. 1/2" Polished Chrome Plated Bronze Primer Tube with Compression Fitting Connection at Wall.
 4. Jay R. Smith Model 2698 or approved equal of a referenced acceptable manufacture.

2.14 STRAINERS

- A. Strainers, 2" and smaller, bronze body, screwed ends, No. 20 mesh type 304 stainless steel screen, screwed cap with bronze blow-off valve (size to be determined by standard tap size in cap).
- B. Strainers, 2 1/2" and larger, Cast iron body, isolating type flanged ends where installed in copper lines, .125" perforated type 304 stainless steel screen, flanged cap with bronze ball blow-off valve (size of blow-off valve shall be determined by standard tap size in cap). Special Note: All strainers 6" and larger shall have studs mounted in the body flange in lieu of bolts for removal of cap. Baskets for strainers 6" and larger shall have stainless steel reinforcing bands at ends to prevent collapsing.

2.15 TEMPERATURE GAUGES:

- A. Thermometers shall be vapor or liquid actuated, direct-mounted, universal adjustable angle dial type with stainless steel or cured polyester powder coated cast aluminum case, stainless steel friction ring and glass window. Dial face shall be white with black figures; pointer shall be friction adjustable type. Movement shall be brass with bronze bushings. Bourdon tube shall be phosphor bronze with a brass socket.
- B. Thermometer range shall be 30 - 240° Fahrenheit and have an accuracy of ±1 scale division.

- C. Dial face shall be 4½" diameter where installed within six feet of floor level and 6" diameter where installed higher than six feet above floor level. Provide remote read-out gauges for isolated or hard to access monitoring points.
- D. Provide a brass or stainless steel separable thermowell for each thermometer.
- E. Thermometers shall have a sensing bulb with an insertion length of roughly half of the pipe diameter; minimum insertion length shall be 2". Thermometers installed on tanks shall have a minimum insertion length of 5".
- F. Where insulation thickness exceeds 2", provide proper bulb length and an extension neck separable thermowell. The extension neck shall be at least 2" long.

2.16 PRESSURE GAUGES:

- A. Gauges shall comply with ASME B40.1, Grade 2A, and have ±0.5 percent of full scale accuracy, with type 304 stainless steel or aluminum case, bronze wetted parts and brass socket. Dial face shall be 3½" diameter where installed within six feet of floor level and 6" diameter where installed higher than six feet above floor level. Dial face shall be aluminum with white background, black graduations and black markings. Pointer shall be adjustable with black finish. Provide remote read-out gauges for isolated or hard to access monitoring points.
- B. Units of measure shall be in pounds per square inch (psi). The proper range shall be selected so that the average operating pressure falls approximately in the middle of the scale selected.
- C. All pressure gauges shall be equipped with brass or stainless steel needle valves and pressure snubbers.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Coordinate cutting and forming of roof and floor construction to receive drains with General Contractor.
- B. Verify location of equipment and housekeeping pads prior to installation of floor drains. Relocation due to misplacement shall be at Contractor's expense.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. Install plumbing specialties in accordance with manufacturer's published instructions.
- C. Extreme care shall be used to set the top elevation of floor drains and floor sinks to meet the low point elevation of the finished floor.
- D. Pipe connections to roof drains, above grade floor drains and floor sinks shall not directly contact or be encased in concrete.
- E. Final mounting of interior cleanout top or access cover shall be set flush with the finished floor or wall surface. Lubricate threaded cleanout plugs with mixture of graphite and linseed oil.
- F. Encase exterior cleanouts within 14" x 14" x 6" thick reinforced concrete pad. Set top flush with finished grade surface.
- G. Locate cleanouts with required clearance for rodding of drainage system.

- H. Isolate all non-potable water requirements from the building domestic water system with backflow prevention device manufactured and certified for the particular application.
- I. Pipe relief from backflow preventer indirectly to drain of sufficient size to evacuate discharge.
- J. Backflow preventers shall be duplexed where located within domestic water lines serving in-patient areas, critical research areas, and/or any area or equipment where un-interruptible (24 hour) water service is required.
- K. Provide hydraulic shock absorbers in cold and hot water supply lines to each fixture branch, battery of fixtures and at each automatic, solenoid-operated or quick-closing valve serving equipment. Locate and size in accordance with PDI-WH-201 Standard and manufacturer's published recommendations.
- L. Provide ball type shut-off valve and union directly upstream of each line pressure activated trap primer unit to allow service.
- M. Locate all trap primers exposed and accessible.

SECTION 22 01 40 00 - PLUMBING FIXTURES**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for medical plumbing fixtures. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the products manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following medical plumbing fixtures and related components:
 - a. Faucets for lavatories, showers, and sinks.
 - b. Laminar-flow, faucet-spout outlets.
 - c. Flushometers.
 - d. Toilet seats.
 - e. Protective shielding guards.
 - f. Fixture supports.
 - g. Bedpan washers.
 - h. Water closets.
 - i. Lavatories.
 - j. Individual showers.
 - k. Patients' combination toilets.
 - l. Clinical sinks.
 - m. Plaster sinks.
 - n. Surgeons' scrub sinks.
 - o. Surgeons' instrument sinks.
 - p. Bathing units.
 - q. Sitz baths.
 - r. Bedpan washing equipment.
 - s. Hydrotherapy whirlpools.
 - t. Outlet boxes.
 - u. Morgue equipment.

C. Definitions

1. Accessible Medical Plumbing Fixture: Plumbing fixture that can be approached, entered, and used by people with disabilities.
2. Fitting: Device that controls the flow of water into or out of the medical plumbing fixture. Fittings specified in this Section include supplies and stops, faucets and spouts, shower heads, drains and tailpieces, and traps and waste pipes.
3. FRP: Fiberglass-reinforced plastic.
4. PMMA: Polymethyl methacrylate (acrylic) plastic.

D. Submittals

1. Product Data: For each type of medical plumbing fixture indicated.
2. LEED Submittal:
 - a. Product Data for Credit WE 2, 3.1, and 3.2: Documentation indicating flow and water consumption requirements.
3. Shop Drawings: Diagram power, signal, and control wiring.
4. Operation and maintenance data.

E. Quality Assurance

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
2. Regulatory Requirements: Comply with requirements in ICC A117.1, "Accessible and Usable Buildings and Facilities"; Public Law 90-480, "Architectural Barriers Act"; and Public Law 101-336, "Americans with Disabilities Act", **as directed**; for plumbing fixtures for people with disabilities.
3. Regulatory Requirements: Comply with requirements in Public Law 102-486, "Energy Policy Act," about water flow and consumption rates for plumbing fixtures.
4. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.
5. Select combinations fixtures and trim, faucets, fittings, and other components that are compatible.
6. Comply with the following applicable standards and other requirements specified for medical plumbing fixtures:
 - a. Enameled, Cast-Iron Fixtures: ASME A112.19.1M.
 - b. Plastic Bathtubs: ANSI Z124.1.
 - c. Plastic Shower Enclosures: ANSI Z124.2.
 - d. Slip-Resistant Bathing Surfaces: ASTM F 462.
 - e. Vitreous-China Fixtures: ASME A112.19.2M.
7. Comply with the following applicable standards and other requirements specified for lavatory and sink faucets:
 - a. Backflow Protection Devices for Faucets with Hose-Thread Outlet: ASME A112.18.3M.
 - b. Diverter Valves for Faucets with Hose Spray: ASSE 1025.
 - c. Faucets: ASME A112.18.1.
 - d. Hose-Connection Vacuum Breakers: ASSE 1011.
 - e. Hose-Coupling Threads: ASME B1.20.7.
 - f. Integral, Atmospheric Vacuum Breakers: ASSE 1001.
 - g. NSF Materials: NSF 61.
 - h. Pipe Threads: ASME B1.20.1.
 - i. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
 - j. Supply Fittings: ASME A112.18.1.
 - k. Brass Waste Fittings: ASME A112.18.2.
8. Comply with the following applicable standards and other requirements specified for bathtub and shower faucets:
 - a. Backflow Protection Devices for Hand-Held Showers: ASME A112.18.3M.
 - b. Combination, Pressure-Equalizing and Thermostatic-Control Antiscald Faucets: ASSE 1016.
 - c. Faucets: ASME A112.18.1.
 - d. Hand-Held Showers: ASSE 1014.
 - e. High-Temperature-Limit Controls for Thermal-Shock-Preventing Devices: ASTM F 445.
 - f. Hose-Coupling Threads: ASME B1.20.7.
 - g. Manual-Control Antiscald Faucets: ASTM F 444.
 - h. Pipe Threads: ASME B1.20.1.
 - i. Pressure-Equalizing-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.
 - j. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
 - k. Thermostatic-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.
9. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:
 - a. Atmospheric Vacuum Breakers: ASSE 1001.
 - b. Brass and Copper Supplies: ASME A112.18.1.
 - c. Flexible Water Connectors: ASME A112.18.6.
 - d. Manual-Operation Flushometers: ASSE 1037.
 - e. Sensor-Operation Flushometers: ASSE 1037 and UL 1951.
 - f. Brass Waste Fittings: ASME A112.18.2.
10. Comply with the following applicable standards and other requirements specified for miscellaneous components:
 - a. Grab Bars: ASTM F 446.
 - b. Hose-Coupling Threads: ASME B1.20.7.

- c. Off-Floor Fixture Supports: ASME A112.6.1M.
- d. Pipe Threads: ASME B1.20.1.
- e. Plastic Toilet Seats: ANSI Z124.5.
- f. Supply and Drain Protective Shielding Guards: ICC A117.1.

1.2 PRODUCTS

A. Single Bowl Sinks:	Elkay LRAD 1716
B. Double Bowl Sinks:	Elkay LRAD 3322
C. Lab Sink	Labtops D55 (IC#8008)
D. Lab Sink	Labtops A55 (IC#8007)
E. Eyewash:	Haws 7612
F. Water Closets:	Kohler K-4330
G. Urinals:	Kohler K-4989-T
H. Lavatories:	Kohler K-2032
I. Cast Iron Bathtubs:	American Standard, Kohler, Crane, Eljer
J. R.O. Faucets:	WaterSaver L7611VB-WSA
K. R.O. Faucets:	WaterSaver L27211VB-WSA
L. Touchless Lab Faucets:	Sloan EBF-750-S-H-8
M. Touchless Lavatory Faucets:	Sloan EAF-150-ISM
N. Lab and Kitchen Faucets:	Chicago Faucets 786-CP
O. Shower	Chicago Faucets 1762
P. Floor Drain	ProFlo PFFW93B
Q. Safety Shower	HAWS 8123HPCP
R. Safety Shower/Eyewash	HAWS 8309PCP

1.3 EXECUTION

- A. Installation
 - 1. Assemble medical plumbing fixtures, trim, fittings, and other components according to manufacturers' written instructions.
 - 2. Install off-floor supports, affixed to building substrate, for wall-mounting fixtures.
 - a. Use carrier supports with waste fitting and seal for back-outlet fixtures.
 - b. Use carrier supports without waste fitting for fixtures with tubular waste piping.
 - c. Use chair-type carrier supports with rectangular steel uprights for accessible fixtures.
 - 3. Install back-outlet, wall-mounting fixtures onto waste fitting seals and attach to supports.
 - 4. Install floor-mounting fixtures on closet flanges or other attachments to piping or building substrate.
 - 5. Install wall-mounting fixtures with tubular waste piping attached to supports.
 - 6. Install counter-mounting fixtures in and attached to casework.
 - 7. Install fixtures level and plumb according to roughing-in drawings.
 - 8. Install water-supply piping with stop on each supply to each fixture to be connected to domestic water piping. Attach supplies to supports or substrate within pipe spaces behind fixtures. Install stops in locations where they can be easily reached for operation.

- a. Exception: Use ball, gate, or globe valve if stops are not specified with fixture. Valves are specified in Division 22 Section "General-duty Valves For Plumbing Piping".
 9. Install trap and tubular waste piping on drain outlet of each fixture to be directly connected to sanitary drainage system.
 10. Install flushometer valves for accessible water closets with handle mounted on wide side of compartment. Install other actuators in locations that are easy for people with disabilities to reach.
 11. Install toilet seats on water closets.
 12. Install faucet-spout fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.
 13. Install shower flow-control fittings with specified maximum flow rates in shower arms.
 14. Install traps on fixture outlets.
 - a. Exception: Omit trap on fixtures with integral traps.
 15. Install escutcheons at piping wall penetrations in exposed, finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding fittings. Escutcheons are specified in Division 22 Section "Common Work Results For Plumbing".
 16. Set showers in leveling bed of cement grout. Grout is specified in Division 22 Section "Common Work Results For Plumbing".
 17. Seal joints between fixtures and walls, floors, and counters using sanitary-type, one-part, mildew-resistant silicone sealant. Match sealant color to fixture color. Sealants are specified in Division 07 Section "Joint Sealants".
- B. Connections
1. Piping installation requirements are specified in other Division 14.. Drawings indicate general arrangement of piping, fittings, and specialties.
 2. Connect water supplies from domestic water piping to medical plumbing fixtures.
 3. Connect drain piping from medical plumbing fixtures to sanitary waste and vent piping.
 4. Ground equipment according to Division 26 Section "Grounding And Bonding For Electrical Systems".
 5. Connect wiring according to Division 26 Section "Low-voltage Electrical Power Conductors And Cables".
- C. Field Quality Control
1. Verify that installed medical plumbing fixtures are categories and types specified for locations where installed.
 2. Check that medical plumbing fixtures are complete with trim, faucets, fittings, and other specified components.
 3. Inspect installed medical plumbing fixtures for damage. Replace damaged fixtures and components.
 4. Test installed fixtures after water systems are pressurized for proper operation. Replace malfunctioning fixtures and components, then retest. Repeat procedure until units operate properly.
 5. Install fresh batteries in sensor-operated mechanisms.
- D. Adjusting
1. Operate and adjust faucets and controls. Replace damaged and malfunctioning medical plumbing fixtures, fittings, and controls.
 2. Adjust water pressure at faucets, shower valves, and flushometer valves to produce proper flow and stream.
 3. Replace washers and seals of leaking and dripping faucets and stops.
- E. Cleaning
1. Clean medical plumbing fixtures, faucets, and other fittings with manufacturers' recommended cleaning methods and materials. Do the following:
 - a. Remove faucet spouts and strainers, remove sediment and debris, and reinstall strainers and spouts.
 - b. Remove sediment and debris from drains.

2. After completing installation of exposed, factory-finished fixtures, faucets, and fittings, inspect exposed finishes and repair damaged finishes.
- F. Protection
1. Provide protective covering for installed fixtures and fittings.
 2. Do not allow use of medical plumbing fixtures for temporary facilities unless approved in writing by Owner.

SECTION 22 05 76 00 - SANITARY SEWERAGE**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for sanitary sewerage. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Pipe and fittings.
 - b. Nonpressure and pressure couplings.
 - c. Expansion joints and deflection fittings.
 - d. Backwater valves.
 - e. Cleanouts.
 - f. Encasement for piping.
 - g. Manholes.

C. Definitions

1. FRP: Fiberglass-reinforced plastic.

D. Submittals

1. Product Data: For the following:
 - a. Expansion joints and deflection fittings.
 - b. Backwater valves.
2. Shop Drawings: For manholes. Include plans, elevations, sections, details, and frames and covers.
3. Coordination Drawings: Show pipe sizes, locations, and elevations. Show other piping in same trench and clearances from sewer system piping. Indicate interface and spatial relationship between manholes, piping, and proximate structures.
4. Profile Drawings: Show system piping in elevation. Draw profiles to horizontal scale of not less than 1 inch equals 50 feet (1:500) and to vertical scale of not less than 1 inch equals 5 feet (1:50). Indicate manholes and piping. Show types, sizes, materials, and elevations of other utilities crossing system piping.
5. Product Certificates: For each type of cast-iron soil pipe and fitting, from manufacturer.
6. Field quality-control reports.

E. Delivery, Storage, And Handling

1. Do not store plastic manholes, pipe, and fittings in direct sunlight.
2. Protect pipe, pipe fittings, and seals from dirt and damage.
3. Handle manholes according to manufacturer's written rigging instructions.

F. Project Conditions

1. Interruption of Existing Sanitary Sewerage Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:
 - a. Notify The University no fewer than two days in advance of proposed interruption of service.
 - b. Do not proceed with interruption of service without The University written permission.

1.2 PRODUCTS

- A. Hub-And-Spigot, Cast-Iron Soil Pipe And Fittings
 - 1. Pipe and Fittings: ASTM A 74, Service class **OR** Service and Extra-Heavy classes **OR** Extra-Heavy class, **as directed**.
 - 2. Gaskets: ASTM C 564, rubber.
 - 3. Calking Materials: ASTM B 29, pure lead and oakum or hemp fiber.
- B. Hubless Cast-Iron Soil Pipe And Fittings
 - 1. Pipe and Fittings: ASTM A 888 or CISPI 301.
 - 2. CISPI-Trademark, Shielded Couplings:
 - a. Description: ASTM C 1277 and CISPI 310, with stainless-steel corrugated shield; stainless-steel bands and tightening devices; and ASTM C 564, rubber sleeve with integral, center pipe stop.
 - 3. Heavy-Duty, Shielded Couplings:
 - a. Description: ASTM C 1277 and ASTM C 1540, with stainless-steel shield; stainless-steel bands and tightening devices; and ASTM C 564, rubber sleeve with integral, center pipe stop.
 - 4. Cast-Iron, Shielded Couplings:
 - a. Description: ASTM C 1277 with ASTM A 48/A 48M, two-piece, cast-iron housing; stainless-steel bolts and nuts; and ASTM C 564, rubber sleeve with integral, center pipe stop.
 - 5. Unshielded Couplings:
 - a. Description: ASTM C 1277 and ASTM C 1461, rigid, sleeve-type, reducing- or transition-type mechanical coupling, with integral, center pipe stop, molded from ASTM C 1440, TPE material; with corrosion-resistant-metal tension band and tightening mechanism on each end.
- C. Ductile-Iron, Gravity Sewer Pipe And Fittings
 - 1. Pipe: ASTM A 746, for push-on joints.
 - 2. Standard Fittings: AWWA C110, ductile or gray iron, for push-on joints.
 - 3. Compact Fittings: AWWA C153, ductile iron, for push-on joints.
 - 4. Gaskets: AWWA C111, rubber.
- D. Ductile-Iron, Pressure Pipe And Fittings
 - 1. Push-on-Joint Piping:
 - a. Pipe: AWWA C151.
 - b. Standard Fittings: AWWA C110, ductile or gray iron.
 - c. Compact Fittings: AWWA C153.
 - d. Gaskets: AWWA C111, rubber, of shape matching pipe and fittings.
 - 2. Mechanical-Joint Piping:
 - a. Pipe: AWWA C151, with bolt holes in bell.
 - b. Standard Fittings: AWWA C110, ductile or gray iron, with bolt holes in bell.
 - c. Compact Fittings: AWWA C153, with bolt holes in bells.
 - d. Glands: Cast or ductile iron; with bolt holes and high-strength, cast-iron or high-strength, low-alloy steel bolts and nuts.
 - e. Gaskets: AWWA C111, rubber, of shape matching pipe, fittings, and glands.
- E. Nonpressure-Type Transition Couplings
 - 1. Comply with ASTM C 1173, elastomeric, sleeve-type, reducing or transition coupling, for joining underground nonpressure piping. Include ends of same sizes as piping to be joined and corrosion-resistant-metal tension band and tightening mechanism on each end.
 - 2. Sleeve Materials:
 - a. For Cast-Iron Soil Pipes: ASTM C 564, rubber.
 - b. For Concrete Pipes: ASTM C 443 (ASTM C 443M), rubber.
 - c. For Fiberglass Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.
 - d. For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.

- e. For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.
 3. Unshielded, Flexible Couplings:
 - a. Description: Elastomeric sleeve, with stainless-steel shear ring, **as directed**, and corrosion-resistant-metal tension band and tightening mechanism on each end.
 4. Shielded, Flexible Couplings:
 - a. Description: ASTM C 1460, elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.
 5. Ring-Type, Flexible Couplings:
 - a. Description: Elastomeric compression seal with dimensions to fit inside bell of larger pipe and for spigot of smaller pipe to fit inside ring.
 6. Nonpressure-Type, Rigid Couplings:
 - a. Description: ASTM C 1461, sleeve-type, reducing- or transition-type mechanical coupling, molded from ASTM C 1440, TPE material; with corrosion-resistant-metal tension band and tightening mechanism on each end.
- F. Pressure-Type Pipe Couplings
 1. Tubular-Sleeve Couplings: AWWA C219, with center sleeve, gaskets, end rings, and bolt fasteners.
 2. Metal, bolted, sleeve-type, reducing or transition coupling, for joining underground pressure piping. Include 150-psig (1035-kPa) **OR** 200-psig (1380-kPa), **as directed**, minimum pressure rating and ends of same sizes as piping to be joined.
 3. Center-Sleeve Material: Manufacturer's standard **OR** Carbon steel **OR** Stainless steel **OR** Ductile iron **OR** Malleable iron, **as directed**.
 4. Gasket Material: Natural or synthetic rubber.
 5. Metal Component Finish: Corrosion-resistant coating or material.
- G. Expansion Joints And Deflection Fittings
 1. Ductile-Iron, Flexible Expansion Joints:
 - a. Description: Compound fitting with combination of flanged and mechanical-joint ends complying with AWWA C110 or AWWA C153. Include two gasketed ball-joint sections and one or more gasketed sleeve sections, rated for 250-psig (1725-kPa) minimum working pressure and for offset and expansion indicated.
 2. Ductile-Iron Expansion Joints:
 - a. Description: Three-piece assembly of telescoping sleeve with gaskets and restrained-type, ductile-iron, bell-and-spigot end sections complying with AWWA C110 or AWWA C153. Include rating for 250-psig (1725-kPa) minimum working pressure and for expansion indicated.
 3. Ductile-Iron Deflection Fittings:
 - a. Description: Compound coupling fitting with ball joint, flexing section, gaskets, and restrained-joint ends complying with AWWA C110 or AWWA C153. Include rating for 250-psig (1725-kPa) minimum working pressure and for up to 15 degrees of deflection.
- H. Backwater Valves
 1. Cast-Iron Backwater Valves:
 - a. Description: ASME A112.14.1, gray-iron body and bolted cover, with bronze seat.
 - b. Horizontal type; with swing check valve and hub-and-spigot ends.
 - c. Combination horizontal and manual gate-valve type; with swing check valve, integral gate valve, and hub-and-spigot ends.
 - d. Terminal type; with bronze seat, swing check valve, and hub inlet.
 2. PVC Backwater Valves:
 - a. Description: Horizontal type; with PVC body, PVC removable cover, and PVC swing check valve.
- I. Cleanouts

1. Cast-Iron Cleanouts:
 - a. Description: ASME A112.36.2M, round, gray-iron housing with clamping device and round, secured, scoriated, gray-iron cover. Include gray-iron ferrule with inside calk or spigot connection and countersunk, tapered-thread, brass closure plug.
 - b. Top-Loading Classification(s): Light Duty **OR** Medium Duty **OR** Heavy Duty **OR** Extra-Heavy Duty, **as directed**.
 - c. Sewer Pipe Fitting and Riser to Cleanout: ASTM A 74, Service class, cast-iron soil pipe and fittings.

J. Encasement For Piping

1. Standard: ASTM A 674 or AWWA C105.
2. Material: Linear low-density polyethylene film of 0.008-inch (0.20-mm) **OR** high-density, cross-laminated polyethylene film of 0.004-inch (0.10-mm), **as directed**, minimum thickness.
3. Form: Sheet **OR** Tube, **as directed**.
4. Color: Black **OR** Natural, **as directed**.

K. Concrete

1. General: Cast-in-place concrete complying with ACI 318, ACI 350/350R (ACI 350M/350RM), and the following:
 - a. Cement: ASTM C 150, Type II.
 - b. Fine Aggregate: ASTM C 33, sand.
 - c. Coarse Aggregate: ASTM C 33, crushed gravel.
 - d. Water: Potable.
2. Portland Cement Design Mix: 4000 psi (27.6 MPa) minimum, with 0.45 maximum water/cementitious materials ratio.
 - a. Reinforcing Fabric: ASTM A 185/A 185M, steel, welded wire fabric, plain.
 - b. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (420 MPa) deformed steel.
3. Manhole Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 4000 psi (27.6 MPa) minimum, with 0.45 maximum water/cementitious materials ratio. Include channels and benches in manholes.
 - a. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope.
 - 1) Invert Slope: 1 **OR** 2, **as directed**, percent through manhole.
 - b. Benches: Concrete, sloped to drain into channel.
 - 1) Slope: 4 **OR** 8, **as directed**, percent.
4. Ballast and Pipe Supports: Portland cement design mix, 3000 psi (20.7 MPa) minimum, with 0.58 maximum water/cementitious materials ratio.
 - a. Reinforcing Fabric: ASTM A 185/A 185M, steel, welded wire fabric, plain.
 - b. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (420 MPa) deformed steel.

1.3 EXECUTION

A. Earthwork

1. Excavating, trenching, and backfilling are specified in Division 31 Section "Earth Moving".

B. Piping Installation

1. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of underground sanitary sewer piping. Location and arrangement of piping layout take into account design considerations. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.
2. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for using lubricants, cements, and other installation requirements.

3. Install manholes for changes in direction unless fittings are indicated. Use fittings for branch connections unless direct tap into existing sewer is indicated.
4. Install proper size increasers, reducers, and couplings where different sizes or materials of pipes and fittings are connected. Reducing size of piping in direction of flow is prohibited.
5. When installing pipe under streets or other obstructions that cannot be disturbed, use pipe-jacking process of microtunneling.
6. Install gravity-flow, nonpressure, drainage piping according to the following:
 - a. Install piping pitched down in direction of flow, at minimum slope of 1 **OR** 2, **as directed**, percent unless otherwise indicated.
 - b. Install piping NPS 6 (DN 150) and larger with restrained joints at tee fittings and at changes in direction. Use corrosion-resistant rods, pipe or fitting manufacturer's proprietary restraint system, or cast-in-place-concrete supports or anchors.
 - c. Install piping with 36-inch (915-mm) **OR** 48-inch (1220-mm) **OR** 60-inch (1520-mm) **OR** 72-inch (1830-mm), **as directed**, minimum cover.
 - d. Install hub-and-spigot, cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook."
 - e. Install hubless cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook."
 - f. Install ductile-iron, gravity sewer piping according to ASTM A 746.
 - g. Install ABS sewer piping according to ASTM D 2321 and ASTM F 1668.
 - h. Install PVC cellular-core sewer piping according to ASTM D 2321 and ASTM F 1668.
 - i. Install PVC corrugated sewer piping according to ASTM D 2321 and ASTM F 1668.
 - j. Install PVC profile sewer piping according to ASTM D 2321 and ASTM F 1668.
 - k. Install PVC Type PSM sewer piping according to ASTM D 2321 and ASTM F 1668.
 - l. Install PVC gravity sewer piping according to ASTM D 2321 and ASTM F 1668.
 - m. Install fiberglass sewer piping according to ASTM D 3839 and ASTM F 1668.
 - n. Install nonreinforced-concrete sewer piping according to ASTM C 1479 and ACPA's "Concrete Pipe Installation Manual."
 - o. Install reinforced-concrete sewer piping according to ASTM C 1479 and ACPA's "Concrete Pipe Installation Manual."
7. Install force-main, pressure piping according to the following:
 - a. Install piping with restrained joints at tee fittings and at horizontal and vertical changes in direction. Use corrosion-resistant rods, pipe or fitting manufacturer's proprietary restraint system, or cast-in-place-concrete supports or anchors.
 - b. Install piping with 36-inch (915-mm) **OR** 48-inch (1220-mm) **OR** 60-inch (1520-mm) **OR** 72-inch (1830-mm), **as directed**, minimum cover.
 - c. Install ductile-iron pressure piping according to AWWA C600 or AWWA M41.
 - d. Install ductile-iron special fittings according to AWWA C600.
 - e. Install PVC pressure piping according to AWWA M23 or to ASTM D 2774 and ASTM F 1668.
 - f. Install PVC water-service piping according to ASTM D 2774 and ASTM F 1668.
8. If required to provide protection for metal piping, install corrosion-protection piping encasement over the following underground metal piping according to ASTM A 674 or AWWA C105:
 - a. Hub-and-spigot, cast-iron soil pipe.
 - b. Hubless cast-iron soil pipe and fittings.
 - c. Ductile-iron pipe and fittings.
 - d. Expansion joints and deflection fittings.
9. Clear interior of piping and manholes of dirt and superfluous material as work progresses. Maintain swab or drag in piping, and pull past each joint as it is completed. Place plug in end of incomplete piping at end of day and when work stops.

C. Pipe Joint Construction

1. Join gravity-flow, nonpressure, drainage piping according to the following:
 - a. Join hub-and-spigot, cast-iron soil piping with gasket joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for compression joints.
 - b. Join hub-and-spigot, cast-iron soil piping with calked joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for lead and oakum calked joints.

- c. Join hubless cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-coupling joints.
 - d. Join ductile-iron, gravity sewer piping according to AWWA C600 for push-on joints.
 - e. Join ABS sewer piping according to ASTM D 2321 and ASTM D 2751 for elastomeric-seal joints.
 - f. Join PVC cellular-core sewer piping according to ASTM D 2321 and ASTM F 891 for solvent-cemented joints.
 - g. Join PVC corrugated sewer piping according to ASTM D 2321.
 - h. Join PVC profile sewer piping according to ASTM D 2321 for elastomeric-seal joints or ASTM F 794 for gasketed joints.
 - i. Join PVC Type PSM sewer piping according to ASTM D 2321 and ASTM D 3034 for elastomeric-seal joints or ASTM D 3034 for elastomeric-gasket joints.
 - j. Join PVC gravity sewer piping according to ASTM D 2321 and ASTM D 3034 for elastomeric-seal joints or ASTM D 3034 for elastomeric-gasket joints.
 - k. Join fiberglass sewer piping according to ASTM D 4161 for elastomeric-seal joints.
 - l. Join nonreinforced-concrete sewer piping according to ASTM C 14 (ASTM C 14M) and ACPA's "Concrete Pipe Installation Manual" for rubber-gasket joints.
 - m. Join reinforced-concrete sewer piping according to ACPA's "Concrete Pipe Installation Manual" for rubber-gasket joints.
 - n. Join dissimilar pipe materials with nonpressure-type, flexible **OR** rigid, **as directed**, couplings.
2. Join force-main, pressure piping according to the following:
- a. Join ductile-iron pressure piping according to AWWA C600 or AWWA M41 for push-on joints.
 - b. Join ductile-iron special fittings according to AWWA C600 or AWWA M41 for push-on joints.
 - c. Join PVC pressure piping according to AWWA M23 for gasketed joints.
 - d. Join PVC water-service piping according to ASTM D 2855.
 - e. Join dissimilar pipe materials with pressure-type couplings.
3. Pipe couplings, expansion joints, and deflection fittings with pressure ratings at least equal to piping rating may be used in applications below unless otherwise indicated.
- a. Use nonpressure flexible couplings where required to join gravity-flow, nonpressure sewer piping unless otherwise indicated.
 - 1) Unshielded **OR** Shielded, **as directed**, flexible **OR** rigid, **as directed**, couplings for pipes of same or slightly different OD.
 - 2) Unshielded, increaser/reducer-pattern, flexible **OR** rigid, **as directed**, couplings for pipes with different OD.
 - 3) Ring-type flexible couplings for piping of different sizes where annular space between smaller piping's OD and larger piping's ID permits installation.
 - b. Use pressure pipe couplings for force-main joints.

D. Manhole Installation

- 1. General: Install manholes complete with appurtenances and accessories indicated.
- 2. Install precast concrete manhole sections with sealants according to ASTM C 891.
- 3. Install FRP manholes according to manufacturer's written instructions.
- 4. Form continuous concrete channels and benches between inlets and outlet.
- 5. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops 3 inches (76 mm) above finished surface elsewhere unless otherwise indicated.
- 6. Install manhole-cover inserts in frame and immediately below cover.

E. Concrete Placement

- 1. Place cast-in-place concrete according to ACI 318.

F. Backwater Valve Installation

- 1. Install horizontal-type backwater valves in piping manholes or pits.
- 2. Install combination horizontal and manual gate valves in piping and in manholes.

3. Install terminal-type backwater valves on end of piping and in manholes. Secure units to sidewalls.
- G. Cleanout Installation
1. Install cleanouts and riser extensions from sewer pipes to cleanouts at grade. Use cast-iron soil pipe fittings in sewer pipes at branches for cleanouts, and use cast-iron soil pipe for riser extensions to cleanouts. Install piping so cleanouts open in direction of flow in sewer pipe.
 - a. Use Light-Duty, top-loading classification cleanouts in earth **OR** unpaved foot-traffic, **as directed**, areas.
 - b. Use Medium-Duty, top-loading classification cleanouts in paved foot-traffic areas.
 - c. Use Heavy-Duty, top-loading classification cleanouts in vehicle-traffic service areas.
 - d. Use Extra-Heavy-Duty, top-loading classification cleanouts in roads.
 2. Set cleanout frames and covers in earth in cast-in-place-concrete block, 18 by 18 by 12 inches (450 by 450 by 300 mm) deep. Set with tops 1 inch (25 mm) above surrounding grade.
 3. Set cleanout frames and covers in concrete pavement and roads with tops flush with pavement surface.
- H. Connections
1. Connect nonpressure, gravity-flow drainage piping to building's sanitary building drains specified in Division 22 Section "Sanitary Waste And Vent Piping".
 2. Connect force-main piping to building's sanitary force mains specified in Division 22 Section "Sanitary Waste And Vent Piping". Terminate piping where indicated.
 3. Make connections to existing piping and underground manholes.
 - a. Use commercially manufactured wye fittings for piping branch connections. Remove section of existing pipe, install wye fitting into existing piping, and encase entire wye fitting plus 6-inch (150-mm) overlap with not less than 6 inches (150 mm) of concrete with 28-day compressive strength of 3000 psi (20.7 MPa).
 - b. Make branch connections from side into existing piping, NPS 4 to NPS 20 (DN 100 to DN 500). Remove section of existing pipe, install wye fitting into existing piping, and encase entire wye with not less than 6 inches (150 mm) of concrete with 28-day compressive strength of 3000 psi (20.7 MPa).
 - c. Make branch connections from side into existing piping, NPS 21 (DN 525) or larger, or to underground manholes by cutting opening into existing unit large enough to allow 3 inches (76 mm) of concrete to be packed around entering connection. Cut end of connection pipe passing through pipe or structure wall to conform to shape of and be flush with inside wall unless otherwise indicated. On outside of pipe or manhole wall, encase entering connection in 6 inches (150 mm) of concrete for minimum length of 12 inches (300 mm) to provide additional support of collar from connection to undisturbed ground.
 - 1) Use concrete that will attain a minimum 28-day compressive strength of 3000 psi (20.7 MPa) unless otherwise indicated.
 - 2) Use epoxy-bonding compound as interface between new and existing concrete and piping materials.
 - d. Protect existing piping and manholes to prevent concrete or debris from entering while making tap connections. Remove debris or other extraneous material that may accumulate.
 4. Connect to grease **OR** oil **OR** sand, **as directed**, interceptors specified in Division 22 Section "Sanitary Waste Interceptors".
- I. Closing Abandoned Sanitary Sewer Systems
1. Abandoned Piping: Close open ends of abandoned underground piping indicated to remain in place. Include closures strong enough to withstand hydrostatic and earth pressures that may result after ends of abandoned piping have been closed. Use either procedure below:
 - a. Close open ends of piping with at least 8-inch- (203-mm-) thick, brick masonry bulkheads.
 - b. Close open ends of piping with threaded metal caps, plastic plugs, or other acceptable methods suitable for size and type of material being closed. Do not use wood plugs.
 2. Abandoned Manholes: Excavate around manhole as required and use either procedure below:
 - a. Remove manhole and close open ends of remaining piping.

- b. Remove top of manhole down to at least 36 inches (915 mm) below final grade. Fill to within 12 inches (300 mm) of top with stone, rubble, gravel, or compacted dirt. Fill to top with concrete.
- 3. Backfill to grade according to Division 31 Section "Earth Moving".

J. Identification

- 1. Materials and their installation are specified in Division 31 Section "Earth Moving". Arrange for installation of green warning tapes directly over piping and at outside edges of underground manholes.
 - a. Use warning tape **OR** detectable warning tape, **as directed**, over ferrous piping.
 - b. Use detectable warning tape over nonferrous piping and over edges of underground manholes.

K. Field Quality Control

- 1. Inspect interior of piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches (600 mm) of backfill is in place, and again at completion of Project.
 - a. Submit separate report for each system inspection.
 - b. Defects requiring correction include the following:
 - 1) Alignment: Less than full diameter of inside of pipe is visible between structures.
 - 2) Deflection: Flexible piping with deflection that prevents passage of ball or cylinder of size not less than 92.5 percent of piping diameter.
 - 3) Damage: Crushed, broken, cracked, or otherwise damaged piping.
 - 4) Infiltration: Water leakage into piping.
 - 5) Exfiltration: Water leakage from or around piping.
 - c. Replace defective piping using new materials, and repeat inspections until defects are within allowances specified.
 - d. Reinspect and repeat procedure until results are satisfactory.
- 2. Test new piping systems, and parts of existing systems that have been altered, extended, or repaired, for leaks and defects.
 - a. Do not enclose, cover, or put into service before inspection and approval.
 - b. Test completed piping systems according to requirements of authorities having jurisdiction.
 - c. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours' advance notice.
 - d. Submit separate report for each test.
 - e. Hydrostatic Tests: Test sanitary sewerage according to requirements of authorities having jurisdiction and the following:
 - 1) Fill sewer piping with water. Test with pressure of at least 10-foot (3-m) head of water, and maintain such pressure without leakage for at least 15 minutes.
 - 2) Close openings in system and fill with water.
 - 3) Purge air and refill with water.
 - 4) Disconnect water supply.
 - 5) Test and inspect joints for leaks.

OR

Air Tests: Test sanitary sewerage according to requirements of authorities having jurisdiction, UNI-B-6, and the following:

 - 6) Option: Test plastic gravity sewer piping according to ASTM F 1417.
 - 7) Option: Test concrete gravity sewer piping according to ASTM C 924 (ASTM C 924M).
 - f. Force Main: Perform hydrostatic test after thrust blocks, supports, and anchors have hardened. Test at pressure not less than 1-1/2 times the maximum system operating pressure, but not less than 150 psig (1035 kPa).
 - 1) Ductile-Iron Piping: Test according to AWWA C600, "Hydraulic Testing" Section.
 - 2) PVC Piping: Test according to AWWA M23, "Testing and Maintenance" Chapter.
 - g. Manholes: Perform hydraulic test according to ASTM C 969 (ASTM C 969M).
- 3. Leaks and loss in test pressure constitute defects that must be repaired.

4. Replace leaking piping using new materials, and repeat testing until leakage is within allowances specified.
- L. Cleaning
 1. Clean dirt and superfluous material from interior of piping. Flush with potable water.

SECTION 22 11 16 00 - PLUMBING PIPING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Provide materials and installation for complete first class plumbing systems, within and to five feet beyond building perimeter unless noted otherwise on Contract Drawings; Sanitary Waste and Vent Piping, Storm Drain Piping, Domestic Water Piping, Domestic Water Valves, Testing and other normal parts that make the systems operable, code compliant and acceptable to the authorities having jurisdiction.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. 2006 Edition of the International Plumbing Code.
 - 2. NOTE: MDACC takes various exceptions to the International Plumbing Code and has adopted the more stringent requirements within the Uniform Plumbing Code. These exceptions are included within Project Specifications and/or Project Design Drawings.
 - 3. ANSI/NSF Standard 61 - Drinking Water System Components - Health Effects.

1.04 QUALITY ASSURANCE

- A. Manufacturer's name and pressure rating shall be permanently marked on valve body.
- B. The Contractor shall notify the manufacturer's representative prior to installing any copper press fittings. The Contractor shall obtain the representative's guidance in any unfamiliar installation procedures. The manufacturer's representative of copper press fittings shall conduct periodic inspections of the installation and shall report in writing to the Contractor and Owner of any observed deviations from manufacturer's recommended installation practices.
- C. Manufacturer Qualifications: Company shall have minimum three years documented experience specializing in manufacturing the products specified in this section. All pipe, fittings, couplings, gaskets and valves shall be manufactured domestically.
- D. Installer Qualifications:
 - 1. Company shall have minimum three years documented experience specializing in performing the work of this section.

2. Installation of plumbing systems shall be performed by individuals licensed by the Texas State Board of Plumbing Examiners as a Journeyman or Master Plumber. Installation may be performed by Apprentice Plumbers provided they are registered with the Texas State Board of Plumbing examiners and under direct supervision of a licensed plumber. All installation shall be supervised by a licensed Master Plumber.
3. All installers of copper press fittings shall be trained by the fitting manufacturer's appointed representative. Written notification of training shall be submitted to Owner prior to any installation.

1.05 SUBMITTALS

A. Product Data:

1. Code and Standards compliance, manufacturer's data for pipe, fittings, valves and all other products included within this specification section.
2. Manufacturer's installation instructions.

B. Record Documents:

1. Record actual locations of valves, etc. and prepare valve charts.
2. Test reports and inspection certification for all systems listed herein.
3. Provide a certificate of completion detailing the domestic water system chlorination procedure and all laboratory test results.
4. Submit proposed location of access panels which vary from quantities or locations indicated on Contract Drawings.
5. Provide full written description of manufacturer's warranty.

C. Operation and Maintenance Data:

1. Include components of system, servicing requirements, Record Drawings, inspection data, installation instructions, exploded assembly views, replacement part numbers and availability, location and contact numbers of service depot.

1.06 DELIVERY, STORAGE AND HANDLING

- A. All materials shall be new, undamaged, and free of rust.
- B. Accept valves on Site in shipping containers and maintain in place until installation.
- C. Provide temporary protective coating and end plugs on valves not packaged within containers. Maintain in place until installation.
- D. Provide temporary end caps and closures on pipe and fittings. Maintain in place until installation.
- E. Protect installed piping, valves and associated materials during progression of the construction period to avoid clogging with dirt, and debris and to prevent damage, rust, etc. Remove dirt and debris and repair materials as work progresses and isolate parts of completed system from uncompleted parts.
- F. Protect all materials that are to be installed within this project from exposure to rain, freezing temperatures and direct sunlight. EXCEPTION: Materials manufactured for exterior locations.

1.07 EXTRA MATERIALS

- A. Provide The University with one differential pressure meter kit for use with domestic hot water return circuit balancing valves installed within this project. Kit shall include meter, hoses, connection accessories, circular slide rule, carrying case and valve manufacturer's curve charts.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Provide materials as specified herein and indicated on Contract Drawings. All materials and work shall meet or exceed all applicable Federal and State requirements and conform to adopted codes and ordinances of authorities having jurisdiction.
- C. Pressure ratings of pipe, fittings, couplings, valves, and all other appurtenances shall be suitable for the anticipated system pressures in which they are installed.

2.02 SANITARY WASTE AND VENT AND STORM DRAINAGE PIPING (AS INDICATED ON DRAWINGS)

- A. Service weight cast iron soil pipe and fittings with hubless connections using clamp type gasketed mechanical fasteners above ground and hub and spigot DWV pipe and fittings with neoprene compression gasket joints for all buried pipe. Cast iron soil pipe, fittings and hub gaskets shall be manufactured by Tyler Pipe or Charlotte Pipe and Foundry. All cast iron pipe and fittings shall be of the same manufacturer.
- B. Unburied storm drainage and sanitary waste and vent piping for sizes 4" and smaller may be seamless copper DWV tube with wrought copper or wrought copper alloy solder joint drainage pattern DWV fittings.
- C. Indirect waste piping sizes 1-1/4" through 2" serving fixtures and equipment shall be seamless copper DWV tube with wrought copper or wrought copper alloy solder joint drainage pattern DWV fittings.
- D. Indirect waste piping sizes 1" and smaller serving equipment shall be type "L" hard drawn copper pipe and wrought copper or cast copper alloy solder joint fittings using lead-free solder and non-corrosive flux. Elbows shall be long radius type. Tee fittings shall be combination wye with 45 degree elbow.
- E. Cast iron soil pipe compression gaskets shall be monolithically molded from an elastomer meeting ASTM C 564 and shall be of same manufacturer as pipe and fittings.
- F. Clamps for joining hubless cast iron pipe and fittings sizes 10" and smaller shall meet the performance criteria of FM 1680, have 28 gauge type 304 stainless steel jacket, minimum .094 inch thick ASTM C 564 neoprene gasket and type 305 stainless steel band screws designed to be installed with a pre-set torque wrench calibrated at 80 inch pounds. Couplings shall be manufactured by Clamp-All, Inc. HI-TORQ 80 or Husky, Inc., Orangesield HD 4000.
- G. Clamps for joining hubless cast iron pipe and fittings sizes 12" and 15" shall meet the performance criteria of FM 1680, have 24 gauge type 304 stainless steel jacket, minimum .100 inch thick ASTM C 564 neoprene gasket and type 305 stainless steel band screws designed to be installed with a pre-set torque wrench calibrated at 125 inch pounds. Couplings shall be manufactured by Clamp-All, Inc. HI-TORQ 125.
- H. Hubless piping systems shall not be used in a directly buried, underground application. EXCEPTION: No-hub type fittings with clamp type coupling joints may be used below ground for pipe sizes up to 10" at connections to existing cast iron sewers provided couplings are cast iron with stainless steel bolts as manufactured by MG Piping Products.

- I. Solder for copper piping shall be lead-free Tin/Copper/Silver/Nickle(optional) solder conforming to ASTM B32, Wolverine Silvabrite 100 Lead-Free Solder or Harris Nick Lead-Free Solder. Use water soluble flux recommended by solder manufacturer and conforming to ASTM B813 and NSF 61, Wolverine Silvabrite 100 Water Soluable Flux or Bridgit Water Soluble Paste Flux.
- J. Lubricant for drainage cleanout plugs shall be Loctite Marine Grade Anti-Seize or approved.
- K. Double sanitary tee fittings shall be not be used as a drainage fitting.
- L. Provide IAPMO figure one, IAPMO figure five or double wye and eighth bend fittings on vertical lines serving back-to-back fixture drains.
- M. Double wye and eighth bend fittings shall not be installed in horizontal drain lines.
- N. All P-traps for floor drains, floor sinks and hub drains shall be deep-seal type.
- O. Provide threaded brass or copper adapters to connect fixture supply stops and waste to service piping within walls. Galvanized nipples shall not be acceptable. Provide DWV copper trap adapters to connect lavatory, sink and drinking fountain trap outlets to sanitary system.

2.03 DOMESTIC WATER PIPING (INCLUDING COLD, HOT & SOFTENED WATER)

- A. All materials within domestic water distribution systems that may come in contact with the potable water delivered shall comply with ANSI/NSF Standard 61.
- B. All brass and bronze piping materials within domestic water distribution systems that may come in contact with the potable water delivered shall have no more than 15% zinc content.
- C. Unburied piping shall be type "L" hard drawn copper pipe and wrought copper or cast copper alloy solder joint fittings using lead-free solder and non-corrosive flux. Piping sizes 2-1/2" and larger may be type "L" hard drawn copper and wrought copper or cast copper alloy roll groove fittings utilizing no-sweat coupling and flange adapter assemblies as manufactured by Victaulic or Anvil.
- D. Unburied piping sizes 1/2" through 2" installed within occupied buildings for modifying systems having an operating pressure that will not exceed 200 p.s.i.g. may utilize copper press fittings manufactured by NIBCO conforming to the material and sizing requirements of ASME B16.18 or ASME B16.22. O-rings for copper press fittings shall be EPDM. Copper press fittings shall be rated at 200 psi working pressure and 250 degree working temperature. All copper press fittings, couplings and specialties shall be the products of a single manufacturer. Installation tools shall be of the same manufacturer as the components.
- E. Solder for copper piping shall be lead-free Tin/Copper/Silver/Nickle(optional) solder conforming to ASTM B32, Wolverine Silvabrite 100 Lead-Free Solder or Harris Nick Lead-Free Solder. Use water soluble flux recommended by solder manufacturer and conforming to ASTM B813 and NSF 61, Wolverine Silvabrite 100 Water Soluable Flux or Bridgit Water Soluble Paste Flux.
- F. Buried domestic water service entrance piping 4" and larger shall be cement mortar lined Class 53 ductile iron pipe and 350 psi working pressure ductile iron fittings using mechanical joints. All buried ductile iron pipe and fittings shall be encased in polyethylene per ANSI/AWWA Standard C105/A21.5, Method A. Minimum thickness of polyethylene shall be 8 mil.
- G. Buried pressurized piping sizes 1" and smaller shall be type "K" soft copper. No joints shall be allowed below slab. Encase piping within 1/2" thick un-slit flexible tube type elastomeric thermal insulation up to 1" above slab at both ends. Insulation shall be AP/Armaflex or Rubatex Insul-Tube 180.
- H. Unburied trap primer piping shall be same as specified for domestic water except all elbows shall be long radius type.

- I. Buried trap primer piping shall be type "K" soft copper. No joints shall be allowed below slab except at connection to drain. Encase piping within ½" thick un-slit flexible tube type elastomeric thermal insulation up 1" above slab. Insulation shall be AP/Armaflex or Rubatex Insul-Tube 180.
- J. Dielectric waterway fittings shall have zinc electroplated steel pipe body with high temperature stabilized polyolefin polymer liner; manufactured by Victaulic, Style 47 or PPP, Inc. Series 19000.
- K. Dielectric unions shall be rated at 250 psi, ground-joint type with inert, non-corrosive thermoplastic sleeve. End connection materials shall be compatible with respective piping materials; manufactured by EPCO Sales, Inc. Provide models to suit applicable transitions.
- L. Dielectric flanges shall be rated at 175 psi, have nylon bolt isolators and dielectric gasket. Materials shall be compatible with respective piping materials; manufactured by EPCO Sales, Inc. Provide models to suit applicable transitions.
- M. Pipe joint compound shall be lead-free, non-toxic, non-hardening and compliant with ANSI/NSF 61 and Federal Specification TT-S-1732. Temperature service range of -15°F to +400°F, manufactured by approved equal by Rectorseal or Oatey.

2.04 DOMESTIC WATER VALVES: (INCLUDING COLD, HOT & SOFTENED WATER)

- A. All materials within domestic water distribution systems that may come in contact with the potable water delivered shall comply with ANSI/NSF Standard 61.
- B. All brass and bronze valve materials within domestic water distribution systems that may come in contact with the potable water delivered shall have no more than 15% zinc content.
- C. Similar types of valves shall be the product of one manufacturer; i.e., all butterfly valves shall be of the same manufacturer, all ball valves shall be of the same manufacturer, etc. EXCEPTION: 2-1/2" & 3" ball valves may be by a different manufacturer than 2" and smaller ball valves.
- D. Line Shut-Off Valves up to and including 2" shall be two-piece bronze body of ASTM B584 Alloy 844, ASTM B61, or ASTM B62, full port ball type rated at 600 WOG with threaded connections, blow-out proof stem, plastic coated handle, Teflon packing, 316 stainless steel ball and stem. Acceptable valves are NIBCO Model T-585-70-66, or approved equivalent model by Apollo.
- E. Line Shut-Off Valves sizes 2-1/2" and 3" shall be full port ball type rated at 400 WOG with threaded connections, two-piece bronze body ASTM B584 with 316 stainless steel ball and stem, plastic coated handle, blow out proof stem and reinforced Teflon seats. Acceptable valves approved equivalent model by NIBCO or Apollo.
- F. Line Shut-Off Valves 4" and larger where system operating pressure will not exceed 160 p.s.i.g. shall be 200 WOG threaded lug type ductile iron body butterfly valve with extended neck, lever handle, 416 stainless steel stem, aluminum bronze disc, EPDM liner and seal, suitable for bi-directional flow and dead end service with downstream flange removed. Acceptable valves are NIBCO Model LD-2000, or approved equivalent model by Apollo.
- G. Line Shut-Off Valves 4" and larger installed within systems having design operating pressures between 160 and 250 p.s.i.g. shall be threaded lug type ductile iron body butterfly valve with extended neck, lever handle, 316 stainless steel stem and disc, EPDM liner and seal, suitable for bi-directional flow and dead end service with downstream flange removed. Acceptable valves are NIBCO Model LD-3022, or approved equivalent model by Apollo.
- H. Line Shut-Off Valves 4" and larger installed in roll grooved copper systems may be 300 psi roll grooved end type bronze body butterfly valve with lever handle, bronze trim, EPDM coated disc, suitable for bi-directional flow and dead end service. Manufactured by Victaulic Model V-size-3-6-2-2-11.

- I. Provide stem extensions of a non-thermal conducting material for valves in insulated lines to allow unobstructed operation.
- J. Provide memory stops on all ball valves installed in domestic hot water return lines. Memory stops shall be adjustable after pipe insulation is applied.
- K. Provide line shut-off valves that have the same inside diameter of the upstream pipe in which they are installed.
- L. Domestic Hot Water Return Circuit Balancing Valves 1/2" through 2" shall be 'Y or T' pattern with threaded inlet and outlet connections, equal percentage globe-style and provide precise flow measurement, precision flow balancing and positive drip-tight shut-off. Valves shall provide multi-turn, 360° adjustment with micrometer type indicators located on the valve handwheel. Valves shall have a minimum of five full 360° handwheel turns. 90° 'circuit-setter' style ball valves are not acceptable. Valve handle shall have hidden memory feature to provide a means for locking the valve position after the system is balanced. Valves shall be furnished with precision machined venturi built into the valve body to provide highly accurate flow measurement and flow balancing. The venturi shall have two, 1/4" threaded brass metering ports with check valves and gasketed caps located on the inlet side of the valve. Valves shall be furnished with flow smoothing fins downstream of the valve seat and integral to the forged valve body to make the flow more laminar. The valve body, stem and plug shall be brass. The handwheel shall be high-strength resin. Provide valves as scheduled on Contract Drawings manufactured by Armstrong Model CBV-VT or NIBCO T-1710 and F737-A. Furnish each valve complete with optional pre-formed 25/50 fire/smoke rated insulation.
- M. Swing Check Valves, 2" and smaller - "Y" or "T" pattern bronze, Class 150, with threaded connections and screw-in cap. Manufactured by NIBCO Model T-433-Y or approved equivalent model by Apollo.
- N. Spring Loaded Check Valves, 2" and smaller - Silent closing, bronze, Class 125, with threaded connections, Buna disc, bronze or stainless steel spring. Manufactured by NIBCO Model T-480 or approved equivalent model by Apollo.
- O. Swing Check Valves, 2-1/2" and larger - 200 pound CWP, Iron body, with bronze or stainless steel trim. Manufactured by NIBCO Model F-918-B or approved equivalent model by Apollo.
- P. Swing Check Valves, 2-1/2" and larger - 285 pound CWP, Iron body, with stainless steel trim. Manufactured by NIBCO Model F-938-33 or approved equivalent model by Apollo.
- Q. Spring Loaded Check Valves, 2-1/2" and larger - 200 pound CWP, Iron body, with bronze or stainless steel trim. Manufactured by NIBCO Model F-910 or approved equivalent model by Apollo.
- R. Spring Loaded Check Valves, 2-1/2" and larger - 400 pound CWP, Iron body, with bronze or stainless steel trim. Manufactured by NIBCO Model F-960 or approved equivalent model by Apollo.

2.05 DIFFERENTIAL PRESSURE METER: (FOR DOMESTIC HOT WATER CIRCUIT BALANCING VALVES)

- A. Meter shall be equipped with one 4-1/2" round dial gauge, 0-135" pressure differential, one 4-1/2" round dial gauge, 0-60' pressure differential, 300 psig maximum working pressure, two five foot hoses with PMP connections and carrying case. Meter and accessories shall be manufactured by Armstrong Model CBDM-135/60 or NIBCO 1022.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Verify that excavations are to required grade, dry and not over-excavated. Do not install underground piping when bedding is wet or frozen.

- B. Before commencing work, check final grade and pipe invert elevations required for drain terminations and connections to ensure proper slope.

3.02 PREPARATION

- A. Ream pipes and tubes. Remove burrs, scale and dirt, inside and outside, before assembly. Remove foreign material from piping.
- B. Prepare piping connections to equipment with flanges or unions.

3.03 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. General
 - 1. Care shall be exercised to avoid all cross connections and to construct the plumbing systems in a manner which eliminates the possibility of water contamination.
 - 2. Install all materials and products in accordance with manufacturer's published recommendations. Use tools manufactured for the installation of the specific material or product.
 - 3. Heat generated by soldering procedures shall not be transmitted to valves, copper alloy roll groove fittings, copper press fittings, no-hub clamps, or any other components installed within the piping system that may be damaged due to high temperatures. Contractor shall take all precautions necessary, including utilizing wet wrapping or allowing heated piping to cool to ambient temperature before attachment.
 - 4. Pipe joints, no-hub clamps, flanges, unions, etc., shall not directly contact or be encased in concrete, or be located within wall, floor or roof penetrations.
 - 5. Route piping in direct orderly manner and maintain proper grades. Installation shall conserve headroom and interfere as little as possible with use of spaces. Route exposed piping parallel to walls. Group piping whenever practical at common elevations.
 - 6. Install piping to allow for expansion and Contraction without stressing pipe, joints or connected equipment.
 - 7. Furnish all supports required by the piping included in this specification section.
 - 8. Penetrations through fire rated walls, floors and partitions shall be sealed to provide a U.L. rating equal to or greater than the wall, floor or partition.
 - 9. Seal all penetrations through floors, exterior building walls and grade beams air and water tight.
 - 10. Each plumbing pipe projecting through roof shall be installed in accordance with Contract Specifications and Drawings. Penetrations shall be sealed air and water tight. Refer to details on Contract Drawings and coordinate with General Contractor for flashing requirements.
 - 11. Furnish and install all necessary valves, traps, gauges, strainers, unions, etc. for each piece of equipment (including Owner furnished equipment) having plumbing connections, to facilitate proper functioning, servicing and compliance with code.
 - 12. Provide code-approved transition adapters when joining dissimilar piping materials. Adaptors installed shall be manufactured specifically for the particular transition.

13. All piping shall have reducing fittings used for reducing or increasing where any change in the pipe sizes occurs. No bushing of any nature shall be allowed in piping.
14. Bury outside water and drainage pipe minimum one foot below recorded frost depth.
15. Buried piping shall be supported throughout its entire length.
16. All excavation required for plumbing work is the responsibility of the plumbing Contractor and shall be done in accordance with Contract Documents.
17. Piping shall be insulated in accordance with Contract Documents.
18. Provide clearance for installation of insulation and for access to valves, air vents, drains, unions, etc.
19. Provide dielectric isolation device where non-ferrous components connect to ferrous components. Devices shall be dielectric union, coupling or dielectric flange fitting.
20. All piping shall be isolated from building structures, including partition studs, to prevent transmission of vibration and noise.
21. Isolate all bare copper pipe from ferrous building materials. Yellow Insulation Tape is acceptable.
22. All nipples or associated piping to the first cut-off valve, connected to pipe taps for domestic, heating, hot water, chilled water, steam, condensate, chemical injection, chemical recirculation, etc., will be stainless steel. First cut-off valve on tap shall be stainless steel or brass.

D. Drainage and Vent Systems

1. Slope drainage lines uniformly at 1/4" per foot, for lines 3" and less, and 1/8" per foot for larger lines, unless noted otherwise on Contract Drawings. Maintain gradients through each joint of pipe and throughout system.
2. Buried pipe shall be laid on a smoothly graded, prepared subgrade soil foundation true to alignment and uniformly graded. Bell holes shall be hand-excavated so that the bottom of the pipe is in continuous contact with the surface of the prepared subgrade material. Piping invert shall form a true and straight line.
3. The size of drainage piping shall not be reduced in size in the direction of flow. Drainage and vent piping shall conform to the sizes indicated on the Contract Drawings. Waste lines from water closets shall not be smaller than four inches. Under no circumstances shall any drain or vent line below slab be smaller than two inches.
4. Unburied horizontal cast iron soil piping shall be supported at least at every other joint except that when the developed length between supports exceeds four feet, they shall be provided at each joint. Supports shall also be provided at each horizontal branch connection and at the base of each vertical rise. Supports shall be placed immediately adjacent to the joint. Suspended lines shall be braced to prevent horizontal movement. Unburied vertical cast iron soil piping rising through more than one floor level shall be supported with riser clamps at each floor level.
5. Install couplings for hubless pipe and fittings in accordance with manufacturer's published recommendations. Use pre-set torque wrench and tighten band screws to 80 inch pounds minimum or as required by manufacturer's published instructions.
6. All unburied change of direction fittings within the roof drainage system shall be braced against thrust loads that might result in joint separation due to dynamic forces caused by sudden, heavy rainfall conditions. Bracing shall incorporate galvanized steel pipe clamps and tie rods.

7. Provide cleanouts within sanitary waste systems at locations and with clearances as required by the code, at the base of each waste stack and at intervals not exceeding 90 feet in horizontal runs.
8. Provide cleanouts at the base of each vertical downspout and at intervals not exceeding 90 feet in horizontal building storm drain. Provide clearances as required by code. Horizontal roof drain piping located above building ground floor level will not require cleanouts.
9. A removable sink or lavatory p-trap with cleanout plug shall be considered as an approved cleanout for 2" diameter pipe.
10. All interior cleanouts shall be accessible from walls or floors. Provide wall cleanouts in lieu of floor cleanouts wherever possible. A floor cleanout shall be installed only where installation of a wall cleanout is not practical.
11. Provide a wall cleanout for each water closet or battery of water closets. Locate wall cleanouts above the flood level rim of the highest water closet but no more than twenty four inches above the finished floor.
12. Coordinate the location of all cleanouts with the architectural features of the building and obtain approval of locations from the Project Architect.
13. Lubricate cleanout plugs with anti-seize lubricant before installation. Prior to final completion, remove cleanout plugs, re-lubricate and reinstall using only enough force to provide a water and gas tight seal.
14. Install trap primer supply to floor drains, hub drains and floor sinks that are susceptible to trap seal evaporation and where indicated on Project Drawings. Primer unit installation shall comply with manufacturer's published recommendations. Trap primer lines shall slope to drain at a minimum $\frac{1}{4}$ " per foot.
15. Capped waste and vent connections for future extensions shall be located accessibly and not extend more than 24" from active main. Waste connections and vent connections shall be located at elevations that will allow future installation of properly sloped piping without the need to dismantle or relocate installed ductwork, piping, conduit, light fixtures, etc.
16. Unless indicated otherwise within Contract Documents, all sanitary vent pipes passing through the roof shall be provided with lead roof flashings constructed of 2-1/2 pound sheet lead with bases extending no less than ten inches on each side of the pipe. The vertical portion of the flashing shall extend upward the entire length of pipe and be turned tightly inside the pipe at least two inches and shall not reduce the inside diameter of vent pipe more than the thickness of the flashing. Lead flashings shall be furnished by Plumbing Contractor and turned over to Roofing Contractor for installation.
17. Locate all sanitary vent terminals a minimum of 10 feet horizontally from or 5 feet vertically above all air intakes, operable windows, doors and any other building openings.
18. Wastewater when discharged into the building drainage system shall be at a temperature not higher than 140°F. When higher temperatures exist, approved cooling methods shall be provided.

E. Domestic Water System

1. On each water supply line serving a plumbing fixture, item of equipment, or other device which has a water supply discharge outlet below the overflow rim, or where cross contamination may occur, provide and install an approved vacuum breaker or backflow preventer. Installation of vacuum breakers shall prevent any possible backflow through them.

2. Provide thrust blocking and clamps for mechanical joint or gasketed underground water pipe at fittings with 3/4" rods, and properly anchor and support. Restraining rods, clamps and hardware shall be thoroughly coated with bituminous material to prevent corrosion.
3. Copper piping shall be supported at no greater than six foot intervals for piping 1-1/2" and smaller and ten foot intervals for piping 2" and larger in diameter.
4. Install all water piping to allow all piping within the system to be drained at low points.
5. Air chambers, dead-legs, or any other piping arrangement that may allow water to stagnate shall not be installed within domestic water systems. Valves installed for future connections shall not extend more than 24" from an active main.
6. Provide manufactured water hammer arrestors in water supply lines as indicated on Contract Drawings and in accordance with Standard PDI-WH201.
7. Pipe insulation shall be applied over installed freeze protection heat tracing tape.
8. Install union type fitting downstream of isolation valves at equipment connections.
9. Solder joint fittings shall not be installed within 24" of a copper press fitting.
10. Threaded adaptors shall be of the same manufacture and type as the system's copper fittings.
11. Threaded adaptors on supply stub-outs shall be installed prior to construction of wall and shall not extend more than 1" beyond wall face.
12. Identify piping utilizing copper press fittings in accordance with project specification section 20 05 53.

F. Domestic Water Valves

1. Domestic water shut-off valves shall be installed where shown on Drawings, at each fixture and piece of equipment, at each branch take-off from mains, at the base of each riser, and at each battery of fixtures.
2. Install shut-off valves in accessible locations. Provide access panels where valves would otherwise be inaccessible. Coordinate quantity, size and location requirements of access panels with General Contractor.
3. Install shut-off valves with stems upright or horizontal, not inverted.
4. Where threaded valves are installed in copper piping systems special care shall be taken to avoid damaging the valve or its parts due to overheating. Install copper or bronze male adapters in each inlet of threaded valves. Sweat solder adapters to pipe prior to connecting to valve body.
5. Provide spring loaded type check valves on discharge of water pumps.
6. Provide accessible check valves in the individual cold and hot water fixture supply lines serving mixing valve type faucets or assemblies having hose connection outlets that are not equipped with integral check stops.
7. Install domestic hot water return circuit balancing valves where indicated on Contract Drawings and locate a minimum of five pipe diameters downstream and three pipe diameters upstream of all fittings and/or line shut-off valves. Location of valves shall allow unobstructed access for monitoring and adjustment.

8. Adjust and set domestic hot water return circuit balancing valves to flows indicated on Contract Drawings and in accordance with valve manufacturer's published instructions. Use flow meter recommended by valve manufacturer.
9. Provide a temperature gauge, strainer, union and line shut-off valve upstream of each hot water return circuit balancing valve.

3.04 TESTING

A. General

1. Equipment, material, power, and labor necessary for the cleaning, flushing, sterilization, inspection and testing of systems covered within this Specification Section shall be furnished by the Plumbing Contractor. All testing and inspection procedures shall be in accordance with Division 1 and Special Condition requirements of this Contract.
2. All new and parts of existing altered, extended, or repaired plumbing system piping shall be tested and inspected for leaks and defects. Piping being tested shall not leak nor show any loss in test pressure for duration specified.
3. In cases of minor installation and repairs where specified water and/or air test procedures are deemed impractical, Contractor shall obtain written approval from Owner's Representative to perform alternate testing and inspection procedures. Alternate testing and inspection procedures for minor installation and repairs shall include visual evaluation of installed components by Owner's Representative during a simulation of use.
4. The water utilized for tests shall be obtained from a potable source of supply.
5. Prepare testing reports. If testing is performed in segments, submit separate report for each segment, complete with diagram or clear description of applicable portion of piping. After inspection has been approved or portions thereof, certify in writing the time, date, name and title of the persons reviewing the test. This shall also include the description of what portion of the system has been approved. Obtain approval signature by Owner's Representative. A complete record shall be maintained of all testing that has been approved, and shall be made available at the job Site. Upon completion of the work, all records and certifications approving testing requirements shall be submitted to The University's Representative before final payment is made.
6. Verify systems are complete, flushed and clean prior to testing. Isolate all equipment subject to damage from test pressure. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. Leave piping uninsulated, uncovered and unconcealed until it has been tested and approved. Where any portion of piping system must be concealed before completion of entire system, the portion shall be tested separately as specified for the entire system prior to concealment. Contractor shall expose all untested covered or concealed piping.
7. Gauges used for testing shall have increments as follows:
 - a. Tests requiring a pressure of 10 psi or less shall utilize a testing gauge having increments of 0.10 psi or less.
 - b. Tests requiring a pressure of greater than 10 psi but less than or equal to 100 psi shall utilize a testing gauge having increments of 1 psi or less.
 - c. Tests requiring a pressure of greater than 100 psi shall utilize a testing gauge having increments of 2 psi or less.
8. Separately test above and below ground piping.

9. Do not introduce test water into piping systems when exposure to freezing temperatures is possible.
10. Do not introduce test water into sections of piping located above existing sensitive areas and/or equipment that may be damaged or contaminated by water leakage. Coordinate with Owner's Representative to determine areas and/or equipment considered as being sensitive.
11. Defective work or material shall be reworked and replaced, and inspection and test repeated. Repairs shall be made with new materials. Pipe dope, caulking, tape, dresser couplings, etc., shall not be used to correct deficiencies.
12. The Contractor shall be responsible for cleaning up any leakage during flushing, testing, repairing and disinfecting to the original condition any building parts subjected to spills or leakage.

B. Drainage and Vent System

1. Subject gravity drainage and vent piping and joints to a vertical water column pressure of at least ten feet. If after 12 hours the level of the water has been lowered by leakage, the leaks must be found and stopped and the water level shall again be raised to the level described and the test repeated until, after a 12 hour retention period, there shall be no perceptible lowering of the water level in the system being tested. EXCEPTION: Portions of drainage and vent piping located on uppermost level of building shall be subjected to a water column pressure created by filling the system to point of overflow at roof vent terminals and roof drains. The pipes for the level being tested shall be filled with water to a verifiable and visible level as described above and be allowed to remain so for 12 hours.
2. Piping located above sensitive areas and/or equipment that may be damaged or become contaminated due to test water leakage shall be tested with air. Isolate the test section from all other sections and slowly fill pipe with oil-free air until there is a uniform gauge pressure of 5 pounds per square inch (34.5 kPa) or sufficient pressure to balance a 10-inch (254 mm) column of mercury. The air pressure shall be regulated to prevent the pressure inside the pipe from exceeding 5.0 PSIG. This pressure shall be held for a test period of at least 15 minutes. Any adjustments to the test pressure required because of changes in ambient temperature or the seating of gaskets shall be made prior to the beginning of the test period.
3. Test forced (pumped) drainage piping by plugging the end of the piping at the point of connection with the gravity drainage system and applying a pressure of 5psi (34.5 kPa) greater than the pump rating, and maintaining such pressure for 15 minutes.
4. After plumbing fixtures have been set and traps filled with water, test connections and prove they are gastight and watertight. Plug vent and drain piping as required to isolate system being tested. Introduce air into piping system equal to pressure of 1-inch wg (250 Pa). Use U-tube or manometer inserted in fixture trap to measure this pressure. Air pressure must remain constant without introducing additional air throughout period of inspection. Inspect plumbing fixture connections for gas and water leaks.
5. Should the completion of these tests leave any reasonable question of a doubt relative to the integrity of the installation, additional tests or measures shall be performed to demonstrate the reliability of these systems to the complete satisfaction of The University's Representative.
6. Test plugs must extend outside the end of pipe to provide a visible indication for removal after the test has been completed.

C. Domestic Water System

1. Subject piping system to a hydrostatic pressure of at least 125 pounds per square inch gauge, but not less than the operating pressure under which it is to be used, for a period of no less than 12 hours. During test period, all pipe, fittings and accessories in the particular piping system that is being tested shall be carefully inspected. If leaks are detected, such leaks shall be stopped and the hydrostatic test shall again be applied. This procedure shall be repeated until no leaks are detected for an entire 12 hour period. EXCEPTION: Piping located above sensitive areas and/or equipment that may be damaged or become contaminated due to test water leakage shall be tested with oil-free air in lieu of water.
 2. After completion of the testing, all new and/or altered water piping systems shall be thoroughly sterilized with a solution containing not less than 50 parts per million of available chlorine. Do not exceed 150 parts per million at any time. Introduce chlorine into the supply stream at a rate sufficient to provide a uniform concentration throughout the system. All outlets shall be opened and closed several times. When the specified level of chlorine is detected at every outlet in the system, close all valves to prevent release of water from the system for 24 hours. At the completion of the 24 hour disinfection period, test every outlet for a minimum chlorine residual of fifty parts per million. This minimum residual must be present to proceed with flushing. Flush the system with clean water at a sufficient velocity until the residual chlorine detected at every outlet is within 0.2 parts per million of the normal water supply's level.
 3. Sufficient samples must be taken no sooner than 24 hours after sterilization and flushing to represent the extent and complexity of the affected water system, along with a control sample to indicate municipal water quality at the time of testing. Send water samples to an accredited laboratory to perform qualitative and quantitative bacteriological analysis in accordance with AWWA C651. Contractor shall obtain written certification from the independent testing agency stating that the water samples meet Federal and State guidelines for safe drinking water. Upon satisfactory completion of all procedures, and receipt of acceptable laboratory test results, obtain written approval by Owner's representative. Failure to fully comply with the above procedures will result in a requirement to repeat the procedure until acceptable results are achieved, at no additional cost to The University.
 4. Isolate or bypass equipment that would be detrimentally affected by disinfecting solution. Isolate all other sections of the domestic water system not being disinfected to prevent migration of chlorine.
 5. Prior to injection of chlorine into the piping system, strategically place signs stating "Heavily Chlorinated Water - Do Not Drink", and protect all outlets to prevent use during disinfection and flushing procedures.
- D. A bacteria test is not necessary for small scale work. However, disinfection is required. Examples of small scale work are less than 20 feet of pipe, replacement and/or installation of a sink, drinking fountain, eyewash, backflow preventer, isolation valve, etc. Disinfect individual parts, fixtures, isolation valves, pipes, etc. by swabbing with full strength bleach (5.25%) or soaking for at least 30 minutes in a 500 ppm chlorine solution. The 500 ppm solution can be made by adding one part 5.25% bleach (household bleach) to 100 parts drinking water. For example 3-1/2 ounces of bleach can be added to 2-1/2 gallons drinking water. Materials should then be thoroughly rinsed before putting into service.

END OF SECTION 22 11 16 0011 10 0010 00

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 11 16 00a - SANITARY WASTE AND VENT PIPING**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for sanitary waste and vent piping. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the products manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following for soil, waste, and vent piping inside the building:
 - a. Pipe, tube, and fittings.
 - b. Special pipe fittings.
 - c. Encasement for underground metal piping.

C. Definitions

1. ABS: Acrylonitrile-butadiene-styrene plastic.
2. EPDM: Ethylene-propylene-diene terpolymer rubber.
3. LLDPE: Linear, low-density polyethylene plastic.
4. NBR: Acrylonitrile-butadiene rubber.
5. PE: Polyethylene plastic.
6. PVC: Polyvinyl chloride plastic.
7. TPE: Thermoplastic elastomer.

D. Performance Requirements

1. Components and installation shall be capable of withstanding the following minimum working pressure, unless otherwise indicated:
 - a. Soil, Waste, and Vent Piping: 10-foot head of water (30 kPa).
 - b. Sanitary Sewer, Force-Main Piping: 50 psig (345 kPa) **OR** 100 psig (690 kPa) **OR** 150 psig (1035 kPa), **as directed**.
2. Seismic Performance: Soil, waste, and vent piping and support and installation shall be capable of withstanding the effects of seismic events determined according to ASCE 7, "Minimum Design Loads for Buildings and Other Structures."

E. Submittals

1. Product Data: For pipe, tube, fittings, and couplings.
2. LEED Submittal:
 - a. Product Data for Credit EQ 4.1: For solvent cements and adhesive primers, including printed statement of VOC content.
3. Shop Drawings:
 - a. Design Calculations: Signed and sealed by a qualified professional engineer for selecting seismic restraints.
 - b. Solvent Drainage System: Include plans, elevations, sections, and details.
4. Field quality-control inspection and test reports.

F. Quality Assurance

1. Piping materials shall bear label, stamp, or other markings of specified testing agency.
2. Comply with NSF 14, "Plastics Piping Systems Components and Related Materials," for plastic piping components. Include marking with "NSF-dwv" for plastic drain, waste, and vent piping; "NSF-drain" for plastic drain piping; "NSF-tubular" for plastic continuous waste piping; and "NSF-sewer" for plastic sewer piping.

1.2 PRODUCTS

A. Piping Materials

1. Refer to Part 1.3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

B. Hub-And-Spigot, Cast-Iron Soil Pipe And Fittings

1. Pipe and Fittings: ASTM A 74, Service and Extra-Heavy class(es).
2. Gaskets: ASTM C 564, rubber.
3. Calking Materials: ASTM B 29, pure lead and oakum or hemp fiber.

C. Hubless Cast-Iron Soil Pipe And Fittings

1. Pipe and Fittings: ASTM A 888 or CISPI 301.
2. Sovent Stack Fittings: ASME B16.45 or ASSE 1043, hubless, cast-iron aerator and deaerator drainage fittings.
3. Shielded Couplings: ASTM C 1277 assembly of metal shield or housing, corrosion-resistant fasteners, and rubber sleeve with integral, center pipe stop.
 - a. Standard, Shielded, Stainless-Steel Couplings: CISPI 310, with stainless-steel corrugated shield; stainless-steel bands and tightening devices; and ASTM C 564, rubber sleeve.
 - b. Heavy-Duty, Shielded, Stainless-Steel Couplings: With stainless-steel shield, stainless-steel bands and tightening devices, and ASTM C 564, rubber sleeve.
 - c. Heavy-Duty, Shielded, Cast-Iron Couplings: ASTM A 48/A 48M, two-piece, cast-iron housing; stainless-steel bolts and nuts; and ASTM C 564, rubber sleeve.
4. Rigid, Unshielded Couplings: ASTM C 1461, sleeve-type, reducing- or transition-type mechanical coupling molded from ASTM C 1440, TPE material with corrosion-resistant-metal tension band and tightening mechanism on each end.

D. Steel Pipe And Fittings

1. Steel Pipe: ASTM A 53/A 53M, Type E or S, Grade A or B, Standard Weight or Schedule 40, galvanized. Include ends matching joining method.
2. Drainage Fittings: ASME B16.12, galvanized, **as directed**, threaded, cast-iron drainage pattern.
3. Pressure Fittings:
 - a. Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M or ASTM A 106, Schedule 40, galvanized, seamless steel pipe. Include ends matching joining method.
 - b. Malleable-Iron Unions: ASME B16.39; Class 150; hexagonal-stock body with ball-and-socket, metal-to-metal, bronze seating surface; and female threaded ends.
 - c. Gray-Iron, Threaded Fittings: ASME B16.4, Class 125, galvanized, **as directed**, standard pattern.
 - d. Cast-Iron Flanges: ASME B16.1, Class 125.
 - e. Cast-Iron, Flanged Fittings: ASME B16.1, Class 125, galvanized, **as directed**.
4. Grooved-Joint Systems:
 - a. Grooved-End, Steel-Piping Fittings: ASTM A 47/A 47M, galvanized, **as directed**, malleable-iron casting; ASTM A 106, galvanized-steel pipe; or ASTM A 536, galvanized, **as directed**, ductile-iron casting; with dimensions matching steel pipe.
 - b. Grooved-End, Steel-Piping Couplings: AWWA C606, for steel-pipe dimensions. Include ferrous housing sections, gasket suitable for water, and bolts and nuts.

E. Ductile-Iron Pipe And Fittings

1. Mechanical-Joint, Ductile-Iron Pipe: AWWA C151, with mechanical-joint bell and plain spigot end, unless grooved or flanged ends are indicated.
 - a. Mechanical-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.
 - b. Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron glands, rubber gaskets, and steel bolts.
2. Push-on-Joint, Ductile-Iron Pipe: AWWA C151, with push-on-joint bell and plain spigot end, unless grooved or flanged ends are indicated.

- a. Push-on-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.
 - b. Gaskets: AWWA C111, rubber.
 3. Grooved-Joint Systems:
 - a. Grooved-End, Ductile-Iron Fittings: ASTM A 47/A 47M, malleable-iron castings or ASTM A 536, ductile-iron castings with dimensions matching pipe.
 - b. Grooved-End, Ductile-Iron-Piping Couplings: AWWA C606, for ductile-iron-pipe dimensions. Include ferrous housing sections, gasket suitable for water, and bolts and nuts.
 4. Flanges: ASME 16.1, Class 125, cast iron.
- F. Copper Tube And Fittings
1. Copper DWV Tube: ASTM B 306, drainage tube, drawn temper.
 - a. Copper Drainage Fittings: ASME B16.23, cast copper or ASME B16.29, wrought copper, solder-joint fittings.
 2. Hard Copper Tube: ASTM B 88, Types L and M (ASTM B 88M, Types B and C), water tube, drawn temper.
 - a. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
 - b. Copper Flanges: ASME B16.24, Class 150, cast copper with solder-joint end.
 - c. Copper Unions: MSS SP-123, copper-alloy, hexagonal-stock body with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.
 3. Soft Copper Tube: ASTM B 88, Type L (ASTM B 88M, Type B), water tube, annealed temper.
 - a. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
- G. Special Pipe Fittings
1. Flexible, Nonpressure Pipe Couplings: Comply with ASTM C 1173, elastomeric, sleeve-type, reducing or transition pattern. Include shear ring, ends of same sizes as piping to be joined, and corrosion-resistant-metal tension band and tightening mechanism on each end.
 - a. Sleeve Materials:
 - 1) For Cast-Iron Soil Pipes: ASTM C 564, rubber.
 - 2) For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.
 - 3) For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.
 2. Shielded Nonpressure Pipe Couplings: ASTM C 1460, elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.
 3. Rigid, Unshielded, Nonpressure Pipe Couplings: ASTM C 1461, sleeve-type reducing- or transition-type mechanical coupling molded from ASTM C 1440, TPE material with corrosion-resistant-metal tension band and tightening mechanism on each end.
 4. Pressure Pipe Couplings: AWWA C219 metal, sleeve-type same size as, with pressure rating at least equal to, and ends compatible with, pipes to be joined.
 - a. Center-Sleeve Material: Manufacturer's standard **OR** Carbon steel **OR** Stainless steel **OR** Ductile iron **OR** Malleable iron, **as directed**.
 - b. Gasket Material: Natural or synthetic rubber.
 - c. Metal Component Finish: Corrosion-resistant coating or material.
 5. Flexible Ball Joints: Ductile-iron fitting with combination of flanged and mechanical-joint ends complying with AWWA C110 or AWWA C153. Include gasketed ball-joint section and ductile-iron gland, rubber gasket, and steel bolts.
 6. Expansion Joints: Two or three-piece, ductile-iron assembly consisting of telescoping sleeve(s) with gaskets and restrained-type, ductile-iron, bell-and-spigot end sections complying with AWWA C110 or AWWA C153. Select and assemble components for expansion indicated. Include AWWA C111, ductile-iron glands, rubber gaskets, and steel bolts.
 7. Wall-Penetration Fittings: Compound, ductile-iron coupling fitting with sleeve and flexing sections for up to 20-degree deflection, gaskets, and restrained-joint ends complying with AWWA C110 or AWWA C153. Include AWWA C111, ductile-iron glands, rubber gaskets, and steel bolts.

- H. Encasement For Underground Metal Piping
1. Description: ASTM A 674 or AWWA C105, high-density, crosslaminated PE film of 0.004-inch (0.10-mm) **OR** LLDPE film of 0.008-inch (0.20-mm), **as directed**, minimum thickness.
 2. Form: Sheet **OR** Tube, **as directed**.
 3. Color: Black **OR** Natural, **as directed**.

1.3 EXECUTION

- A. Excavation
1. Refer to Division 31 Section "Earth Moving" for excavating, trenching, and backfilling.
- B. Piping Applications
1. Flanges and unions may be used on aboveground pressure piping, unless otherwise indicated.
 2. Aboveground, soil and waste piping NPS 4 (DN 100) and smaller shall be any of the following:
 - a. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
 - b. Hubless cast-iron soil pipe and fittings and solvent stack fittings, **as directed**; standard, shielded, stainless-steel **OR** heavy-duty shielded, stainless-steel **OR** rigid, unshielded, **as directed**, couplings; and hubless-coupling joints.
 - c. Steel pipe, drainage fittings, and threaded joints.
 - d. Stainless-steel pipe and fittings, gaskets, and gasketed joints.
 - e. Copper DWV tube, copper drainage fittings, and soldered joints.
 - f. Solid-wall **OR** Cellular-core, **as directed**, ABS pipe, ABS socket fittings, and solvent-cemented joints.
 - g. Solid-wall **OR** Cellular-core, **as directed**, PVC pipe, PVC socket fittings, and solvent-cemented joints.
 - h. Dissimilar Pipe-Material Couplings: Flexible, **OR** Shielded, **OR** Rigid, unshielded, **as directed**, nonpressure pipe couplings for joining dissimilar pipe materials with small difference in OD.
 3. Aboveground, soil and waste piping NPS 5 (DN 125) and larger shall be any of the following:
 - a. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
 - b. Hubless cast-iron soil pipe and fittings and solvent stack fittings, **as directed**; standard, **OR** heavy-duty, **as directed**, shielded, stainless-steel couplings; and hubless-coupling joints.
 - c. Steel pipe, drainage fittings, and threaded joints.
 - d. Solid-wall **OR** Cellular-core, **as directed**, PVC pipe, PVC socket fittings, and solvent-cemented joints.
 - e. Dissimilar Pipe-Material Couplings: Flexible, **OR** Shielded, **as directed**, nonpressure pipe couplings for joining dissimilar pipe materials with small difference in OD.
 4. Aboveground, vent piping NPS 4 (DN 100) and smaller shall be any of the following:
 - a. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
 - b. Hubless cast-iron soil pipe and fittings; standard, shielded, stainless-steel **OR** heavy-duty shielded, stainless-steel **OR** rigid, unshielded, **as directed**, couplings; and hubless-coupling joints.
 - c. Steel pipe, drainage fittings, and threaded joints.
 - d. Stainless-steel pipe and fittings gaskets, and gasketed joints.
 - e. Copper DWV tube, copper drainage fittings, and soldered joints.
 - 1) Option for Vent Piping, NPS 2-1/2 and NPS 3-1/2 (DN 65 and DN 90): Hard copper tube, Type M (Type C); copper pressure fittings; and soldered joints.
 - f. Solid-wall **OR** Cellular-core, **as directed**, ABS pipe, ABS socket fittings, and solvent-cemented joints.
 - g. Solid-wall **OR** Cellular-core, **as directed**, PVC pipe, PVC socket fittings, and solvent-cemented joints.
 - h. Dissimilar Pipe-Material Couplings: Flexible, **OR** Shielded, **OR** Rigid, unshielded, **as directed**, nonpressure pipe couplings for joining dissimilar pipe materials with small difference in OD.
 5. Aboveground, vent piping NPS 5 (DN 125) and larger shall be any of the following:

- a. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
- b. Hubless cast-iron soil pipe and fittings; standard, **OR** heavy-duty, **as directed**, shielded, stainless-steel couplings; and hubless-coupling joints.
- c. Steel pipe, drainage fittings, and threaded joints.
- d. Solid-wall **OR** Cellular-core, **as directed**, PVC pipe, PVC socket fittings, and solvent-cemented joints.
- e. Dissimilar Pipe-Material Couplings: Flexible, **OR** Shielded, **as directed**, nonpressure pipe couplings for joining dissimilar pipe materials with small difference in OD.
6. Underground, soil, waste, and vent piping NPS 4 (DN 100) and smaller shall be any of the following:
 - a. Extra-Heavy **OR** Service, **as directed**, class, cast-iron soil piping; gaskets; and gasketed **OR** calking materials; and calked, **as directed**, joints.
 - b. Hubless cast-iron soil pipe and fittings; standard, shielded, stainless-steel **OR** heavy-duty shielded, stainless-steel **OR** heavy-duty shielded, cast-iron **OR** rigid, unshielded, **as directed**, couplings; and hubless-coupling joints.
 - c. Stainless-steel pipe and fittings, gaskets, and gasketed joints.
 - d. Cellular-core **OR** Solid wall, **as directed**, ABS pipe, ABS socket fittings, and solvent-cemented joints.
 - e. Cellular-core **OR** Solid wall, **as directed**, PVC pipe, PVC socket fittings, and solvent-cemented joints.
 - f. Cellular-core, Sewer and Drain Series, PVC pipe; PVC socket fittings; and solvent-cemented joints.
 - g. Dissimilar Pipe-Material Couplings: Flexible, **OR** Shielded, **OR** Rigid, unshielded, **as directed**, nonpressure pipe couplings for joining dissimilar pipe materials with small difference in OD.
7. Underground, soil and waste piping NPS 5 (DN 125) and larger shall be any of the following:
 - a. Extra-Heavy **OR** Service, **as directed**, class, cast-iron soil piping; gaskets; and gasketed **OR** calking materials; and calked, **as directed**, joints.
 - b. Hubless cast-iron soil pipe and fittings; standard, shielded, stainless-steel **OR** heavy-duty shielded, stainless-steel **OR** heavy-duty shielded, cast-iron, **as directed**, couplings; and hubless-coupling joints.
 - c. Cellular-core **OR** Solid-wall, **as directed**, Schedule 40, PVC pipe; PVC socket fittings; and solvent-cemented joints.
 - d. Cellular-core, Sewer and Drain Series, PVC pipe; PVC socket fittings; and solvent-cemented joints.
 - e. Dissimilar Pipe-Material Couplings: Flexible, **OR** Shielded, **as directed**, nonpressure pipe couplings for joining dissimilar pipe materials with small difference in OD.
8. Aboveground sanitary-sewage force mains NPS 1-1/2 and NPS 2 (DN 40 and DN 50) shall be any of the following:
 - a. Hard copper tube, Type L (Type B) **OR** Type M (Type C), **as directed**; copper pressure fittings; and soldered joints.
 - b. Steel pipe, pressure fittings, and threaded joints.
9. Aboveground sanitary-sewage force mains NPS 2-1/2 to NPS 6 (DN 65 to DN 150) shall be any of the following:
 - a. Hard copper tube, Type L (Type B) **OR** Type M (Type C), **as directed**; copper pressure fittings; and soldered joints.
 - b. Steel pipe, pressure fittings, and threaded joints.
 - c. Grooved-end steel pipe, grooved-joint system fittings and couplings, and grooved joints.
10. Underground sanitary-sewage force mains NPS 4 (DN 100) and smaller shall be any of the following:
 - a. Hard **OR** Soft, **as directed**, copper tube, Type L (Type B); copper **OR** wrought-copper, **as directed**, pressure fittings; and soldered joints.
 - b. Steel pipe, pressure fittings, and threaded joints.
 - 1) Include grooved-joint system fittings and couplings and grooved joints where indicated.
 - c. Mechanical-joint, ductile-iron pipe; mechanical-joint, ductile-iron fittings; glands, gaskets, and bolts; and mechanical joints.

- 1) Include grooved-joint system fittings and couplings and grooved joints where indicated.
- d. Push-on-joint, ductile-iron pipe; push-on-joint ductile-iron fittings; gaskets; and gasketed joints.
 - 1) Include grooved-joint system fittings and couplings and grooved joints where indicated.
- e. Pressure pipe couplings, if dissimilar pipe materials or piping with small difference in OD must be joined.
- 11. Underground sanitary-sewage force mains NPS 5 (DN 125) and larger shall be any of the following:
 - a. Steel pipe, pressure fittings, and threaded joints.
 - b. Mechanical-joint, ductile-iron pipe; mechanical-joint, ductile-iron fittings; glands, gaskets, and bolts; and mechanical-joint joints.
 - c. Push-on-joint, ductile-iron pipe; push-on-joint, ductile-iron fittings; gaskets; and gasketed joints.
 - d. Pressure pipe couplings, if dissimilar pipe materials or piping with small difference in OD must be joined.

C. Piping Installation

- 1. Sanitary sewer piping outside the building is specified in Division 22 Section "Facility Sanitary Sewers"
- 2. Basic piping installation requirements are specified in Division 22 Section "Common Work Results For Plumbing".
- 3. Install seismic restraints on piping. Seismic-restraint devices are specified in Division 22 Section "Vibration And Seismic Controls For Plumbing Piping And Equipment".
- 4. Install cleanouts at grade and extend to where building sanitary drains connect to building sanitary sewers.
- 5. Install cleanout fitting with closure plug inside the building in sanitary force-main piping.
- 6. Install underground, steel, force-main piping. Install encasement on piping according to ASTM A 674 or AWWA C105, **as directed**.
- 7. Install underground, ductile-iron, force-main piping according to AWWA C600. Install buried piping inside the building between wall and floor penetrations and connection to sanitary sewer piping outside the building with restrained joints. Anchor pipe to wall or floor. Install thrust-block supports at vertical and horizontal offsets.
 - a. Install encasement on piping according to ASTM A 674 or AWWA C105.
- 8. Install underground, copper, force-main tubing according to CDA's "Copper Tube Handbook."
 - a. Install encasement on piping according to ASTM A 674 or AWWA C105.
- 9. Install underground, ductile-iron, special pipe fittings according to AWWA C600.
 - a. Install encasement on piping according to ASTM A 674 or AWWA C105.
- 10. Install cast-iron sleeve with water stop and mechanical sleeve seal at each service pipe penetration through foundation wall. Select number of interlocking rubber links required to make installation watertight. Sleeves and mechanical sleeve seals are specified in Division 22 Section "Common Work Results For Plumbing".
- OR**
- Install wall-penetration fitting at each service pipe penetration through foundation wall. Make installation watertight.
- 11. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."
 - a. Install encasement on underground piping according to ASTM A 674 or AWWA C105.
- 12. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical. Use long-turn, double Y-branch and 1/8-bend fittings if 2 fixtures are installed back to back or side by side with common drain pipe. Straight tees, elbows, and crosses may be used on vent lines. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

13. Lay buried building drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.
14. Install soil and waste drainage and vent piping at the following minimum slopes, unless otherwise indicated:
 - a. Building Sanitary Drain: 2 percent downward in direction of flow for piping NPS 3 (DN 80) and smaller; 1 percent downward in direction of flow for piping NPS 4 (DN 100) and larger.
 - b. Horizontal Sanitary Drainage Piping: 2 percent downward in direction of flow.
 - c. Vent Piping: 1 percent down toward vertical fixture vent or toward vent stack.
15. Install engineered soil and waste drainage and vent piping systems as follows:
 - a. Combination Waste and Vent: Comply with standards of authorities having jurisdiction.
 - b. Solvent Drainage System: Comply with ASSE 1043 and solvent fitting manufacturer's written installation instructions.
 - c. Reduced-Size Venting: Comply with standards of authorities having jurisdiction.
16. Sleeves are not required for cast-iron soil piping passing through concrete slabs-on-grade if slab is without membrane waterproofing.
17. Install ABS soil and waste drainage and vent piping according to ASTM D 2661.
18. Install PVC soil and waste drainage and vent piping according to ASTM D 2665.
19. Install underground ABS and PVC soil and waste drainage piping according to ASTM D 2321.
20. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

D. Joint Construction

1. Basic piping joint construction requirements are specified in Division 22 Section "Common Work Results For Plumbing".
2. Join hub-and-spigot, cast-iron soil piping with gasket joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for compression joints.
3. Join hub-and-spigot, cast-iron soil piping with calked joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for lead and oakum calked joints.
4. Join hubless cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-coupling joints.
5. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.
6. Grooved Joints: Assemble joint with keyed coupling, gasket, lubricant, and bolts according to coupling and fitting manufacturer's written instructions.
7. PVC Nonpressure Piping Joints: Join piping according to ASTM D 2665.

E. Valve Installation

1. General valve installation requirements are specified in Division 22 Section "General-duty Valves For Plumbing Piping".
2. Shutoff Valves: Install shutoff valve on each sewage pump discharge.
 - a. Install gate or full-port ball valve for piping NPS 2 (DN 50) and smaller.
 - b. Install gate valve for piping NPS 2-1/2 (DN 65) and larger.
3. Check Valves: Install swing check valve, between pump and shutoff valve, on each sewage pump discharge.
4. Backwater Valves: Install backwater valves in piping subject to sewage backflow.
 - a. Horizontal Piping: Horizontal backwater valves. Use normally closed type, unless otherwise indicated.
 - b. Floor Drains: Drain outlet backwater valves, unless drain has integral backwater valve.
 - c. Install backwater valves in accessible locations.
 - d. Backwater valve are specified in Division 22 Section "Sanitary Waste Piping Specialties".

F. Hanger And Support Installation

1. Seismic-restraint devices are specified in Division 22 Section "Vibration And Seismic Controls For Plumbing Piping And Equipment".

2. Pipe hangers and supports are specified in Division 22 Section "Hangers And Supports For Plumbing Piping And Equipment". Install the following:
 - a. Vertical Piping: MSS Type 8 or Type 42, clamps.
 - b. Install individual, straight, horizontal piping runs according to the following:
 - 1) 100 Feet (30 m) and Less: MSS Type 1, adjustable, steel clevis hangers.
 - 2) Longer Than 100 Feet (30 m): MSS Type 43, adjustable roller hangers.
 - 3) Longer Than 100 Feet (30 m), if Indicated: MSS Type 49, spring cushion rolls.
 - c. Multiple, Straight, Horizontal Piping Runs 100 Feet (30 m) or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
 - d. Base of Vertical Piping: MSS Type 52, spring hangers.
3. Install supports according to Division 22 Section "Hangers And Supports For Plumbing Piping And Equipment".
4. Support vertical piping and tubing at base and at each floor.
5. Rod diameter may be reduced 1 size for double-rod hangers, with 3/8-inch (10-mm) minimum rods.
6. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:
 - a. NPS 1-1/2 and NPS 2 (DN 40 and DN 50): 60 inches (1500 mm) with 3/8-inch (10-mm) rod.
 - b. NPS 3 (DN 80): 60 inches (1500 mm) with 1/2-inch (13-mm) rod.
 - c. NPS 4 and NPS 5 (DN 100 and DN 125): 60 inches (1500 mm) with 5/8-inch (16-mm) rod.
 - d. NPS 6 (DN 150): 60 inches (1500 mm) with 3/4-inch (19-mm) rod.
 - e. NPS 8 to NPS 12 (DN 200 to DN 300): 60 inches (1500 mm) with 7/8-inch (22-mm) rod.
7. Install supports for vertical cast-iron soil piping every 15 feet (4.5 m).
8. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
 - a. NPS 1-1/4 (DN 32): 84 inches (2100 mm) with 3/8-inch (10-mm) rod.
 - b. NPS 1-1/2 (DN 40): 108 inches (2700 mm) with 3/8-inch (10-mm) rod.
 - c. NPS 2 (DN 50): 10 feet (3 m) with 3/8-inch (10-mm) rod.
 - d. NPS 2-1/2 (DN 65): 11 feet (3.4 m) with 1/2-inch (13-mm) rod.
 - e. NPS 3 (DN 80): 12 feet (3.7 m) with 1/2-inch (13-mm) rod.
 - f. NPS 4 and NPS 5 (DN 100 and DN 125): 12 feet (3.7 m) with 5/8-inch (16-mm) rod.
 - g. NPS 6 (DN 150): 12 feet (3.7 m) with 3/4-inch (19-mm) rod.
 - h. NPS 8 to NPS 12 (DN 200 to DN 300): 12 feet (3.7 m) with 7/8-inch (22-mm) rod.
9. Install supports for vertical steel piping every 15 feet (4.5 m).
10. Install hangers for stainless-steel piping with the following maximum horizontal spacing and minimum rod diameters:
 - a. NPS 2 (DN 50): 84 inches (2100 mm) with 3/8-inch (10-mm) rod.
 - b. NPS 3 (DN 80): 96 inches (2400 mm) with 1/2-inch (13-mm) rod.
 - c. NPS 4 (DN 100): 108 inches (2700 mm) with 1/2-inch (13-mm) rod.
 - d. NPS 6 (DN 150): 10 feet (3 m) with 5/8-inch (16-mm) rod.
11. Install supports for vertical stainless-steel piping every 10 feet (3 m).
12. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
 - a. NPS 1-1/4 (DN 32): 72 inches (1800 mm) with 3/8-inch (10-mm) rod.
 - b. NPS 1-1/2 and NPS 2 (DN 40 and DN 50): 96 inches (2400 mm) with 3/8-inch (10-mm) rod.
 - c. NPS 2-1/2 (DN 65): 108 inches (2700 mm) with 1/2-inch (13-mm) rod.
 - d. NPS 3 to NPS 5 (DN 80 to DN 125): 10 feet (3 m) with 1/2-inch (13-mm) rod.
 - e. NPS 6 (DN 150): 10 feet (3 m) with 5/8-inch (16-mm) rod.
 - f. NPS 8 (DN 200): 10 feet (3 m) with 3/4-inch (19-mm) rod.
13. Install supports for vertical copper tubing every 10 feet (3 m).
14. Install hangers for ABS and PVC piping with the following maximum horizontal spacing and minimum rod diameters:
 - a. NPS 1-1/2 and NPS 2 (DN 40 and DN 50): 48 inches (1200 mm) with 3/8-inch (10-mm) rod.
 - b. NPS 3 (DN 80): 48 inches (1200 mm) with 1/2-inch (13-mm) rod.

- c. NPS 4 and 5 (DN 100 and 125): 48 inches (1200 mm) with 5/8-inch (16-mm) rod.
- d. NPS 6 (DN 150): 48 inches (1200 mm) with 3/4-inch (19-mm) rod.
- e. NPS 8 to NPS 12 (DN 200 to DN 300): 48 inches (1200 mm) with 7/8-inch (22-mm) rod.
- 15. Install supports for vertical ABS and PVC piping every 48 inches (1200 mm).
- 16. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

G. Connections

- 1. Drawings indicate general arrangement of piping, fittings, and specialties.
- 2. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.
- 3. Connect drainage and vent piping to the following:
 - a. Plumbing Fixtures: Connect drainage piping in sizes indicated, but not smaller than required by plumbing code.
 - b. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by authorities having jurisdiction.
 - c. Plumbing Specialties: Connect drainage and vent piping in sizes indicated, but not smaller than required by plumbing code.
 - d. Equipment: Connect drainage piping as indicated. Provide shutoff valve, if indicated, and union for each connection. Use flanges instead of unions for connections NPS 2-1/2 (DN 65) and larger.
- 4. Connect force-main piping to the following:
 - a. Sanitary Sewer: To exterior force main or sanitary manhole.
 - b. Sewage Pumps: To sewage pump discharge.

H. Field Quality Control

- 1. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
 - a. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
 - b. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.
- 2. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.
- 3. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.
- 4. Test sanitary drainage and vent piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
 - a. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
 - b. Leave uncovered and unconcealed new, altered, extended, or replaced drainage and vent piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
 - c. Roughing-in Plumbing Test Procedure: Test drainage and vent piping, except outside leaders, on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water (30 kPa). From 15 minutes before inspection starts to completion of inspection, water level must not drop. Inspect joints for leaks.
 - d. Finished Plumbing Test Procedure: After plumbing fixtures have been set and traps filled with water, test connections and prove they are gastight and watertight. Plug vent-stack openings on roof and building drains where they leave building. Introduce air into piping system equal to pressure of 1-inch wg (250 Pa). Use U-tube or manometer inserted in trap of water closet to measure this pressure. Air pressure must remain constant without introducing additional air throughout period of inspection. Inspect plumbing fixture connections for gas and water leaks.
 - e. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.

- f. Prepare reports for tests and required corrective action.
- 5. Test force-main piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
 - a. Leave uncovered and unconcealed new, altered, extended, or replaced force-main piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
 - b. Cap and subject piping to static-water pressure of 50 psig (345 kPa) above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
 - c. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
 - d. Prepare reports for tests and required corrective action.
- I. Cleaning
 - 1. Clean interior of piping. Remove dirt and debris as work progresses.
 - 2. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.
 - 3. Place plugs in ends of uncompleted piping at end of day and when work stops.
- J. Protection
 - 1. Exposed ABS and PVC Piping: Protect plumbing vents exposed to sunlight with two coats of water-based latex paint.

END OF SECTION 22 11 16 00a11 10 00a

SECTION 22 11 16 00b - STEAM AND CONDENSATE PIPING**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for steam and condensate piping. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the products manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following for LP and HP steam and condensate piping:
 - a. Pipe and fittings.
 - b. Strainers.
 - c. Flash tanks.
 - d. Safety valves.
 - e. Pressure-reducing valves.
 - f. Steam traps.
 - g. Thermostatic air vents and vacuum breakers.
 - h. Steam and condensate meters.

C. Definitions

1. HP Systems: High-pressure piping operating at more than 15 psig (104 kPa) as required by ASME B31.1.
2. LP Systems: Low-pressure piping operating at 15 psig (104 kPa) or less as required by ASME B31.9.
3. RTRF: Reinforced thermosetting resin (fiberglass) fittings.
4. RTRP: Reinforced thermosetting resin (fiberglass) pipe.

D. Performance Requirements

1. Components and installation shall be capable of withstanding the following minimum working pressures and temperatures:
 - a. HP Steam Piping: **<Insert psig (kPa).>**
 - b. LP Steam Piping: **<Insert psig (kPa).>**
 - c. Condensate Piping: **<Insert psig (kPa)>** at 250 deg F (121 deg C).
 - d. Makeup-Water Piping: 80 psig (552 kPa) at 150 deg F (66 deg C).
 - e. Blowdown-Drain Piping: Equal to pressure of the piping system to which it is attached.
 - f. Air-Vent and Vacuum-Breaker Piping: Equal to pressure of the piping system to which it is attached.
 - g. Safety-Valve-Inlet and -Outlet Piping: Equal to pressure of the piping system to which it is attached.

E. Submittals

1. Product Data: For each type of the following:
 - a. RTRP and RTRF with adhesive.
 - b. Pressure-reducing and safety valve.
 - c. Steam trap.
 - d. Air vent and vacuum breaker.
 - e. Flash tank.
 - f. Meter.
2. Shop Drawings: Detail, 1/4 inch equals 1 foot (1:50) scale, flash tank assemblies and fabrication of pipe anchors, hangers, pipe, multiple pipes, alignment guides, and expansion joints and loops and their attachment to the building structure. Detail locations of anchors, alignment guides, and expansion joints and loops.

3. Welding certificates.
4. Field quality-control test reports.
5. Operation and Maintenance Data: For valves, safety valves, pressure-reducing valves, steam traps, air vents, vacuum breakers, and meters to include in emergency, operation, and maintenance manuals.

F. Quality Assurance

1. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code - Steel."
2. Pipe Welding: Qualify processes and operators according to the following:
 - a. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
 - b. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.
3. ASME Compliance: Comply with ASME B31.1, "Power Piping" **AND/OR** ASME B31.9, "Building Services Piping", **as directed**, for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp flash tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

1.2 PRODUCTS

A. Steel Pipe And Fittings

1. Steel Pipe: ASTM A 53/A 53M, black steel, plain ends, Type, Grade, and Schedule as indicated in Part 3 piping applications articles.
2. Cast-Iron Threaded Fittings: ASME B16.4; Classes 125, 150, and 300 as indicated in Part 3 piping applications articles.
3. Malleable-Iron Threaded Fittings: ASME B16.3; Classes 150 and 300 as indicated in Part 3 piping applications articles.
4. Malleable-Iron Unions: ASME B16.39; Classes 150, 250, and 300 as indicated in Part 3 piping applications articles.
5. Cast-Iron Threaded Flanges and Flanged Fittings: ASME B16.1, Classes 125 and 250 as indicated in Part 3 piping applications articles; raised ground face, and bolt holes spot faced.
6. Wrought-Steel Fittings: ASTM A 234/A 234M, wall thickness to match adjoining pipe.
7. Wrought-Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:
 - a. Material Group: 1.1.
 - b. End Connections: Butt welding.
 - c. Facings: Raised face.
8. Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, black steel of same Type, Grade, and Schedule as pipe in which installed.
9. Stainless-Steel Bellows, Flexible Connectors:
 - a. Body: Stainless-steel bellows with woven, flexible, bronze, wire-reinforced, protective jacket.
 - b. End Connections: Threaded or flanged to match equipment connected.
 - c. Performance: Capable of 3/4-inch (20-mm) misalignment.
 - d. CWP Rating: 150-psig (1035-kPa).
 - e. Maximum Operating Temperature: 250 deg F (121 deg C).

B. Joining Materials

1. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
 - a. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch (3.2-mm) maximum thickness unless thickness or specific material is indicated.
 - 1) Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
 - 2) Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
2. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

3. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.
 4. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for joining copper with copper; or BAg-1, silver alloy for joining copper with bronze or steel.
 5. Welding Filler Metals: Comply with AWS D10.12 (AWS D10.12M) for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.
 6. Welding Materials: Comply with Section II, Part C, of ASME Boiler and Pressure Vessel Code for welding materials appropriate for wall thickness and for chemical analysis of pipe being welded.
- C. Dielectric Fittings
1. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.
 2. Insulating Material: Suitable for system fluid, pressure, and temperature.
 3. Dielectric Unions:
 - a. Factory-fabricated union assembly, for 250-psig (1725-kPa) minimum working pressure at 180 deg F (82 deg C).
 4. Dielectric Flanges:
 - a. Factory-fabricated companion-flange assembly, for 150- or 300-psig (1035- or 2070-kPa) minimum working pressure as required to suit system pressures.
 5. Dielectric-Flange Kits:
 - a. Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.
 - b. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig (1035- or 2070-kPa) minimum working pressure as required to suit system pressures.
- D. Valves
1. Gate, Globe, Check, Ball, and Butterfly Valves: Comply with requirements specified in Division 23 Section "General-duty Valves For Hvac Piping".
 2. Stop-Check Valves:
 - a. Body and Bonnet: Malleable iron.
 - b. End Connections: Flanged.
 - c. Disc: Cylindrical with removable liner and machined seat.
 - d. Stem: Brass alloy.
 - e. Operator: Outside screw and yoke with cast-iron handwheel.
 - f. Packing: Polytetrafluoroethylene-impregnated packing with two-piece packing gland assembly.
 - g. Pressure Class: 250.
- E. Strainers
1. Y-Pattern Strainers:
 - a. Body: ASTM A 126, Class B cast iron, with bolted cover and bottom drain connection.
 - b. End Connections: Threaded ends for strainers NPS 2 (DN 50) and smaller; flanged ends for strainers NPS 2-1/2 (DN 65) and larger.
 - c. Strainer Screen: Stainless-steel, 20 mesh strainer, and perforated stainless-steel basket with 50 percent free area.
 - d. Tapped blowoff plug.
 - e. CWP Rating: 250-psig (1725-kPa) working steam pressure.
 2. Basket Strainers:
 - a. Body: ASTM A 126, Class B cast iron, with bolted cover and bottom drain connection.
 - b. End Connections: Threaded ends for strainers NPS 2 (DN 50) and smaller; flanged ends for strainers NPS 2-1/2 (DN 65) and larger.
 - c. Strainer Screen: Stainless-steel, 20 mesh strainer, and perforated stainless-steel basket with 50 percent free area.
 - d. CWP Rating: 250-psig (1725-kPa) working steam pressure.

F. Flash Tanks

1. Shop or factory fabricated of welded steel according to ASME Boiler and Pressure Vessel Code, for 150-psig (1035-kPa) rating; and bearing ASME label. Fabricate with tappings for low-pressure steam and condensate outlets, high-pressure condensate inlet, air vent, safety valve, and legs.

G. Safety Valves

1. Cast-Iron Safety Valves:
 - a. Disc Material: Forged copper alloy with bronze nozzle.
 - b. End Connections: Raised-face flanged inlet and threaded or flanged outlet connections.
 - c. Spring: Fully enclosed cadmium-plated steel spring with adjustable pressure range and positive shutoff, factory set and sealed.
 - d. Pressure Class: 250.
 - e. Drip-Pan Elbow: Cast iron and having threaded inlet, outlet, and drain, with threads complying with ASME B1.20.1.
 - f. Exhaust Head: Cast iron and having threaded inlet and drain, with threads complying with ASME B1.20.1.
 - g. Size and Capacity: As required for equipment according to ASME Boiler and Pressure Vessel Code.

H. Pressure-Reducing Valves

1. Size, Capacity, and Pressure Rating: Factory set for inlet and outlet pressures indicated.
2. Description: Pilot-actuated, diaphragm type, with adjustable pressure range and positive shutoff.
3. Body: Cast iron.
4. End Connections: Threaded connections for valves NPS 2 (DN 50) and smaller and flanged connections for valves NPS 2-1/2 (DN 65) and larger.
5. Trim: Hardened stainless steel.
6. Head and Seat: Replaceable, main head stem guide fitted with flushing and pressure-arresting device cover over pilot diaphragm.
7. Gaskets: Non-asbestos materials.

I. Steam Traps

1. Thermostatic Traps:
 - a. Body: Bronze angle-pattern body with integral union tailpiece and screw-in cap.
 - b. Trap Type: Balanced-pressure.
 - c. Bellows: Stainless steel or monel.
 - d. Head and Seat: Replaceable, hardened stainless steel.
 - e. Pressure Class: 125.
2. Thermodynamic Traps:
 - a. Body: Stainless steel with screw-in cap.
 - b. End Connections: Threaded.
 - c. Disc and Seat: Stainless steel.
 - d. Maximum Operating Pressure: 600 psig (4140 kPa).
3. Float and Thermostatic Traps:
 - a. Body and Bolted Cap: ASTM A 126, cast iron.
 - b. End Connections: Threaded.
 - c. Float Mechanism: Replaceable, stainless steel.
 - d. Head and Seat: Hardened stainless steel.
 - e. Trap Type: Balanced pressure.
 - f. Thermostatic Bellows: Stainless steel or monel.
 - g. Thermostatic air vent capable of withstanding 45 deg F (25 deg C) of superheat and resisting water hammer without sustaining damage.
 - h. Vacuum Breaker: Thermostatic with phosphor bronze bellows, and stainless steel cage, valve, and seat.
 - i. Maximum Operating Pressure: 125 psig (860 kPa).
4. Inverted Bucket Traps:
 - a. Body and Cap: Cast iron.
 - b. End Connections: Threaded.

- c. Head and Seat: Stainless steel.
 - d. Valve Retainer, Lever, and Guide Pin Assembly: Stainless steel.
 - e. Bucket: Brass or stainless steel.
 - f. Strainer: Integral stainless-steel inlet strainer within the trap body.
 - g. Air Vent: Stainless-steel thermostatic vent.
 - h. Pressure Rating: 250 psig (1725 kPa).

- J. Thermostatic Air Vents And Vacuum Breakers
 - 1. Thermostatic Air Vents:
 - a. Body: Cast iron, bronze or stainless steel.
 - b. End Connections: Threaded.
 - c. Float, Valve, and Seat: Stainless steel.
 - d. Thermostatic Element: Phosphor bronze bellows in a stainless-steel cage.
 - e. Pressure Rating: 125 psig (861 kPa) **OR** 300 psig (2068 kPa), **as directed**.
 - f. Maximum Temperature Rating: 350 deg F (177 deg C).
 - 2. Vacuum Breakers:
 - a. Body: Cast iron, bronze, or stainless steel.
 - b. End Connections: Threaded.
 - c. Sealing Ball, Retainer, Spring, and Screen: Stainless steel.
 - d. O-ring Seal: EPR.
 - e. Pressure Rating: 125 psig (861 kPa) **OR** 300 psig (2068 kPa), **as directed**.
 - f. Maximum Temperature Rating: 350 deg F (177 deg C).

- K. Steam Meters
 - 1. Meters shall have a microprocessor to display totalizer flow, flow rate, temperature, pressure, time, and date; alarms for high and low flow rate and temperature.
 - a. Computer shall have 4 to 20-mA or 2 to 10 volt output for temperature, pressure, and contact closure for flow increments.
 - b. Independent timers to store four peak flow rates and total flow.
 - c. Interface compatible with central workstation described in Division 23 Section "Instrumentation And Control For Hvac".
 - d. Microprocessor Enclosure: NEMA 250, Type 4.
 - 2. Sensor:
 - a. Venturi, of stainless-steel **OR** carbon-steel, **as directed**, construction, for insertion in pipeline between flanges. At least 10:1 turndown with plus or minus 1 percent accuracy over full-flow range.
 - b. Vortex type with stainless-steel wetted parts and wafer **OR** flange, **as directed**, connections; and with a piezoelectric sensor removable and serviceable without shutting down the process. At least 10:1 turndown with plus or minus 1 percent accuracy over full-flow range.
 - c. Spring-loaded, variable-area flowmeter type; density compensated with stainless-steel wetted parts and wafer **OR** flange, **as directed**, connections. At least 10:1 turndown with plus or minus 2 percent accuracy over full-flow range.

- L. Condensate Meters
 - 1. Body: Cast iron.
 - 2. Turbine: stainless steel.
 - 3. Connections: Threaded for NPS 2 (DN 50) and smaller and flanged for NPS 2-1/2 (DN 65).
 - 4. Totalizer: Meters shall have a microprocessor to display flow, flow rate, time, and date; alarms for high and low flow rate, pressure, and temperature.
 - a. Computer shall have 4- to 20-mA or 2- to 10-volt output for temperature, pressure, and contact closure for flow increments.
 - b. Independent timers to store four peak flow rates and total flow.
 - c. Interface compatible with central workstation specified in Division 23 Section "Instrumentation And Control For Hvac".
 - d. Microprocessor Enclosure: NEMA 250, Type 4.
 - 5. Pressure Rating: Atmospheric.

6. Maximum Temperature Rating: 250 deg F (121 deg C).

1.3 EXECUTION

A. LP Steam Piping Applications

1. LP Steam Piping, NPS 2 (DN 50) and Smaller: Schedule 40 **OR** 80, **as directed**, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.
2. LP Steam Piping, NPS 2-1/2 through NPS 12 (DN 65 through DN 300): Schedule 40 **OR** 80, **as directed**, Type E, Grade B, steel pipe; Class 150 wrought-steel fittings, flanges, and flange fittings; and welded and flanged joints.
3. LP Steam Piping, NPS 14 through NPS 18 (DN 350 through DN 450): Schedule 30, Type E, Grade B, steel pipe; Class 150 wrought-steel fittings, flanges, and flange fittings; and welded and flanged joints.
4. LP Steam Piping, NPS 20 (DN 500) and Larger: Schedule 20, Type E, Grade B, steel pipe; Class 150 wrought-steel fittings, flanges, and flange fittings; and welded and flanged joints.
5. Condensate piping above grade, NPS 2 (DN 50) and smaller, shall be either of the following, **as directed**:
 - a. Schedule 80, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.
 - b. RTRP and RTRF with adhesive or flanged joints.
6. Condensate piping above grade, NPS 2-1/2 (DN 65) and larger, shall be either of the following, **as directed**:
 - a. Schedule 80, Type E, Grade B, steel pipe; Class 150 wrought-steel fittings, flanges, and flange fittings; and welded and flanged joints.
 - b. RTRP and RTRF with adhesive or flanged joints.
7. Condensate piping below grade, NPS 2 (DN 50) and smaller, shall be either of the following, **as directed**:
 - a. Schedule 80, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.
 - b. RTRP and RTRF with adhesive or flanged joints.
8. Condensate piping below grade, NPS 2-1/2 (DN 65) and larger, shall be either of the following, **as directed**:
 - a. Schedule 80, Type E, Grade B, steel pipe; Class 150 wrought-steel fittings, flanges, and flange fittings; and welded and flanged joints.
 - b. RTRP and RTRF with adhesive or flanged joints.

B. HP Steam Piping Applications

1. HP Steam Piping, NPS 2 (DN 50) and Smaller: Schedule 40 **OR** 80, **as directed**, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.
2. HP Steam Piping, NPS 2-1/2 through NPS 12 (DN 65 through DN 300): Schedule 40 **OR** 80, **as directed**, Type E, Grade B, steel pipe; Class 150 wrought-steel fittings, flanges, and flange fittings; and welded and flanged joints.
3. HP Steam Piping, NPS 14 through NPS 18 (DN 350 through DN 450): Schedule 30, Type E, Grade B, steel pipe; Class 150 wrought-steel fittings, flanges, and flange fittings; and welded and flanged joints.
4. HP Steam Piping, NPS 20 (DN 500) and Larger: Schedule 20, Type E, Grade B, steel pipe; Class 150 wrought-steel fittings, flanges, and flange fittings; and welded and flanged joints.
5. Condensate piping above grade, NPS 2 (DN 50) and smaller, shall be either of the following, **as directed**:
 - a. Schedule 80, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.
 - b. RTRP and RTRF with adhesive or flanged joints.
6. Condensate piping above grade, NPS 2-1/2 (DN 65) and larger, shall be either of the following, **as directed**:
 - a. Schedule 80, Type E, Grade B, steel pipe; Class 150 wrought-steel fittings, flanges, and flange fittings; and welded and flanged joints.
 - b. RTRP and RTRF with adhesive or flanged joints.
7. Condensate piping below grade, NPS 2 (DN 50) and smaller, shall be either of the following, **as directed**:

- a. Schedule 80, Type S, Grade B, steel pipe; Class 125 cast-iron fittings; and threaded joints.
 - b. RTRP and RTRF with adhesive or flanged joints.
8. Condensate piping below grade, NPS 2-1/2 (DN 65) and larger, shall be either of the following, **as directed**:
 - a. Schedule 80, Type E, Grade B, steel pipe; Class 150 wrought-steel fittings, flanges, and flange fittings; and welded and flanged joints.
 - b. RTRP and RTRF with adhesive or flanged joints.
- C. Ancillary Piping Applications
 1. Makeup-water piping installed above grade shall be either of the following, **as directed**:
 - a. Drawn-temper copper tubing, wrought-copper fittings, and soldered **OR** brazed, **as directed**, joints.
 - b. Schedule 40 **OR** 80, **as directed**, CPVC plastic pipe and fittings, and solvent welded joints.
 2. Makeup-Water Piping Installed below Grade and within Slabs: Annealed-temper copper tubing, wrought-copper fittings, and soldered joints. Use the fewest possible joints.
 3. Blowdown-Drain Piping: Same materials and joining methods as for piping specified for the service in which blowdown drain is installed.
 4. Air-Vent Piping:
 - a. Inlet: Same as service where installed.
 - b. Outlet: Type K (A) annealed-temper copper tubing with soldered or flared joints.
 5. Vacuum-Breaker Piping: Outlet, same as service where installed.
 6. Safety-Valve-Inlet and -Outlet Piping: Same materials and joining methods as for piping specified for the service in which safety valve is installed.
- D. Valve Applications
 1. Install shutoff duty valves at branch connections to steam supply mains, at steam supply connections to equipment, and at the outlet of steam traps.
 2. Install safety valves on pressure-reducing stations and elsewhere as required by ASME Boiler and Pressure Vessel Code. Install safety-valve discharge piping, without valves, to nearest floor drain or as indicated on Drawings. Comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, for installation requirements.
- E. Piping Installation
 1. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Use indicated piping locations and arrangements if such were used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
 2. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.
 3. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
 4. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
 5. Install piping to permit valve servicing.
 6. Install piping free of sags and bends.
 7. Install fittings for changes in direction and branch connections.
 8. Install piping to allow application of insulation.
 9. Select system components with pressure rating equal to or greater than system operating pressure.
 10. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.
 11. Install drains, consisting of a tee fitting, NPS 3/4 (DN 20) full port-ball valve, and short NPS 3/4 (DN 20) threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.
 12. Install steam supply piping at a minimum uniform grade of 0.2 percent downward in direction of steam flow.

13. Install condensate return piping at a minimum uniform grade of 0.4 percent downward in direction of condensate flow.
14. Reduce pipe sizes using eccentric reducer fitting installed with level side down.
15. Install branch connections to mains using mechanically formed, **as directed**, tee fittings in main pipe, with the branch connected to top of main pipe.
16. Install valves according to Division 23 Section "General-duty Valves For Hvac Piping".
17. Install unions in piping, NPS 2 (DN 50) and smaller, adjacent to valves, at final connections of equipment, and elsewhere as indicated.
18. Install flanges in piping, NPS 2-1/2 (DN 65) and larger, at final connections of equipment and elsewhere as indicated.
19. Install strainers on supply side of control valves, pressure-reducing valves, traps, and elsewhere as indicated. Install NPS 3/4 (DN 20) nipple and full port ball valve in blowdown connection of strainers NPS 2 (DN 50) and larger. Match size of strainer blowoff connection for strainers smaller than NPS 2 (DN 50).
20. Install expansion loops, expansion joints, anchors, and pipe alignment guides as specified in Division 23 Section "Expansion Fittings And Loops For Hvac Piping".
21. Identify piping as specified in Division 23 Section "Identification For Hvac Piping And Equipment".
22. Install drip legs at low points and natural drainage points such as ends of mains, bottoms of risers, and ahead of pressure regulators, and control valves.
 - a. On straight runs with no natural drainage points, install drip legs at intervals not exceeding 300 feet (90 m).
 - b. Size drip legs same size as main. In steam mains NPS 6 (DN 150) and larger, drip leg size can be reduced, but to no less than NPS 4 (DN 100).
23. Flash Tank:
 - a. Pitch condensate piping down toward flash tank.
 - b. If more than one condensate pipe discharges into flash tank, install a check valve in each line.
 - c. Install thermostatic air vent at tank top.
 - d. Install safety valve at tank top.
 - e. Install full-port ball valve, and swing check valve on condensate outlet.
 - f. Install inverted bucket or float and thermostatic trap at low-pressure condensate outlet, sized for three times the calculated heat load.
 - g. Install pressure gage on low-pressure steam outlet according to Division 23 Section "Meters And Gages For Hvac Piping".

F. Steam-Trap Installation

1. Install steam traps in accessible locations as close as possible to connected equipment.
2. Install full-port ball valve, strainer, and union upstream from trap; install union, check valve, and full-port ball valve downstream from trap unless otherwise indicated.

G. Pressure-Reducing Valve Installation

1. Install pressure-reducing valves in accessible location for maintenance and inspection.
2. Install bypass piping around pressure-reducing valves, with globe valve equal in size to area of pressure-reducing valve seat ring, unless otherwise indicated.
3. Install gate valves on both sides of pressure-reducing valves.
4. Install unions or flanges on both sides of pressure-reducing valves having threaded- or flanged-end connections respectively.
5. Install pressure gages on low-pressure side of pressure-reducing valves after the bypass connection according to Division 23 Section "Meters And Gages For Hvac Piping".
6. Install strainers upstream for pressure-reducing valve.
7. Install safety valve downstream from pressure-reducing valve station.

H. Steam Or Condensate Meter Installation

1. Install meters with lengths of straight pipe upstream and downstream according to steam meter manufacturer's instructions.
2. Provide data acquisition wiring. Refer to Division 23 Section "Instrumentation And Control For Hvac".

- I. Safety Valve Installation
 1. Install safety valves according to ASME B31.1, "Power Piping" **OR** ASME B31.9, "Building Services Piping," **as directed**
 2. Pipe safety-valve discharge without valves to atmosphere outside the building.
 3. Install drip-pan elbow fitting adjacent to safety valve and pipe drain connection to nearest floor drain.
 4. Install exhaust head with drain to waste, on vents equal to or larger than NPS 2-1/2 (DN 65).
- J. Hangers And Supports
 1. Install hangers and supports according to Division 23 Section "Hangers And Supports For Hvac Piping And Equipment". Comply with requirements below for maximum spacing.
 2. Seismic restraints are specified in Division 23 Section "Vibration And Seismic Controls For Hvac Piping And Equipment".
 3. Install the following pipe attachments:
 - a. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet (6 m) long.
 - b. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet (6 m) or longer.
 - c. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet (6 m) or longer, supported on a trapeze.
 - d. Spring hangers to support vertical runs.
 4. Install hangers with the following maximum spacing and minimum rod sizes:
 - a. NPS 3/4 (DN 20): Maximum span, 9 feet (2.7 m); minimum rod size, 1/4 inch (6.4 mm).
 - b. NPS 1 (DN 25): Maximum span, 9 feet (2.7 m); minimum rod size, 1/4 inch (6.4 mm).
 - c. NPS 1-1/2 (DN 40): Maximum span, 12 feet (3.7 m); minimum rod size, 3/8 inch (10 mm).
 - d. NPS 2 (DN 50): Maximum span, 13 feet (4 m); minimum rod size, 3/8 inch (10 mm).
 - e. NPS 2-1/2 (DN 65): Maximum span, 14 feet (4.3 m); minimum rod size, 3/8 inch (10 mm).
 - f. NPS 3 (DN 80): Maximum span, 15 feet (4.6 m); minimum rod size, 3/8 inch (10 mm).
 - g. NPS 4 (DN 100): Maximum span, 17 feet (5.2 m); minimum rod size, 1/2 inch (13 mm).
 - h. NPS 6 (DN 150): Maximum span, 21 feet (6.4 m); minimum rod size, 1/2 inch (13 mm).
 - i. NPS 8 (DN 200): Maximum span, 24 feet (7.3 m); minimum rod size, 5/8 inch (16 mm).
 - j. NPS 10 (DN 250): Maximum span, 26 feet (8 m); minimum rod size, 3/4 inch (19 mm).
 - k. NPS 12 (DN 300): Maximum span, 30 feet (9.1 m); minimum rod size, 7/8 inch (22 mm).
 - l. NPS 14 (DN 350): Maximum span, 32 feet (9.8 m); minimum rod size, 1 inch (25 mm).
 - m. NPS 16 (DN 400): Maximum span, 35 feet (10.7 m); minimum rod size, 1 inch (25 mm).
 - n. NPS 18 (DN 450): Maximum span, 37 feet (11.3 m); minimum rod size, 1-1/4 inches (32 mm).
 - o. NPS 20 (DN 500): Maximum span, 39 feet (11.9 m); minimum rod size, 1-1/4 inches (32 mm).
 5. Install hangers for drawn-temper copper piping with the following maximum spacing and minimum rod sizes:
 - a. NPS 1/2 (DN 15): Maximum span, 4 feet (1.2 m); minimum rod size, 1/4 inch (6.4 mm).
 - b. NPS 3/4 (DN 20): Maximum span, 5 feet (1.5 m); minimum rod size, 1/4 inch (6.4 mm).
 - c. NPS 1 (DN 25): Maximum span, 6 feet (1.8 m); minimum rod size, 1/4 inch (6.4 mm).
 - d. NPS 1-1/2 (DN 40): Maximum span, 8 feet (2.4 m); minimum rod size, 3/8 inch (10 mm).
 - e. NPS 2 (DN 50): Maximum span, 8 feet (2.4 m); minimum rod size, 3/8 inch (10 mm).
 - f. NPS 2-1/2 (DN 65): Maximum span, 9 feet (2.7 m); minimum rod size, 3/8 inch (10 mm).
 - g. NPS 3 (DN 80): Maximum span, 10 feet (3 m); minimum rod size, 3/8 inch (10 mm).
 6. Support vertical runs at roof, at each floor, and at 10-foot (3-m) intervals between floors.
 7. Fiberglass Piping Hanger Spacing: Space hangers according to pipe manufacturer's written instructions for service conditions. Avoid point loading. Space and install hangers with the fewest practical rigid anchor points.
- K. Pipe Joint Construction
 1. Join pipe and fittings according to the following requirements and Division 21 specifying piping systems.
 2. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
 3. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

4. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube ends. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.
 5. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.
 6. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
 - a. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
 - b. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
 7. Welded Joints: Construct joints according to AWS D10.12 (AWS D10.12M), using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.
 8. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.
 9. Fiberglass Bonded Joints: Prepare pipe ends and fittings, apply adhesive, and join according to pipe manufacturer's written instructions.
- L. Terminal Equipment Connections
1. Size for supply and return piping connections shall be the same as or larger than equipment connections.
 2. Install traps and control valves in accessible locations close to connected equipment.
 3. Install bypass piping with globe valve around control valve. If parallel control valves are installed, only one bypass is required.
 4. Install vacuum breakers downstream from control valve, close to coil inlet connection.
 5. Install a drip leg at coil outlet.
- M. Field Quality Control
1. Prepare steam and condensate piping according to ASME B31.1, "Power Piping" **AND/OR** ASME B31.9, "Building Services Piping," **as directed**, and as follows:
 - a. Leave joints, including welds, uninsulated and exposed for examination during test.
 - b. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
 - c. Flush system with clean water. Clean strainers.
 - d. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
 2. Perform the following tests on steam and condensate piping:
 - a. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.
 - b. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the working pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength.
 - c. After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.
 3. Prepare written report of testing.

END OF SECTION 22 11 16 00b11 10 00b

SECTION 22 11 16 00c - GENERAL-SERVICE COMPRESSED-AIR PIPING**1.1 GENERAL****A. Description Of Work:**

1. This specification covers the furnishing and installation of materials for general-service compressed-air piping. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes piping and related specialties for general-service compressed-air systems operating at 200 psig (1380 kPa) or less.

C. Definitions

1. ABS: Acrylonitrile-butadiene-styrene plastic.
2. CR: Chlorosulfonated polyethylene synthetic rubber.
3. EPDM: Ethylene-propylene-diene terpolymer rubber.
4. HDPE: High-density polyethylene plastic.
5. NBR: Acrylonitrile-butadiene rubber.
6. PE: Polyethylene plastic.
7. PVC: Polyvinyl chloride plastic.
8. High-Pressure Compressed-Air Piping: System of compressed-air piping and specialties operating at pressures between 150 and 200 psig (1035 and 1380 kPa).
9. Low-Pressure Compressed-Air Piping: System of compressed-air piping and specialties operating at pressures of 150 psig (1035 kPa) or less.

D. Performance Requirements

1. Seismic Performance: Compressed-air piping and support and installation shall withstand effects of seismic events determined according to SEI/ASCE 7, "Minimum Design Loads for Buildings and Other Structures."

E. Submittals

1. Product Data: For the following:
 - a. Plastic pipes, fittings, and valves.
 - b. Dielectric fittings.
 - c. Flexible pipe connectors.
 - d. Safety valves.
 - e. Pressure regulators. Include rated capacities and operating characteristics.
 - f. Automatic drain valves.
 - g. Filters. Include rated capacities and operating characteristics.
 - h. Lubricators. Include rated capacities and operating characteristics.
 - i. Quick couplings.
 - j. Hose assemblies.
2. Brazing **OR** Welding, **as directed**, certificates.
3. Field quality-control test reports.
4. Operation and maintenance data.

F. Quality Assurance

1. Brazing: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications," or to AWS B2.2, "Standard for Brazing Procedure and Performance Qualification."
2. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX.

3. ASME Compliance:
 - a. Comply with ASME B31.1, "Power Piping," for high-pressure compressed-air piping.
 - b. Comply with ASME B31.9, "Building Services Piping," for low-pressure compressed-air piping.

G. Project Conditions

1. Interruption of Existing Compressed-Air Service: Do not interrupt compressed-air service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary compressed-air service according to requirements indicated:
 - a. Notify Owner no fewer than two days in advance of proposed interruption of compressed-air service.
 - b. Do not proceed with interruption of compressed-air service without Owner's written permission.

1.2 PRODUCTS

A. Pipes, Tubes, And Fittings

1. Schedule 40, Steel Pipe: ASTM A 53/A 53M, Type E or S, Grade B, black or hot-dip zinc coated with ends threaded according to ASME B1.20.1.
 - a. Steel Nipples: ASTM A 733, made of ASTM A 53/A 53M or ASTM A 106, Schedule 40, galvanized seamless steel pipe. Include ends matching joining method.
 - b. Malleable-Iron Fittings: ASME B16.3, Class 150 or 300, threaded.
 - c. Malleable-Iron Unions: ASME B16.39, Class 150 or 300, threaded.
 - d. Steel Flanges: ASME B16.5, Class 150 or 300, carbon steel, threaded.
 - e. Wrought-Steel Butt-Welding Fittings: ASME B16.9, Schedule 40.
 - f. Steel Flanges: ASME B16.5, Class 150 or 300, carbon steel.
 - g. Grooved-End Fittings and Couplings:
 - 1) Grooved-End Fittings: ASTM A 47/A 47M, malleable-iron castings or ASTM A 536, ductile-iron casting; with grooves according to AWWA C606 and dimensions matching steel pipe.
 - 2) Couplings: AWWA C606 or UL 213, for steel-pipe dimensions and rated for 300-psig (2070-kPa) minimum working pressure. Include ferrous housing sections, gasket suitable for compressed air, and bolts and nuts. Provide EDPM gaskets for oil-free compressed air. Provide NBR gaskets if compressed air contains oil or oil vapor.
2. Copper Tube: ASTM B 88, Type K (ASTM B 88M, Type A or B) seamless, drawn-temper, water tube.
 - a. Wrought-Copper Fittings: ASME B16.22, solder-joint pressure type or MSS SP-73, wrought copper with dimensions for brazed joints.
 - b. Cast-Copper-Alloy Flanges: ASME B16.24, Class 150 or 300.
 - c. Copper Unions: ASME B16.22 or MSS SP-123.
 - d. Press-Type Fittings, NPS 2 (DN 50) and Smaller: Wrought-copper fitting with EPDM O-ring seal in each end.
 - e. Press-Type Fittings, NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Bronze fitting with stainless-steel grip ring and EPDM O-ring seal in each end.
 - f. Extruded-Tee Outlets: Procedure for making branch outlets in copper tube according to ASTM F 2144.
 - g. Grooved-End Fittings and Couplings:
 - 1) Grooved-End Fittings: ASTM B 75 (ASTM B 75M), copper tube or ASTM B 584, bronze castings.
 - 2) Couplings: Copper-tube dimensions and design similar to AWWA C606. Include ferrous housing sections, gasket suitable for compressed air, and bolts and nuts. Provide EDPM gasket for oil-free compressed air. Provide NBR gasket if compressed air contains oil or oil vapor.

3. Transition Couplings for Metal Piping: Metal coupling or other manufactured fitting same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.
- B.
- C. Joining Materials
1. Pipe-Flange Gasket Materials: Suitable for compressed-air piping system contents.
 - a. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch (3.2-mm) maximum thickness unless thickness or specific material is indicated.
 - 1) Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
 - 2) Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
 2. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.
 3. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.
 4. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated.
 5. Welding Filler Metals: Comply with AWS D10.12/D10.12M for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.
- D. Valves
1. Metal Ball, Butterfly, Check, Gate, and Globe Valves: Comply with requirements in Division 22 Section "General-duty Valves For Plumbing Piping".
- E. Dielectric Fittings
1. General Requirements for Dielectric Fittings: Combination fitting of copper alloy and ferrous materials with insulating material; suitable for system fluid, pressure, and temperature. Include threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.
 2. Dielectric Unions: Factory-fabricated union assembly, for 250-psig (1725-kPa) minimum working pressure at 180 deg F (82 deg C).
 3. Dielectric Flanges: Factory-fabricated companion-flange assembly, for 150- or 300-psig (1035- or 2070-kPa) minimum working pressure as required to suit system pressures.
 4. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.
 - a. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig (1035- or 2070-kPa) minimum working pressure where required to suit system pressures.
 - b. .
 5. Stainless-Steel-Hose Flexible Pipe Connectors: Corrugated-stainless-steel tubing with stainless-steel wire-braid covering and ends welded to inner tubing.
 - a. Working-Pressure Rating: 200 psig (1380 kPa) **OR** 250 psig (1725 kPa), **as directed**, minimum.
 - b. End Connections, NPS 2 (DN 50) and Smaller: Threaded steel pipe nipple.
 - c. End Connections, NPS 2-1/2 (DN 65) and Larger: Flanged steel nipple.
- F. Sleeves
1. Galvanized-Steel Sheet: 0.0239-inch (0.6-mm) minimum thickness; round tube closed with welded longitudinal joint.
 2. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
 - a. Underdeck Clamp: Clamping ring with set screws.
- G. Escutcheons
1. General Requirements: Manufactured wall and ceiling escutcheons and floor plates, with ID to closely fit around pipe and tube and OD that completely covers opening.
 2. One-Piece, Deep-Pattern Escutcheons: Deep-drawn, box-shaped brass with polished chrome-plated finish.

3. One-Piece, Cast-Brass Escutcheons: With set screw.
 - a. Finish: Polished chrome-plated **OR** Rough brass, **as directed**.
4. Split-Casting, Cast-Brass Escutcheons: With concealed hinge and set screw.
 - a. Finish: Polished chrome-plated **OR** Rough brass, **as directed**.
5. One-Piece, Stamped-Steel Escutcheons: With set screw **OR** spring clips, **as directed**, and chrome-plated finish.
6. Split-Plate, Stamped-Steel Escutcheons: With concealed **OR** exposed-rivet, **as directed**, hinge, set screw **OR** spring clips, **as directed**, and chrome-plated finish.
7. One-Piece, Floor-Plate Escutcheons: Cast iron.
8. Split-Casting, Floor-Plate Escutcheons: Cast brass with concealed hinge and set screw.

H. Specialties

1. Safety Valves: ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels," construction; National Board certified, labeled, and factory sealed; constructed of bronze body with poppet-type safety valve for compressed-air service.
 - a. Pressure Settings: Higher than discharge pressure and same or lower than receiver pressure rating.
2. Air-Main Pressure Regulators: Bronze body, direct acting, spring-loaded manual pressure-setting adjustment, and rated for 250-psig (1725-kPa) inlet pressure, unless otherwise indicated.
 - a. Type: Pilot operated.
3. Air-Line Pressure Regulators: Diaphragm **OR** Pilot, **as directed**, operated, bronze body, direct acting, spring-loaded manual pressure-setting adjustment, and rated for 200-psig (1380-kPa) minimum inlet pressure, unless otherwise indicated.
OR
 Air-Line Pressure Regulators: Diaphragm operated, aluminum alloy or plastic body, direct acting, spring-loaded manual pressure-setting adjustment, and rated for 200-psig (1380-kPa) minimum inlet pressure, unless otherwise indicated.
4. Automatic Drain Valves: Stainless-steel body and internal parts, rated for 200-psig (1380-kPa) minimum working pressure, capable of automatic discharge of collected condensate. Include mounting bracket if wall mounting is indicated, **as directed**.
5. Coalescing Filters: Coalescing type with activated carbon capable of removing water and oil aerosols; with color-change dye to indicate when carbon is saturated and warning light to indicate when selected maximum pressure drop has been exceeded. Include mounting bracket if wall mounting is indicated, **as directed**.
6. Mechanical Filters: Two-stage, mechanical-separation-type, air-line filters. Equip with deflector plates, resin-impregnated-ribbon-type filters with edge filtration, and drain cock. Include mounting bracket if wall mounting is indicated, **as directed**.
7. Air-Line Lubricators: With drip chamber and sight dome for observing oil drop entering air stream; with oil-feed adjustment screw and quick-release collar for easy bowl removal. Include mounting bracket if wall mounting is indicated, **as directed**.
 - a. Provide with automatic feed device for supplying oil to lubricator.

I. Quick Couplings

1. General Requirements for Quick Couplings: Assembly with locking-mechanism feature for quick connection and disconnection of compressed-air hose.
2. Automatic-Shutoff Quick Couplings: Straight-through brass body with O-ring or gasket seal and stainless-steel or nickel-plated-steel operating parts.
 - a. Socket End: With one-way valve and threaded inlet for connection to piping or threaded hose fitting.
 - b. Plug End: Flow-sensor-bleeder, check-valve **OR** Straight-through, **as directed**, type with barbed outlet for attaching hose.
3. Valveless Quick Couplings: Straight-through brass body with stainless-steel or nickel-plated-steel operating parts.
 - a. Socket End: With O-ring or gasket seal, without valve, and with barbed inlet for attaching hose.
 - b. Plug End: With barbed outlet for attaching hose.

J. Hose Assemblies

1. Description: Compatible hose, clamps, couplings, and splicers suitable for compressed-air service, of nominal diameter indicated, and rated for 300-psig (2070-kPa) minimum working pressure, unless otherwise indicated.
 - a. Hose: Reinforced single **OR** double, **as directed**, -wire-braid, CR-covered hose for compressed-air service.
 - b. Hose Clamps: Stainless-steel clamps or bands.
 - c. Hose Couplings: Two-piece, straight-through, threaded brass or stainless-steel O-ring or gasket-seal swivel coupling with barbed ends for connecting two sections of hose.
 - d. Hose Splicers: One-piece, straight-through brass or stainless-steel fitting with barbed ends for connecting two sections of hose.

K. Grout

1. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
 - a. Characteristics: Post-hardening, volume adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
 - b. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.
 - c. Packaging: Premixed and factory packaged.

1.3 EXECUTION

A. Piping Applications

1. Compressed-Air Piping between Air Compressors and Receivers: Use one of the following piping materials for each size range:
 - a. NPS 2 (DN 50) and Smaller: Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; threaded, malleable-iron fittings; and threaded joints.
 - b. NPS 2 (DN 50) and Smaller: Schedule 5, galvanized-steel pipe; pressure-seal fittings; and pressure-sealed joints.
 - c. NPS 2 (DN 50) and Smaller: Schedule 40, black-steel pipe; wrought-steel fittings; and welded joints.
 - d. NPS 2 (DN 50) and Smaller: Type K or L (Type A or B), copper tube; wrought-copper fittings; and brazed joints.
 - e. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; threaded, malleable-iron fittings; and threaded joints.
 - f. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; grooved-end fittings; couplings; and grooved joints.
 - g. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Schedule 40, black-steel pipe; wrought-steel fittings; and welded joints.
 - h. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Type K or L (Type A or B), copper tube; wrought-copper fittings; and brazed joints.
 - i. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Type K or L (Type A or B), copper tube; grooved-end copper fittings; couplings; and grooved joints.
 - j. NPS 5 (DN 125) and Larger: Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; threaded, malleable-iron fittings; and threaded joints.
 - k. NPS 5 (DN 125) and Larger: Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; grooved-end fittings; couplings; and grooved joints.
 - l. NPS 5 (DN 125) and Larger: Schedule 40, black-steel pipe; wrought-steel fittings; and welded joints.
 - m. NPS 5 (DN 125) and Larger: Grooved-end, Type K or L (ASTM B 88M Type A or B), copper tube; grooved-end copper fittings; couplings; and grooved joints.
2. Low-Pressure Compressed-Air Distribution Piping: Use one of the following piping materials for each size range:
 - a. NPS 2 (DN 50) and Smaller: Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; threaded, malleable-iron fittings; and threaded joints.

- b. NPS 2 (DN 50) and Smaller: Schedule 5, galvanized-steel pipe; pressure-seal fittings; and pressure-sealed joints.
- c. NPS 2 (DN 50) and Smaller: Type K or L (Type A or B), copper tube; wrought-copper fittings; and brazed **OR** soldered, **as directed**, joints.
- d. NPS 2 (DN 50) and Smaller: Type K or L (Type A or B), copper tube; press-type fittings; and pressure-sealed joints.
- e. NPS 2 (DN 50) and Smaller: 63-mm and smaller, blue ABS pipe and fittings; transition fittings; valves; and solvent-cemented joints.
- f. NPS 2 (DN 50) and Smaller: Green ABS pipe and fittings, transition fittings, and valves; and solvent-cemented joints.
- g. NPS 2 (DN 50) and Smaller: HDPE pipe, fittings, and valves; and heat-fusion joints.
- h. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; threaded, malleable-iron fittings; and threaded joints.
- i. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; grooved-end fittings; couplings; and grooved joints.
- j. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Type K or L (Type A or B), copper tube; wrought-copper fittings; and brazed **OR** soldered, **as directed**, joints.
- k. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Type K or L (Type A or B), copper tube; grooved-end copper fittings; couplings; and grooved joints.
- l. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Type K or L (Type A or B), copper tube; press-type fittings; and pressure-sealed joints.
- m. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): 90- and 110-mm, blue ABS pipe and fittings; transition fittings; and solvent-cemented joints. Include butterfly valves and flanged joints.
- n. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): NPS 3 and NPS 4 (DN 80 and DN 100), green ABS pipe and fittings; transition fittings; and solvent-cemented joints. Include ball valves and flanged joints.
- o. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): NPS 3 and NPS 4 (DN 80 and DN 100), HDPE pipe and fittings; valves; and heat-fusion joints.
- p. NPS 5 and NPS 6 (DN 125 and DN 150): Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; threaded, malleable-iron fittings; and threaded joints.
- q. NPS 5 (DN 125) and Larger: Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; grooved-end fittings; couplings; and grooved joints.
- r. NPS 5 to NPS 8 (DN 125 to DN 200): Type K or L (Type A or B), copper tube; grooved-end copper fittings; couplings; and grooved joints.
- 3. High-Pressure Compressed-Air Distribution Piping: Use one of the following piping materials for each size range:
 - a. NPS 2 (DN 50) and Smaller: Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; threaded, malleable-iron fittings; and threaded joints.
 - b. NPS 2 (DN 50) and Smaller: Schedule 5, galvanized-steel pipe; pressure-seal fittings; and pressure-sealed joints.
 - c. NPS 2 (DN 50) and Smaller: Schedule 40, black-steel pipe; wrought-steel fittings; and welded joints.
 - d. NPS 2 (DN 50) and Smaller: Type K or L (Type A or B), copper tube; wrought-copper fittings; and brazed **OR** soldered, **as directed**, joints.
 - e. NPS 2-1/2 to NPS 6 (DN 65 to DN 150): Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; threaded, malleable-iron fittings; and threaded joints.
 - f. NPS 2-1/2 to NPS 6 (DN 65 to DN 150): Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; grooved-end fittings; couplings; and grooved joints.
 - g. NPS 2-1/2 to NPS 6 (DN 65 to DN 150): Schedule 40, black-steel pipe; wrought-steel fittings; and welded joints.
 - h. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Type K or L (Type A or B), copper tube; wrought-copper fittings; and brazed **OR** soldered, **as directed**, joints.
 - i. NPS 2-1/2 to NPS 6 (DN 65 to DN 150): Type K or L (Type A or B), copper tube; wrought-copper fittings; and brazed joints.
 - j. NPS 2-1/2 to NPS 6 (DN 65 to DN 150): Type K or L (Type A or B), copper tube; grooved-end copper fittings; couplings; and grooved joints.

- k. NPS 8 (DN 200) and Larger: Schedule 40, black **OR** galvanized, **as directed**, -steel pipe; grooved-end fittings; couplings; and grooved joints.
 - l. NPS 8 (DN 200) and Larger: Schedule 40, black-steel pipe; wrought-steel fittings; and welded joints.
 - m. NPS 8 (DN 200): Type K or L (Type A or B), copper tube; grooved-end copper fittings; couplings; and grooved joints.
 4. Drain Piping: Use one of the following piping materials:
 - a. NPS 2 (DN 50) and Smaller: Type M (Type C) copper tube; wrought-copper fittings; and brazed or soldered joints.
 - b. NPS 2 (DN 50) and Smaller: PVC pipe and fittings; and solvent-cemented joints.
- B. Valve Applications
 1. General-Duty Valves: Comply with requirements in Division 22 Section "General-duty Valves For Plumbing Piping" for metal general-duty valves. Use metal valves, unless otherwise indicated.
 - a. Metal General-Duty Valves: Use valve types specified in "Valve Applications" Article in Division 22 Section "General-duty Valves For Plumbing Piping" according to the following:
 - 1) Low-Pressure Compressed Air: Valve types specified for low-pressure compressed air.
 - 2) High-Pressure Compressed Air: Valve types specified for medium-pressure compressed air.
 - 3) Equipment Isolation NPS 2 (DN 50) and Smaller: Safety-exhaust, copper-alloy ball valve with exhaust vent and pressure rating at least as great as piping system operating pressure.
 - 4) Grooved-end valves may be used with grooved-end piping and grooved joints.
 - b. Plastic General-Duty Valves: Provide valves, made by piping manufacturer, that are compatible with piping. Do not use plastic valves between air compressors and receivers.
 - 1) Blue ABS Piping System: Ball and butterfly valves.
 - 2) Green ABS Piping System: Ball valves.
 - 3) HDPE Piping System: Ball valves.
- C. Piping Installation
 1. Drawing plans, schematics, and diagrams indicate general location and arrangement of compressed-air piping. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, air-compressor sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
 2. Install piping concealed from view and protected from physical contact by building occupants, unless otherwise indicated and except in equipment rooms and service areas.
 3. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited, unless otherwise indicated.
 4. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal and to coordinate with other services occupying that space.
 5. Install piping adjacent to equipment and machines to allow service and maintenance.
 6. Install air and drain piping with 1 percent slope downward in direction of flow.
 7. Install nipples, flanges, unions, transition and special fittings, and valves with pressure ratings same as or higher than system pressure rating, unless otherwise indicated.
 8. Equipment and Specialty Flanged Connections:
 - a. Use steel companion flange with gasket for connection to steel pipe.
 - b. Use cast-copper-alloy companion flange with gasket and brazed **OR** soldered, **as directed**, joint for connection to copper tube. Do not use soldered joints for connection to air compressors or to equipment or machines producing shock or vibration.
 9. Flanged joints may be used instead of specified joint for any piping or tubing system.
 10. Extended-tee outlets with brazed branch connection may be used for copper tubing, within extruded-tee connection diameter to run tube diameter ratio for tube type, according to Extruded Tee Connections Sizes and Wall Thickness for Copper Tube (Inches) Table in ASTM F 2014.
 11. Install eccentric reducers where compressed-air piping is reduced in direction of flow, with bottoms of both pipes and reducer fitting flush.

12. Install branch connections to compressed-air mains from top of main. Provide drain leg and drain trap at end of each main and branch and at low points.
13. Install thermometer and pressure gage on discharge piping from each air compressor and on each receiver. Comply with requirements in Division 22 Section "Meters And Gages For Plumbing Piping".
14. Install piping to permit valve servicing.
15. Install piping free of sags and bends.
16. Install fittings for changes in direction and branch connections.
17. Install seismic restraints on piping. Seismic-restraint devices are specified in Division 22 Section "Vibration And Seismic Controls For Plumbing Piping And Equipment".

D. Joint Construction

1. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
2. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
3. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
 - a. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
 - b. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
4. Welded Joints for Steel Piping: Join according to AWS D10.12/D10.12M.
5. Brazed Joints for Copper Tubing: Join according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter.
6. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Join according to ASTM B 828 or CDA's "Copper Tube Handbook."
7. Extruded-Tee Outlets for Copper Tubing: Form branches according to ASTM F 2014, with tools recommended by procedure manufacturer, and using operators qualified according to Part 1 "Quality Assurance" Article.
8. Flanged Joints: Use asbestos-free, nonmetallic gasket suitable for compressed air. Join flanges with gasket and bolts according to ASME B31.9 for bolting procedure.
9. Grooved Joints: Assemble couplings with housing, gasket, lubricant, and bolts. Join according to AWWA C606 for grooved joints. Do not apply lubricant to prelubricated gaskets.
10. Heat-Fusion Joints for PE Piping: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D 2657 for socket-fusion joints.
11. Pressure-Sealed Joints: Join with tools recommended by fitting manufacturer, using operators qualified according to Part 1 "Quality Assurance" Article.
12. Solvent-Cemented Joints for ABS Piping: Clean and dry joining surfaces. Join according to the following:
 - a. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
 - b. Join according to ASME B31.9 for solvent-cemented joints and to ASTM D 2235 Appendix.
13. Solvent-Cemented Joints for PVC Piping: Clean and dry joining surfaces. Join according to the following:
 - a. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
 - b. Apply primer and join according to ASME B31.9 for solvent-cemented joints and to ASTM D 2672.
14. Dissimilar Metal Piping Material Joints: Use dielectric fittings.

E. Valve Installation

1. General-Duty Valves: Comply with requirements in Division 22 Section "General-duty Valves For Plumbing Piping".
2. Install shutoff valves and unions or flanged joints at compressed-air piping to air compressors.
3. Install shutoff valve at inlet to each automatic drain valve, filter, lubricator, and pressure regulator.
4. Install check valves to maintain correct direction of compressed-air flow to and from compressed-air piping specialties and equipment.

- F. Dielectric Fitting Installation
 - 1. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.
 - 2. NPS 2 (DN 50) and Smaller: Use dielectric unions.
 - 3. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Use dielectric flanges.
 - 4. NPS 5 (DN 125) and Larger: Use dielectric flange kits.

- G. Flexible Pipe Connector Installation
 - 1. Install flexible pipe connectors in discharge piping and in inlet air piping from remote air-inlet filter, **as directed**, of each air compressor.
 - 2. Install bronze-hose flexible pipe connectors in copper compressed-air tubing.
 - 3. Install stainless-steel-hose flexible pipe connectors in steel compressed-air piping.

- H. Specialty Installation
 - 1. Install safety valves on receivers in quantity and size to relieve at least the capacity of connected air compressors.
 - 2. Install air-main pressure regulators in compressed-air piping at or near air compressors.
 - 3. Install air-line pressure regulators in branch piping to equipment and tools, **as directed**.
 - 4. Install automatic drain valves on aftercoolers, receivers, and dryers. Discharge condensate onto nearest floor drain.
 - 5. Install coalescing filters in compressed-air piping at or near air compressors and upstream from mechanical filters. Mount on wall at locations indicated, **as directed**.
 - 6. Install mechanical filters in compressed-air piping at or near air compressors and downstream from coalescing filters. Mount on wall at locations indicated, **as directed**.
 - 7. Install air-line lubricators in branch piping to machine tools. Mount on wall at locations indicated, **as directed**.
 - 8. Install quick couplings at piping terminals for hose connections.
 - 9. Install hose assemblies at hose connections.

- I. Connections
 - 1. Install unions, in piping NPS 2 (DN 50) and smaller, adjacent to each valve and at final connection to each piece of equipment and machine.
 - 2. Install flanges, in piping NPS 2-1/2 (DN 65) and larger, adjacent to flanged valves and at final connection to each piece of equipment and machine.

- J. Sleeve Installation
 - 1. Sleeves are not required for core-drilled holes.
 - 2. Permanent sleeves are not required for holes formed by removable PE sleeves.
 - 3. Install sleeves for pipes passing through concrete and masonry walls and concrete floor and roof slabs using galvanized-steel pipe **OR** galvanized-steel sheet **OR** stack sleeve fittings **OR** PVC pipe, **as directed**.
OR
Install sleeves for pipes passing through concrete and masonry walls, gypsum board partitions, and concrete floor and roof slabs.
 - a. Wall Penetrations: Cut sleeves to length for mounting flush with both surfaces.
 - b. Floor Penetrations: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches (50 mm) above finished floor level. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.
 - 4. Install sleeves in new walls and slabs as new walls and slabs are constructed.
 - 5. Install sleeves that are large enough to provide 1/4-inch (6.4-mm) annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:
 - a. PVC **OR** Steel, **as directed**, Pipe Sleeves: For pipes smaller than NPS 6 (DN 150).
 - b. Steel Sheet Sleeves: For pipes NPS 6 (DN 150) and larger, penetrating gypsum board partitions.
 - c. Stack Sleeve Fittings: For pipes penetrating floors with membrane waterproofing. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to

2 inches (50 mm) above finished floor level. Comply with requirements in Division 07 Section "Sheet Metal Flashing And Trim" for flashing.

1) Seal space outside of sleeve fittings with grout.

6. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements in Division 07 Section "Penetration Firestopping".

K. Escutcheon Installation

1. Install escutcheons for penetrations of walls, ceilings, and floors according to the following:

a. New Piping:

- 1) Piping with Fitting or Sleeve Protruding from Wall: One piece, deep pattern.
- 2) Bare Piping at Wall and Floor Penetrations in Finished Spaces: One piece, cast brass with polished chrome-plated finish **OR** stamped steel with set screw **OR** stamped steel with set screw or spring clips **OR** stamped steel with spring clips, **as directed**.
- 3) Bare Piping at Ceiling Penetrations in Finished Spaces: One piece, cast brass with polished chrome-plated finish **OR** One piece or split-casting, cast brass with polished chrome-plated finish **OR** Split casting, cast brass with polished chrome-plated finish **OR** One piece, stamped steel with set screw **OR** One piece or split plate, stamped steel with set screw **OR** Split plate, stamped steel with set screw, **as directed**.
- 4) Bare Piping in Unfinished Service Spaces: One piece, cast brass with polished chrome-plated finish **OR** cast brass with rough-brass finish **OR** stamped steel with set screw **OR** stamped steel with spring clips **OR** stamped steel with set screw or spring clips, **as directed**.
- 5) Bare Piping in Equipment Rooms: One piece, cast brass **OR** stamped steel with set screw **OR** stamped steel with spring clips **OR** stamped steel with set screw or spring clips, **as directed**.
- 6) Bare Piping at Floor Penetrations in Equipment Rooms: One-piece floor plate.

b. Existing Piping:

- 1) Chrome-Plated Piping: Split-casting, cast brass with chrome-plated finish.
- 2) Insulated Piping: Split-plate, stamped steel with concealed **OR** exposed-rivet, **as directed**, hinge and spring clips.
- 3) Bare Piping at Wall and Floor Penetrations in Finished Spaces: Split casting, cast brass with chrome-plated finish **OR** plate, stamped steel with concealed hinge and spring clips, **as directed**.
- 4) Bare Piping at Ceiling Penetrations in Finished Spaces: Split casting, cast brass with chrome-plated finish **OR** plate, stamped steel with concealed hinge and set screw, **as directed**.
- 5) Bare Piping in Unfinished Service Spaces: Split casting, cast brass with polished chrome-plated finish **OR** casting, cast brass with rough-brass finish **OR** plate, stamped steel with concealed hinge and set screw or spring clips **OR** plate, stamped steel with concealed or exposed-rivet hinge and set screw or spring clips **OR** plate, stamped steel with exposed-rivet hinge and set screw or spring clips, **as directed**.
- 6) Bare Piping in Equipment Rooms: Split casting, cast brass **OR** plate, stamped steel with set screw or spring clips, **as directed**.
- 7) Bare Piping at Floor Penetrations in Equipment Rooms: Split-casting floor plate.

L. Hanger And Support Installation

1. Comply with requirements in Division 22 Section "Vibration And Seismic Controls For Plumbing Piping And Equipment" for seismic-restraint devices.
2. Comply with requirements in Division 22 Section "Hangers And Supports For Plumbing Piping And Equipment" for pipe hanger and support devices.
3. Vertical Piping: MSS Type 8 or 42, clamps.
4. Individual, Straight, Horizontal Piping Runs:
 - a. 100 Feet (30 m) or Less: MSS Type 1, adjustable, steel clevis hangers.
 - b. Longer Than 100 Feet (30 m): MSS Type 43, adjustable roller hangers.

5. Multiple, Straight, Horizontal Piping Runs 100 Feet (30 m) or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
6. Base of Vertical Piping: MSS Type 52, spring hangers.
7. Support horizontal piping within 12 inches (300 mm) of each fitting and coupling.
8. Rod diameter may be reduced 1 size for double-rod hangers, with 3/8-inch (10-mm) minimum rods.
9. Install hangers for Schedule 40, steel piping with the following maximum horizontal spacing and minimum rod diameters:
 - a. NPS 1/4 to NPS 1/2 (DN 8 to DN 15): 96 inches (2400 mm) with 3/8-inch (10-mm) rod.
 - b. NPS 3/4 to NPS 1-1/4 (DN 20 to DN 32): 84 inches (2100 mm) with 3/8-inch (10-mm) rod.
 - c. NPS 1-1/2 (DN 40): 12 feet (3.7 m) with 3/8-inch (10-mm) rod.
 - d. NPS 2 (DN 50): 13 feet (4 m) with 3/8-inch (10-mm) rod.
 - e. NPS 2-1/2 (DN 65): 14 feet (4.3 m) with 1/2-inch (13-mm) rod.
 - f. NPS 3 (DN 80): 15 feet (4.6 m) with 1/2-inch (13-mm) rod.
 - g. NPS 3-1/2 (DN 90): 16 feet (4.9 m) with 1/2-inch (13-mm) rod.
 - h. NPS 4 (DN 100): 17 feet (5.2 m) with 5/8-inch (16-mm) rod.
 - i. NPS 5 (DN 125): 19 feet (5.8 m) with 5/8-inch (16-mm) rod.
 - j. NPS 6 (DN 150): 21 feet (6.4 m) with 3/4-inch (19-mm) rod.
 - k. NPS 8 (DN 200): 24 feet (7.3 m) with 3/4-inch (19-mm) rod.
 - l. NPS 10 (DN 250): 26 feet (7.9 m) with 7/8-inch (22-mm) rod.
 - m. NPS 12 (DN 300): 30 feet (9.1 m) with 7/8-inch (22-mm) rod.
10. Install supports for vertical, Schedule 40, steel piping every 15 feet (4.6 m).
11. Install hangers for Schedule 5, steel piping with the following maximum horizontal spacing and minimum rod diameters:
 - a. NPS 1/2 (DN 15): 72 inches (1800 mm) with 3/8-inch (10-mm) rod.
 - b. NPS 3/4 (DN 20): 84 inches (2100 mm) with 3/8-inch (10-mm) rod.
 - c. NPS 1 (DN 25): 96 inches (2400 mm) with 3/8-inch (10-mm) rod.
 - d. NPS 1-1/4 (DN 32): 108 inches (2700 mm) with 3/8-inch (10-mm) rod.
 - e. NPS 1-1/2 (DN 40): 10 feet (3 m) with 3/8-inch (10-mm) rod.
 - f. NPS 2 (DN 50): 11 feet (3.4 m) with 3/8-inch (10-mm) rod.
12. Install supports for vertical, Schedule 5, steel piping every 10 feet (3 m).
13. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
 - a. NPS 1/4 (DN 8): 60 inches (1500 mm) with 3/8-inch (10-mm) rod.
 - b. NPS 3/8 and NPS 1/2 (DN 10 and DN 15): 72 inches (1800 mm) with 3/8-inch (10-mm) rod.
 - c. NPS 3/4 (DN 20): 84 inches (2100 mm) with 3/8-inch (10-mm) rod.
 - d. NPS 1 (DN 25): 96 inches (2400 mm) with 3/8-inch (10-mm) rod.
 - e. NPS 1-1/4 (DN 32): 108 inches (2700 mm) with 3/8-inch (10-mm) rod.
 - f. NPS 1-1/2 (DN 40): 10 feet (3 m) with 3/8-inch (10-mm) rod.
 - g. NPS 2 (DN 50): 11 feet (3.4 m) with 3/8-inch (10-mm) rod.
 - h. NPS 2-1/2 (DN 65): 13 feet (4 m) with 1/2-inch (13-mm) rod.
 - i. NPS 3 (DN 80): 14 feet (4.3 m) with 1/2-inch (13-mm) rod.
 - j. NPS 3-1/2 (DN 90): 15 feet (4.6 m) with 1/2-inch (13-mm) rod.
 - k. NPS 4 (DN 100): 16 feet (4.9 m) with 1/2-inch (13-mm) rod.
 - l. NPS 5 (DN 125): 18 feet (5.5 m) with 1/2-inch (13-mm) rod.
 - m. NPS 6 (DN 150): 20 feet (6 m) with 5/8-inch (16-mm) rod.
 - n. NPS 8 (DN 200): 23 feet (7 m) with 3/4-inch (19-mm) rod.
14. Install supports for vertical copper tubing every 10 feet (3 m).
15. Install vinyl-coated hangers for ABS piping with the following maximum horizontal spacing and minimum rod diameters:
 - a. All Sizes: Install continuous support for piping with compressed air at normal operating temperature above 100 deg F (38 deg C).
 - b. NPS 3/8 and NPS 1/2 (DN 10 and DN 15): 30 inches (760 mm) with 3/8-inch (10-mm) rod.
 - c. NPS 3/4 (DN 20): 38 inches (975 mm) with 3/8-inch (10-mm) rod.
 - d. NPS 1 (DN 25): 40 inches (1015 mm) with 3/8-inch (10-mm) rod.
 - e. NPS 1-1/4 (DN 32): 45 inches (1140 mm) with 3/8-inch (10-mm) rod.

- f. NPS 1-1/2 (DN 40): 52 inches (1330 mm) with 3/8-inch (10-mm) rod.
- g. NPS 2 (DN 50): 58 inches (1470 mm) with 3/8-inch (10-mm) rod.
- h. NPS 3 (DN 80): 68 inches (1730 mm) with 1/2-inch (13-mm) rod.
- i. NPS 4 (DN 100): 76 inches (1900 mm) with 1/2-inch (13-mm) rod.
- 16. Install supports for vertical ABS piping every 48 inches (1220 mm).
- 17. Install vinyl-coated hangers for HDPE piping with the following maximum horizontal spacing and minimum rod diameters:
 - a. All Sizes: Install continuous support for piping with compressed air at normal operating temperature above 100 deg F (38 deg C).
 - b. NPS 1/2 (DN 15): 30 inches (760 mm) with 3/8-inch (10-mm) rod.
 - c. NPS 3/4 (DN 20): 35 inches (890 mm) with 3/8-inch (10-mm) rod.
 - d. NPS 1 (DN 25): 40 inches (1015 mm) with 3/8-inch (10-mm) rod.
 - e. NPS 1-1/4 (DN 32): 43 inches (1090 mm) with 3/8-inch (10-mm) rod.
 - f. NPS 1-1/2 (DN 40): 49 inches (1245 mm) with 3/8-inch (10-mm) rod.
 - g. NPS 2 (DN 50): 55 inches (1400 mm) with 3/8-inch (10-mm) rod.
 - h. NPS 3 and NPS 4 (DN 80 and DN 100): 96 inches (2440 mm) with 1/2-inch (13-mm) rod.
- 18. Install supports for vertical HDPE piping every 48 inches (1220 mm).

M. Labeling And Identification

- 1. Install identifying labels and devices for general-service compressed-air piping, valves, and specialties. Comply with requirements in Division 22 Section "Identification For Plumbing Piping And Equipment".

N. Field Quality Control

- 1. Perform field tests and inspections.
- 2. Tests and Inspections:
 - a. Piping Leak Tests for Metal Compressed-Air Piping: Test new and modified parts of existing piping. Cap and fill general-service compressed-air piping with oil-free dry air or gaseous nitrogen to pressure of 50 psig (345 kPa) above system operating pressure, but not less than 150 psig (1035 kPa). Isolate test source and let stand for four hours to equalize temperature. Refill system, if required, to test pressure; hold for two hours with no drop in pressure.
 - b. Piping Leak Tests for ABS Compressed-Air Piping: Test new and modified parts of existing piping. Cap and fill general-service compressed-air piping with oil-free dry air or gaseous nitrogen, at temperature of 110 deg F (43 deg C) or less, to pressure of 40 psig (275 kPa) above system operating pressure, but not less than 80 psig (550 kPa) **OR** 100 psig (690 kPa), **as directed**, or more than 120 psig (825 kPa). Isolate test source and let stand for four hours to equalize temperature. Refill system, if required, to test pressure; hold for two hours with no drop in pressure.
 - c. Piping Leak Tests for HDPE Compressed-Air Piping: Test new and modified parts of existing piping. Cap and fill general-service compressed-air piping with oil-free dry air or gaseous nitrogen, at temperature of 100 deg F (38 deg C) or less, to pressure of 40 psig (275 kPa) above system operating pressure, but not less than 100 psig (690 kPa) **OR** 125 psig (860 kPa) **OR** 150 psig (1035 kPa), **as directed**, or more than 180 psig (1240 kPa). Isolate test source and let stand for four hours to equalize temperature. Refill system, if required, to test pressure; hold for two hours with no drop in pressure.
 - d. Repair leaks and retest until no leaks exist.
 - e. Inspect filters, lubricators, and pressure regulators for proper operation.
- 3. Prepare test reports.

END OF SECTION 22 11 16 00c11 10 00c

SECTION 22 11 16 00D - MEDICAL VACUUM AND GAS PIPING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. This section includes the furnishing of all labor and materials necessary for complete installation, cleaning, testing and certification of medical vacuum, waste anesthesia gas disposal and gas distribution and monitoring systems, including; piping, inlets, outlets, alarms, valves, supports, labeling, identification and all related accessories. Medical gas systems include Oxygen, Compressed Air, Nitrous Oxide, Carbon Dioxide and Nitrogen.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. NFPA 99 Standard for Health Care Facilities
 - 2. NFPA 70 National Electrical Code
 - 3. ASTM B819 Seamless Copper Tube for Medical Gas Systems
 - 4. AWS A5.8 Brazing Filler Metal
 - 5. CGA V-5 Diameter Index Safety System
 - 6. Title 25, Texas Administrative Code, Chapter 133, Hospital Licensing
- D. Comply with all Federal and State regulations applicable to this installation.

1.04 QUALITY ASSURANCE

- A. All materials, equipment, installation, testing and certification shall be in strict accordance with NFPA 99 for Level 1 Medical–Surgical Vacuum, WAGD and Gases.
- B. Manufacturer's name and pressure rating shall be permanently marked on valve body.
- C. Products of same type shall be by one manufacturer. All valves, valve boxes, inlets, outlets, alarms and associated components shall be supplied by a single manufacturer and shall be fully compatible with existing system and service devices.
- D. Verify compatibility of all new components with existing system and services.

- E. Maintain one copy of each Contract Document on Site.
- F. Prior to any installation Work, the installer of medical vacuum and gas piping shall provide and maintain documentation on the job Site for the qualification of brazing procedures and individual brazers as required by NFPA 99.

1.05 SUBMITTALS

A. General:

- 1. All submitted data shall be specific to this project and identified as such. Generic submittal data will not be accepted.

B. Product Data:

- 1. Manufacturers descriptive literature, illustrations and installation instructions for all components included within this project indicating compliance with applicable referenced standards, size, dimensions, model number, electrical characteristics and connection requirements.

C. Shop Drawings:

- 1. Wiring diagrams for medical vacuum and gas alarm systems. Differentiate between manufacturer-installed and field-installed wiring.

D. Record Documents:

- 1. Record actual locations of piping, valves, alarm sensors, alarm panels, station inlets and outlets.
- 2. Prepare and provide valve charts.
- 3. Provide record of test procedures and the results of all tests indicating room and area designations, dates of the tests, and names of persons conducting the tests.
- 4. Brazer Certificates: Installation Contractor shall present written documentation (less than 1 year old) from a recognized agency trained in administering and testing brazing techniques as per AWS B2.2 or ASME Section IX, certifying that all brazers have been thoroughly trained and tested in the complete installation of medical gas systems.
- 5. Provide full written description of manufacturer's warranty.

E. Operation and Maintenance Data:

- 1. Operation Data: Include manufacturer's installation and operating instructions.
- 2. Maintenance Data: Servicing and testing requirements, inspection data, exploded assembly views, Record Documents, inspection data, test reports, installation instructions, replacement part numbers and availability, location and contact numbers of service depot.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Tubes, valves, fittings, station outlets, and other piping components in medical gas systems shall have been cleaned for oxygen service by the manufacturer prior to installation in accordance with CGA 4.1, Cleaning Equipment for Oxygen Service, except that fittings shall be permitted to be cleaned by a supplier or agency other than the manufacturer.
- B. Each length of tube shall be delivered plugged or capped by the manufacturer and kept sealed until prepared for installation.

- C. Fittings, valves, and other components shall be delivered sealed, labeled, and kept sealed until installation.
- D. Where contamination is known to have occurred, the materials affected must be removed and replaced with new materials that are cleaned and sealed by the manufacturer or supplier.

1.07 QUALIFICATIONS

- A. General: Companies specializing in manufacturing, installing, testing, certifying and servicing the products and systems specified in this section shall have minimum five years documented experience and be certified as required by the Texas Department of Health and NFPA 99.
- B. Manufacturers: Firms regularly engaged in manufacture of medical gas systems equipment and products, of types, materials, and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years. References may be required.
- C. Equipment Supplier: The medical vacuum and gas systems equipment supplier shall provide the services of a manufacturer authorized product specialist to periodically coordinate with the installing Contractor during initial installation of the pipeline systems and have a service organization located within 50 miles of the project Site to provide ongoing service support to MDACC after project completion.
- D. Installer: Firm with at least 5 years of successful installation experience on projects with medical gas systems work similar to that required for project. All installations of the medical gas piping systems shall be done only by, or under the direct supervision of a holder of a master plumber license or a journeyman plumber license with a medical gas piping installation endorsement issued by the Texas State Board of Plumbing Examiners. All installers of medical gas system components must be qualified in accordance with the requirements of NFPA 99 and ASSE 6010, Medical Gas Systems Installers Professional Qualifications Standard. In addition, all brazers of medical gas system piping must be qualified in accordance with the requirements of either Section IX, Welding and Brazing Requirements of the ASME Boiler and Pressure Vessel Code, or AWS B2.2, Standard for Brazing Procedure and Performance Qualification.
- E. System Verification Testing Agency: Testing shall be conducted by a party technically competent and experienced in the field of medical gas and vacuum pipeline testing and meeting the requirements of ANSI/ASSE Standard 6030, Medical Gas Verifiers Professional Qualifications Standard. Quality control standards of testing agency shall be in strict accordance with American National Standards Institute (ANSI) Q-91. Firm shall be regularly engaged in the testing and certification of similar facilities with a minimum of 5 years of experience.

1.08 SCHEDULING

- A. Schedule Work to ensure installation is complete, tested and certified prior to Substantial Completion.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 PRESSURIZED MEDICAL GAS PIPING

- A. All pipe shall be Type "K", ASTM B819, hard drawn seamless copper medical gas tubing. Pipe shall be identified by the manufacturer's markings, "OXY," "MED," or "OXY/MED" and with size designated reflecting nominal inside diameter.

- B. Turns, offsets, and other changes in direction shall be made with brazed wrought copper capillary fittings complying with ANSI B16.22, Wrought Copper and Copper Alloy Solder-Joint Fittings; or brazed fittings complying with MSS SP-73, Braze Joints for Wrought and Cast Copper Alloy Solder Joint Pressure Fittings. Cast copper alloy fittings shall not be permitted.
- C. Braze joints shall be made using a brazing alloy that exhibits a melting temperature in excess of 538°C (1000°F). Copper-to-copper joints shall be brazed using a copper-phosphorus or copper-phosphorus-silver brazing filler metal (BCuP series) without flux. Flux shall only be used when brazing dissimilar metals such as copper and bronze or brass, using a silver (BAg series) brazing filler metal. Brazing alloy comply with ANSI/AWS A.5.8, Specification for Brazing Filler Metal.
- D. Threaded joints in medical gas distribution piping shall be limited to connections to pressure/vacuum indicators, alarm devices, and source equipment. All threads shall be tapered pipe threads complying with ANSI B1.20.1, Pipe Threads, General Purpose and be made up with polytetrafluoroethylene (such as Teflon™) tape or other thread sealant recommended for oxygen service, with the sealant applied to the male threads only. Where threaded nipples are required these shall be I.P.S. brass.
- E. The use of shape memory alloy couplings may be used when making connections to existing piping sizes 2" and smaller. Memory-metal couplings shall have temperature and pressure ratings joints not less than that of a brazed joint. Shape memory alloy couplings shall be manufactured by TW Metals "CryoMed" or AeroFit "CryoFit".
- F. Straight-threaded connections, including unions, flared and compression-type connections, including connections to station outlets and inlets, alarm devices, and other components shall not be permitted.
- G. All pipe and fittings shall be supplied cleaned and sealed for oxygen service.

2.03 MEDICAL VACUUM PIPING

- A. All vacuum piping sizes 1-1/2" and smaller shall be as specified for pressurized medical gas pipe. Vacuum pipe sizes 2" and larger shall be Type "K" or "L" hard-drawn seamless copper, either ASTM B 819 medical gas tube or ASTM B 88 water tube.
- B. Turns, offsets, and other changes in direction shall be made with brazed wrought copper capillary fittings complying with ANSI B16.22, Wrought Copper and Copper Alloy Solder-Joint Fittings; or brazed fittings complying with MSS SP-73, Braze Joints for Wrought and Cast Copper Alloy Solder Joint Pressure Fittings. Cast copper alloy fittings shall not be permitted.
- C. Braze joints shall be made using a brazing alloy that exhibits a melting temperature in excess of 538°C (1000°F). Copper-to-copper joints shall be brazed using a copper-phosphorus or copper-phosphorus-silver brazing filler metal (BCuP series) without flux. Flux shall only be used when brazing dissimilar metals such as copper and bronze or brass, using a silver (BAg series) brazing filler metal. Brazing alloy comply with ANSI/AWS A.5.8, Specification for Brazing Filler Metal.
- D. Threaded joints in medical vacuum distribution piping shall be limited to connections to pressure/vacuum indicators, alarm devices, and source equipment. All threads shall be tapered pipe threads complying with ANSI B1.20.1, Pipe Threads, General Purpose and be made up with polytetrafluoroethylene (such as Teflon™) tape or other thread sealant recommended for oxygen service, with the sealant applied to the male threads only. Where threaded nipples are required, these shall be I.P.S. brass.
- E. The use of shape memory alloy couplings may be used when making connections to existing piping sizes 2" and smaller. Memory-metal couplings shall have temperature and pressure ratings joints not less than that of a brazed joint. Shape memory alloy couplings shall be manufactured by TW Metals "CryoMed" or AeroFit "CryoFit".
- F. Mechanically formed, drilled and extruded tee-branch connections shall not be permitted.

- G. Couplings and fittings incorporating an o-ring seal shall not be permitted.
- H. Roll-grooved joints shall not be permitted.
- I. Straight-threaded connections, including unions, flared and compression-type connections, including connections to station outlets and inlets, alarm devices, and other components shall not be permitted.

2.04 MEDICAL VACUUM AND GAS VALVES

A. General:

- 1. All valves for pressurized gases and valves for vacuum or WAGD services 1-1/2" and smaller shall be supplied cleaned and sealed (bagged) for oxygen service by the manufacturer.
- 2. Valves for vacuum or WAGD service sizes 2" and larger will not be required to be cleaned and sealed for oxygen service.
- 3. Provide quantity and size of valves as indicated on Contract Drawings and as required by NFPA 99.
- 4. Medical vacuum and gas valves, zone valve boxes and related accessories shall be manufactured by BeaconMedaes.

B. Source, Main, Riser and Service Line Shut-Off Valves:

- 1. Shut-off valves shall be full port, double seal, ball-type three piece design, designed for vacuum to 29 inches Hg and working pressures up to 600 WOG with bronze/brass body, blow-out proof stem and chrome plated brass ball and be serviceable in the line. Valve body shall have Teflon (TFE) material ball seat and stem seals. Seats/seals, lubricants and valve material shall be compatible with medical oxygen, nitrous oxide, compressed air, carbon dioxide, nitrogen and mixtures thereof at continuous pressure up to 600 psig and up to 100 degrees Fahrenheit.
- 2. Valve shall be provided with and operated by a lever-type handle requiring only a quarter turn from a fully open position to a fully closed position.
- 3. All valves shall be equipped with type "K" washed and degreased copper pipe stub extensions at both the inlet and outlet sides of the valve port to facilitate installation. On outlet pipe stub provide 1/8" FPT tap with plug to accept gauge or nitrogen purge connection. Stub extensions shall be supplied to Site capped at both ends
- 4. Valve tags showing the appropriate gas services, pressure rating, etc. shall be attached to each valve.
- 5. Each shut-off valve shall be provided with locking kit.

C. Zone Valve and Box Assemblies:

- 1. Each zone valve cabinet shall be recessed type and consist of the following components: A steel valve box housing single or multiple shut-off ball valves with tube extensions, an aluminum frame, and a pull-out removable window. Boxes shall be provided to accommodate size and type of medical vacuum and gas valves as indicated on Contract Drawings.
- 2. The valve box shall be constructed of 18 gauge steel complete with a white epoxy finish and provided with two galvanized steel brackets for the purpose of mounting to structural support. The assembly trim shall accommodate various finished wall thickness of up to one inch and be field adjustable. Cabinets shall be designed to permit box assemblies to be ganged together in a vertical stack.

3. The doorframe assembly shall be constructed of anodized aluminum mounted to the back box assembly by screws as provided and shall have a sliding removable front consisting of an opaque door with a pre-mounted pullout ring and clear gauge window. Access to the zone shut-off valves shall be by merely pulling the ring assembly to remove the window from the doorframe. The window shall be capable of re-installation without the use of tools and only after the valve handles have been returned to the open position. The window shall be labeled "Caution – Medical Gas Shut-Off Valve - Close Only in Emergency", or equivalent wording in accordance with NFPA 99.
4. Valves shall be same as specified herein for line shut-off valves except locking devices are not required.
5. Each valve shall be supplied with an identification bracket bolted directly onto the valve body for the purpose of applying an approved medical gas identification label. A package of labels shall be supplied with each valve box assembly for application by the installer.
6. All valves shall be securely attached to the box and provided with with Type "K" washed and degreased copper pipe stub extensions of sufficient length to protrude beyond the sides of the box for connection to system piping. All pipe stub extensions shall be supplied with 1/8" NPT gauge port located on the terminal outlet side of the valve to register pipeline pressure or vacuum. Suitable plugs or caps shall be installed by the manufacturer to prevent contamination of the assembly prior to installation.
7. Gauges shall be minimum 1-1/2" diameter, with metal case and ring, and an 1/8" NPT brass stud at the back of the gauge for the purpose of mounting onto pipe stub extension within the box. The pipe stub extension shall be complete with a soldered gauge holder. Gauge holders shall be sealed with a brass plug to prevent contamination prior to mounting gauges. Pressure gauges shall read 0-700 kPa (0-100 psig) for all gases except nitrogen, which shall read 0-2000 kPa (0-300 psig), and vacuum, which shall read -100-0 kPa (0-30" Hg). Gauges shall be visible through the door of the zone valve box.

2.05 MEDICAL VACUUM AND GAS CHECK VALVES

- A. Check valves shall be center guided, self-aligning, spring loaded ball type check with brass body, Teflon seat, straight-through flow, 400 psi WOG minimum working pressure, having vibration free, silent operation.
- B. Check valves shall be 100% leak tested and comply with NFPA 99.

2.06 SERVICE INLETS AND OUTLETS

A. General:

1. Inlets and outlets shall be UL listed and conform to applicable NFPA and CGA standards.
2. Inlets and outlets shall consist of separate roughing-in and finish assemblies and be modular in design for wall recessed type installation and attachment to concealed piping.
3. For positive pressure gas services, the outlet shall be equipped with a primary and secondary check valve. The secondary check valve shall be rated at a minimum 1379 KPa (200 psi) in the event the primary check valve is removed for maintenance.
4. The roughing-in assembly shall be corrosion resistant with a permanent pin-keying system for each specific gas and be provided with a Type "K", 1/2" outside diameter, 6-1/2" long copper inlet pipe stub, which is silver brazed to the outlet body. The copper tubing inlet shall rotate 360 degrees to allow connection from any direction. The assembly shall allow pressure testing without additional labor to remove plug or adapter after testing.

5. The finishing assembly shall contain a primary check valve, pin-key indexing, a minimum of 2.5 square inches of color coding and incorporate a plaster adjustment from 3/8" to 3/4" variation in wall thickness. Design shall be such as to ensure absolutely no gas flow until the correct adapter is fully engaged. Each assembly shall have a separate cover plate for ease of service without preventing use of other inlets or outlets.
6. All inlets and outlets shall be factory assembled, tested, cleaned for oxygen service, and supplied with temporary protective covers and packages to protect outlet during handling and installation at the job Site.
7. Medical inlets and outlets and related accessories shall be manufactured by BeaconMedaes.

B. Wall Inlets:

1. Wall inlets for Waste Anesthesia Gas Disposal (WAGD) services shall be quick-connect recessed type and be compatible with Medaes Diamond style pin indexed adapters.
2. Wall inlets for Vacuum services shall be Diameter Index Safety System (DISS) recessed type and only accept corresponding DISS type gas specific adapters.
3. Each vacuum outlet shall have an adjacent slide for supporting vacuum bottle assembly.

C. Wall Outlets:

1. Wall outlets for oxygen, nitrous oxide, nitrogen, carbon dioxide and medical compressed air service shall be Diameter Index Safety System (DISS) recessed type and only accept corresponding DISS type gas specific adapters.

D. Ceiling Inlets and Outlets with Hose Drops:

1. Ceiling outlets for oxygen, nitrous oxide, medical compressed air, vacuum and evacuation services shall be Diameter Index Safety System (DISS) recessed type and only accept corresponding DISS type gas specific adapters.
2. Provide an upper hose assembly with a reel-type retractor kit. Hose shall terminate 6'-4" above finished floor.
3. Hose assembly shall consist of a UL-listed high-pressure color-coded conductive hose with a DISS nut and gland on the upper end. Provide a DISS Hand-I-Twist check unit on the lower end for all services except WAGD. Provide a Diamond quick-connect on the lower end for the Waste Anesthesia Gas Disposal service.

2.07 MEDICAL VACUUM AND GAS ALARMS

A. General:

1. Provide master alarms for source equipment as indicated on Contract Drawings and as required by NFPA 99.
2. Provide area alarms for station inlets and outlets as indicated on Contract Drawings and as required by NFPA 99.
3. Alarms shall provide signals as required by the latest edition of NFPA 99. Alarms shall be listed to UL 1069 and CSA C22.2 NO 601.1-M90 and comply with the following electromagnetic compatibility standards: FCC Part 15 Class A, ICES 003 Class A, EN 61326, EN 61000-3-2 and EN 61000-3-3.
4. All field wiring and signals shall be self-monitoring and on a closed circuit. Fault signals shall activate on an open circuit.

5. Input power to the alarm panel shall be 100 to 250 VAC 50/60 Hz, double fused on the input side. An internal power supply shall convert the input voltage to low voltage +5 and +24 VDC. All user accessible electronics and wiring shall utilize low voltage. A guard must be removed to access the high voltage wiring.
6. A green front panel POWER ON indicator shall illuminate when the alarm panel is powered. Each monitored condition shall have a separate red indicator illuminated when in alarm. A red indicator on the alarm silence button shall be illuminated after any audible alarm has been silenced.
7. Each panel shall provide an audible signal activated by digital display modules or multi-signal alarm modules. The audible signal shall produce a minimum sound pressure level of 90 dBA measured at a distance of 3 feet. The alarm panel shall contain alarm silence, test, and setup buttons.
8. Each panel shall include a general fault relay for the entire panel, an RS-485 data port and an additional auxiliary relay.
9. Medical gas alarm panels, sensors and related accessories shall be manufactured by BeaconMedaes.

B. Area Alarms

1. Area alarm panels shall be provided to monitor all medical gas, medical/surgical vacuum, and piped WAGD systems supplying anesthetizing locations, and other vital life support and critical areas such as post anesthesia recovery, intensive care units, emergency departments, and where indicated on Contract Drawings.
2. Digital display modules shall provide a digital LED display continuously indicating the pressure or vacuum in the piping system being monitored. The brightness of the LED display shall be adjustable to compensate for ambient lighting. The display shall be programmable to read psig, in Hg, mm Hg, or kPa in increments of 1 psig, 1 in Hg, 1 mm Hg, or 1 kPa respectively.
3. The digital display module shall provide an audible and visual signal when a fault condition occurs. A front panel alarm mute button shall be provided to silence the audio. A visual signal shall flash until the alarm silence button is pressed, and shall then remain statically illuminated. The visual signal shall automatically cancel when the fault is corrected.
4. Separate visual signals for system pressure or vacuum are NORMAL (green LED), LOW (red LED), and HIGH (red LED). Signal limits are factory set per NFPA 99 and field programmable without the use of tools. Pressing and holding the front panel TEST button initiates a self-test function to test the LED display, visual indicators, audible alarm, and to view the alarm set points.
5. Each digital display module shall be equipped with separate relays for high and low alarms. Relays shall be single-pole double-throw type (30 VAC/VDC 2A max). Digital readings from one display module shall be capable of being monitored by another digital display module at a remote panel.
6. A sensor module shall be provided for each digital display module. Sensor modules shall contain a transducer capable of providing calibrated signals to the digital display module. Sensor modules shall be gas specific. The alarm panel shall be factory configured for sensor mounting within the alarm panel rough-in box (local sensors) or mounting above ceiling directly to the medical gas pipeline (remote sensors). Remote sensors may be located up to 1524 m (5,000 feet) from the alarm panel.
7. Pipeline connections shall be 3/8" nominal (1/2" OD) Type "K" copper tube. Connectors shall be provided for attaching field wiring. Sensors shall be gas specific for periodic testing without interrupting medical gas pipeline pressures or vacuum.

C. Master Alarms

1. A master alarm system shall be provided to monitor the operation and condition of the source of supply, the reserve source, and the pressure in the main lines of each medical vacuum and gas piping system. The master alarm system shall consist of two or more alarm panels located in at least two separate locations as required by NFPA 99.
2. Each Multi-signal alarm module shall be capable of monitoring up to five dry-contact signals. Each signal shall illuminate a green LED to indicating normal conditions. When a fault occurs, the green LED shall turn off, a red LED shall illuminate, and an audible alarm shall sound. The red LED shall flash until the front panel alarm silence button is pressed. After the alarm silence button is pressed, the red LED shall remain statically illuminated. The red indicator shall automatically turn off and the green LED shall illuminate when the fault is corrected.
3. LED illumination for unused signals shall be deactivated in the field. Field programming shall be accomplished without the use of tools. Pressing and holding the front panel TEST button shall initiate a self-test function to test the LED indicators and audible alarm. The multi-signal module shall be supplied with five, dry-contact, normally closed relays for connection to a building automation system. Relay ratings shall be 30 VAC/VDC 2A max.
4. A blank overlay shall be used to fill unused alarm panel locations and/or reserve a module location for future expansion. It shall be removable for installing additional modules.

D. Vacuum and Pressure Switches

1. Switches shall incorporate UL listed single-pole, double-throw, and snap-action switching elements. Switch shall automatically reset.
2. Switches shall be housed in a watertight NEMA 4 enclosure with tamper-resistant external adjustment.
3. Signal setting for low vacuum shall be at 12" HG.
4. Signal settings for all pressure gases except Nitrogen shall be; Low – 40 psig, High – 60 psig.
5. Signal settings for Nitrogen gas shall be; Low – 140 psig, High – 190 psig.
6. Pressure switches shall be cleaned and sealed for oxygen service.

2.08 LINE GAUGES**A. General:**

1. Gauges shall comply with ANSI/ASME B-40.1 and be constructed of materials compatible with medical vacuum and gas applications. Pressure indicators for medical gas piping systems shall be cleaned for oxygen service.
2. Gauge housings shall be drawn steel with black, corrosion-resistant paint. Dial shall be 4-1/2" in diameter with white background and black markings. Pointer shall be aluminum with black finish. Gauge movement shall be brass construction. Bottom of gauge shall be provided with 1/4" – 18 NPT – 2A brass connection.
3. Indicators adjacent to master alarm actuators and area alarms shall be labeled to identify the name of or chemical symbol for the particular piping system that they monitor.
4. Provide Diameter Index Safety System connection kits with all appropriate fittings for connecting gauges to pipelines.

- B. Medical vacuum and gas line gauges and DISS connection kits shall be manufactured by BeaconMedaes.
- C. Vacuum Line Gauges
 - 1. Vacuum bourbon tube shall be beryllium copper and soft soldered.
 - 2. Gauge shall register 0 – 30 inches HG.
- D. Pressure Line Gauges
 - 1. Pressure bourbon tube shall be phosphor bronze and soft soldered.
 - 2. Gauge shall register 0 – 100 psig for all medical gases except Nitrogen.
 - 3. Gauge shall register 0 – 300 psig for Nitrogen gas.
 - 4. Gauges for positive pressure gases shall be cleaned and sealed for oxygen service.

2.09 UNDERGROUND WARNING TAPE

- A. Minimum 3 inch wide polyethylene detectable type marking tape. The tape shall be resistant to alkalis, acids and other destructive agents found in soil and impregnated with metal so that it can be readily recognized after burial by standard locating equipment.
 - 1. Lamination bond of 1 layer of Minimum 0.35 mils thick aluminum foil between 2 layers of minimum 4.3 mils thick inert plastic film.
 - 2. Minimum tensile strength: 63 LBS per 3 IN width.
 - 3. Minimum elongation: 500 percent.
 - 4. Provide continuous yellow with black letter printed message repeated every 16 to 36 inches warning of pipe by specific name buried below (e.g.: "CAUTION OXYGEN LINE BURIED BELOW").
 - 5. Manufactured by Reef Industries "Terra Tape" or approved equal.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install all system components in complete compliance with referenced standards and manufacturer's published instructions.
- D. Exercise great care in the storage and handling of all materials and in the condition of tools used in cutting and reaming to prevent oil or grease or any contaminants from being introduced into tubing. The interior surfaces of tube ends, fittings, and other components that were cleaned for oxygen service by the manufacturer, but become contaminated prior to being installed, shall be recleaned on-Site by the installer by thoroughly scrubbing the interior surfaces with a clean, hot water-alkaline solution, such as sodium carbonate or trisodium phosphate 450 g to 11 L (1 lb to 3 gal) of potable water and thoroughly rinsing them with clean, hot potable water. Material that has become contaminated internally and is not clean for oxygen service shall not be installed.

- E. The exterior surface of all tubes, joints and fittings shall be cleaned prior to brazing with non-abrasive pads by washing with hot water after assembly to remove any surface oxides or excess flux and provide for clear visual inspection of brazed connections. A visual inspection of each brazed joint shall be made to assure that the alloy has flowed completely around the joint at the tube-fitting interface. Where flux has been used, assure that solidified flux residue has not formed a temporary seal that could hold test pressure.
- F. Apply flux sparingly to the clean tube only and in a manner to avoid leaving any excess inside of completed joints. (NOTE: Ensure proper ventilation. Some BAg series filler metals contain cadmium, which, when heated during brazing, can produce toxic fumes.)
- G. Joints shall be brazed within one hour after the surfaces are cleaned for brazing.
- H. While being brazed, all vacuum and oxygen piping joints shall be continuously purged with oil-free, dry Nitrogen to prevent the formation of copper oxide on the inside surfaces of the joint. The purge shall be maintained until the joint is cool to the touch. The final connection of new piping to an existing, in-use pipeline shall be permitted to be made without the use of a nitrogen purge.
- I. Bury all underground piping at least 3 feet below finished grade and fully encase within schedule 40 PVC piping sleeve. Provide a continuous detectable warning tape immediately above buried lines. Warning tape shall clearly identify the pipeline by specific name. A continuous warning means shall also be provided on tamped backfill above the pipeline at approximately one-half the depth of bury.
- J. Do not install piping in the same trench with other buried utilities. The minimum horizontal clearance between medical pipe and parallel buried utility pipe shall be 8 feet. Do not install pipe through catch basins, vaults, manholes or similar underground structures.
- K. Piping systems for gases shall not be used as a grounding electrode.
- L. Piping shall not be installed in kitchens, electrical switchgear rooms, elevator shafts, and areas with open flames.
- M. Memory-metal couplings shall not be installed within eight inches of a brazed joint.
- N. Shut-off valves installed for future connections shall be provided with downstream piping closed with a brazed cap and sufficient tubing allowance for cutting and re-brazing.
- O. Branch takeoffs from horizontal piping shall be taken off above the centerline of the main or branch pipe and rise vertically or at an angle of not less than 45 degrees from vertical.
- P. Support all piping in accordance with NFPA 99 and Contract Documents.
- Q. Pressure and vacuum indicators shall be readable from a standing position.
- R. Zone valve boxes shall be installed where they are visible and accessible at all time and readily operable from a standing position in the corridor on the same floor they serve.
- S. Area alarm panels shall be located where indicated on Contract Drawings at a nurse's station or other location that will provide for continuous responsible surveillance.
- T. Locate master alarm panels shall where indicated on Contract Drawings in at least two separate locations as required by NFPA 99.
- U. All alarm panels shall be mounted at a height allowing monitoring and operation from a standing position.
- V. Coordinate with Electrical Contractor to insure that power is provided to alarms from the life safety branch of the emergency electrical system as described in NFPA 99.

- W. Provide low voltage wiring from sensors to alarm panels as required by NFPA 99. All low voltage wiring shall be routed within conduit. Wiring from switches or sensors shall be supervised or protected as required by NFPA 70, National Electrical Code, for emergency system circuits.

3.02 LABELING

- A. Label all piping, valves, station inlets and outlets, and alarms in accordance with NFPA 99 requirements and Contract Documents.
- B. Re-label existing shut-off valves and alarm panels when modifications are made changing the areas served. New labels shall be in accordance with NFPA 99 and Contract Documents.

3.03 TESTING AND INSPECTION

- A. Inspection and testing shall be performed on all new piped gas systems, additions, renovations, temporary installations, or repaired systems, to assure the facility, by a documented procedure, that all applicable provisions of NFPA 99 have been adhered to and system integrity has been achieved or maintained.
- B. After brazing, the outside of all joints shall be cleaned by washing with water and a wire brush to remove any residue and permit clear visual inspection of the joint. Each brazed joint shall be visually inspected after cleaning the outside surfaces. Brazed joints identified as defective shall be repaired or replaced as required by NFPA 99.
- C. After installation of the distribution piping and before installation of station outlets/inlets and other system components (e.g., pressure/vacuum alarm devices, pressure/vacuum indicators), piping in medical vacuum and gas distribution systems shall be blown clear by means of oil-free, dry Nitrogen.
- D. Installer shall perform initial pressure tests, cross-connection test, piping purge test and standing pressure test prior to third party system verification and in strict accordance with NFPA 99.
- E. The rated accuracy of indicators used for testing shall be 1 percent (full scale) or better at the point of reading.
- F. System verification tests shall be performed only after all installer performed tests, have been completed. Equipment Vendor or installing Contractor shall not perform system verification, final testing or certification.
- G. A Third Party Medical Gas System Verification Testing Agency shall perform standing pressure test, cross-connection test, valve test, alarm test, piping purge test, piping particulate test, piping purity test, final tie-in test, operational pressure test and medical gas concentration test.
- H. The Third Party Medical Gas System Verification Testing Agency shall verify the presence and correctness of labeling required by this standard for all components (e.g., station outlets/inlets, shutoff valves, and alarm panels).
- I. It shall be the responsibility of the Third Party Medical Gas System Verification Testing Agency to make periodic job Site visits to assure all requirements of this specification and NFPA 99 are strictly adhered to.
- J. Certification shall clearly state that the system is approved for patient use and meets all requirements of NFPA-99 inclusive of all referenced and/or related documents. Any exceptions or limitations shall be clearly stated on the same certification document.

3.04 VENDOR SUPERVISION AND OPERATING INSTRUCTIONS

- A. An authorized representative of the equipment manufacturer shall periodically check with the installing Contractor during initial installation of the pipeline systems and equipment and shall assist the Contractor in final check to make certain that all systems are operating as recommended by the manufacturer, as specified and in accordance with NFPA 99. The equipment manufacturer's representative shall provide a minimum of 4 hours instruction to MDACC personnel in the use of the piping systems and the related equipment operated from those systems.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 11 19 00 - LABORATORY VACUUM AND GAS PIPING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. This section includes the furnishing of all labor and materials necessary for complete installation, cleaning, testing and certification of laboratory vacuum, waste anesthesia gas disposal and gas distribution and monitoring systems, including; piping, inlets, outlets, alarms, valves, supports, labeling, identification and all related accessories. Laboratory gas systems include Oxygen, Compressed Air, Nitrous Oxide, Carbon Dioxide and Nitrogen.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. NFPA 99 Standard for Health Care Facilities.
 - 2. NFPA 70/ASTM B819 Seamless Copper Tube for Medical Gas Systems.
 - 3. AWS A5.8 Brazing Filler Metal.
 - 4. CGA V-5 Diameter Index Safety System.
- D. Comply with all Federal and State regulations applicable to this installation.

1.04 QUALITY ASSURANCE

- 1. All materials, equipment, installation, testing and certification shall be in strict accordance with NFPA 99 for Level 1 Medical–Surgical Vacuum, WAGD and Gases.
- 2. Manufacturer's name and pressure rating shall be permanently marked on valve body.
- 3. Products of same type shall be by one manufacturer. All valves, valve boxes, inlets, outlets, alarms and associated components shall be supplied by a single manufacturer and shall be fully compatible with existing system and service devices.
- 4. Verify compatibility of all new components with existing system and services.
- 5. Maintain one copy of each Contract Document on Site.

6. Prior to any installation Work, the installer of laboratory vacuum and gas piping shall provide and maintain documentation on the job Site for the qualification of brazing procedures and individual brazers as required by NFPA 99.

1.05 SUBMITTALS

A. General:

1. All submitted data shall be specific to this project and identified as such. Generic submittal data will not be accepted.

B. Product Data:

1. Manufacturers descriptive literature, illustrations and installation instructions for all components included within this project indicating compliance with applicable referenced standards, size, dimensions, model number, electrical characteristics and connection requirements.

C. Shop Drawings:

1. Wiring diagrams for laboratory vacuum and gas alarm systems. Differentiate between manufacturer-installed and field-installed wiring.

D. Record Documents:

1. Record actual locations of piping, valves, alarm sensors, alarm panels, station inlets and outlets.
2. Prepare and provide valve charts.
3. Provide record of test procedures and the results of all tests indicating room and area designations, dates of the tests, and names of persons conducting the tests.
4. Brazer Certificates: Installation Contractor shall present written documentation (less than 1 year old) from a recognized agency trained in administering and testing brazing techniques as per AWS B2.2 or ASME Section IX, certifying that all brazers have been thoroughly trained and tested in the complete installation of medical gas systems.
5. Product Certificates: The installer shall furnish documentation certifying that all installed pipe, valves, fittings, station outlets, and other piping components in laboratory gas systems shall have been cleaned for oxygen service in accordance with CGA 4.1, Cleaning Equipment for Oxygen Service and NFPA 99. Submit letter signed by manufacturer certifying that copper tubing complies with NFPA 99. Submit letter from manufacturer stating that station outlets and inlets are designed and manufactured to comply with NFPA 99. Outlet and inlet shall bear label of approval as an assembly, by Underwriters Laboratories, Inc., or Associated Factory Mutual Research Corporation.
6. Inspection and Test Reports: Furnish documentation that all installer inspections and tests required by NFPA 99 for Level 1 Medical–Surgical Vacuum, WAGD and Gases have been performed. Identify test type, procedure and results.
7. Independent Third Party System Verification Testing Agency Reports and Certification: Documentation verifying that completed systems have been installed, tested, purged, and analyzed in accordance with the requirements of referenced standards and contract documents. Provide copy of agency's written Q-91 standards.
8. Provide full written description of manufacturer's warranty.

E. Operation and Maintenance Data:

1. Operation Data: Include manufacturer's installation and operating instructions.
2. Maintenance Data: Servicing and testing requirements, inspection data, exploded assembly views, Record Documents, inspection data, test reports, installation instructions, replacement part numbers and availability, location and contact numbers of service depot.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Tubes, valves, fittings, station outlets, and other piping components in laboratory gas systems shall have been cleaned for oxygen service by the manufacturer prior to installation in accordance with CGA 4.1, Cleaning Equipment for Oxygen Service, except that fittings shall be permitted to be cleaned by a supplier or agency other than the manufacturer.
- B. Each length of tube shall be delivered plugged or capped by the manufacturer and kept sealed until prepared for installation.
- C. Fittings, valves, and other components shall be delivered sealed, labeled, and kept sealed until installation.
- D. Where contamination is known to have occurred, the materials affected must be removed and replaced with new materials that are cleaned and sealed by the manufacturer or supplier.

1.07 QUALIFICATIONS

- A. General: Companies specializing in manufacturing, installing, testing, certifying and servicing the products and systems specified in this section shall have minimum five years documented experience and be certified as required by the Texas Department of Health and NFPA 99.
- B. Manufacturers: Firms regularly engaged in manufacture of medical vacuum and gas systems equipment and products, of types, materials, and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years. References may be required.
- C. Equipment Supplier: The laboratory vacuum and gas systems equipment supplier shall provide the services of a manufacturer authorized product specialist to periodically coordinate with the installing Contractor during initial installation of the pipeline systems and have a service organization located within 50 miles of the project Site to provide ongoing service support to M. D. Anderson Cancer Center after project completion.
- D. Installer: Firm with at least 5 years of successful installation experience on projects with medical vacuum and gas systems work similar to that required for project. All installations of the piping systems shall be done only by, or under the direct supervision of a holder of a master plumber license or a journeyman plumber license with a medical gas piping installation endorsement issued by the Texas State Board of Plumbing Examiners. All installers of laboratory vacuum and gas system components must be qualified in accordance with the requirements of NFPA 99 and ASSE 6010, Medical Gas Systems Installers Professional Qualifications Standard. In addition, all brazers of laboratory gas system piping must be qualified in accordance with the requirements of either Section IX, Welding and Brazing Requirements of the ASME Boiler and Pressure Vessel Code, or AWS B2.2, Standard for Brazing Procedure and Performance Qualification.
- E. System Verification Testing Agency: Testing shall be conducted by a party technically competent and experienced in the field of medical gas and vacuum pipeline testing and meeting the requirements of ANSI/ASSE Standard 6030, Medical Gas Verifiers Professional Qualifications Standard. Quality control standards of testing agency shall be in strict accordance with American National Standards Institute (ANSI) Q-91. Firm shall be regularly engaged in the testing and certification of similar facilities with a minimum of 5 years of experience.

1.08 SCHEDULING

- A. Schedule Work to ensure installation is complete, tested and certified prior to Substantial Completion.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 PRESSURIZED LABORATORY GAS PIPING

- A. All pipe shall be Type "K", ASTM B819, hard drawn seamless copper medical gas tubing. Pipe shall be identified by the manufacturer's markings, "OXY," "MED," or "OXY/MED" and with size designated reflecting nominal inside diameter.
- B. Turns, offsets, and other changes in direction shall be made with brazed wrought copper capillary fittings complying with ANSI B16.22, Wrought Copper and Copper Alloy Solder-Joint Fittings; or brazed fittings complying with MSS SP-73, Braze Joints for Wrought and Cast Copper Alloy Solder Joint Pressure Fittings. Cast copper alloy fittings shall not be permitted.
- C. Braze joints shall be made using a braze alloy that exhibits a melting temperature in excess of 538°C (1000°F). Copper-to-copper joints shall be braze using a copper-phosphorus or copper-phosphorus-silver braze filler metal (BCuP series) without flux. Flux shall only be used when braze dissimilar metals such as copper and bronze or brass, using a silver (BAg series) braze filler metal. Braze alloy comply with ANSI/AWS A.5.8, Specification for Braze Filler Metal.
- D. Threaded joints in laboratory gas distribution piping shall be limited to connections to pressure/vacuum indicators, alarm devices, and source equipment. All threads shall be tapered pipe threads complying with ANSI B1.20.1, Pipe Threads, General Purpose and be made up with polytetrafluoroethylene (such as Teflon™) tape or other thread sealant recommended for oxygen service, with the sealant applied to the male threads only. Where threaded nipples are required these shall be I.P.S. brass.
- E. The use of shape memory alloy couplings is may be used when making connections to existing piping sizes 2" and smaller. Memory-metal couplings shall have temperature and pressure ratings joints not less than that of a braze joint. Shape memory alloy couplings shall be manufactured by TW Metals "CryoMed" or AeroFit "CryoFit".
- F. Straight-threaded connections, including unions, flared and compression-type connections, including connections to station outlets and inlets, alarm devices, and other components shall not be permitted.
- G. All pipe and fittings shall be supplied cleaned and sealed for oxygen service.

2.03 LABORATORY VACUUM PIPING

- A. All vacuum piping sizes 1-1/2" and smaller shall be as specified for pressurized laboratory gas pipe. Vacuum pipe sizes 2" and larger shall be Type "K" or "L" hard-drawn seamless copper, either ASTM B 819 medical gas tube or ASTM B 88 water tube.
- B. Turns, offsets, and other changes in direction shall be made with braze wrought copper capillary fittings complying with ANSI B16.22, Wrought Copper and Copper Alloy Solder-Joint Fittings; or braze fittings complying with MSS SP-73, Braze Joints for Wrought and Cast Copper Alloy Solder Joint Pressure Fittings. Cast copper alloy fittings shall not be permitted.

- C. Brazed joints shall be made using a brazing alloy that exhibits a melting temperature in excess of 538°C (1000°F). Copper-to-copper joints shall be brazed using a copper-phosphorus or copper-phosphorus-silver brazing filler metal (BCuP series) without flux. Flux shall only be used when brazing dissimilar metals such as copper and bronze or brass, using a silver (BAg series) brazing filler metal. Brazing alloy comply with ANSI/AWS A.5.8, Specification for Brazing Filler Metal.
- D. Threaded joints in laboratory vacuum distribution piping shall be limited to connections to pressure/vacuum indicators, alarm devices, and source equipment. All threads shall be tapered pipe threads complying with ANSI B1.20.1, Pipe Threads, General Purpose and be made up with polytetrafluoroethylene (such as Teflon™) tape or other thread sealant recommended for oxygen service, with the sealant applied to the male threads only. Where threaded nipples are required, these shall be I.P.S. brass.
- E. The use of shape memory alloy couplings is may be used when making connections to existing piping sizes 2" and smaller. Memory-metal couplings shall have temperature and pressure ratings joints not less than that of a brazed joint. Shape memory alloy couplings shall be manufactured by TW Metals "CryoMed" or Aerofit "CryoFit".
- F. Mechanically formed, drilled and extruded tee-branch connections shall not be permitted.
- G. Couplings and fittings incorporating an o-ring seal shall not be permitted.
- H. Roll-grooved joints shall not be permitted.
- I. Straight-threaded connections, including unions, flared and compression-type connections, including connections to station outlets and inlets, alarm devices, and other components shall not be permitted.

2.04 LABORATORY VACUUM AND GAS VALVES

A. General:

- 1. All valves for pressurized gases and valves for vacuum or WAGD services 1-1/2" and smaller shall be supplied cleaned and sealed (bagged) for oxygen service by the manufacturer.
- 2. Valves for vacuum or WAGD service sizes 2" and larger will not be required to be cleaned and sealed for oxygen service.
- 3. Provide quantity and size of valves as indicated on Contract Drawings and as required by NFPA 99.
- 4. Laboratory vacuum and gas valves, zone valve boxes and related accessories shall be manufactured by BeaconMedaes.

B. Source, main, riser and service line shut-off valves shall

- 1. Shut-off valves shall be full port, double seal, ball-type three piece design, designed for vacuum to 29 inches Hg and working pressures up to 600 WOG with bronze/brass body, blow-out proof stem and chrome plated brass ball and be serviceable in the line. Valve body shall have Teflon (TFE) material ball seat and stem seals. Seats/seals, lubricants and valve material shall be compatible with oxygen, nitrous oxide, compressed air, carbon dioxide, nitrogen and mixtures thereof at continuous pressure up to 600 psig and up to 100 degrees Fahrenheit.
- 2. Valve shall be provided with and operated by a lever-type handle requiring only a quarter turn from a fully open position to a fully closed position.
- 3. All valves shall be equipped with type "K" washed and degreased copper pipe stub extensions at both the inlet and outlet sides of the valve port to facilitate installation. On outlet pipe stub provide 1/8" FPT tap with plug to accept gauge or nitrogen purge connection. Stub extensions shall be supplied to Site capped at both ends

4. Valve tags showing the appropriate gas services, pressure rating, etc. shall be attached to each valve.
5. Each shut-off valve shall be provided with locking kit.

C. Zone Valve and Box Assemblies:

1. Each zone valve cabinet shall be recessed type and consist of the following components: A steel valve box housing single or multiple shut-off ball valves with tube extensions, an aluminum frame, and a pull-out removable window. Boxes shall be provided to accommodate size and type of vacuum and gas valves as indicated on Contract Drawings.
2. The valve box shall be constructed of 18 gauge steel complete with a white epoxy finish and provided with two galvanized steel brackets for the purpose of mounting to structural support. The assembly trim shall accommodate various finished wall thickness of up to one inch and be field adjustable. Cabinets shall be designed to permit box assemblies to be ganged together in a vertical stack.
3. The doorframe assembly shall be constructed of anodized aluminum mounted to the back box assembly by screws as provided and shall have a sliding removable front consisting of an opaque door with a pre-mounted pullout ring and clear gauge window. Access to the zone shut-off valves shall be by merely pulling the ring assembly to remove the window from the doorframe. The window shall be capable of re-installation without the use of tools and only after the valve handles have been returned to the open position. The window shall be labeled "Caution – Laboratory Gas Shut-Off Valve - Close Only in Emergency", or equivalent wording in accordance with NFPA 99.
4. Valves shall be same as specified herein for line shut-off valves except locking devices are not required.
5. Each valve shall be supplied with an identification bracket bolted directly onto the valve body for the purpose of applying an approved identification label. A package of labels shall be supplied with each valve box assembly for application by the installer.
6. All valves shall be securely attached to the box and provided with with Type "K" washed and degreased copper pipe stub extensions of sufficient length to protrude beyond the sides of the box for connection to system piping. All pipe stub extensions shall be supplied with 1/8" NPT gauge port located on the terminal outlet side of the valve to register pipeline pressure or vacuum. Suitable plugs or caps shall be installed by the manufacturer to prevent contamination of the assembly prior to installation.
7. Gauges shall be minimum 1-1/2" diameter, with metal case and ring, and an 1/8" NPT brass stud at the back of the gauge for the purpose of mounting onto pipe stub extension within the box. The pipe stub extension shall be complete with a soldered gauge holder. Gauge holders shall be sealed with a brass plug to prevent contamination prior to mounting gauges. Pressure gauges shall read 0-700 kPa (0-100 psig) for all gases except nitrogen, which shall read 0-2000 kPa (0-300 psig), and vacuum, which shall read -100-0 kPa (0-30" Hg). Gauges shall be visible through the door of the zone valve box.

2.05 SERVICE INLETS AND OUTLETS

A. General:

- B. For Gas, Air and Vac valves, UTHSCSA specify Chicago 909 series valves, but they need to be specified so the proper service indicated. If the GAV are deck mounted, we specify Chicago turrets, 980-CP or 981-CP, depending on arrangement desired. There are other arrangements available, which we have used on occasion, but these two work for almost every application we see. For curb or wall mount GAV valves, specify Chicago 986-CP flange

C. Vacuum and Pressure Switches

1. Switches shall incorporate UL listed single-pole, double-throw, and snap-action switching elements. Switch shall automatically reset.
2. Switches shall be housed in a watertight NEMA 4 enclosure with tamper-resistant external adjustment.
3. Signal setting for low vacuum shall be at 12" HG.
4. Signal settings for all pressure gases except Nitrogen shall be; Low – 40 psig, High – 60 psig.
5. Signal settings for Nitrogen gas shall be; Low – 140 psig, High – 190 psig.

D. Pressure switches shall be cleaned and sealed for oxygen service.**E. Natural gas piping only**

1. The gas distribution system shall be installed as indicted on the Drawings, complete with all valves, regulators, meters and other required item.
2. Verify and coordinate, with actual various users on the site, all the times and timing involved with modifications, additions to, or alterations thereof, of gas piping serving these users
3. The natural gas system shall be installed using the materials and methods as specified herein and in the following paragraphs

a. Piping

- 1) All pipe used for the fabrication of gas piping system shall be schedule 40 black steel pipe and fittings. See section 23 21 10.
- 2) Unless otherwise specifically required, all steel pipe provided for gas piping systems shall be provided with plain ends and assembled with weld fittings on all pipe 1 ¼". No pipe smaller than ¾", except as detailed for laboratory furniture, shall be used. From emergency shutoff valve to the outlets the pipe shall be assembled with threaded fittings provided all joints are exposed or within the confines of the laboratory furniture.
- 3) All gas piping within the building shall be installed exposed to view.
- 4) Assemble threaded joints with Teflon tape rated for use with natural gas
- 5) All exposed natural gas piping shall be painted safety yellow

b. Headers

- 1) The gas distribution header installed by the Contractor in the building shall be fabricated of schedule 40 steel pipe. The pipe and welding material for this header shall be carefully selected, and the welding operations shall be carefully supervised.

- 2) Welding nipples neatly aligned shall be provided for the outlets of the header. After the header has been completely fabricated, it shall be temporarily sealed and subjected to a pneumatic pressure test of 100 pounds per square inch. While the header is subjected to this pressure, all welded joints shall be given an application of soapy water for the purpose of detecting minute leaks which might not otherwise be observed. These leaks shall not be repaired by any peening operations. Such leaks shall be remedied by the shipping and re-welding until the header is devoid of leaks at that pressure. The header shall then be subjected to a hydrostatic pressure test of 200 pounds per square inch. Under these circumstances, the test pressure of the water confined in the header shall not decrease in a four hour period of observation. If leaks are encountered, they shall be repaired and re-tested until proven tight.
- 3) The header shall be provided with a one-half inch (1/2") drain connection "taken off" the bottom of the header and terminated in a suitable stop cock. This one-half inch (1/2") drain connection shall have its origin in a 2" x 1/2" welding reducer having its two inch (2") end so welded to the header as to completely drain that member. Each outgoing branch from the header shall be provided with a gas stop valve or gas cock. The nature of the outgoing welding nipples shall be such that these cocks shall be aligned in a neat horizontal line.

c. Cocks

- 1) Near the point at which each outgoing line leaves the gas heater, the contractor shall install a gas stop valve or gas cock. These wrench operated valves shall each be provided with an appropriate wrench. Cocks of the same type shall, moreover, be installed at each other point indicated on the drawings.
- 2) Each separate laboratory shall have an emergency gas shut off valve (E650) controlling all natural gas in the lab, reference make and model of IC# 6205.

d. Drip pipes

- 1) Drip pipes shall be provided throughout the gas piping system for the purpose of accumulating moisture and condensate. They shall be sized no smaller than the gas piping to which they are connected in each instance. These drip pipes shall be U-shaped providing an effective water seal of no less than twelve inches (12") of water. The extremity of each U-shaped drip pipe shall be threaded and capped with a suitably sized, screwed pattern, black, standard weight, and malleable iron cap.
- 2) All drip pipes shall be located in an accessible position so that the condensate may either be pumped from the system or so that a water deal shall be provided in the event that the water forming the seal evaporates.

e. Fabrication methods

- 1) All interior gas piping shall, wherever possible, be installed so as to grade back toward the gas header in the basement. In all cases where such grading is impracticable and it is necessary to grade the house piping away from the inlet, drip pipes of adequate capacity must be installed where traps are formed by such changes in grade. Drip pipes shall terminate with a screwed pattern, malleable iron black cap. No drip pipes shall be used as outlets for the attachment of any fixture or gas appliance. Drip pipes must, moreover, be placed at the bottom of all vertical pipes which rise from and connect to the end of any horizontal pipe.

- 2) All house piping must be securely fastened in place in such a manner as to maintain its grading. Under no circumstances shall extension bars be used for supporting gas piping. Under no circumstances shall any gas piping be used to support any weight other than its own weight.
- 3) All branch outlet pipes shall be taken from the top or sides of running horizontal lines and not from the bottom. No crosses shall be installed in any horizontal gas line. No unions, gas cocks, or valves shall be used in any concealed location. Every gas cock and valve shall be accessible for inspection and repair.
- 4) The general arrangement of all gas piping shall be such that the number of threaded joints involved is reduced to an absolute minimum. If obstructions are encountered, pipe shall not be bent to circumvent such obstructions. Welding fittings shall be used for this purpose in the case of the welded lines, and if threaded lines are involved, screwed fittings shall be used. Wherever gas pipes run through outside brick, stone or other walls, the opening around the pipe shall be securely and rigidly sealed. Gas pipe sizes shall be at least one pipe size larger than the inlet of the gas appliance which they supply. No bushings shall be used in conjunction with any gas piping.

f. Testing

- 1) All gas piping systems shall be completely tested by the contractor. These piping systems shall first be subjected to a pneumatic test pressure per Section 20 01 00. All hydro and pneumatic tests shall be dead weighted, recorded, and countersigned by the project inspector. While the systems are subjected to this air pressure, all welded joints shall have a soapy water solution applied for the purpose of detecting minute as well as larger leaks, and shall be witnessed by Owner. A final test shall be performed after casework and lab hook up are completed at 15 psi for a minimum of 4 hours. If leaks are found, they shall be repaired until gas piping systems are absolutely tight at the pneumatic test pressure indicated above. If leaks occur in the case of threaded joints, such leaks shall be eliminated by legitimate means, i.e., either by replacing leaking fittings or by tightening them properly. Leaking flanged joints shall have flange bolts appropriately tightened or have gaskets causing leaks repaired.
- 2) The entire gas piping systems shall be re-subjected to a pneumatic test pressure per Section 20 01 00. Such gas piping systems must be demonstrated to be absolutely tight when subjected to this pressure for a period of twenty-four hours. In all instances in which leaks are then found, they shall be eliminated in a manner designated by The University's duly authorized representative. A one-half inch (1/2") test connection and cap shall be provided in each branch of the gas piping system.
- 3) After all pneumatic testing of the entire gas piping system has been completed and all leaks have been repaired and at a time deemed suitable by The University's duly authorized representative, the contractor shall have the gas supply turned on and the gas odorant chemical added by a representative of a gas company. The contractor shall then bleed gas from every riser and every run out until the odor is present in the proper quantity at every gas outlet.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.:

- C. Exercise great care in the storage and handling of all materials and in the condition of tools used in cutting and reaming to prevent oil or grease or any contaminants from being introduced into tubing. The interior surfaces of tube ends, fittings, and other components that were cleaned for oxygen service by the manufacturer, but become contaminated prior to being installed, shall be recleaned on-Site by the installer by thoroughly scrubbing the interior surfaces with a clean, hot water-alkaline solution, such as sodium carbonate or trisodium phosphate 450 g to 11 L (1 lb to 3 gal) of potable water and thoroughly rinsing them with clean, hot potable water. Material that has become contaminated internally and is not clean for oxygen service shall not be installed.
- D. The exterior surface of all tubes, joints and fittings shall be cleaned prior to brazing with non-abrasive pads by washing with hot water after assembly to remove any surface oxides or excess flux and provide for clear visual inspection of brazed connections. A visual inspection of each brazed joint shall be made to assure that the alloy has flowed completely around the joint at the tube-fitting interface. Where flux has been used, assure that solidified flux residue has not formed a temporary seal that could hold test pressure.
- E. Apply flux sparingly to the clean tube only and in a manner to avoid leaving any excess inside of completed joints. (NOTE: Ensure proper ventilation. Some BAg series filler metals contain cadmium, which, when heated during brazing, can produce toxic fumes.)
- F. Joints shall be brazed within one hour after the surfaces are cleaned for brazing.
- G. While being brazed, all vacuum and oxygen piping joints shall be continuously purged with oil-free, dry Nitrogen to prevent the formation of copper oxide on the inside surfaces of the joint. The purge shall be maintained until the joint is cool to the touch. The final connection of new piping to an existing, in-use pipeline shall be permitted to be made without the use of a nitrogen purge.
- H. Bury all underground piping at least 3 feet below finished grade and fully encase within schedule 40 PVC piping sleeve. Provide a continuous detectable warning tape immediately above buried lines. Warning tape shall clearly identify the pipeline by specific name. A continuous warning means shall also be provided on tamped backfill above the pipeline at approximately one-half the depth of bury.
- I. Do not install piping in the same trench with other buried utilities. The minimum horizontal clearance between laboratory pipe and parallel buried utility pipe shall be 8 feet. Do not install pipe through catch basins, vaults, manholes or similar underground structures.
- J. Piping shall not be installed in kitchens, electrical switchgear rooms, elevator shafts, and areas with open flames.
- K. Memory-metal couplings shall not be installed within eight inches of a brazed joint.
- L. Shut-off valves installed for future connections shall be provided with downstream piping closed with a brazed cap and sufficient tubing allowance for cutting and re-brazing.
- M. Branch takeoffs from horizontal piping shall be taken off above the centerline of the main or branch pipe and rise vertically or at an angle of not less than 45 degrees from vertical.
- N. Support all piping in accordance with NFPA 99 and Specification Section 15140.
- O. Pressure and vacuum indicators shall be readable from a standing position.
- P. Zone valve boxes shall be installed where they are visible and accessible at all time and readily operable from a standing position in the corridor on the same floor they serve.
- Q. Area alarm panels shall be located where indicated on Contract Drawings at a nurse's station or other location that will provide for continuous responsible surveillance.

- R. Locate master alarm panels shall where indicated on Contract Drawings in at least two separate locations as required by NFPA 99.
- S. All alarm panels shall be mounted at a height allowing monitoring and operation from a standing position.

3.02 LABELING

- A. Label all piping, valves, station inlets and outlets, and alarms in accordance with NFPA 99 requirements and Contract Documents.
- B. Re-label existing shut-off valves and alarm panels when modifications are made changing the areas served. New labels shall be in accordance with NFPA 99 and Contract Documents.

3.03 TESTING AND INSPECTION

- A. Inspection and testing shall be performed on all new piped gas systems, additions, renovations, temporary installations, or repaired systems, to assure the facility, by a documented procedure, that all applicable provisions of NFPA 99 have been adhered to and system integrity has been achieved or maintained.
- B. After brazing, the outside of all joints shall be cleaned by washing with water and a wire brush to remove any residue and permit clear visual inspection of the joint. Each brazed joint shall be visually inspected after cleaning the outside surfaces. Brazed joints identified as defective shall be repaired or replaced as required by NFPA 99.
- C. After installation of the distribution piping and before installation of station outlets/inlets and other system components (e.g., pressure/vacuum alarm devices, pressure/vacuum indicators), piping in laboratory vacuum and gas distribution systems shall be blown clear by means of oil-free, dry Nitrogen.
- D. Installer shall perform initial pressure tests, cross-connection test, piping purge test and standing pressure test prior to third party system verification and in strict accordance with NFPA 99.
- E. System verification tests shall be performed only after all installer performed tests, have been completed. Equipment Vendor or installing Contractor shall not perform system verification, final testing or certification.
- F. A Third Party Medical Gas System Verification Testing Agency shall perform standing pressure test, cross-connection test, valve test, alarm test, piping purge test, piping particulate test, piping purity test, final tie-in test, operational pressure test and gas concentration test.
- G. The Third Party Medical Gas System Verification Testing Agency shall verify the presence and correctness of labeling required by this standard for all components (e.g., station outlets/inlets, shutoff valves, and alarm panels).
- H. It shall be the responsibility of the Third Party Medical Gas System Verification Testing Agency to make periodic job Site visits to assure all requirements of this specification and NFPA 99 are strictly adhered to.
- I. Certification shall clearly state that the system is approved for use and meets all requirements of NFPA-99 inclusive of all referenced and/or related documents. Any exceptions or limitations shall be clearly stated on the same certification document.

3.04 VENDOR SUPERVISION AND OPERATING INSTRUCTIONS

- A. An authorized representative of the equipment manufacturer shall periodically check with the installing Contractor during initial installation of the pipeline systems and equipment and shall assist the Contractor in final check to make certain that all systems are operating as recommended by the manufacturer, as specified and in accordance with NFPA 99. The equipment manufacturer's representative shall provide a minimum of 4 hours instruction to M. D. Anderson Cancer Center personnel in the use of the piping systems and the related equipment operated from those systems.

END OF SECTION 22 11 19 0011 10 00G60 53

SECTION 22 11 19 00A - LABORATORY WASTE AND VENT PIPING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Provide materials and installation for complete first class systems, within and to five feet beyond building perimeter unless noted otherwise on Contract Drawings; pipe, fittings, supports, testing and other normal parts that make the systems operable, code compliant and acceptable to the authorities having jurisdiction.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. 2006 Edition of the International Plumbing Code.
 - 2. NOTE: MDACC takes various exceptions to the International Plumbing Code and has adopted the more stringent requirements within the Uniform Plumbing Code. These exceptions are included within Project Specifications and/or Project Design Drawings.

1.04 QUALITY ASSURANCE

- A. All above ground pipe and fittings of same material shall be product of one manufacturer.
- B. All buried pipe and fittings of same material shall be product of one manufacturer
- C. All materials shall be new and undamaged.
- D. Manufacturer Qualifications: Company shall have minimum three years documented experience specializing in manufacturing the products specified in this Section.
- E. Installer Qualifications: Company shall have minimum three years documented experience specializing in performing the Work and installing the types of materials specified within this Section. Installation of drainage and vent systems shall be performed by individuals licensed by the Texas State Board of Plumbing Examiners as a Journeyman or Master Plumber. Installation may be performed by Apprentice Plumbers provided they are registered with the Texas State Board of Plumbing examiners and under direct supervision of a licensed plumber. All installation shall be supervised by a licensed Master Plumber.

1.05 SUBMITTALS

- A. Product Data:

1. Provide Code and Standards compliance, manufacturer's data for pipe, fittings, couplings, gaskets and all other products included within this Specification Section.

B. Record Documents:

1. Submit test reports and inspection certification for all systems listed herein.
2. Provide full written description of manufacturer's warranty.
3. Record actual locations and sizes of piping.
4. Manufacturer's Installation Instructions.

C. Operation and Maintenance Data:

1. Include components of system, Record Documents, inspection data, installation instructions, exploded coupling assembly views, replacement part numbers and availability, location and contact numbers of supply depot.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Accept products on Site in shipping containers and maintain in place until installation.
- B. Provide temporary protection for materials not packaged within containers. Maintain in place until installation.
- C. Provide temporary end caps and closures on pipe and fittings. Maintain in place until installation.
- D. Protect installed piping and associated materials during progression of the construction period to avoid clogging with dirt, and debris and to prevent damage, paint spray, etc. Remove all foreign materials and clean materials as Work progresses.
- E. Protect all materials that are to be installed within this project from exposure to rain, freezing temperatures and direct sunlight.
- F. Protect Sealite rope packing prior to installation within packaging to maintain a moisture content of 8-10%.

1.07 EXTRA MATERIALS

- A. Furnish to Owner pipe grooving tools after completion of the job. Tools shall be of same manufacturer as pipe and capable of grooving all sizes of thermoplastic piping installed.

PART 2 - PRODUCTS

2.01 GENERAL

- A. Provide materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 PIPE AND FITTINGS

- A. Above ground pipe and fittings not located within spaces utilized as air plenums shall be manufactured from NSF listed Type 1, flame retardant Schedule 40 polypropylene conforming to ASTM D4101, with a maximum average flame spread of zero seconds and a maximum extent of burning of 13 mm, in accordance with ASTM D635. Matched fittings shall be manufactured from NSF listed flame retardant polypropylene with average maximum burn time of 80 seconds and maximum extent of burning of 20 mm in accordance with ASTM D635. Fittings shall be designed to lock into a machined groove on the mating piping. All fittings shall have integrally molded union connections. No metallic grab rings or clamps shall be allowed. Fittings containing EVA (ethylene vinyl acetate) are strictly prohibited. Couplings shall not be added to make mechanical joint fittings.
- B. Polypropylene pipe and fittings shall be as manufactured by IPEX, "Labline", or approved equivalent. Connections between polypropylene pipe and matched fittings shall be made using the "Labline" Joint.
- C. Above ground pipe and fittings located within spaces utilized as air plenums shall be IAPMO listed, Schedule 40, FR-PVDF manufactured from Kynar 740-02, flame retardant Polyvinylidene Fluoride (PVDF) conforming to ASTM F 1673, with a limiting oxygen index (LOI) of 60, Resin must have a vertical burn rating of 94 V-0. Kynar 740-02 resin based on testing to ASTM E84 (UL 723) must have surface burning characteristics greater than or equal to a flame spread 5 and smoke development 35. Fittings shall be third party certified to ASTM F 1673 and ASTM E84, and IAPMO approved, with a tapered elastic retaining ring designed to lock into a machined groove on the mating piping. All fittings shall have integrally molded union connections. No metallic grab rings or clamps shall be allowed.
- D. Polyvinylidene Fluoride pipe and fittings shall be as manufactured by IPEX, "Plenumline", or approved equivalent.
- E. Polypropylene traps under sinks shall be two-piece p-traps, Labline Number W1021 or approved equal. Polypropylene traps for cup sinks and for special areas that may contain a high content of solids in waste shall be universal type trap, Labline Number W501 or approved equal.
- F. All buried pipe and fittings shall be bell & spigot, extra heavy weight, high silicon iron pipe and fittings conforming to the most recent revision of ASTM Specifications A518 and A861, as manufactured under the trade name of "Duriron" by the Flowserve Corporation. Joints shall be made utilizing virgin lead and Red Stripe Sealite A312 acid-resistant rope packing. Hemp, oakum, nor dry asbestos packing will be acceptable.
- G. Make connections and provide adapters and transition fittings recommended by piping manufacturer where connecting to fixtures and dissimilar piping.

2.03 FLOOR DRAINS

- A. Floor drains shall be high silicon content corrosion-resistant cast iron, with sediment basin, flashing ring, grate and inside caulk connection, as manufactured under the trade name of "Duriron" by the Flowserve Corporation, model D5501BBF or approved equal.

2.04 CLEANOUTS

- A. Cleanout ferrules and plugs shall be of the same material or have chemical resistance equal to or greater than the piping material.
- B. Cleanouts shall be provided with stainless steel access covers of adequate size to allow rodding of system. Cleanouts incorporating cover screws that extend completely through access plugs are not acceptable.

PART 3 - EXECUTION**3.01 EXAMINATION**

- A. Verify that excavations are to required grade, dry and not over-excavated. Do not install underground piping when bedding is wet or frozen.
- B. Before commencing Work, check final grade and pipe invert elevations required for drain terminations and connections to ensure proper slope.
- C. Do not use excessively wet or frozen Sealite rope packing within hub and spigot joints. Sealite rope packing shall be soft and pliable when installed.

3.02 PREPARATION

- A. Remove foreign material, burrs, scale and dirt from inside and outside of piping, before assembly.

3.03 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. General
 - 1. Install all materials and products in accordance with manufacturer's published recommendations. Use tools manufactured for the installation of the specific material or product.
 - 2. All excavation required for plumbing Work is the responsibility of the Plumbing Contractor and shall be done in accordance with Contract Specifications.
 - 3. Trenches shall be excavated so as to provide adequate room to make joints, align, and properly grade the pipe. The trench bottom shall be properly compacted and rock-free and shall support the pipe throughout its entire length. Fill material shall be applied in layers not exceeding 6 inches loose depth and each layer shall be thoroughly compacted. The first 6 inches of fill material shall be rock-free.
 - 4. Buried piping shall be supported throughout its entire length.
 - 5. Bury outside drainage pipe minimum one foot below recorded frost depth.
 - 6. Pipe, fittings and couplings shall not directly contact or be encased in concrete. Pipe joints shall not be located within wall, floor or roof penetrations.
 - 7. All piping shall be isolated from building structures, including partition studs, to prevent pipe damage and transmission of vibration and noise.
 - 8. Route piping in direct orderly manner and maintain proper grades. Installation shall conserve headroom and interfere as little as possible with use of spaces. Route exposed piping parallel to walls.
 - 9. Install piping to allow for expansion and Contraction without stressing pipe or joints and as recommended by the piping manufacturer.
 - 10. Furnish all supports required by the piping included in this Specification Section.

11. Penetrations through fire rated walls, floors and partitions shall be sealed to provide a U.L. rating equal to or greater than the wall, floor or partition.
12. Seal all penetrations through exterior building walls and grade beams air and watertight.
13. Furnish and install all necessary traps, adapters, etc. for each fixture having laboratory waste connections, to facilitate proper functioning, servicing and compliance with code.
14. Provide code-approved transition adapters when joining dissimilar piping materials. Adapters installed shall be manufactured specifically for the particular transition. Molten lead shall not be used to join thermoplastic piping to Duriron pipe hubs or floor drains.
15. Insulate all above ground floor drain bodies, p-traps and horizontal waste piping from drain to vertical stack that receives cold (60 degree F. or below) drainage to prevent condensation in accordance with Contract Documents.
16. Provide clearance for installation of insulation.
17. Slope drainage lines uniformly at 1/4" per foot, for lines 3" and less, and 1/8" per foot for larger lines, unless noted otherwise on Drawings. Slope vent piping uniformly to drain. Maintain gradients through each joint of pipe and throughout system.
18. The size of drainage piping shall not be reduced in size in the direction of flow. Drainage and vent piping shall conform to the sizes indicated on the Contract Drawings. Under no circumstances shall any drain or vent line below slab be smaller than two inches.
19. Unburied horizontal piping shall be supported at maximum intervals of four feet on piping sizes 4" and larger, and three feet on piping sizes 2" and smaller and at least at every other joint. Supports shall also be provided at each horizontal branch connection and at the base of each vertical rise. Supports shall be placed immediately adjacent to the joint. Suspended lines shall be braced to prevent horizontal movement. Unburied vertical piping rising through more than one floor level shall be supported with padded riser clamps at each floor level.
20. Supports shall not clasp the pipe so tightly as to prevent normal lateral movement due to expansion.
21. Horizontal supports shall provide a wide bearing area and be free of burrs or sharp edges.
22. Provide cleanouts within waste systems at locations and with clearances as required by the International Plumbing Code, at the base of each waste stack and at intervals not exceeding 90 feet in horizontal runs.
23. All interior cleanouts shall be accessible from walls or floors. Provide wall cleanouts in lieu of floor cleanouts wherever possible. A floor cleanout shall be installed only where installation of a wall cleanout is not practical.
24. Coordinate the location of all cleanouts with the architectural features of the building and obtain approval of locations from the Project Architect.
25. A removable sink p-trap with cleanout plug shall be considered as an approved cleanout for 2" diameter pipe.
26. Cleanout plugs shall provide a water and gas tight seal.
27. Install trap primer supply to floor drains and hub drains that are susceptible to trap seal evaporation and where indicated on Project Drawings. Primer unit installation shall comply with manufacturer's published recommendations. Trap primer lines shall slope to drain at a minimum 1/4" per foot.

28. Capped waste and vent connections for future extensions shall be located accessibly and not extend more than 24" from active main. Waste connections and vent connections shall be located at elevations that will allow future installation of properly sloped piping without the need to dismantle or relocate installed ductwork, piping, conduit, light fixtures, etc.
29. Each plumbing pipe projecting through roof shall be installed in accordance with Contract Specifications and Drawings. Penetrations shall be sealed air and water tight. Refer to details on Contract Drawings and coordinate with General Contractor for flashing requirements.
30. Unless indicated otherwise within Contract Documents, all vent pipes passing through the roof shall be provided with lead roof flashings constructed of 2-1/2 pound sheet lead with bases extending no less than ten inches on each side of the pipe. The vertical portion of the flashing shall extend upward the entire length of pipe and be turned tightly inside the pipe at least two inches and shall not reduce the inside diameter of vent pipe more than the thickness of the flashing. Lead flashings shall be furnished by Plumbing Contractor and turned over to Roofing Contractor for installation.
31. Locate all laboratory vent terminals a minimum of 25 feet horizontally from or 3 feet vertically above all air intakes, operable windows, doors and any other building openings.

3.04 TESTING

A. General

1. Equipment, material, power, and labor necessary for the cleaning, flushing, inspection and testing of systems covered within this Specification Section shall be furnished by the Plumbing Contractor. All testing and inspection procedures shall be in accordance with Division 1 and Special Condition requirements of this Contract.
2. Prior to testing fill hub and spigot pipe and fittings with water and waiting 24 hours to allow the Sealite rope packing to absorb the fluid and sufficiently expand to seal the joint.
3. Prepare testing reports. If testing is performed in segments, submit separate report for each segment, complete with diagram or clear description of applicable portion of piping. After inspection has been approved or portions thereof, certify in writing the time, date, name and title of the persons reviewing the test. This shall also include the description of what portion of the system has been approved. Obtain approval signature by Owner's Representative. A complete record shall be maintained of all testing that has been approved, and shall be made available at the job Site. Upon completion of the Work, all records and certifications approving testing requirements shall be submitted to The University's Representative before final payment is made.
4. Verify systems are complete, flushed and clean prior to testing. Isolate all fixtures subject to damage from test pressure. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. Leave piping uncovered and unconcealed until it has been tested and approved. Expose Work that was covered or concealed before it was tested.
5. Testing with compressed air is prohibited.
6. Separately test above and below ground piping. Do not introduce water into piping systems when exposure to freezing temperatures is possible.
7. Defective Work or material shall be reworked and replaced, and inspection and test repeated. Repairs shall be made with new materials. Pipe dope, caulking, tape, dresser couplings, etc., shall not be used to correct deficiencies.
8. The Contractor shall be responsible for cleaning up any leakage during flushing, testing, repairing and disinfecting to the original condition any building parts subjected to spills or leakage.

9. Subject all piping and joints to a vertical water column pressure of at least ten feet. EXCEPTION: Portions of drainage and vent piping located on uppermost level of building shall be subjected to a water column pressure created by filling the system to point of overflow at roof vent terminals and roof drains. The pipes for the level being tested shall be filled with water to a verifiable and visible level as described above and be allowed to remain so for 12 hours. If after 12 hours the level of the water has been lowered by leakage, the leaks must be found and stopped and the water level shall again be raised to the level described and the test repeated until, after a 12 hour retention period, there shall be no perceptible lowering of the water level in the system being tested.
10. Should the completion of these tests leave any reasonable question of a doubt relative to the integrity of the installation, additional tests or measures shall be performed to demonstrate the reliability of these systems to the complete satisfaction of The University's Representative.
11. Test plugs must extend outside the end of pipe to provide a visible indication for removal after the test has been completed.

SECTION 22 43 39 00 - MEDICAL PLUMBING FIXTURES**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for medical plumbing fixtures. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the products manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following medical plumbing fixtures and related components:
 - a. Faucets for lavatories, showers, and sinks.
 - b. Laminar-flow, faucet-spout outlets.
 - c. Flushometers.
 - d. Toilet seats.
 - e. Protective shielding guards.
 - f. Fixture supports.
 - g. Bedpan washers.
 - h. Water closets.
 - i. Lavatories.
 - j. Individual showers.
 - k. Patients' combination toilets.
 - l. Clinical sinks.
 - m. Plaster sinks.
 - n. Surgeons' scrub sinks.
 - o. Surgeons' instrument sinks.
 - p. Bathing units.
 - q. Sitz baths.
 - r. Bedpan washing equipment.
 - s. Hydrotherapy whirlpools.
 - t. Outlet boxes.
 - u. Morgue equipment.

C. Definitions

1. Accessible Medical Plumbing Fixture: Plumbing fixture that can be approached, entered, and used by people with disabilities.
2. Fitting: Device that controls the flow of water into or out of the medical plumbing fixture. Fittings specified in this Section include supplies and stops, faucets and spouts, shower heads, drains and tailpieces, and traps and waste pipes.
3. FRP: Fiberglass-reinforced plastic.
4. PMMA: Polymethyl methacrylate (acrylic) plastic.

D. Submittals

1. Product Data: For each type of medical plumbing fixture indicated.
2. LEED Submittal:
 - a. Product Data for Credit WE 2, 3.1, and 3.2: Documentation indicating flow and water consumption requirements.
3. Shop Drawings: Diagram power, signal, and control wiring.
4. Operation and maintenance data.

E. Quality Assurance

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
2. Regulatory Requirements: Comply with requirements in ICC A117.1, "Accessible and Usable Buildings and Facilities"; Public Law 90-480, "Architectural Barriers Act"; and Public Law 101-336, "Americans with Disabilities Act", **as directed**; for plumbing fixtures for people with disabilities.
3. Regulatory Requirements: Comply with requirements in Public Law 102-486, "Energy Policy Act," about water flow and consumption rates for plumbing fixtures.
4. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.
5. Select combinations fixtures and trim, faucets, fittings, and other components that are compatible.
6. Comply with the following applicable standards and other requirements specified for medical plumbing fixtures:
 - a. Enameled, Cast-Iron Fixtures: ASME A112.19.1M.
 - b. Plastic Bathtubs: ANSI Z124.1.
 - c. Plastic Shower Enclosures: ANSI Z124.2.
 - d. Slip-Resistant Bathing Surfaces: ASTM F 462.
 - e. Vitreous-China Fixtures: ASME A112.19.2M.
7. Comply with the following applicable standards and other requirements specified for lavatory and sink faucets:
 - a. Backflow Protection Devices for Faucets with Hose-Thread Outlet: ASME A112.18.3M.
 - b. Diverter Valves for Faucets with Hose Spray: ASSE 1025.
 - c. Faucets: ASME A112.18.1.
 - d. Hose-Connection Vacuum Breakers: ASSE 1011.
 - e. Hose-Coupling Threads: ASME B1.20.7.
 - f. Integral, Atmospheric Vacuum Breakers: ASSE 1001.
 - g. NSF Materials: NSF 61.
 - h. Pipe Threads: ASME B1.20.1.
 - i. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
 - j. Supply Fittings: ASME A112.18.1.
 - k. Brass Waste Fittings: ASME A112.18.2.
8. Comply with the following applicable standards and other requirements specified for bathtub and shower faucets:
 - a. Backflow Protection Devices for Hand-Held Showers: ASME A112.18.3M.
 - b. Combination, Pressure-Equalizing and Thermostatic-Control Antiscald Faucets: ASSE 1016.
 - c. Faucets: ASME A112.18.1.
 - d. Hand-Held Showers: ASSE 1014.
 - e. High-Temperature-Limit Controls for Thermal-Shock-Preventing Devices: ASTM F 445.
 - f. Hose-Coupling Threads: ASME B1.20.7.
 - g. Manual-Control Antiscald Faucets: ASTM F 444.
 - h. Pipe Threads: ASME B1.20.1.
 - i. Pressure-Equalizing-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.
 - j. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
 - k. Thermostatic-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.
9. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:
 - a. Atmospheric Vacuum Breakers: ASSE 1001.
 - b. Brass and Copper Supplies: ASME A112.18.1.
 - c. Flexible Water Connectors: ASME A112.18.6.
 - d. Manual-Operation Flushometers: ASSE 1037.
 - e. Sensor-Operation Flushometers: ASSE 1037 and UL 1951.
 - f. Brass Waste Fittings: ASME A112.18.2.
10. Comply with the following applicable standards and other requirements specified for miscellaneous components:
 - a. Grab Bars: ASTM F 446.
 - b. Hose-Coupling Threads: ASME B1.20.7.

- c. Off-Floor Fixture Supports: ASME A112.6.1M.
- d. Pipe Threads: ASME B1.20.1.
- e. Plastic Toilet Seats: ANSI Z124.5.
- f. Supply and Drain Protective Shielding Guards: ICC A117.1.

1.2 PRODUCTS

A. Lavatory Faucets

1. Description: Faucet for lavatory-type medical plumbing fixture. Coordinate faucet inlets with supplies, connectors, and fixture holes; coordinate outlet with spout and fixture receptor.
 - a. Maximum Flow Rate: 2.2 gpm (8.3 L/min.).
 - b. Body Material: Solid brass.
 - c. Finish: Polished chrome plate.
 - d. Type: Single-control mixing **OR** Single-valve nonmixing **OR** Two-handle mixing, **as directed**.
 - e. Tempering System: Not required **OR** Thermostatic **OR** Pressure balance, **as directed**.
 - f. Supply Centers: Single hole **OR** 4 inches (102 mm) **OR** 6 inches (152 mm) **OR** 8 inches (203 mm) **OR** 12 inches (305 mm) **OR** Adjustable, **as directed**.
 - g. Mounting: Deck, exposed **OR** Deck, concealed **OR** Back/wall, exposed **OR** Back/wall, concealed, **as directed**.
 - h. Handle(s): Single lever **OR** Cross, four arm **OR** Wrist blade, 4 inches (102 mm) **OR** Elbow, 6 inches (152 mm) **OR** Not applicable, **as directed**.
 - i. Temperature Indicators: Color-coded for hot and cold water.
 - j. Inlet(s): NPS 3/8 (DN 10) tubing, plain end **OR** NPS 3/8 (DN 10) tubing, with NPS 1/2 (DN 15) male adaptor **OR** NPS 1/2 (DN 15) male shank **OR** NPS 1/2 (DN 15) female shank, **as directed**.
 - k. Spout: Rigid **OR** Swing **OR** Rigid gooseneck **OR** Swivel gooseneck, **as directed**, brass.
 - l. Spout Outlet: Aerator **OR** Spray **OR** Laminar flow **OR** Plain end **OR** Spray, 0.5 gpm (1.5 L/min.), **as directed**.
 - m. Operation: Compression, manual **OR** Noncompression, manual **OR** Automatic, hard-wired electric sensor, **as directed**.
 - n. Drain: Pop up **OR** See fixture, **as directed**.

B. Shower Faucets

1. Description: Faucet for shower-type medical plumbing fixtures. Include hot- and cold-water indicators; check stops; and shower head, arm, and flange. Coordinate faucet inlets with supplies.
 - a. Maximum Flow Rate: 2.5 gpm (9.5 L/min.), unless otherwise indicated.
 - b. Body Material: Solid brass.
 - c. Finish: Polished chrome plate.
 - d. Type: Thermostatic **OR** Pressure balance **OR** Thermostatic and pressure balance, **as directed**, with integral or field-installed check stops on hot- and cold-water supplies.
 - e. Mounting: Exposed **OR** Concealed, **as directed**.
 - f. Handle(s): Single lever **OR** Cross, four arm **OR** Not applicable, **as directed**.
 - g. Temperature Indicators: Color-coded for hot and cold water.
 - h. Diverter Valve: Not required **OR** Integral with mixing valve **OR** Not integral with mixing valve, **as directed**.
 - i. Backflow Protection Device for Hand-Held Shower: Required **OR** Not required, **as directed**.
 - j. Operation: Compression, manual **OR** Noncompression, manual **OR** Automatic, hard-wired electric sensor, **as directed**.
 - k. Antiscald Device: Integral with mixing valve **OR** Not required, **as directed**.
 - l. Supply Connections: NPS 1/2 (DN 15) **OR** NPS 1/2 (DN 15), union **OR** Sweat, **as directed**.
 - m. Shower Head Material: Brass with chrome-plated finish.

- n. Head Type: Ball joint **OR** Without ball joint **OR** Hand held, slide-bar mounted **OR** Hand held, hook mounted, **as directed**.
- o. Spray Pattern: Fixed **OR** Adjustable, **as directed**.
- p. Integral Volume Control: Required **OR** Not required, **as directed**.
- q. Shower-Arm, Flow-Control Fitting: Not required **OR** 1.5 gpm (5.7 L/min.) **OR** 2.0 gpm (7.6 L/min.), **as directed**.

C. Sink Faucets

1. Description: Faucet for sink-type medical plumbing fixtures. Coordinate faucet inlets with supplies and fixture holes; coordinate outlet with spout and fixture receptor.
 - a. Maximum Flow Rate: 2.5 gpm (9.5 L/min.), unless otherwise indicated.
 - b. Body Material: Solid brass.
 - c. Finish: Polished chrome plate **OR** Rough chrome plate, **as directed**.
 - d. Type: Sink faucet **OR** Clinical-sink faucet with stops in shanks, vacuum breaker, hose-thread outlet, and pail hook, **as directed**.
 - e. Tempering Device: Thermostatic **OR** Pressure balance **OR** Not required, **as directed**.
 - f. Mixing Valve: Single control **OR** Two-lever handle, **as directed**.
 - g. Backflow Protection Device for Hose Outlet: Required **OR** Not required **OR** Not applicable, **as directed**.
 - h. Supply Centers: Single hole **OR** 4 inches (102 mm) **OR** 6 inches (152 mm) **OR** 8 inches (203 mm) **OR** Adjustable, **as directed**.
 - i. Mounting: Deck, exposed **OR** Deck, concealed **OR** Back/wall, exposed **OR** Back/wall, concealed, **as directed**.
 - j. Handle(s): Lever **OR** Knob **OR** Cross, four arm **OR** Wrist blade, 4 inches (102 mm) **OR** Elbow, 6 inches (152 mm) **OR** Not applicable, **as directed**.
 - k. Temperature Indicators: Color-coded for hot water on left and cold water on right.
 - l. Inlet(s): NPS 3/8 (DN 10) plain-end tubing **OR** NPS 3/8 (DN 10) tubing with NPS 1/2 (DN 15) male adapter **OR** NPS 1/2 (DN 15) male shank **OR** NPS 1/2 (DN 15) female shank, **as directed**.
 - m. Spout: Rigid, solid **OR** Swing tubular **OR** Rigid, gooseneck, solid **OR** Swivel, gooseneck, solid, **as directed**, brass with wall brace, **as directed**.
 - n. Spout Outlet: Aerator **OR** Swivel aerator/spray **OR** Spray **OR** Laminar flow **OR** Hose thread **OR** Plain end, **as directed**.
 - o. Vacuum Breaker: Required **OR** Not required, **as directed**.
 - p. Operation: Compression, manual **OR** Noncompression, manual **OR** Automatic, hard-wired electric sensor, **as directed**.

D. Laminar-Flow Faucet-Spout Outlets

1. Description: Chrome-plated-brass faucet-spout outlet that produces non-aerating laminar stream. Include male or female thread that mates with faucet outlet for attachment to faucets where indicated and flow-rate range that includes flow of faucet.

E. Flushometers

1. Description: Flushometer for clinical-sink-type **OR** water-closet-type, **as directed**, medical plumbing fixture. Include brass body with corrosion-resistant internal components, non-hold-open feature, **as directed**, control stop with check valve, vacuum breaker, and copper or brass tubing, and polished chrome-plated finish on exposed parts.
 - a. Internal Design: Diaphragm operation.
 - b. Style: Exposed **OR** Concealed, **as directed**.
 - c. Inlet Size: NPS 1 (DN 25).
 - d. Trip Mechanism: Oscillating, lever-handle actuator **OR** Mechanical, push-button actuator with stainless-steel access plate **OR** Hydraulic, push-button actuator **OR** Foot-pedal actuator **OR** Hard-wired, electric-sensor actuator **OR** Battery-operated sensor actuator, **as directed**.
 - e. Consumption: 1.6 gal./flush (6.0 L/flush) **OR** 3.5 gal./flush (13.3 L/flush), **as directed**.
 - f. Tailpiece Size: NPS 1-1/4 (DN 32) **OR** NPS 1-1/2 (DN 40), **as directed**, and standard length to top of bowl.

- g. Integral Bedpan Washer: Not required **OR** Factory fabricated, attached to tailpiece, and with spray head, **as directed**.
- F. Toilet Seats
1. Description: Plastic toilet seat for water-closet-type medical plumbing fixture.
 - a. Material: Molded, solid plastic with antimicrobial agent, **as directed**.
 - b. Configuration: Closed **OR** Open, **as directed**, front with **OR** without, **as directed**, cover.
 - c. Size: Elongated, unless otherwise indicated.
 - d. Class: Standard **OR** Heavy-duty, **as directed**, commercial.
 - e. Hinge Type: Stainless-steel CK, check **OR** SC, self-sustaining check, **as directed**.
 - f. Color: White **OR** Black, **as directed**.
- G. Protective Shielding Guards
1. Protective Shielding Pipe Covers:
 - a. Description: Manufactured plastic wraps for covering medical plumbing fixture hot-water supply **OR** hot- and cold-water supplies, **as directed**, and trap and drain piping. Comply with Americans with Disabilities Act (ADA) requirements.
 2. Protective Shielding Piping Enclosures:
 - a. Description: Manufactured plastic enclosure for covering medical plumbing fixture hot- and cold-water supplies and trap and drain piping. Comply with ADA requirements.
- H. Fixture Supports
1. Water-Closet Supports:
 - a. Description: Combination carrier designed for accessible **OR** standard, **as directed**, mounting height of wall-mounting, water-closet-type medical plumbing fixture. Include single or double, vertical or horizontal, hub-and-spigot or hubless waste fitting as required for piping arrangement; faceplates; couplings with gaskets; feet; and fixture bolts and hardware matching fixture. Include additional extension coupling, faceplate, and feet for installation in wide pipe space.
 2. Lavatory Supports:
 - a. Description: Type I, lavatory carrier with exposed arms and tie rods **OR** Type II, lavatory carrier with concealed arms and tie rod **OR** Type III, lavatory carrier with hanger plate and tie rod, **as directed**, for wall-mounting, lavatory-type medical plumbing fixture. Include steel uprights with feet.
 - b. Accessible-Fixture Support: Include rectangular steel uprights.
 3. Sink Supports:
 - a. Description: Type I, sink carrier with exposed arms and tie rods **OR** Type II, sink carrier with hanger plate, bearing studs, and tie rod **OR** Type III, sink carrier with hanger plate and exposed arms, **as directed**, for sink-type medical plumbing fixture. Include steel uprights with feet.
 4. Bedpan Washers
 - a. Description: Wall-mounting, hand-held, hand-control **OR** single-pedal, foot-control **OR** double-pedal, hot- and cold-water control, **as directed**, medical plumbing fixture.
 - 1) Hose: 48-inch- (1220-mm-) long rubber or vinyl hose with spray nozzle, wall bracket, and hook.
 - 2) Self-closing valve.
 - 3) Loose-key supply stop.
 - 4) Vacuum Breaker: Wall mounting, atmospheric.
 - 5) Finish: Polished, chrome-plated finish on metal parts exposed after installation.
- I. Water Closets
1. Wall-Mounting Water Closets:
 - a. Description: Accessible, wall-mounting **OR** Wall-mounting, **as directed**, back-outlet, vitreous-china medical plumbing fixture designed for bedpan washing and flushometer valve operation.
 - 1) Style: Flushometer valve.

- a) Bowl Type: Elongated with siphon-jet design and bedpan lugs or slots.
 - b) Design Consumption: 1.6 gal./flush (6 L/flush).
 - c) Color: White.
- 2. Floor-Mounting Water Closets:
 - a. Description: Accessible, floor-mounting **OR** Floor-mounting, **as directed**, floor-outlet, vitreous-china medical plumbing fixture designed for bedpan washing and flushometer valve operation.
 - 1) Style: Flushometer valve.
 - a) Bowl Type: Elongated with siphon-jet design and bedpan lugs or slots. Include bolt caps matching fixture.
 - b) Height: Standard **OR** Accessible, **as directed**.
 - c) Design Consumption: 1.6 gal./flush (6 L/flush).
 - d) Color: White.

J. Lavatories

- 1. Wall-Mounting Lavatories:
 - a. Description: Accessible, wall-mounting **OR** Wall-mounting, **as directed**, vitreous-china medical plumbing fixture.
 - 1) Type: With back **OR** Ledge back **OR** Shelf back **OR** Slab, **as directed**.
 - 2) Size: 18 by 15 inches (457 by 381 mm) **OR** 19 by 16 inches (483 by 406 mm) **OR** 20 by 18 inches (508 by 457 mm) **OR** 24 by 20 inches (610 by 508 mm), **as directed**, rectangular.
 - 3) Faucet Hole Punching: One hole **OR** Three holes, 2-inch (51-mm) centers **OR** Three holes, 4-inch (102-mm) centers, **as directed**.
 - 4) Faucet Hole Location: Top **OR** Front wall **OR** Inclined panel, **as directed**.
 - 5) Color: White.
 - 6) Faucet: Lavatory with pop-up waste **OR** for separate drain, **as directed**.
 - 7) Supplies: NPS 3/8 (DN 10) chrome-plated copper tubes or flexible connectors, **as directed**, with stops.
 - 8) Drain: See faucet **OR** Grid **OR** Grid with offset, **as directed**.
 - a) Location: Not applicable.
 - 9) Drain Piping: NPS 1-1/4 (DN 32) **OR** NPS 1-1/4 by NPS 1-1/2 (DN 32 by DN 40), **as directed**, chrome-plated, cast-brass P-trap; NPS 1-1/4 (DN 32) **OR** NPS 1-1/2 (DN 40), **as directed**, 0.032-inch- (0.8-mm-) **OR** 0.045-inch- (1.1-mm-), **as directed**, thick tubular brass waste to wall; and wall escutcheon.
 - 10) Protective Shielding Guard(s): Designation, as approved by The University.
 - 11) Fixture Support: Lavatory.
- 2. Counter-Mounting Lavatories:
 - a. Description: Accessible, **as directed**, Counter-mounting **OR** Undercounter-mounting, **as directed**, vitreous-china, medical plumbing fixture.
 - 1) Type: Flat rim with ledge **OR** Self-rimming, **as directed**.
 - 2) Rectangular Lavatory Size: 18 by 15 inches (457 by 381 mm) **OR** 19 by 16 inches (483 by 406 mm) **OR** 20 by 18 inches (508 by 457 mm) **OR** 24 by 20 inches (610 by 508 mm), **as directed**.
 - 3) Oval Lavatory Size: 19 by 16 inches (483 by 406 mm) **OR** 20 by 17 inches (508 by 432 mm), **as directed**.
 - 4) Round Lavatory Size: 18 inches (457 mm) **OR** 19 inches (483 mm), **as directed**, in diameter.
 - 5) Faucet Hole Punching: One hole **OR** Three holes, 2-inch (51-mm) centers **OR** Three holes, 4-inch (102-mm) centers, **as directed**.
 - 6) Faucet Hole Location: Top **OR** Front wall **OR** Inclined panel, **as directed**.
 - 7) Color: White.
 - 8) Faucet: Lavatory with pop-up waste **OR** for separate drain, **as directed**.
 - 9) Supplies: NPS 3/8 (DN 10) chrome-plated copper tubes or flexible connectors, **as directed**, with stops.
 - 10) Drain: See faucet **OR** Grid **OR** Grid with offset, **as directed**.
 - a) Location: Not applicable.

- 11) Drain Piping: NPS 1-1/4 (DN 32) **OR** NPS 1-1/4 by NPS 1-1/2 (DN 32 by DN 40), **as directed**, chrome-plated, cast-brass P-trap; NPS 1-1/4 (DN 32) **OR** NPS 1-1/2 (DN 40), **as directed**, 0.032-inch- (0.8-mm-) **OR** 0.045-inch- (1.1-mm-), **as directed**, thick tubular brass waste to wall; and wall escutcheon.
- 12) Protective Shielding Guard(s): Designation, as approved by The University.

K. Individual Showers:

1. Description: Accessible, **as directed**, FRP **OR** PMMA, **as directed**, shower enclosure medical plumbing fixture with slip-resistant bathing surface complying with ASTM F 462. Comply with ADA requirements for use by people with disabilities.
 - a. Size: 36 by 34 inches (915 by 865 mm) **OR** 42 by 36 inches (1065 by 915 mm) **OR** 43 by 39 inches (1090 by 990 mm) **OR** 48 by 34 inches (1220 by 865 mm) **OR** 52 by 36 inches (1320 by 915 mm) **OR** 60 by 36 inches (1525 by 915 mm) **OR** 72 by 36 inches (1830 by 915 mm), **as directed**.
 - b. Surround: One piece.
 - c. Color: White.
 - d. Faucet: Shower.
 - e. Drain: Grid, NPS 2 (DN 50).
 - 1) Location: Left side **OR** Center **OR** Right side, **as directed**.
 - f. Accessories: If not furnished as integral components of specified fixture. Accessories are specified in Division 10 Section "Toilet, Bath, And Laundry Accessories".
 - 1) Grab bar(s).
 - 2) Normal-duty **OR** Heavy-duty, **as directed**, shower-curtain rod.
 - 3) Vinyl **OR** Duck **OR** Antibacterial, **as directed**, shower curtain.
 - 4) Shower-curtain hooks.
 - 5) Folding seat, **as directed**.

L. Patients' Combination Toilets

1. Swing-Away, Patients' Combination Toilets:
 - a. Description: Factory-fabricated, combination water closet and lavatory medical plumbing fixture.
 - 1) Cabinet: Fixed installation with storage space and toilet paper holder.
 - a) Material: Stainless steel **OR** Stainless steel, plastic laminate, or fiberglass, **as directed**, with laminated-wood or -plastic **OR** solid-plastic **OR** stainless-steel, **as directed**, top surface.
 - b) Color: Not applicable.
 - c) Mounting: Wall bracket.
 - 2) Water Closet: Swivel, floor-mounting, back-outlet **OR** floor-outlet, **as directed**, flushometer valve design.
 - a) Material: Stainless steel.
 - b) Orientation: Left **OR** Right, **as directed**, hand.
 - c) Color: Not applicable.
 - d) Toilet Seat: White, solid plastic.
 - e) Flushometer: Concealed flushometer valve with push-button trip mechanism, check stop, and vacuum breaker on tailpiece.
 - f) Fixture Support: Floor plate.
 - g) Seal: For outlet.
 - 3) Lavatory: Counter mounting.
 - a) Material: Stainless steel.
 - b) Color: Not applicable.
 - c) Faucet: Gooseneck type with wrist-blade handles **OR** Swing-spout type with single lever, **as directed**.
 - d) Drain: Grid, NPS 1-1/4 (DN 32).
 - e) Drain Piping: NPS 1-1/4 (DN 32) chrome-plated, cast-brass P-trap; tubular-brass waste to wall; and wall flange.
 - 4) Bedpan Washer: On flushometer valve tailpiece or separate attachment affixed to unit.

2. Static, Patients' Combination Toilets:

- a. Description: Factory-fabricated, combination water closet and lavatory fixture.
 - 1) Cabinet: Fixed installation; swing-away cabinet or retractable, water-closet cover design with storage space and toilet paper holder.
 - a) Material: Stainless steel **OR** Stainless steel, plastic laminate, or fiberglass, **as directed**, with laminated-wood or -plastic **OR** solid-plastic **OR** stainless-steel, **as directed**, top surface.
 - b) Color: Not applicable.
 - c) Mounting: Wall bracket.
 - 2) Water Closet: Floor-mounting, floor-outlet, flushometer valve design.
 - a) Material: Stainless steel or vitreous china.
 - b) Orientation: Left **OR** Right, **as directed**, hand.
 - c) Color: Not applicable.
 - d) Toilet Seat: White, solid plastic.
 - e) Flushometer: Concealed flushometer valve with push-button trip mechanism, check stop, and vacuum breaker on tailpiece.
 - f) Seal: For outlet.
 - 3) Lavatory: Counter mounting.
 - a) Material: Stainless steel.
 - b) Color: Not applicable.
 - c) Faucet: Gooseneck type with wrist-blade handles **OR** Swing-spout type with single lever, **as directed**.
 - d) Drain: Grid, NPS 1-1/4 (DN 32).
 - e) Drain Piping: NPS 1-1/4 (DN 32) chrome-plated, cast-brass P-trap; tubular-brass waste to wall; and wall flange.
 - 4) Bedpan Washer: On flushometer valve tailpiece or separate attachment affixed to unit.

M. Clinical Sinks

1. Wall-Mounting Clinical Sinks:
 - a. Description: Wall-mounting, back-outlet, vitreous-china, flushing-rim, service-sink-type medical plumbing fixture.
 - 1) Size: Approximately 25 by 20 inches (635 by 510 mm).
 - 2) Color: White.
 - 3) Rim Guard: Stainless steel on front and also on sides if flat rim.
 - 4) Faucet: Sink, polished, chrome-plated, solid-brass, service-sink faucet type, including integral stops in shanks, vacuum breaker, hose-thread outlet, and pail hook.
2. Floor-Mounting Clinical Sinks:
 - a. Description: Floor-mounting, bottom-outlet, vitreous-china, flushing-rim, service-sink-type medical plumbing fixture. Include bolt caps.
 - 1) Size: Approximately 27 by 20 inches (685 by 510 mm).
 - 2) Color: White.
 - 3) Rim Guards: Stainless steel on front and sides.
 - 4) Sink Base: 10-inch (25.4-mm) -high, cast terrazzo if required.
 - 5) Faucet: Sink, polished, chrome-plated, solid-brass, service-sink faucet type, including integral stops in shanks, vacuum breaker, hose-thread outlet, and pail hook.

N. Plaster Sinks:

1. Description: Wall-mounting, vitreous-china medical plumbing fixture.
 - a. Size: 24 by 22 inches (610 by 560 mm) **OR** 30 by 22 inches (760 by 560 mm), **as directed**, with back or ledge faucet holes.
 - b. Color: White.
 - c. Faucet Holes: One **OR** Two, **as directed**, in back or ledge.
 - d. Faucet: Sink.

- e. Supplies: NPS 1/2 (DN 15) chrome-plated copper tubes or flexible connectors, **as directed**, with stops.
 - f. Drain: Grid, NPS 1-1/2 (DN 40) with NPS 1-1/2 (DN 40) to NPS 2 (DN 50) adaptor, **as directed**.
 - g. Drain Piping: NPS 1-1/2 (DN 40) **OR** NPS 2 (DN 50), **as directed**, chrome-plated brass; 0.045-inch- (1.1-mm-) thick waste to interceptor; interceptor to wall; and wall flange.
 - h. Plaster Interceptor:
 - 1) Description: Cast-iron or steel body and removable cover with acid-resistant-enameled interior lining and outside coating; removable, corrosion-resistant metal screens or strainer; and NPS 1-1/2 (DN 40) **OR** NPS 2 (DN 50), **as directed**, inlet and outlet.
 2. Fixture Support: Sink with white-enameled-steel brackets.
- O. Surgeons' Scrub Sinks
1. Stainless-Steel Surgeons' Scrub Sinks:
 - a. Description: Wall-mounting, sink-type medical plumbing fixture.
 - 1) Size: Approximately 31 by 20 inches (790 by 510 mm) with back with 1 faucet hole.
 - 2) Faucet: Chrome-plated-brass, gooseneck type matching fixture.
 - 3) Operation: Foot-pedal **OR** Knee **OR** Automatic, hard-wired electric sensor, **as directed**, control.
 - 4) Supplies: NPS 1/2 (DN 15) chrome-plated copper tubes or flexible connectors, **as directed**, with stops.
 - 5) Drain: Grid, NPS 1-1/2 (DN 40).
 - 6) Drain Piping: NPS 1-1/2 (DN 40) chrome-plated, cast-brass P-trap; 0.045-inch- (1.1-mm-) thick tubular-brass waste to wall; and wall flange.
 - 7) Fixture Support: Sink.
 2. Vitreous-China Surgeons' Scrub Sinks:
 - a. Description: Wall-mounting, sink-type medical plumbing fixture.
 - 1) Size: 28 by 22 inches (710 by 560 mm) **OR** 30 by 22 inches (760 by 560 mm), **as directed**, with back or ledge with 1 faucet hole.
 - 2) Color: White.
 - 3) Faucet: Chrome-plated-brass, gooseneck-type matching fixture.
 - 4) Operation: Foot-pedal **OR** Knee, **as directed**, control.
 - 5) Supplies: NPS 1/2 (DN 15) chrome-plated copper tubes or flexible connectors, **as directed**, with stops.
 - 6) Drain: Grid, NPS 1-1/2 (DN 40).
 - 7) Drain Piping: NPS 1-1/2 (DN 40) chrome-plated, cast-brass P-trap; 0.045-inch- (1.1-mm-) thick tubular-brass waste to wall; and wall flange.
 - 8) Fixture Support: Sink.
- P. Surgeons' Instrument Sinks:
1. Description: Wall-mounting, stainless-steel, sink-type medical plumbing fixture. Include instrument tray on each side.
 - a. Size: 28 by 20 inches (710 by 510 mm) with 1 hole for deck-mounting faucet.
 - b. Faucet: Chrome-plated-brass, gooseneck type matching fixture with knee **OR** foot-pedal, **as directed**, control for mixing hot- and cold-water supplies.
 - c. Supplies: NPS 1/2 (DN 15) chrome-plated copper tubes or flexible connectors, **as directed**, with stops.
 - d. Drain: Grid, NPS 1-1/2 (DN 40).
 - e. Drain Piping: NPS 1-1/2 (DN 40) chrome-plated, cast-brass P-trap; 0.045-inch- (1.1-mm-) thick tubular-brass waste to wall; and wall flange.
 - f. Fixture Support: Sink.
- Q. Bathing Units
1. Institutional Bath Tubs:
 - a. Description: Enameled, cast-iron, island medical plumbing fixture with separate wall-mounting faucet.

- 1) Size: 66 by 30 by 18 inches (1680 by 765 by 455 mm).
 - 2) Base: Enameled, cast iron to raise rim of bathtub to 28 inches (710 mm) above the floor.
 - 3) Faucet: Shower **OR** Sink, **as directed**, modified to include tub filler spout.
 - 4) Supplies: NPS 1/2 (DN 15) chrome-plated copper tubes or flexible connectors, **as directed**, with stops. Include atmospheric vacuum breaker.
 - 5) Drain: NPS 1-1/2 (DN 40); chrome-plated exposed parts; brass pop-up waste and overflow.
 - 6) Drain Piping: NPS 1-1/2 (DN 40) chrome-plated, cast-brass P-trap; 0.045-inch- (1.1-mm-) thick tubular-brass waste to wall; and wall flange.
2. Bathing Units:
- a. Description: Plastic-tub, institutional side-entry bath **OR** whirlpool-bath, **as directed**, fixture with integral controls.
 - 1) Tub Size: 60 by 30 inches (1525 by 765 mm).
 - 2) Controls: Vacuum breakers on supplies, thermostatic mixing valve, tub fill spout, and hand-held shower head.
 - 3) Supplies: NPS 3/4 (DN 20) **OR** NPS 1 (DN 25), **as directed**, copper tubing with ball, gate, or globe valves.
 - 4) Drain: NPS 1-1/2 (DN 40) and NPS 2 (DN 50).
 - 5) Drain Piping: NPS 1-1/2 (DN 40) **OR** NPS 2 (DN 50), **as directed**, cast-brass P-trap, waste to wall, and wall flange. Include combined drain piping if two drains.
3. Bathing Units:
- a. Description: Plastic-tub, institutional side-entry **OR** transfer-lift-entry **OR** slide-on-entry, **as directed**, adjustable-height **OR** fixed-height, **as directed**, bath fixture with integral controls.
 - 1) Tub Size: 60 by 30 inches (1525 by 765 mm).
 - 2) Controls: Vacuum breakers on supplies, thermostatic mixing valve, tub fill spout, and hand-held shower head.
 - 3) Supplies: NPS 3/4 (DN 20) **OR** NPS 1 (DN 25), **as directed**, copper tubing with ball, gate, or globe valves.
 - 4) Drain: NPS 1-1/2 (DN 40) and NPS 2 (DN 50).
 - 5) Drain Piping: NPS 1-1/2 (DN 40) **OR** NPS 2 (DN 50), **as directed**, cast-brass P-trap, waste to wall, and wall flange. Include combined drain piping if two drains.
 - 6) Lift System: Not required.
4. Bathing Units:
- a. Description: Plastic-tub, institutional front-entry shower fixture with integral controls.
 - 1) Cabinet Size: 35 by 41 inches (889 by 1041 mm).
 - 2) Controls: Vacuum breakers on supplies, thermostatic mixing valve, tub fill spout, and hand-held shower head.
 - 3) Supplies: NPS 3/4 (DN 20) **OR** NPS 1 (DN 25), **as directed**, copper tubing with ball, gate, or globe valves.
 - 4) Drain: NPS 2 (DN 50).
 - 5) Drain Piping: NPS 2 (DN 50) cast-brass P-trap, waste to wall, and wall flange.
5. Residential Bath Tubs:
- a. Description: Plastic island or against-wall-installation, **as directed**, medical plumbing fixture with side door, seat, and separate wall-mounting faucet.
 - 1) Size 1
 - a) Size: Approximately 60 by 32 by 21 inches (1525 by 815 by 535 mm).
 - b) Seat: Integral.
 - c) Drain Location: Left **OR** Right, **as directed**, end.
 - 2) Size 2
 - a) Size: Approximately 60 by 42 by 24.5 inches (1525 by 1070 by 620 mm).
 - b) Seat: Integral bench **OR** None, **as directed**.
 - c) Drain Location: Right end.
 - 3) Material: PMMA.
 - 4) Skirt: Front only **OR** Full, on three sides, **as directed**.
 - 5) Door: Side opening with rubber sealing gasket.
 - 6) Faucet: Shower **OR** Sink, **as directed**, modified to include tub filler spout.

- 7) Supplies: NPS 1/2 (DN 15) chrome-plated copper tubes or flexible connectors, **as directed**, with stops. Include atmospheric vacuum breaker.
- 8) Drain: NPS 1-1/2 (DN 40); chrome-plated exposed parts; brass pop-up waste and overflow.
- 9) Drain Piping: NPS 1-1/2 (DN 40) cast-brass P-trap and 0.045-inch- (1.1-mm-) thick, tubular-brass waste to wall.

R. Sitz Baths:

1. Description: Pedestal-mounting **OR** Wall-mounting, **as directed**, vitreous-china, perineal bath medical plumbing fixture.
 - a. Color: White.
 - b. Drain: NPS 1-1/2 (DN 40) with removable overflow attachment.
 - c. Drain Piping: NPS 1-1/2 (DN 40) chrome-plated, cast-brass P-trap; waste to wall; and wall flange.
 - d. Fixture Support: Sink.
 - e. Faucet:
 - 1) Description: Wall-mounting, single-lever-handle, thermostatic-mixing-valve faucet with concealed supplies and wall-mounting thermometer.
 - a) Material: Brass body and escutcheon.
 - b) Flow Rate: Modified to 1.5 gpm (5.7 L/min.) maximum, unless otherwise indicated.
 - c) Finish: Polished chrome plate.
 - d) Temperature Indicators: Color-coded for hot and cold water.
 - f. Exposed Piping: Chrome-plated; brass pipe or copper tube.

S. Bedpan Washing Equipment

1. Bedpan Washers/Sanitizers:
 - a. Description: Recessed-mounting **OR** On-wall-mounting **OR** Pedestal-mounting, **as directed**, medical plumbing fixture for cleaning bedpans and urinals having cast-iron chamber and waste assembly with spray nozzles and enameled-steel **OR** stainless-steel, **as directed**, front panel and cover box.
 - 1) Controls: Electric, 120-V ac, automatic operation with timer, solenoid valves, and circuit breaker.
 - 2) Door Mechanism: Foot-pedal operation.
 - 3) Supplies: NPS 1 (DN 25) cold water and NPS 3/8 (DN 10) hot water **OR** steam, **as directed**.
 - 4) Drain: NPS 3 (DN 80) P-trap and soil pipe.
 - 5) Atmospheric Vent: NPS 2 (DN 50).
 - 6) Mounting Hardware: Matching fixture mounting arrangement.
 - 7) Accessories:
 - a) Bedpan Rack(s): One **OR** Two, **as directed**.
 - b) Urinal Rack(s): One **OR** Two, **as directed**.
 - c) Drain Tray(s): One **OR** Two, **as directed**.
2. Bedpan Washers/Disinfectors:
 - a. Description: Freestanding-mounting **OR** On-wall-mounting **OR** Undercounter-mounting, **as directed**, medical plumbing fixture for cleaning bedpans and urinals; with steam generator, pump, and spray nozzle.
 - 1) Controls: Electric, automatic operation.
 - 2) Cabinet: Stainless steel.
 - 3) Wash Chamber: Stainless steel.
 - 4) Supplies: NPS 1/2 (DN 15) cold water and NPS 1/2 (DN 15) hot water.
 - 5) Drain: NPS 4 (DN 100) P-trap and soil pipe.
 - 6) Mounting Hardware: Matching fixture mounting arrangement.

T. Hydrotherapy Whirlpools

1. Podiatry Whirlpools:
 - a. Description: Stationary, stainless-steel tank for feet and ankles.

- 1) Water Capacity: 15 gal. (57 L).
- 2) Drain: Waste connection.
- 3) Controls.
- 4) Thermometer: Control panel or tank mounted.
- 5) One electric turbine ejector.
2. Upper-Extremity Whirlpools:
 - a. Description: Stationary, pedestal-mounted, stainless-steel tank for arms, hands, and elbows.
 - 1) Water Capacity: 25 gal. (95 L).
 - 2) Drain: Waste connection.
 - 3) One arm support.
 - 4) Controls.
 - 5) Thermometer: Control panel or tank mounted.
 - 6) One electric turbine ejector.
3. High-Tank Body Whirlpools:
 - a. Description: Stationary, stainless-steel tank for legs, hip, and back.
 - 1) Water Capacity: 105 gal. (397 L).
 - 2) Drain: Waste connection.
 - 3) Controls.
 - 4) Thermometer: Control panel or tank mounted.
 - 5) One electric turbine ejector.
4. Low-Tank Body Whirlpools:
 - a. Description: Stationary, extended-length stainless-steel tank for legs, hip, and lower back.
 - 1) Water Capacity: 105 gal. (397 L).
 - 2) Drain: Waste connection.
 - 3) Controls.
 - 4) Thermometer: Control panel or tank mounted.
 - 5) Head rest.
 - 6) One electric turbine ejector.
5. Small, Hubbard Immersion Tanks:
 - a. Description: Stationary, butterfly-shaped tank, for full-body massage
 - 1) Tank Dimensions: 93 by 64 by 22 inches (2362 by 1626 by 560 mm).
 - 2) Overall Height: 34 to 38 inches (864 to 965 mm).
 - 3) Water Capacity: 268 gal. (1014 L).
 - 4) Material: Stainless steel.
 - 5) Supports: Legs or base.
 - 6) Controls.
 - 7) Thermometer: Control panel or tank rim mounted.
 - 8) Supply: Over-the-rim fill spout.
 - 9) Drains: Two waste connections.
 - 10) Electric Turbine Ejectors: Two; one rail mounted on each side.
 - 11) Thermostatic, mixing-valve assembly.
 - 12) Hose and hand-held shower.
 - 13) Wash-out-hose assembly.
 - 14) Stretcher lift.
 - 15) Overhead electric, **as directed**, hoist.
6. Medium, Hubbard Immersion Tanks:
 - a. Description: Stationary, butterfly-shaped tank, for full-body massage.
 - 1) Tank Dimensions: 100 by 73 by 24 inches (2540 by 1854 by 610 mm).
 - 2) Overall Height: 34 to 38 inches (864 to 965 mm).
 - 3) Water Capacity: 377 gal. (1468 L).
 - 4) Material: Stainless steel.
 - 5) Supports: Legs or base.
 - 6) Controls.
 - 7) Thermometer: Control panel or tank rim mounted.
 - 8) Supply: Over-the-rim fill spout.
 - 9) Drain: One waste connection.

- 10) Electric Turbine Ejector: One, panel mounted.
- 11) Thermostatic, mixing-valve assembly.
- 12) Hose and hand-held shower.
- 13) Wash-out-hose assembly.
- 14) Stretcher lift.
- 15) Overhead electric, **as directed**, hoist.
7. Large, Hubbard Immersion Tanks:
 - a. Description: Stationary, butterfly-shaped tank, for full-body massage.
 - 1) Tank Dimensions: 106 by 77 by 22 inches (2692 by 1956 by 560 mm).
 - 2) Overall Height: 34 inches (864 mm).
 - 3) Water Capacity: 425 gal. (1609 L).
 - 4) Material: Stainless steel.
 - 5) Supports: Legs or base.
 - 6) Controls.
 - 7) Thermometer: Control panel or tank rim mounted.
 - 8) Supply: Over-the-rim fill spout.
 - 9) Drain(s): One or two waste connections.
 - 10) Electric Turbine Ejectors: Two; one rail mounted on each side.
 - 11) Thermostatic, mixing-valve assembly.
 - 12) Hose and hand-held shower.
 - 13) Wash-out-hose assembly.
 - 14) Stretcher lift.
 - 15) Overhead electric, **as directed**, hoist.
8. Full-Body Immersion Tanks:
 - a. Description: Stationary, rectangular tank, for full-body massage
 - 1) Tank Dimensions: 90 by 32 by 19 inches (2286 by 813 by 483 mm) **OR** 95 by 41 by 22 inches (2413 by 1041 by 560 mm), **as directed**.
 - 2) Overall Height: 32 or 34 inches (813 or 860 mm).
 - 3) Water Capacity: 195 gal. (738 L) **OR** 260 gal. (984 L), **as directed**.
 - 4) Material: Stainless steel.
 - 5) Supports: Legs or base.
 - 6) Controls.
 - 7) Thermometer: Control panel or tank rim mounted.
 - 8) Supply: Over-the-rim fill spout.
 - 9) Drain(s): One or two waste connections.
 - 10) Electric Turbine Ejector: One, tank mounted at end **OR** on rail **OR** on side, **as directed**.
 - 11) Thermostatic, mixing-valve assembly.
 - 12) Hose and hand-held shower.
 - 13) Wash-out-hose assembly.
 - 14) Stretcher lift.
 - 15) Overhead electric, **as directed**, hoist.

U. Outlet Boxes

1. Dialysis Equipment Outlet Boxes:
 - a. Description: Recessed-mounting outlet box with water supply and drain connections.
 - 1) Box and Faceplate: Stainless steel.
 - 2) Supply Fitting(s): 1 **OR** 2, **as directed**, NPS 1/2 (DN 15) PVC ball valve(s) and adapter with male hose-thread outlet.
 - 3) Drain: NPS 2 (DN 50) standpipe, P-trap, and direct waste connection to drainage piping.
 - b. Reinforcement: 2-by-4-inch (50-by-100-mm) fire-retardant-treated-wood blocking between studs. Fire-retardant-treated wood blocking is specified in Division 06 Section "Rough Carpentry".

V. Morgue Equipment

1. Autopsy Tables:

- a. Description: Pedestal stainless-steel table with sink; designed for downdraft ventilation.
 - 1) Material: Stainless steel.
 - 2) Overall Size: Approximately 88 by 30 inches (2250 by 760 mm) with deck faucet holes.
 - 3) Faucet: Deck mounted with wrist- or elbow-blade handles.
 - 4) Aspirator: Deck mounted.
 - 5) Removable body supports.
 - 6) Rinse Assembly: Deck-mounted faucet with hose.
 - 7) Disposer: Not required **OR** Required, **as directed**.
 - 8) Fixture Support: Sink.
 - 9) Receptacle: Duplex, hospital grade with ground-fault interruption.
 - 10) Supplies: Chrome-plated copper tubes or flexible connectors, **as directed**, with atmospheric vacuum breakers and stops.
 - 11) Drain: Chrome-plated, cast-brass P-trap and waste to wall.
2. Dissecting Sinks:
 - a. Description: Wall-mounting sink with backsplash.
 - 1) Material: Stainless steel.
 - 2) Overall Size: 84 by 28 inches (2134 by 711 mm) with back faucet holes.
 - 3) Sink Size: Approximately 30 inches (763 mm) wide.
 - 4) Equipment drawer.
 - 5) Faucet: Back mounted with wrist- or elbow-blade handles.
 - 6) Aspirator: Back mounted.
 - 7) Rinse Assembly: One back-mounted faucet with hose.
 - 8) Disposer: Not required **OR** Required, **as directed**.
 - 9) Fixture Support: Sink.
 - 10) Supplies: Chrome-plated copper tubes or flexible connectors, **as directed**, with atmospheric vacuum breakers and stops.
 - 11) Drain: Chrome-plated, cast-brass P-trap and waste to wall.
 - 12) Back-mounted, hand-held-type eye wash.

1.3 EXECUTION

A. Installation

1. Assemble medical plumbing fixtures, trim, fittings, and other components according to manufacturers' written instructions.
2. Install off-floor supports, affixed to building substrate, for wall-mounting fixtures.
 - a. Use carrier supports with waste fitting and seal for back-outlet fixtures.
 - b. Use carrier supports without waste fitting for fixtures with tubular waste piping.
 - c. Use chair-type carrier supports with rectangular steel uprights for accessible fixtures.
3. Install back-outlet, wall-mounting fixtures onto waste fitting seals and attach to supports.
4. Install floor-mounting fixtures on closet flanges or other attachments to piping or building substrate.
5. Install wall-mounting fixtures with tubular waste piping attached to supports.
6. Install counter-mounting fixtures in and attached to casework.
7. Install fixtures level and plumb according to roughing-in drawings.
8. Install water-supply piping with stop on each supply to each fixture to be connected to domestic water piping. Attach supplies to supports or substrate within pipe spaces behind fixtures. Install stops in locations where they can be easily reached for operation.
 - a. Exception: Use ball, gate, or globe valve if stops are not specified with fixture. Valves are specified in Division 22 Section "General-duty Valves For Plumbing Piping".
9. Install trap and tubular waste piping on drain outlet of each fixture to be directly connected to sanitary drainage system.
10. Install flushometer valves for accessible water closets with handle mounted on wide side of compartment. Install other actuators in locations that are easy for people with disabilities to reach.
11. Install toilet seats on water closets.

12. Install faucet-spout fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.
 13. Install shower flow-control fittings with specified maximum flow rates in shower arms.
 14. Install traps on fixture outlets.
 - a. Exception: Omit trap on fixtures with integral traps.
 15. Install escutcheons at piping wall penetrations in exposed, finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding fittings. Escutcheons are specified in Division 22 Section "Common Work Results For Plumbing".
 16. Set showers in leveling bed of cement grout. Grout is specified in Division 22 Section "Common Work Results For Plumbing".
 17. Seal joints between fixtures and walls, floors, and counters using sanitary-type, one-part, mildew-resistant silicone sealant. Match sealant color to fixture color. Sealants are specified in Division 07 Section "Joint Sealants".
- B. Connections
1. Piping installation requirements are specified in other Division 14.. Drawings indicate general arrangement of piping, fittings, and specialties.
 2. Connect water supplies from domestic water piping to medical plumbing fixtures.
 3. Connect drain piping from medical plumbing fixtures to sanitary waste and vent piping.
 4. Ground equipment according to Division 26 Section "Grounding And Bonding For Electrical Systems".
 5. Connect wiring according to Division 26 Section "Low-voltage Electrical Power Conductors And Cables".
- C. Field Quality Control
1. Verify that installed medical plumbing fixtures are categories and types specified for locations where installed.
 2. Check that medical plumbing fixtures are complete with trim, faucets, fittings, and other specified components.
 3. Inspect installed medical plumbing fixtures for damage. Replace damaged fixtures and components.
 4. Test installed fixtures after water systems are pressurized for proper operation. Replace malfunctioning fixtures and components, then retest. Repeat procedure until units operate properly.
 5. Install fresh batteries in sensor-operated mechanisms.
- D. Adjusting
1. Operate and adjust faucets and controls. Replace damaged and malfunctioning medical plumbing fixtures, fittings, and controls.
 2. Adjust water pressure at faucets, shower valves, and flushometer valves to produce proper flow and stream.
 3. Replace washers and seals of leaking and dripping faucets and stops.
- E. Cleaning
1. Clean medical plumbing fixtures, faucets, and other fittings with manufacturers' recommended cleaning methods and materials. Do the following:
 - a. Remove faucet spouts and strainers, remove sediment and debris, and reinstall strainers and spouts.
 - b. Remove sediment and debris from drains.
 2. After completing installation of exposed, factory-finished fixtures, faucets, and fittings, inspect exposed finishes and repair damaged finishes.
- F. Protection
1. Provide protective covering for installed fixtures and fittings.
 2. Do not allow use of medical plumbing fixtures for temporary facilities unless approved in writing by Owner.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 60 00 00 - EMERGENCY SHOWER AND EYE WASH EQUIPMENT**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Provide all materials and labor for emergency shower and eye wash equipment, and associated piping, supports, valves, and accessories to provide complete, operable, and code compliant installation that is acceptable to the authorities having jurisdiction.
- B. Emergency shower and eye wash equipment addressed by this specification shall be installed within conditioned or ventilated spaces having ambient temperatures between 60 and 100 degrees Fahrenheit.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. 2006 Edition of the International Plumbing Code.
 - 2. ANSI Standard: Comply with ANSI Z358.1-2004, "Emergency Eyewash and Shower Equipment."
 - 3. Texas Department of Licensing and Regulation, Texas Accessibility Standards of the Architectural Barriers Act, Article 9102, Texas Civil Statutes.
 - 4. Americans with Disabilities Act, 28 CFR Part 35 Nondiscrimination on the Basis of Disability in State and Local Government Services, Final Rule, as published in the Federal Register.
 - 5. ICC/ANSI A117.1, "Accessible and Usable Buildings and Facilities" relative to plumbing fixtures for people with disabilities.
 - 6. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

1.04 QUALITY ASSURANCE

- A. All materials shall be new, undamaged, and free of rust. Protect installed products and associated materials during progression of the construction period to avoid clogging with dirt, and debris and to prevent damage, rust, etc. Remove dirt and debris as Work progresses.
- B. Manufacturer Qualifications: Company shall have minimum three (3) years documented experience specializing in manufacturing the products specified in this section.

- C. Installer Qualifications: Company shall have minimum three (3) years documented experience specializing in performing the Work of this Section. Installation of plumbing systems shall be performed by individuals licensed by the Texas State Board of Plumbing Examiners as a Journeyman or Master Plumber. Installation may be performed by Apprentice Plumbers provided they are registered with the Texas State Board of Plumbing examiners and under direct supervision of a licensed plumber. All installation shall be supervised by a licensed Master Plumber.

1.05 SUBMITTALS

- A. Product Data:
 - 1. Provide Code and Standards compliance, component dimensions, service sizes and finishes.
- B. Record Documents:
 - 1. Record actual locations of supply isolation valves, emergency shower and eye wash equipment installed.
 - 2. Provide full written description of manufacturer's warranty.
 - 3. Manufacturer's Installation Instructions: Indicate assembly and support requirements, adjustment and testing procedures.
- C. Operation and Maintenance Data:
 - 1. Include installation instructions, exploded assembly views, servicing requirements, inspection data, installation instructions, spare parts lists, replacement part numbers and availability, location and contact numbers of service depot, for all components installed.
 - 2. Include cleaning, testing and adjustment procedures for all components installed.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Accept equipment and materials on Site in shipping containers and maintain in place until installation.
- B. Protect installed equipment from damage and/or entry of foreign materials by temporary covers during the construction phase of this Project.
- C. Do not allow use of installed equipment for any reason, other than testing, during the construction phase of this Project.
- D. Protect all materials before and after installation from exposure to rain, freezing temperatures and direct sunlight.

1.07 EXTRA MATERIALS

- A. Provide manufacturer's drench shower tester for each emergency shower installed.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Provide emergency equipment as indicated and scheduled on the Contract Drawings and as specified herein.

- C. Pressure ratings of equipment and related accessories shall be suitable for the anticipated system pressures in which they are installed.
- D. Equipment and components of same type shall be product of one (1) manufacturer.
- E. All emergency equipment shall meet American with Disabilities Act (ADA) accessibility requirements for activation of controls and height of eye/face outlets with the following exceptions:
 - 1. Equipment within boiler rooms or central plants.
 - 2. Eye/face outlets located in countertops that are not required to be accessible.
- F. Emergency equipment activation devices shall be designed so that the flushing water remains on without requiring the use of the operator's hands. The valve shall be designed to remain activated until intentionally shut off.
- G. Shower head flow rate shall be 20 gallons per minute at a minimum 30 pounds per square inch water pressure.
- H. Eye Wash unit shall provide flushing fluid at 0.4 gallons per minute at a minimum 30 pounds per square inch water pressure.
- I. Face Wash unit shall provide flushing fluid at 3 gallons per minute at a minimum 30 pounds per square inch water pressure.
- J. Provide floor drains or other means of drainage for emergency showers and eyewash equipment.

2.02 ACCEPTABLE MANUFACTURERS:

- A. Haws
- B. Or approved equal

2.03 COMBINATION EMERGENCY SHOWER AND EYE/FACE WASH:

- A. Barrier-free design with coated galvanized steel piping; 10 inch diameter yellow impact-resistant plastic shower head; Chrome-plated brass 1 inch IPS stay-open ball-type shower valve operated by stainless steel pull rod having triangular handle; 10 inch diameter stainless steel eye wash bowl; chrome-plated brass spray head assembly with twin, soft flow, eye wash heads and protective spray head covers; integral flow control capable of maintaining uniform flow under varying water supply conditions from 30-90 psig; Chrome-plated 1/2 inch IPS stay-open ball-type eye wash valve hand operated by a large, highly visible safety yellow PVC push handle; chrome-plated circular face spray ring; universal identification sign; inspection tag, and 1-1/4 inch water supply connection.
- B. Combination emergency shower and eye/face wash units shall be HAWS 8300 or approved equal by an acceptable manufacturer listed herein.

2.04 DRENCH SHOWER WITH HORIZONTAL SUPPLY:

- A. Barrier-free design with coated galvanized steel piping; 10 inch diameter yellow impact-resistant plastic shower head; Chrome-plated brass 1 inch IPS stay-open ball-type shower valve operated by stainless steel pull rod having triangular handle; universal identification sign; inspection tag, and 1 inch water supply connection.
- B. Drench shower units with horizontal supply shall be HAWS 8133H or approved equal by an acceptable manufacturer listed herein.

2.05 DRENCH SHOWER - FLUSH-MOUNTED:

- A. Barrier-free design with coated galvanized steel piping; 12-7/8 inch diameter flanged stainless steel shower head; Chrome-plated brass 1 inch IPS stay-open ball-type shower valve operated by stainless steel pull rod having triangular handle; universal identification sign; inspection tag, and 1 inch water supply connection.
- B. Flush-mounted drench shower units shall be HAWS 8164 or approved equal by an acceptable manufacturer listed herein.

2.06 DRENCH SHOWER WITH VERTICAL SUPPLY:

- A. Barrier-free design with 10 inch diameter stainless steel shower head; stainless steel 1 inch IPS stay-open ball-type shower valve operated by stainless steel pull rod having triangular handle; universal identification sign; inspection tag, and 1 inch water supply connection.
- B. Drench shower units with horizontal supply shall be HAWS 8133V or approved equal by an acceptable manufacturer listed herein.

2.07 DRENCH SHOWER TESTER:

- A. Watertight, chemical resistant 84 inch long funnel constructed of Tyvek®, with weighted bottom and 6 foot telescoping aluminum handle.
- B. Drench shower testers shall be Bradley Model S19-330ST or approved equal by an acceptable manufacturer listed herein.

2.08 EYEWASH - SWING-TYPE, COUNTER MOUNTED:

- A. Chrome-plated brass spray head assembly with twin, soft flow, eye wash heads and protective spray head covers; integral flow control capable of maintaining uniform flow under varying water supply conditions from 30-90 psig; Chrome-plated 1/2 inch IPS stay-open ball-type eye wash valve hand operated by a large, highly visible stainless steel push handle; chrome plated brass pipe and fittings; universal identification sign; inspection tag, and 1/2 inch water supply connection.
- B. Swing-type eyewash units shall HAWS 7612 or 7612 LH or approved equal by an acceptable manufacturer listed herein.

2.09 EYE/FACE WASH - DECK/COUNTER TOP MOUNTED:

- A. Stainless steel 13-5/8 inch diameter bowl; twin perforated disc eye/face wash heads with protective pop-off spray head covers; integral flow control capable of maintaining uniform flow under varying water supply conditions from 30-90 psig; Chrome-plated 1/2 inch IPS stay-open ball-type valve operated by stainless steel push down handle; coated galvanized steel pipe and fittings; dome type strainer; 1-1/4 inch drain fitting; universal identification sign; inspection tag, and 1/2 inch water supply connection.
- B. Counter top mounted bowl type eye/face wash units shall be HAWS 7760B or approved equal by an acceptable manufacturer listed herein.

2.10 EYE/FACE WASH - WALL MOUNTED:

- A. Barrier-free design with stainless steel 10 inch diameter bowl; stainless steel wrap-around skirt; chrome-plated brass spray head assembly with twin, soft flow, eye wash heads and protective spray head covers; integral flow control capable of maintaining uniform flow under varying water supply conditions from 30-90 psig; Chrome-plated 1/2 inch IPS stay-open ball-type eye wash valve hand operated by a large, stainless steel push handle; chrome-plated circular face spray ring; chrome plated brass pipe and fittings; dome type strainer; 1-1/4 inch drain fitting, wall tube and trap; universal identification sign; inspection tag, and 1/2 inch water supply connection.

- B. Wall mounted bowl type eye/face wash units shall be HAWS 7760BT or approved equal by an acceptable manufacturer listed herein.

2.11 EYEWASH - WALL CABINET MOUNTED:

- A. Barrier-free design with stainless steel cabinet and doors; lockable, hinged bottom panel for plumbing access; chrome-plated brass spray head assembly with twin, soft flow, eye wash heads and protective spray head covers; integral flow control capable of maintaining uniform flow under varying water supply conditions from 30-90 psig; Chrome-plated 1/2 inch IPS stay-open ball-type eye wash valve activated by pulling door down 90 degree; chrome plated brass pipe and fittings; 1-1/4 inch drain fitting and trap; brass water stop valve; universal identification sign; inspection tag, and 1/2 inch water supply connection.
- B. Wall cabinet mounted eyewash units shall be HAWS 8356WC or approved equal by an acceptable manufacturer listed herein.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine roughing-in for plumbing piping systems to verify actual locations of piping connections prior to installation of emergency equipment. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Coordinate location of emergency equipment with General Contractor to allow identification of required clear floor space area for emergency shower access.
- C. Coordinate location of counter mounted emergency eyewash and eye/face wash fixture with General Contractor for proper drilling/cutting of casework to allow drenching water to spill into sink.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Install in emergency shower, eyewash and eye/face wash equipment in accordance with manufacturer's published instructions.
- D. Locate emergency equipment on a level surface area for user.
- E. Safety drenching equipment shall not be located within eighteen (18) inches of electrical apparatus, telephones, thermostats, or power outlets.
- F. Emergency shower heads shall be positioned 82 inches – 96 inches from floor. The center of the spray pattern shall be located at least 16 inches from wall or nearest obstruction.
- G. Emergency eyewash nozzles shall be positioned 33 inches- 45 inches from floor and at least 6" from wall or nearest obstruction.
- H. Connect potable water supply having a temperature between 60 degrees F. and 100 degrees F. to emergency equipment. Potable water supply shall be capable of supplying adequate flushing to meet requirements of reference standards.
- I. Provide hydraulic shock absorbers in water supply lines to each emergency shower. Locate and size in accordance with PDI-WH-201 Standard and manufacturer's published recommendations.

- J. Provide and accessible ball type shutoff valve in individual water supply line serving safety drenching equipment. Valves shall be labeled for identification and locked in the open position.
- K. Provide and install stainless steel escutcheons on piping wall and ceiling penetrations in exposed, finished locations.
- L. Coordinate with General Contractor for location and installation of emergency equipment identification signage and inspection tags.

3.03 TESTING

- A. Adjust or replace fixture flow regulators for proper flow.
- B. After plumbing connections have been made, test for compliance with requirements. Verify ability to achieve required flows and temperatures.
- C. Report test results in writing.

END OF SECTION 22 60 00 0066 80 0045 00

SECTION 22 60 00 00A - HIGH PURITY WATER SYSTEMS (RO)**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. The water conditioning system/supplier shall be totally responsible for the supply and installation of the water treatment system to include the central RO water system, the building supply and return loop system, the final connection to the RO water outlet and quality assurance/quality controls of the entire system to assure meeting quality standards for CAP/NCCLS reagent water Specifications Type III at the point of use.
- B. The system/supplier shall guarantee that the water quality coming from the central system is the same quality at any point of use in the RO water loop system at initial start-up.
- C. Provide an RO system with capacities and electrical characteristics as scheduled on Contract Drawings. Scheduled gallons per day (24 hour period) shall be based on a feed water temperature of 77 degrees F.
- D. Provide complete system as manufactured by WRC LLC dba Water Resources Company or Osmonics.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. 2006 Edition of the International Plumbing Code.
 - 2. Texas Water Code Chapter 37
 - 3. Texas Health & Safety Code Chapter 341
 - 4. Title 30 Texas Administrative Code, Chapter 30, Subchapter H
 - 5. Underwriters Laboratories Listings.
 - 6. 2005 Edition of the National Electric Code
 - 7. ASME - Boiler and Pressure Vessel Code.
 - 8. ASTM D 3222 - Standard Specifications for Unmodified PVDF molding material.
 - 9. ASTM D 638 - Standard Test Method for Tensile Properties of Plastic.

10. ASTM D 790 - Standard Test Method of Flexural Properties of Unreinforced and Reinforced Plastics and Electric Insulating Materials.

1.04 QUALITY ASSURANCE

- A. Manufacturer's name and contact information shall be permanently marked on equipment.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. Manufacturer Qualifications: Company shall have minimum three years documented experience specializing in manufacturing the products specified in this section.
- D. Installer Qualifications:
 - 1. Company shall have minimum three years documented experience specializing in performing the Work of this section and be licensed by the State of Texas to install water treatment equipment.
 - 2. Installation of plumbing systems shall be performed by individuals licensed by the Texas State Board of Plumbing Examiners as a Journeyman or Master Plumber. Installation may be performed by Apprentice Plumbers provided they are registered with the Texas State Board of Plumbing examiners and under direct supervision of a licensed plumber. All installation shall be supervised by a licensed Master Plumber.
 - 3. All installers of water treatment equipment must meet the qualifications and be licensed according to the State of Texas.

1.05 SUBMITTALS

- A. Product Data:
 - 1. Code and Standards compliance, manufacturer's data for pipe, fittings, valves, controls, water testing kits, and all furnished specialties, and accessories.
 - 2. Include rated pressures, temperatures, capacities and operating characteristics.
 - 3. Manufacturer's installation instructions.
- B. Record Documents:
 - 1. Shop Drawings: Include plans, elevations, sections, details, and connections to piping systems. Indicate size, profiles, and dimensional service requirements of system based on the specific components being installed.
 - 2. Wiring Diagrams: Power, signal, and control wiring.
 - 3. Manufacturer Certificates: Signed by manufacturers certifying that components comply with requirements.
 - 4. Maintenance service agreement.
 - 5. Provide full written description of manufacturer's warranty including special warranty specified in this Section.
 - 6. Source and Site quality-control test reports.
- C. Operation and Maintenance Data:

1. Include manufacturer's operation instructions, start-up data, trouble-shooting check lists.
2. Include system components manufacturer's literature, servicing requirements, Record Documents, installation instructions, exploded assembly views, replacement part numbers and availability.
3. Include cleaning procedures, preventive maintenance schedule, preventive maintenance recommendations and procedures.
4. Identify place of purchase, location and contact numbers of service depot and technical support for each product installed.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Accept delivery of packaged high purity water equipment, storage vessel, etc. on Site in factory fabricated containers with shipping skids and pipe end protectors in place. Inspect for damage. Comply with manufacturers rigging and installation instructions.
- B. All componenets and materials shall be new, undamaged, and free of rust.
- C. Provide temporary protective coating and end plugs on valves not packaged within containers. Maintain in place until installation.
- D. Provide temporary end caps and closures on openings, connections, pipe and fittings. Maintain in place until installation.
- E. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the Work and isolating parts of completed system.
- F. Protect all components and materials that are to be installed within this project from exposure to rain, freezing temperatures and direct sunlight. EXCEPTION: Materials manufactured for exterior locations.

1.07 WARRANTY

- A. Warranty: Include, but not limited to, coverage for the RO water system, storage tank, pumps, softener system, all associated controls and accessories.
- B. The system/supplier shall be responsible for the operation of the water treatment system for a period of one year from the date of Substantial Completion. During this period the system/supplier shall also be responsible for periodic ongoing training of the building maintenance personnel. The vendor shall supply all the necessary consumables for the first year of operation and include the labor to change out the consumables. A daily log indicating the performance of the system will be kept by the building maintenance personnel and reviewed by the system/supplier on a monthly basis.

1.08 MAINTENANCE SERVICE

- A. Submit four copies of manufacturer's "Agreement for Continued Service and Maintenance," before Substantial Completion, for Owner's acceptance. Offer terms and conditions for furnishing chemicals and providing continued testing and servicing to include replacing materials and equipment. Include one-year term of agreement with option for one-year renewal.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

B. The RO water central system will consist of the following components and include the interconnecting piping, valves, fittings, instrumentation, control wiring and electrical wiring to the equipment.

1. Piping, Valves, Fittings
2. Multi-layer Filter
3. Activated Carbon Filter
4. Water Softeners
5. Reverse Osmosis System
6. Storage Tank
7. Level Controllers
8. Repressure Pumps
9. Ultraviolet Sterilizers
10. Final Filters
11. Instrumentation
12. Control Panel

2.02 PIPING, VALVES AND FITTINGS

- A. Pipe, valves and fittings from the reverse osmosis unit to include the supply and return building loop system shall be SYGEF, SDR-11 through SDR-21 (or pipe schedule equivalent), flame resistant, self-extinguishing polyvinylidene fluoride (PVDF) with heat fusion socket connections.
- B. Installation practices, including support spacing and joint fusion shall be in compliance with manufacturer's printed recommendations.
- C. Material from which pipe, fitting and valves are manufactured shall conform to the standards of ASTM D 3222. The PVDF material shall have a tensile strength of 7,800 psi and a flexural strength of 10,750 psi when tested at 73°F according to ASTM D 638 and ASTM D 790 and shall be as manufactured by George Fischer Company or Simtech.
- D. To ensure installation uniformity, all system piping components shall be the products of one manufacturer.
- E. All piping shall be thoroughly rinsed and flushed to remove all dirt and debris before installation. After installation the Contractor shall flush the entire piping system with deionized water to the satisfaction of The University.
- F. Valves shall be diaphragm valve type and shall be manufactured of the same virgin, unpigmented molding compound as the fittings to assure compatibility.
- G. Diaphragm valves shall have PVDF body, PTEF diaphragm, seals, and seats. Valves shall carry a pressure rating of 150 psi at a minimum of 68°F, and shall be of socket fusion design as manufactured by George Fischer Company or Simtech.

- H. The reverse osmosis pretreatment shall be piped by the system/supplier PVDF and install a pressure gauge and test port before and after each piece of equipment. Each unit shall be installed using a "H" type 3-valve bypass. The person doing this installation or person supervising this installation must possess a currently valid Texas Department of Health Class III Certificate.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Important Safety Precautions: Prior to any operations, be sure that protective equipment and safety shower and/or hose stream is available for personnel protection. Follow chemical manufacturer's safety instructions. Tag all distribution valves with the following information: "DANGER-Men Working on Equipment-DO NOT TOUCH".

3.02 CLEANING AND DISINFECTION

- A. Semi-conductor grade 35 percent unstabilized hydrogen peroxide diluted to 5 percent with deionized water shall be used as the disinfectant. Sodium hypochlorite is not acceptable. Hydrogen peroxide disinfection solution shall be placed in storage tanks, pumped through 0.2 micron absolute membrane filters and into the PVDF piping system. All valves and sample ports shall be opened to purge distribution lines of gases.
- B. Hydrogen peroxide solution shall recirculate for 24 hours. Outlets and sample ports shall be opened and closed each 6 hours for two minutes. At the end of the 24 hour recirculation period, valves and sample ports shall be opened and system shall be drained. Flush system with deionized water. At the completion of the disinfection process, the RO system and DI water system shall be on line with equipment ready for operation and distribution piping system in the recirculation mode.

3.03 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

3.04 START-UP AND SERVICE

- A. Make available the service of qualified personnel to supervise the installation and start-up of the entire system. Provide qualified personnel to train Owner maintenance and operations personnel in the maintenance and operation of the entire system. When start-up is complete and the system is operational, notify Owner that the acceptance test will be started. Provide all chemicals, filters and expandable materials necessary to perform start-up service. Provide necessary chemical test kits as required by maintenance manuals in corrosion-resistant metal cabinet mounted on wall.

3.05 TESTING

- A. Test the system under design operating conditions for a period of 24 hours and check for leaks. After all leaks have been repaired, retest the system until proven airtight.

SECTION 23 01 10 00 - SEQUENCE OF OPERATION**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for sequence of operation. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes control sequences for HVAC systems, subsystems, and equipment.

C. Definitions

1. DDC: Direct digital control.
2. VAV: Variable air volume.

D. Heating Control Sequences

1. Heating-Water Supply Temperature Control:
 - a. Input Device: Thermostat **OR** Thermistor temperature sensor **OR** Resistance temperature sensor, **as directed**.
 - b. Output Device: Control valve.
 - c. Action: Modulate control valve to maintain heating-water supply temperature.
 - d. Display:
 - 1) Heating-water supply temperature.
 - 2) Heating-water supply temperature set point.
 - 3) Control-valve position.
2. Heating-Water Supply Temperature Reset:
 - a. Input Device: Electric, outdoor-air-reset controller **OR** Outdoor-air sensor, **as directed**.
 - b. Output Device: Unitary controller **OR** DDC system software, **as directed**.
 - c. Action: Reset heating-water supply temperature in straight-line relationship with outdoor-air temperature for the following conditions:
 - 1) 195 deg F (90 deg C) heating water when outdoor-air temperature is minus 30 deg F (minus 35 deg C).
 - 2) 130 deg F (54 deg C) heating water when outdoor-air temperature is 75 deg F (24 deg C).
 - 3) 150 deg F (65 deg C) minimum, heating-water temperature.
 - d. Display:
 - 1) Outdoor-air temperature.
 - 2) Heating-water supply temperature.
 - 3) Heating-water supply temperature set point.
3. Control Primary Circulating Pump(s):
 - a. Input Device: Thermostat **OR** DDC system, **as directed**.
 - b. Output Device: Starter **OR** DDC system command to starter, **as directed**, relay.
 - c. Action: Energize pump(s) at outdoor-air temperatures below 65 deg F (18 deg C).
 - d. Display:
 - 1) Outdoor-air temperature.
 - 2) Operating status of primary circulating pump(s).

E. Central Refrigeration Equipment Sequences

1. Start and Stop Condenser-Water Pump(s):
 - a. Enable: Allow pump to start when water is in cooling tower:
 - 1) Input Device: Water pressure transducer.

- 2) Output Device: Hard wired through motor starter; DDC system binary output, **as directed**.
 - 3) Action: Confirm water in cooling-tower sump.
 - b. Enable: When outdoor-air temperature conditions are met:
 - 1) Input Device: Space thermostat **OR** DDC system outdoor-air temperature, **as directed**.
 - 2) Output Device: Hard wired through motor starter; DDC system binary output, **as directed**.
 - 3) Action: Confirm outdoor-air temperature is above 50 deg F (10 deg C).
 - c. Enable: When demand conditions are met:
 - 1) Input Device: DDC system software demand.
 - 2) Action: Confirm cooling demand from ventilation system(s).
 - d. Initiate:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**.
 - 3) Action: Energize pump(s).
 - e. Display:
 - 1) Low-level cooling-tower sump alarm.
 - 2) Outdoor-air temperature.
 - 3) Cooling (software) demand indication.
 - 4) Time and time schedule.
 - 5) Condenser-water pump(s) on-off status.
 - 6) Condenser-water pump(s) on-off indication.
2. Start and Stop Chilled-Water Pump(s):
 - a. Input Device: Flow switch in condenser-water circuit.
 - b. Output Device: Starter **OR** DDC system command to starter, **as directed**, relay.
 - c. Action: Energize pump(s).
 - d. Display:
 - 1) Chilled-water flow indication.
 - 2) Chilled-water pump(s) on-off status.
 - 3) Chilled-water pump(s) on-off indication.
3. Start and Stop Cooling-Tower Fans(s):
 - a. Input Device: Flow switch in condenser-water circuit.
 - b. Output Device: Starter **OR** DDC system command to starter, **as directed**, relay.
 - c. Action: Energize fan(s).
 - d. Display:
 - 1) Condenser-water flow indication.
 - 2) Cooling-tower fan(s) on-off indication.
4. Start and Stop Refrigeration Machine(s):
 - a. Input Device: Flow switch in condenser-water circuit. Flow switch in chilled-water circuit, **as directed**.
 - b. Output Device: Refrigeration **OR** DDC system command to refrigeration, **as directed**, machine terminal strip.
 - c. Action: Energize refrigeration machine(s) internal control circuit.
 - d. Display:
 - e. Condenser-water flow indication.
 - f. Chilled-water flow indication.
 - g. Refrigeration machine on-off indication.
 - h. Chilled-water supply and return temperature.
 - i. Chilled-water temperature control-point adjustment.
5. Start and Stop Chiller(s):
 - a. Input Device: Flow switches in condenser-water and chilled-water circuit.
 - b. Output Device: Chiller **OR** DDC system command to chiller, **as directed**, terminal strip.
 - c. Action: Energize chiller internal control circuit.
 - d. Display:
 - 1) Condenser-water flow indication.

- 2) Chilled-water flow indication.
- 3) Chiller(s) on-off status.
- 4) Chiller(s) on-off indication.
- 5) Chilled-water supply and return temperature.
- 6) Chilled-water temperature control-point adjustment.
6. Alternate Chiller(s):
 - a. Input Device: Electric alternator **OR** DDC system software, **as directed**.
 - b. Output Device: Chiller **OR** DDC system command to chiller, **as directed**, terminal strip.
 - c. Action: Operate chiller(s) on lead-lag, alternating each startup.
OR
Action: Adding and dropping chiller(s) as follows: **<Insert sequence and parameters.>**
 - d. Display: Chiller(s) on-off indication.
7. Alarm Chiller(s) Start Failure:
 - a. Input Device: Chiller control panel terminal strip contact **OR** software signal, **as directed**.
 - b. Output Device: Analog control panel **OR** DDC system alarm, **as directed**.
 - c. Action: Signal alarm.
 - d. Display: Chiller "failure-to-start" indication.
8. Chilled-Water Level:
 - a. Input Device: Expansion tank level switch **OR** liquid sensor, **as directed**.
 - b. Output Device: Electric relay signal to alarm panel **OR** DDC system alarm, **as directed**.
 - c. Action: Signal alarm.
 - d. Display: Expansion tank low-level alarm.
9. Chilled-Water Supply Temperature:
 - a. Input Device: Temperature sensor **OR** transmitter, **as directed**, in common chilled-water supply piping.
 - b. Output Device: Integral chiller controls **OR** DDC system signal to chiller control panel, **as directed**.
 - c. Action: Maintain constant leaving chilled-water temperature reset according to highest cooling demand, **as directed**.
 - 1) Display: Chilled-water supply temperature.
10. Condenser-Water Temperature:
 - a. Input Device: Temperature sensor **OR** transmitter, **as directed**, in cooling-tower sump.
 - b. Output Device: Bypass control valve **OR** Cooling-tower fan starter relay **OR** DDC system command to cooling-tower fan starter relay, **as directed**.
 - c. Action: Modulate control valve open to cooling tower and closed to bypass and cycle tower fan(s) on and off **OR** and to low speed and then to high speed, **as directed**, to maintain 65 deg F (18 deg C) **OR** 70 deg F (21 deg C), **as directed**, sump temperature. Close valve when unoccupied, **as directed**.
 - d. Display:
 - 1) Condenser-water sump (return) control-point temperature.
 - 2) Condenser-water sump (return) temperature.
 - 3) Control-valve position.
 - 4) Cooling-tower fan(s) on-off indication.
 - 5) Condenser-water supply temperature.
11. Cooling-Tower Sump Heater:
 - a. Input Device: Sump temperature sensor **OR** transmitter, **as directed**.
 - b. Output Device: Electric relay **OR** DDC system command to electric relay, as directed, and solenoid valve, **as directed**.
 - c. Action: Energize sump heater; drain sump on low temperature, **as directed**.
 - d. Display:
 - 1) Cooling-tower sump temperature.
 - 2) Cooling-tower sump heater on-off indication.
 - 3) Cooling-tower dump indication.
12. Operator Station Display: Indicate the following on operator workstation display terminal:
 - a. DDC system graphic.
 - b. DDC system status, on-off.
 - c. Low-level cooling-tower sump alarm.

- d. Outdoor-air temperature.
- e. Cooling (software) demand indication.
- f. Time and time schedule.
- g. Condenser-water pump(s) on-off status.
- h. Condenser-water pump(s) on-off indication.
- i. Condenser-water flow indication.
- j. Chilled-water pump(s) on-off status.
- k. Chilled-water pump(s) on-off indication.
- l. Cooling-tower fan(s) on-off indication.
- m. Chilled-water flow indication.
- n. Refrigeration machine on-off indication.
- o. Chilled-water supply temperature.
- p. Chilled-water return temperature.
- q. Chilled-water temperature control-point adjustment.
- r. Chiller(s) on-off status.
- s. Chiller(s) on-off indication.
- t. Chiller "failure-to-start" indication.
- u. Expansion tank low-level alarm.
- v. Condenser-water sump (return) control-point temperature.
- w. Condenser-water sump (return) temperature.
- x. Condenser-water control-valve position.
- y. Cooling-tower fan(s) on-off indication.
- z. Condenser-water supply temperature.
- aa. Cooling-tower sump temperature.
- bb. Cooling-tower sump heater on-off indication.
- cc. Cooling-tower dump indication.
- dd. Chilled-water pressure drop through chiller.
- ee. Entering condenser-water temperature.
- ff. Leaving condenser-water temperature.
- gg. Condenser-water pressure drop through chiller.
- hh. Chiller condenser-water supply and return temperature.
- ii. Chiller chilled-water supply and return temperature.
- jj. System capacity in tons.

F. Air-Handling-Unit Control Sequences

- 1. Start and Stop Supply Fan(s):
 - a. Enable: Freeze Protection:
 - 1) Input Device: Duct-mounted averaging element thermostat, located before supply fan.
 - 2) Output Device: Hard wired through motor starter; analog alarm panel **OR** DDC system alarm, **as directed**.
 - 3) Action: Allow start if duct temperature is above 37 deg F (3 deg C); signal alarm if fan fails to start as commanded.
 - b. Enable: High-Temperature Protection:
 - 1) Input Device: Duct-mounted thermostat, located in return air.
 - 2) Output Device: Hard wired through motor starter; analog alarm panel **OR** DDC system alarm, **as directed**.
 - 3) Action: Allow start if duct temperature is below 300 deg F (150 deg C).
 - c. Enable: Smoke Control:
 - 1) Input Device: Duct-mounted smoke detector, located in return **OR** supply, **as directed**, air.
 - 2) Output Device: Hard wired through motor starter; analog alarm panel **OR** DDC system alarm, **as directed**.
 - 3) Action: Allow start if duct is free of products of combustion.
 - d. Initiate: Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**, to motor starter.

- 3) Action: Energize fan(s).
- e. Initiate: Unoccupied Time Schedule:
 - 1) Input Device: Room thermostat **OR** DDC system demand, **as directed**.
 - 2) Output Device: Room thermostat **OR** Binary output, **as directed**, to motor starter.
 - 3) Action: Energize fan(s).
- f. Unoccupied Ventilation:
 - 1) Input Device: Time clock and room thermostat **OR** DDC system time schedule and output, **as directed**.
 - 2) Output Device: Room thermostat **OR** DDC system binary output, **as directed**, to motor starter.
 - 3) Action: Cycle fan(s) during unoccupied periods.
- g. Display: Supply-fan on-off indication.
2. Supply Fan(s) Variable-Volume Control:
 - a. Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**.
 - 3) Action: Enable control.
 - b. Volume Control (for fans equipped with variable inlet vanes):
 - 1) Input Device: Static-pressure transmitter **OR** Differential-pressure switch, **as directed**, sensing supply-duct static pressure referenced to conditioned-space static pressure.
 - 2) Output Device: Receiver controller **OR** DDC system analog output **OR** DDC system analog output to digital-to-pneumatic transducer, **as directed**, to modulating damper actuator. Set inlet guide vanes to minimum **OR** closed, **as directed**, position when fan is stopped.
 - 3) Action: Maintain constant supply-duct static pressure.
 - c. Volume Control (for fans equipped with variable-speed drives):
 - 1) Input Device: Static-pressure transmitter **OR** Differential-pressure switch, **as directed**, sensing supply-duct static pressure referenced to conditioned-space static pressure.
 - 2) Output Device: Receiver controller **OR** DDC system analog output, **as directed**, to motor speed controller. Set variable-speed drive to minimum speed when fan is stopped.
 - 3) Action: Maintain constant supply-duct static pressure.
 - d. High Pressure:
 - 1) Input Device: Static-pressure transmitter sensing supply-duct static pressure referenced to static pressure outside the duct.
 - 2) Output Device: Receiver controller **OR** DDC system binary output, **as directed**, to alarm panel **OR** motor starter, **as directed**.
 - 3) Action: Stop fan and signal alarm when static pressure rises above excessive-static-pressure set point.
 - e. Display:
 - 1) Supply-fan-discharge static-pressure indication.
 - 2) Supply-fan-discharge static-pressure set point.
 - 3) Supply-fan airflow rate.
 - 4) Supply-fan inlet vane position **OR** speed, **as directed**.
3. Start and Stop Return Fan(s):
 - a. Initiate: Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**, to motor starter.
 - 3) Action: Energize fans when supply fans are energized.
 - b. Initiate: Unoccupied Time Schedule:
 - 1) Input Device: Room thermostat **OR** DDC system demand, **as directed**.
 - 2) Output Device: Room thermostat **OR** Binary output, **as directed**, to motor starter.
 - 3) Action: Energize fans when supply fans are energized.
 - c. Unoccupied Ventilation:

- 1) Input Device: Time clock and room thermostat **OR** DDC system time schedule and output, **as directed**.
- 2) Output Device: Room thermostat **OR** DDC system binary output, **as directed**, to motor starter.
- 3) Action: Cycle fan(s) during unoccupied periods.
- d. Display: Return-fan on-off indication.
4. Return Fan(s) Variable-Volume Control:
 - a. Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**.
 - 3) Action: Enable control.
 - b. Volume Control (for fans equipped with variable inlet vanes):
 - 1) Input Device: Static-pressure transmitter **OR** Differential-pressure switch, **as directed**, sensing building static pressure referenced to outdoor static pressure.
 - 2) Output Device: Receiver controller **OR** DDC system analog output **OR** DDC system analog output to digital-to-pneumatic transducer, **as directed**, to modulating damper actuator. Set inlet guide vanes to minimum **OR** closed, **as directed**, position when fan is stopped.
 - 3) Action: Maintain constant building static pressure.
 - c. Volume Control (for fans equipped with variable-speed drives):
 - 1) Input Device: Static-pressure transmitter **OR** Differential-pressure switch, **as directed**, sensing building static pressure referenced to outdoor static pressure.
 - 2) Output Device: Receiver controller **OR** DDC system analog output, **as directed**, to motor speed controller. Set variable-speed drive to minimum speed when fan is stopped.
 - 3) Action: Maintain constant building static pressure.
 - d. Display:
 - 1) Return-air static-pressure indication.
 - 2) Return-air static-pressure set point.
 - 3) Return-fan airflow rate.
 - 4) Return-fan inlet vane position **OR** speed, **as directed**.
 - 5) Building static-pressure indication.
 - 6) Building static-pressure set point.
5. Return Fan(s) Variable-Volume Control:
 - a. Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**.
 - 3) Action: Enable control.
 - b. Volume Control (for fans equipped with variable inlet vanes):
 - 1) Input Device: Static-pressure transmitter **OR** Differential-pressure switch, **as directed**, sensing building static pressure referenced to outdoor static pressure.
 - 2) Output Device: Receiver controller **OR** DDC system analog output **OR** DDC system analog output to digital-to-pneumatic transducer, **as directed**, to modulating damper actuator. Set inlet guide vanes to minimum **OR** closed, **as directed**, position when fan is stopped.
 - 3) Action: Maintain constant building static pressure.
 - c. Volume Control (for fans equipped with variable-speed drives):
 - 1) Input Device: Static-pressure transmitter **OR** Differential-pressure switch, **as directed**, sensing building static pressure referenced to outdoor static pressure.
 - 2) Output Device: Receiver controller **OR** DDC system analog output, **as directed**, to motor speed controller. Set variable-speed drive to minimum speed when fan is stopped.
 - 3) Action: Maintain constant building static pressure.
 - d. Display:
 - 1) Return-fan-discharge static-pressure indication.
 - 2) Return-fan-discharge static-pressure set point.
 - 3) Return-fan airflow rate.

- 4) Return-fan inlet vane position **OR** speed, **as directed**.
6. Preheat Coil:
 - a. Freeze Protection:
 - 1) Input Device: Duct-mounted averaging element thermostat, located after preheat coil.
 - 2) Output Device: Hard wired through motor starter; analog alarm panel **OR** DDC system alarm, **as directed**.
 - 3) Action: Allow start if duct temperature is above 33 deg F (1 deg C).
 - b. Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**, to motor starter.
 - 3) Action: Energize coil circulating pump(s).
 - c. Supply **OR** Discharge, **as directed**, -Air Temperature:
 - 1) Input Device: Time clock and duct-mounted thermostat **OR** DDC system time schedule and electronic temperature sensor, **as directed**.
 - 2) Output Device: Modulating control valve.
 - 3) Action: Maintain air temperature set point of 55 deg F (13 deg C).
 - d. Unoccupied Time Schedule:
 - 1) Input Device: Time clock and duct-mounted thermostat mounted in outdoor air **OR** DDC system time schedule and outdoor-air temperature, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**, to motor starter.
 - 3) Action: Energize coil circulating pump(s) when outdoor-air temperature falls below 35 deg F (2 deg C).
 - e. Display:
 - 1) Preheat-coil air-temperature indication.
 - 2) Preheat-coil air-temperature set point.
 - 3) Preheat-coil pump operation indication.
 - 4) Preheat-coil control-valve position.
7. Mixed-Air Control:
 - a. Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Pneumatic relay **OR** DDC system output, **as directed**.
 - 3) Action: Enable control.
 - b. Minimum Position:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Receiver controller **OR** DDC system analog output **OR** DDC system analog output to digital-to-pneumatic transducer, **as directed**, to modulating damper actuator(s).
 - 3) Action: Open minimum outdoor-air dampers **OR** outdoor-air dampers to minimum position, **as directed**.
 - c. Heating Reset:
 - 1) Input Device: Room thermostat **OR** DDC system software, **as directed**.
 - 2) Output Device: Receiver controller **OR** DDC system analog output **OR** DDC system analog output to digital-to-pneumatic transducer, **as directed**, to modulating damper actuator(s).
 - 3) Action: Close minimum outdoor-air dampers **OR** Set outdoor-air dampers to minimum position, **as directed**.
 - d. Supply **OR** Mixed, **as directed**, -Air Temperature:
 - 1) Input Device: Duct-mounted thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Receiver controller **OR** DDC system analog output **OR** DDC system analog output to digital-to-pneumatic transducer, **as directed**, to modulating damper actuator(s).
 - 3) Action: Modulate outdoor-, return-, and relief-air dampers to maintain air temperature set point of 55 deg F (13 deg C).
 - e. Cooling Reset:

- 1) Input Device: Outdoor- and return-air, duct-mounted thermostats **OR** electronic temperature sensors, **as directed**.
 - 2) Output Device: Receiver controller **OR** DDC system analog output **OR** DDC system analog output to digital-to-pneumatic transducer, **as directed**, to damper actuator(s).
 - 3) Action: Set outdoor-air dampers to minimum position when outdoor-air temperature exceeds return-air temperature **OR** enthalpy exceeds return-air enthalpy, **as directed**.
 - f. Unoccupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Receiver controller **OR** DDC system analog output **OR** DDC system analog output to digital-to-pneumatic transducer, **as directed**, to modulating damper actuator(s).
 - 3) Action: Position outdoor- and relief-air dampers closed and return-air dampers open.
 - g. Display:
 - 1) Mixed-air-temperature indication.
 - 2) Mixed-air-temperature set point.
 - 3) Mixed-air damper position.
8. Humidifier:
 - a. Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**, and airflow switch
 - 2) Output Device: Pneumatic relay **OR** DDC system output, **as directed**.
 - 3) Action: Enable control.
 - b. Humidity:
 - 1) Input Device: Room humidistat **OR** Return-air, duct-mounted humidistat **OR** DDC system, **as directed**.
 - 2) Output Device: Receiver controller **OR** DDC system analog output **OR** DDC system analog output to digital-to-pneumatic transducer, **as directed**, enables humidifier **OR** modulates control valve to maintain humidity **OR** cycles pump to maintain humidity **OR** cycles pump and modulates control valve to maintain humidity, **as directed**, in straight-line relationship for the following conditions:
 - a) 20 percent when outdoor-air temperature is minus 30 deg F (minus 35 deg C).
 - b) 40 percent when outdoor-air temperature is 75 deg F (24 deg C).
 - 3) Action: Modulate outdoor-, return-, and relief-air dampers to maintain air temperature set point of 55 deg F (13 deg C).
 - c. Display:
 - 1) Relative humidity indication.
 - 2) Relative humidity set point.
 - 3) Relative humidity control-valve position.
9. Filters: During occupied periods, when fan is running, differential air-pressure transmitters exist.
 - a. Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Electric relay **OR** DDC system output, **as directed**.
 - 3) Action: Enable control.
 - b. Differential Pressure:
 - 1) Input Device: Differential-pressure switches **OR** Pressure transmitter, **as directed**.
 - 2) Output Device: Analog alarm panel **OR** DDC system alarm, **as directed**.
 - 3) Action: Signal alarm on low- and high-pressure conditions.
 - c. Display:
 - 1) Filter air-pressure-drop indication.
 - 2) Filter low-air-pressure set point.
 - 3) Filter high-air-pressure set point.
10. Hydronic **OR** Steam, **as directed**, Heating Coil:
 - a. Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.

- 2) Output Device: Time clock **OR** Binary output, **as directed**.
 - 3) Action: Enable control.
 - b. Supply **OR** Discharge, **as directed**, -Air Temperature:
 - 1) Input Device: Duct-mounted thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Normally open **OR** closed, **as directed**, modulating control valve.
 - 3) Action: Maintain supply-air temperature set point of 55 deg F (13 deg C).
 - c. Temperature Reset (for constant-temperature supply-air systems):
 - 1) Input Device: Duct-mounted thermostat **OR** Electronic temperature sensor, **as directed**, in return air.
 - 2) Output Device: Direct to receiver controller **OR** DDC system, **as directed**, in straight-line relationship for the following conditions:
 - a) 65 deg F (18 deg C) when return-air temperature is 70 deg F (21 deg C).
 - b) 55 deg F (13 deg C) when return-air temperature is 75 deg F (24 deg C).
 - 3) Action: Reset supply-air temperature set point of 55 deg F (13 deg C).
 - d. Temperature Reset (for multizone or dual-duct supply-air systems):
 - 1) Input Device: Load analyzer **OR** DDC system, **as directed**, with input from room thermostats **OR** temperature sensors, **as directed**.
 - 2) Output Device: Direct to receiver controller **OR** DDC system, **as directed**.
 - 3) Action: Reset supply-air temperature in response to greatest heating demand.
 - e. Unoccupied Time Schedule:
 - 1) Input Device: Time clock and room thermostat **OR** DDC system time schedule and output, **as directed**.
 - 2) Output Device: Room thermostat (cycling fan) **OR** DDC system binary output, **as directed**.
 - 3) Action: Enable normal control **OR** Return valve to normal position, **as directed**, when fan is cycled on.
 - f. Display:
 - 1) Fan-discharge air-temperature indication.
 - 2) Fan-discharge air-temperature set point.
 - 3) Heating-coil air-temperature indication.
 - 4) Heating-coil air-temperature set point.
 - 5) Heating-coil pump operation indication.
 - 6) Heating-coil control-valve position.
 - 7) Hot-deck air-temperature indication.
 - 8) Hot-deck air-temperature set point.
11. Hydronic Cooling Coil:
- a. Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**.
 - 3) Action: Enable control.
 - b. Supply **OR** Discharge, **as directed**, -Air Temperature:
 - 1) Input Device: Duct-mounted thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Normally open **OR** closed, **as directed**, modulating control valve.
 - 3) Action: Maintain supply-air temperature set point of 55 deg F (13 deg C).
 - c. Temperature Reset (for constant-temperature systems):
 - 1) Input Device: Duct-mounted thermostat **OR** Electronic temperature sensor, **as directed**, in return air.
 - 2) Output Device: Direct to receiver controller **OR** DDC system, **as directed**, in straight-line relationship for the following conditions:
 - a) 65 deg F (18 deg C) when return-air temperature is 70 deg F (21 deg C).
 - b) 55 deg F (13 deg C) when return-air temperature is 75 deg F (24 deg C).
 - 3) Action: Reset supply-air temperature set point of 55 deg F (13 deg C).
 - d. Temperature Reset (for multizone or dual-duct supply-air systems):
 - 1) Input Device: Load analyzer **OR** DDC system, **as directed**, with input from room thermostats **OR** temperature sensors, **as directed**.

- 2) Output Device: Direct to receiver controller **OR** DDC system, **as directed**.
- 3) Action: Reset supply-air temperature in response to greatest heating demand.
- e. Unoccupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**.
 - 3) Action: Disable control.
- f. Display:
 - 1) Fan-discharge air-temperature indication.
 - 2) Fan-discharge air-temperature set point.
 - 3) Cooling-coil air-temperature indication.
 - 4) Cooling-coil air-temperature set point.
 - 5) Cooling-coil control-valve position.
 - 6) Cold-deck air-temperature indication.
 - 7) Cold-deck air-temperature set point.
- 12. Multizone Damper Control:
 - a. Occupied Time Schedule:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**.
 - 3) Action: Enable control.
 - b. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Damper actuator.
 - 3) Action: Maintain room temperature.
 - c. Display:
 - 1) Room temperature indication.
 - 2) Room temperature set point.
 - 3) Multizone damper position.
- 13. Coordination of Air-Handling Unit Sequences: Ensure that preheat, mixed-air, heating-coil, and cooling-coil controls have common inputs and do not overlap in function.
- 14. Operator Station Display: Indicate the following on operator workstation display terminal:
 - a. DDC system graphic.
 - b. DDC system on-off indication.
 - c. DDC system occupied/unoccupied mode.
 - d. Outdoor-air-temperature indication.
 - e. Supply-fan on-off indication.
 - f. Supply-fan-discharge static-pressure indication.
 - g. Supply-fan-discharge static-pressure set point.
 - h. Supply-fan airflow rate.
 - i. Supply-fan inlet vane position **OR** speed, **as directed**.
 - j. Return-fan on-off indication.
 - k. Return-air static-pressure indication.
 - l. Return-air static-pressure set point.
 - m. Return-fan airflow rate.
 - n. Return-fan inlet vane position **OR** speed, **as directed**.
 - o. Building static-pressure indication.
 - p. Building static-pressure set point.
 - q. Preheat-coil air-temperature indication.
 - r. Preheat-coil air-temperature set point.
 - s. Preheat-coil pump operation indication.
 - t. Preheat-coil control-valve position.
 - u. Mixed-air-temperature indication.
 - v. Mixed-air-temperature set point.
 - w. Mixed-air damper position.
 - x. Relative humidity indication.
 - y. Relative humidity set point.
 - z. Relative humidity control-valve position.
 - aa. Filter air-pressure-drop indication.

- bb. Filter low-air-pressure set point.
- cc. Filter high-air-pressure set point.
- dd. Fan-discharge air-temperature indication.
- ee. Fan-discharge air-temperature set point.
- ff. Heating-coil air-temperature indication.
- gg. Heating-coil air-temperature set point.
- hh. Heating-coil pump operation indication.
- ii. Heating-coil control-valve position.
- jj. Hot-deck air-temperature indication.
- kk. Hot-deck air-temperature set point.
- ll. Cooling-coil air-temperature indication.
- mm. Cooling-coil air-temperature set point.
- nn. Cooling-coil control-valve position.
- oo. Cold-deck air-temperature indication.
- pp. Cold-deck air-temperature set point.
- qq. Room temperature indication.
- rr. Room temperature set point.
- ss. Multizone damper position.

G. Terminal Unit Operating Sequence

1. Cabinet Unit Heater, Hydronic **OR** Steam, **as directed**:
 - a. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Room thermostat **OR** DDC system binary output, **as directed**.
 - 3) Action: Cycle fan to maintain temperature.
 - b. Low-Temperature Safety:
 - 1) Input Device: Line-voltage, on-off thermostat, pipe mounted.
 - 2) Output Device: Hard wired.
 - 3) Action: Stop fan when return heating-water **OR** condensate, **as directed**, temperature falls below 35 deg F (2 deg C).
 - c. Display:
 - 1) Room temperature indication.
 - 2) Room temperature set point.
2. Cabinet Unit Heater, Electric: Room thermostat cycles fan and sequences stages of heating.
3. Unit Heater, Hydronic **OR** Steam, **as directed**:
 - a. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Room thermostat **OR** DDC system binary output, **as directed**.
 - 3) Action: Cycle fan to maintain temperature.
 - b. Low-Temperature Safety:
 - 1) Input Device: Line-voltage, on-off thermostat, pipe mounted.
 - 2) Output Device: Hard wired.
 - 3) Action: Stop fan when return heating-water **OR** condensate, **as directed**, temperature falls below 35 deg F (2 deg C).
 - c. Display:
 - 1) Room temperature indication.
 - 2) Room temperature set point.
4. Unit Heater, Electric: Room thermostat cycles fan and sequences stages of heating.
5. Combustion-Air Unit Heaters:
 - a. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Pneumatic **OR** Electronic, **as directed**, control-valve operator.
 - 3) Action: Modulate valve to maintain temperature.
 - b. Display:
 - 1) Room temperature indication.
 - 2) Room temperature set point.
 - 3) Control-valve position.

6. Radiant Heating Cable, Electric: Room thermostat cycles power.
7. Radiant Heating Panel, Electric: Room thermostat cycles power.
8. Radiant Heating Panel, Hydronic:
 - a. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Pneumatic **OR** Electronic, **as directed**, control-valve operator.
 - 3) Action: Modulate valve to maintain temperature.
 - b. Display:
 - 1) Room temperature indication.
 - 2) Room temperature set point.
 - 3) Control-valve position.
9. Two-Pipe, Single-Coil, Fan-Coil Unit:
 - a. Occupied Time Schedule:
 - 1) Input Device: Fan switch **OR** Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**.
 - 3) Action: Start and stop fan and enable control.
 - b. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**, in room **OR** return air, **as directed**.
 - 2) Output Device: Pneumatic **OR** Electronic, **as directed**, control-valve operator.
 - 3) Action: Modulate valve to maintain temperature.
 - c. DDC System Changeover:
 - 1) Input Device: Thermostat **OR** Electronic temperature sensor, **as directed**, in supply-water **OR** on supply-water piping **OR** DDC system, **as directed**.
 - 2) Output Device: Hard-wired relay **OR** DDC system software, **as directed**.
 - 3) Action: Reverse control-valve action to switch from heating to cooling.
 - d. Display:
 - 1) DDC system graphic.
 - 2) DDC system on-off indication.
 - 3) DDC system occupied/unoccupied mode.
 - 4) Room temperature indication.
 - 5) Room temperature set point.
 - 6) Control-valve position.
 - 7) Supply-water temperature indication.
10. Four-Pipe, Hydronic Fan-Coil Unit:
 - a. Occupied Time Schedule:
 - 1) Input Device: Fan switch **OR** Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Time clock **OR** Binary output, **as directed**.
 - 3) Action: Start and stop fan, and enable control.
 - b. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Pneumatic **OR** Electronic, **as directed**, control-valve operators.
 - 3) Action: Modulate multiport control valves to maintain temperature.
 - c. Display:
 - 1) DDC system graphic.
 - 2) DDC system on-off indication.
 - 3) DDC system occupied/unoccupied mode.
 - 4) Room temperature indication.
 - 5) Room temperature set point.
 - 6) Control-valve position.
11. Unit Ventilator: Room thermostat modulates heating-and-cooling control valves; airstream thermostats modulate outdoor- and return-air dampers as follows:
 - a. Occupied Time Schedule:
 - 1) Input Device: Fan switch **OR** Time clock **OR** DDC system time schedule, **as directed**.

- 2) Output Device: Time clock **OR** Binary output, **as directed**.
- 3) Action: Start and stop fan, move outdoor- and return-air dampers to minimum **OR** maximum, **as directed**, outdoor-air position, and enable control.
- b. Room Temperature - Valves:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Pneumatic **OR** Electronic, **as directed**, control-valve operators.
 - 3) Action: Modulate heating-water supply control valve and chilled-water supply control valve in sequence to maintain temperature.
- c. Room Temperature - Dampers:
 - 1) Input Device: Thermostat **OR** Electronic temperature sensor, **as directed**, in mixed air.
 - 2) Output Device: Pneumatic **OR** Electronic, **as directed**, control damper actuators.
 - 3) Action: Modulate outdoor- and return-air dampers to maintain temperature.
- d. Supply-Air Temperature Limit:
 - 1) Input Device: Thermostat **OR** Electronic temperature sensor, **as directed**, in discharge air.
 - 2) Output Device: Pneumatic **OR** Electronic, **as directed**, control-valve operators and control damper actuators.
 - 3) Action: Override room thermostat to control valves and dampers to prevent discharge air from dropping below a minimum set point.
- e. Warm-up Cycle:
 - 1) Input Device: Time clock **OR** DDC system time schedule, **as directed**.
 - 2) Output Device: Hard-wired relay **OR** DDC system binary output, **as directed**.
 - 3) Action: Open heating-water supply control valve, close outdoor-air damper, and open return-air damper.
- f. Display:
 - 1) DDC system graphic.
 - 2) DDC system on-off indication.
 - 3) DDC system occupied/unoccupied mode.
 - 4) Room temperature indication.
 - 5) Room temperature set point.
 - 6) Control-valve position.
 - 7) Damper position.
12. Heating Coils, Hydronic **OR** Steam, **as directed**:
 - a. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Pneumatic **OR** Electronic **OR** Electric, **as directed**, control-valve operators.
 - 3) Action: Modulate **OR** Cycle, **as directed**, valve to maintain temperature.
 - b. Display:
 - 1) Room temperature indication.
 - 2) Room temperature set point.
 - 3) Control-valve position.
13. Heating Coils, Electric: Room thermostat cycles coils **OR** sequences stages of heating, **as directed**.
14. Radiators and Convectors, Hydronic **OR** Steam, **as directed**:
 - a. Occupancy:
 - 1) Input Device: Occupancy sensor.
 - 2) Output Device: DDC system binary output.
 - 3) Action: Report occupancy and enable occupied temperature set point.
 - b. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Pneumatic **OR** Electronic **OR** Electric, **as directed**, control-valve operators.
 - 3) Action: Modulate **OR** Cycle, **as directed**, valve to maintain temperature.
 - a) Occupied Temperature: 75 deg F (24 deg C).
 - b) Unoccupied Temperature: 65 deg F (18 deg C).

- c. Display:
 - 1) Room/area served.
 - 2) Room temperature indication.
 - 3) Room temperature set point.
 - 4) Room temperature set point, occupied.
 - 5) Room temperature set point, occupied standby.
 - 6) Room temperature set point, unoccupied.
 - 7) Control-valve position as percent open.
- 15. Radiators and Convector, Electric: Room thermostat cycles coils **OR** sequences stages of heating, **as directed**.
- 16. Constant-Volume, Terminal Air Units, Hydronic **OR** Steam, **as directed**:
 - a. Occupancy:
 - 1) Input Device: Occupancy sensor.
 - 2) Output Device: DDC system binary output.
 - 3) Action: Report occupancy and enable occupied temperature set point.
 - a) Occupied Temperature: 75 deg F (24 deg C).
 - b) Unoccupied Temperature: 65 deg F (18 deg C).
 - b. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Pneumatic **OR** Electronic **OR** Electric, **as directed**, control-valve operators.
 - 3) Action: Modulate **OR** Cycle, **as directed**, valve to maintain temperature.
 - c. Display:
 - 1) Room/area served.
 - 2) Room occupied/unoccupied.
 - 3) Room temperature indication.
 - 4) Room temperature set point.
 - 5) Room temperature set point, occupied.
 - 6) Room temperature set point, unoccupied.
 - 7) Control-valve position as percent open.
- 17. VAV, Terminal Air Units with Hydronic **OR** Steam, **as directed**, Coils:
 - a. Occupancy:
 - 1) Input Device: Occupancy sensor.
 - 2) Output Device: DDC system binary output.
 - 3) Action: Report occupancy and enable occupied temperature set point.
 - a) Occupied Temperature: 75 deg F (24 deg C).
 - b) Unoccupied Temperature: 65 deg F (18 deg C).
 - b. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Pneumatic **OR** Electronic, **as directed**, damper actuators and control-valve operators.
 - 3) Action: Modulate damper and valve to maintain temperature.
 - a) Sequence damper from full open to minimum position, then valve from closed to fully open.
 - c. Display:
 - 1) Room/area served.
 - 2) Room occupied/unoccupied.
 - 3) Room temperature indication.
 - 4) Room temperature set point.
 - 5) Room temperature set point, occupied.
 - 6) Room temperature set point, unoccupied.
 - 7) Air-damper position as percent open.
 - 8) Control-valve position as percent open.
- 18. Dual-Duct, VAV, Terminal Air Units:
 - a. Occupancy:
 - 1) Input Device: Occupancy sensor.
 - 2) Output Device: DDC system binary output.

- 3) Action: Report occupancy and enable occupied temperature set point.
 - a) Occupied Temperature: 75 deg F (24 deg C).
 - b) Unoccupied Temperature: 65 deg F (18 deg C).
- b. Room Temperature:
 - 1) Input Device: Room thermostat **OR** Electronic temperature sensor, **as directed**.
 - 2) Output Device: Pneumatic **OR** Electronic, **as directed**, damper actuators.
 - 3) Action: Modulate dampers to maintain temperature.
 - a) Sequence when space temperature is below set point: Close VAV damper to minimum position, open hot-deck dampers and close cold-deck dampers, then open VAV damper.
 - b) Sequence when space temperature is above set point: Close VAV damper to minimum position, close hot-deck dampers and open cold-deck dampers, then open VAV damper.
- c. Display:
 - 1) Room/area served.
 - 2) Room occupied/unoccupied.
 - 3) Room temperature indication.
 - 4) Room temperature set point.
 - 5) Room temperature set point, occupied.
 - 6) Room temperature set point, unoccupied.
 - 7) VAV damper position as percent open.
 - 8) Hot-deck damper position as percent open.
 - 9) Cold-deck damper position as percent open.

H. Ventilation Sequences

1. Combustion-Air, Makeup Unit Control, Electric: Start fan when served appliance burner starts; room thermostat sequences stages of heating.
2. Combustion-Air, Makeup Unit Control, Hydronic **OR** Steam, **as directed**: Start fan when served appliance burner starts; room thermostat cycles **OR** modulates, **as directed**, control valve.
3. Gravity Roof Ventilator: Occupancy sensor **OR** Room thermostat, **as directed**, opens dampers.
4. Exhaust Fan: Occupancy sensor **OR** Interlock with light switch **OR** Room thermostat, **as directed**, cycles fan.
5. Kitchen Exhaust Fan: Occupancy sensor starts fan and energizes makeup air unit.

1.3 EXECUTION (Not Applicable)

END OF SECTION 23 01 10 00

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 01 10 00a - TESTING, ADJUSTING, AND BALANCING**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for testing, adjusting and balancing. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Balancing Air Systems:
 - 1) Constant-volume air systems.
 - 2) Dual-duct systems.
 - 3) Variable-air-volume systems.
 - 4) Multizone systems.
 - 5) Induction-unit systems.
 - b. Balancing Hydronic Piping Systems:
 - 1) Constant-flow hydronic systems.
 - 2) Variable-flow hydronic systems.
 - 3) Primary-secondary hydronic systems.

C. Definitions

1. AABC: Associated Air Balance Council.
2. NEBB: National Environmental Balancing Bureau.
3. TAB: Testing, adjusting, and balancing.
4. TABB: Testing, Adjusting, and Balancing Bureau.
5. TAB Specialist: An entity engaged to perform TAB Work.

D. Submittals

1. LEED Submittal:
 - a. Air-Balance Report for LEED Prerequisite EQ 1: Documentation of work performed for ASHRAE 62.1, Section 7.2.2, "Air Balancing."
2. Strategies and Procedures Plan: Within 30 **OR** 60 **OR** 90, **as directed**, days of Contractor's Notice to Proceed, submit TAB strategies and step-by-step procedures as specified in "Preparation" Article.
3. Certified TAB reports.

E. Quality Assurance

1. TAB Contractor Qualifications: Engage a TAB entity certified by AABC **OR** NEBB **OR** TABB, **as directed**.
 - a. TAB Field Supervisor: Employee of the TAB contractor and certified by AABC **OR** NEBB **OR** TABB, **as directed**.
 - b. TAB Technician: Employee of the TAB contractor and who is certified by AABC **OR** NEBB **OR** TABB, **as directed**, as a TAB technician.
2. Certify TAB field data reports and perform the following:
 - a. Review field data reports to validate accuracy of data and to prepare certified TAB reports.
 - b. Certify that the TAB team complied with the approved TAB plan and the procedures specified and referenced in this Specification.
3. TAB Report Forms: Use standard TAB contractor's forms approved by The University **OR** Owner **OR** Commissioning Authority, **as directed**.
4. Instrumentation Type, Quantity, Accuracy, and Calibration: As described in ASHRAE 111, Section 5, "Instrumentation."

F. Project Conditions

1. Full Owner Occupancy: Owner will occupy the site and existing building during entire TAB period. Cooperate with Owner during TAB operations to minimize conflicts with Owner's operations.

OR

Partial Owner Occupancy: Owner may occupy completed areas of building before Substantial Completion. Cooperate with Owner during TAB operations to minimize conflicts with Owner's operations.

1.2 PRODUCTS (Not Applicable)

1.3 EXECUTION

A. Examination

1. Examine the Contract Documents to become familiar with Project requirements and to discover conditions in systems' designs that may preclude proper TAB of systems and equipment.
2. Examine systems for installed balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers. Verify that locations of these balancing devices are accessible.
3. Examine the approved submittals for HVAC systems and equipment.
4. Examine design data including HVAC system descriptions, statements of design assumptions for environmental conditions and systems' output, and statements of philosophies and assumptions about HVAC system and equipment controls.
5. Examine ceiling plenums and underfloor air plenums used for supply, return, or relief air to verify that they meet the leakage class of connected ducts as specified in Division 23 Section(s) "Metal Ducts" OR "Nonmetal Ducts", **as directed**, and are properly separated from adjacent areas. Verify that penetrations in plenum walls are sealed and fire-stopped if required.
6. Examine equipment performance data including fan and pump curves.
 - a. Relate performance data to Project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.
 - b. Calculate system-effect factors to reduce performance ratings of HVAC equipment when installed under conditions different from the conditions used to rate equipment performance. To calculate system effects for air systems, use tables and charts found in AMCA 201, "Fans and Systems," or in SMACNA's "HVAC Systems - Duct Design." Compare results with the design data and installed conditions.
7. Examine system and equipment installations and verify that field quality-control testing, cleaning, and adjusting specified in individual Sections have been performed.
8. Examine test reports specified in individual system and equipment Sections.
9. Examine HVAC equipment and filters and verify that bearings are greased, belts are aligned and tight, and equipment with functioning controls is ready for operation.
10. Examine terminal units, such as variable-air-volume boxes, and verify that they are accessible and their controls are connected and functioning.
11. Examine strainers. Verify that startup screens are replaced by permanent screens with indicated perforations.
12. Examine three-way valves for proper installation for their intended function of diverting or mixing fluid flows.
13. Examine heat-transfer coils for correct piping connections and for clean and straight fins.
14. Examine system pumps to ensure absence of entrained air in the suction piping.
15. Examine operating safety interlocks and controls on HVAC equipment.
16. Report deficiencies discovered before and during performance of TAB procedures. Observe and record system reactions to changes in conditions. Record default set points if different from indicated values.

B. Preparation

1. Prepare a TAB plan that includes strategies and step-by-step procedures.
2. Complete system-readiness checks and prepare reports. Verify the following:
 - a. Permanent electrical-power wiring is complete.
 - b. Hydronic systems are filled, clean, and free of air.
 - c. Automatic temperature-control systems are operational.
 - d. Equipment and duct access doors are securely closed.
 - e. Balance, smoke, and fire dampers are open.
 - f. Isolating and balancing valves are open and control valves are operational.
 - g. Ceilings are installed in critical areas where air-pattern adjustments are required and access to balancing devices is provided.
 - h. Windows and doors can be closed so indicated conditions for system operations can be met.

C. General Procedures For Testing And Balancing

1. Perform testing and balancing procedures on each system according to the procedures contained in AABC's "National Standards for Total System Balance" **OR** ASHRAE 111 **OR** NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems" **OR** SMACNA's "HVAC Systems - Testing, Adjusting, and Balancing", **as directed**, and in this Section.
 - a. Comply with requirements in ASHRAE 62.1, Section 7.2.2, "Air Balancing."
2. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary for TAB procedures.
 - a. After testing and balancing, patch probe holes in ducts with same material and thickness as used to construct ducts.
OR
After testing and balancing, install test ports and duct access doors that comply with requirements in Division 23 Section "Air Duct Accessories".
 - b. Install and join new insulation that matches removed materials. Restore insulation, coverings, vapor barrier, and finish according to Division 23 Section "Hvac Insulation".
3. Mark equipment and balancing devices, including damper-control positions, valve position indicators, fan-speed-control levers, and similar controls and devices, with paint or other suitable, permanent identification material to show final settings.
4. Take and report testing and balancing measurements in inch-pound (IP) **OR** metric (SI) **OR** inch-pound (IP) and metric (SI), **as directed**, units.

D. General Procedures For Balancing Air Systems

1. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.
2. Prepare schematic diagrams of systems' "as-built" duct layouts.
3. For variable-air-volume systems, develop a plan to simulate diversity.
4. Determine the best locations in main and branch ducts for accurate duct-airflow measurements.
5. Check airflow patterns from the outdoor-air louvers and dampers and the return- and exhaust-air dampers through the supply-fan discharge and mixing dampers.
6. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.
7. Verify that motor starters are equipped with properly sized thermal protection.
8. Check dampers for proper position to achieve desired airflow path.
9. Check for airflow blockages.
10. Check condensate drains for proper connections and functioning.
11. Check for proper sealing of air-handling-unit components.
12. Verify that air duct system is sealed as specified in Division 23 Section "Metal Ducts".

E. Procedures For Constant-Volume Air Systems

1. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.

- a. Measure total airflow.
 - 1) Where sufficient space in ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow.
 - b. Measure fan static pressures as follows to determine actual static pressure:
 - 1) Measure outlet static pressure as far downstream from the fan as practical and upstream from restrictions in ducts such as elbows and transitions.
 - 2) Measure static pressure directly at the fan outlet or through the flexible connection.
 - 3) Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from the flexible connection, and downstream from duct restrictions.
 - 4) Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.
 - c. Measure static pressure across each component that makes up an air-handling unit, rooftop unit, and other air-handling and -treating equipment.
 - 1) Report the cleanliness status of filters and the time static pressures are measured.
 - d. Measure static pressures entering and leaving other devices, such as sound traps, heat-recovery equipment, and air washers, under final balanced conditions.
 - e. Review Record Documents to determine variations in design static pressures versus actual static pressures. Calculate actual system-effect factors. Recommend adjustments to accommodate actual conditions.
 - f. Obtain approval from The University **OR** Owner **OR** Commissioning Authority, **as directed**, for adjustment of fan speed higher or lower than indicated speed. Comply with requirements in Division 21 for air-handling units for adjustment of fans, belts, and pulley sizes to achieve indicated air-handling-unit performance.
 - g. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload will occur. Measure amperage in full-cooling, full-heating, economizer, and any other operating mode to determine the maximum required brake horsepower.
2. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows within specified tolerances.
 - a. Measure airflow of submain and branch ducts.
 - 1) Where sufficient space in submain and branch ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow for that zone.
 - b. Measure static pressure at a point downstream from the balancing damper, and adjust volume dampers until the proper static pressure is achieved.
 - c. Remeasure each submain and branch duct after all have been adjusted. Continue to adjust submain and branch ducts to indicated airflows within specified tolerances.
 3. Measure air outlets and inlets without making adjustments.
 - a. Measure terminal outlets using a direct-reading hood or outlet manufacturer's written instructions and calculating factors.
 4. Adjust air outlets and inlets for each space to indicated airflows within specified tolerances of indicated values. Make adjustments using branch volume dampers rather than extractors and the dampers at air terminals.
 - a. Adjust each outlet in same room or space to within specified tolerances of indicated quantities without generating noise levels above the limitations prescribed by the Contract Documents.
 - b. Adjust patterns of adjustable outlets for proper distribution without drafts.

F. Procedures For Dual-Duct Systems

1. Verify that the cooling coil is capable of full-system airflow, and set mixing boxes at full-cold airflow position for fan volume.
2. Measure static pressure in both hot and cold ducts at the end of the longest duct run to determine that sufficient static pressure exists to operate controls of mixing boxes and to overcome resistance in the ducts and outlets downstream from mixing boxes.
 - a. If insufficient static pressure exists, increase airflow at the fan.

3. Test and adjust the constant-volume mixing boxes as follows:
 - a. Verify both hot and cold operations by adjusting the thermostat and observing changes in air temperature and volume.
 - b. Verify sufficient inlet static pressure before making volume adjustments.
 - c. Adjust mixing boxes to indicated airflows within specified tolerances. Measure airflow by Pitot-tube traverse readings or by measuring static pressure at mixing-box taps if provided by mixing-box manufacturer.
 4. Do not overpressurize ducts.
 5. Remeasure static pressure in both hot and cold ducts at the end of the longest duct run to determine that sufficient static pressure exists to operate controls of mixing boxes and to overcome resistance in the ducts and outlets downstream from mixing boxes.
 6. Adjust variable-air-volume, dual-duct systems in the same way as constant-volume, dual-duct systems; adjust maximum- and minimum-airflow setting of each mixing box.
- G. Procedures For Variable-Air-Volume Systems
1. Compensating for Diversity: When the total airflow of all terminal units is more than the indicated airflow of the fan, place a selected number of terminal units at a minimum set-point airflow with the remainder at maximum-airflow condition until the total airflow of the terminal units equals the indicated airflow of the fan. Select the reduced-airflow terminal units so they are distributed evenly among the branch ducts.
 2. Pressure-Independent, Variable-Air-Volume Systems: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
 - a. Set outdoor-air dampers at minimum, and set return- and exhaust-air dampers at a position that simulates full-cooling load.
 - b. Select the terminal unit that is most critical to the supply-fan airflow and static pressure. Measure static pressure. Adjust system static pressure so the entering static pressure for the critical terminal unit is not less than the sum of the terminal-unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge system losses.
 - c. Measure total system airflow. Adjust to within indicated airflow.
 - d. Set terminal units at maximum airflow and adjust controller or regulator to deliver the designed maximum airflow. Use terminal-unit manufacturer's written instructions to make this adjustment. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
 - e. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow the same as described for constant-volume air systems.
 - 1) If air outlets are out of balance at minimum airflow, report the condition but leave outlets balanced for maximum airflow.
 - f. Remeasure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow.
 - 1) Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.
 - g. Measure static pressure at the most critical terminal unit and adjust the static-pressure controller at the main supply-air sensing station to ensure that adequate static pressure is maintained at the most critical unit.
 - h. Record final fan-performance data.
 3. Pressure-Dependent, Variable-Air-Volume Systems without Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
 - a. Balance variable-air-volume systems the same as described for constant-volume air systems.
 - b. Set terminal units and supply fan at full-airflow condition.
 - c. Adjust inlet dampers of each terminal unit to indicated airflow and verify operation of the static-pressure controller. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
 - d. Readjust fan airflow for final maximum readings.

- e. Measure operating static pressure at the sensor that controls the supply fan if one is installed, and verify operation of the static-pressure controller.
 - f. Set supply fan at minimum airflow if minimum airflow is indicated. Measure static pressure to verify that it is being maintained by the controller.
 - g. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow the same as described for constant-volume air systems.
 - 1) If air outlets are out of balance at minimum airflow, report the condition but leave the outlets balanced for maximum airflow.
 - h. Measure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow.
 - 1) Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.
4. Pressure-Dependent, Variable-Air-Volume Systems with Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
- a. Set system at maximum indicated airflow by setting the required number of terminal units at minimum airflow. Select the reduced-airflow terminal units so they are distributed evenly among the branch ducts.
 - b. Adjust supply fan to maximum indicated airflow with the variable-airflow controller set at maximum airflow.
 - c. Set terminal units at full-airflow condition.
 - d. Adjust terminal units starting at the supply-fan end of the system and continuing progressively to the end of the system. Adjust inlet dampers of each terminal unit to indicated airflow. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
 - e. Adjust terminal units for minimum airflow.
 - f. Measure static pressure at the sensor.
 - g. Measure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow. Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.
- H. Procedures For Multizone Systems
- 1. Set unit at maximum airflow through the cooling coil.
 - 2. Adjust each zone's balancing damper to achieve indicated airflow within the zone.
- I. Procedures For Induction-Unit Systems
- 1. Balance primary-air risers by measuring static pressure at the nozzles of the top and bottom units of each riser to determine which risers must be throttled. Adjust risers to indicated airflow within specified tolerances.
 - 2. Adjust each induction unit.
- J. General Procedures For Hydronic Systems
- 1. Prepare test reports with pertinent design data, and number in sequence starting at pump to end of system. Check the sum of branch-circuit flows against the approved pump flow rate. Correct variations that exceed plus or minus 5 percent.
 - 2. Prepare schematic diagrams of systems' "as-built" piping layouts.
 - 3. Prepare hydronic systems for testing and balancing according to the following, in addition to the general preparation procedures specified above:
 - a. Open all manual valves for maximum flow.
 - b. Check liquid level in expansion tank.
 - c. Check makeup water-station pressure gage for adequate pressure for highest vent.
 - d. Check flow-control valves for specified sequence of operation, and set at indicated flow.
 - e. Set differential-pressure control valves at the specified differential pressure. Do not set at fully closed position when pump is positive-displacement type unless several terminal valves are kept open.
 - f. Set system controls so automatic valves are wide open to heat exchangers.

- g. Check pump-motor load. If motor is overloaded, throttle main flow-balancing device so motor nameplate rating is not exceeded.
- h. Check air vents for a forceful liquid flow exiting from vents when manually operated.

K. Procedures For Constant-Flow Hydronic Systems

1. Measure water flow at pumps. Use the following procedures except for positive-displacement pumps:
 - a. Verify impeller size by operating the pump with the discharge valve closed. Read pressure differential across the pump. Convert pressure to head and correct for differences in gage heights. Note the point on manufacturer's pump curve at zero flow and verify that the pump has the intended impeller size.
 - 1) If impeller sizes must be adjusted to achieve pump performance, obtain approval from The University **OR** Owner **OR** Commissioning Authority, **as directed**, and comply with requirements in Division 23 Section "Hydronic Pumps".
 - b. Check system resistance. With all valves open, read pressure differential across the pump and mark pump manufacturer's head-capacity curve. Adjust pump discharge valve until indicated water flow is achieved.
 - 1) Monitor motor performance during procedures and do not operate motors in overload conditions.
 - c. Verify pump-motor brake horsepower. Calculate the intended brake horsepower for the system based on pump manufacturer's performance data. Compare calculated brake horsepower with nameplate data on the pump motor. Report conditions where actual amperage exceeds motor nameplate amperage.
 - d. Report flow rates that are not within plus or minus 10 percent of design.
2. Measure flow at all automatic flow control valves to verify that valves are functioning as designed.
3. Measure flow at all pressure-independent characterized control valves, with valves in fully open position, to verify that valves are functioning as designed.
4. Set calibrated balancing valves, if installed, at calculated presettings.
5. Measure flow at all stations and adjust, where necessary, to obtain first balance.
 - a. System components that have Cv rating or an accurately cataloged flow-pressure-drop relationship may be used as a flow-indicating device.
6. Measure flow at main balancing station and set main balancing device to achieve flow that is 5 percent greater than indicated flow.
7. Adjust balancing stations to within specified tolerances of indicated flow rate as follows:
 - a. Determine the balancing station with the highest percentage over indicated flow.
 - b. Adjust each station in turn, beginning with the station with the highest percentage over indicated flow and proceeding to the station with the lowest percentage over indicated flow.
 - c. Record settings and mark balancing devices.
8. Measure pump flow rate and make final measurements of pump amperage, voltage, rpm, pump heads, and systems' pressures and temperatures including outdoor-air temperature.
9. Measure the differential-pressure-control-valve settings existing at the conclusion of balancing.
10. Check settings and operation of each safety valve. Record settings.

L. Procedures For Variable-Flow Hydronic Systems

1. Balance systems with automatic two- and three-way control valves by setting systems at maximum flow through heat-exchange terminals and proceed as specified above for hydronic systems.

M. Procedures For Primary-Secondary Hydronic Systems

1. Balance the primary circuit flow first and then balance the secondary circuits.

N. Procedures For Steam Systems

1. Measure and record upstream and downstream pressure of each piece of equipment.
2. Measure and record upstream and downstream steam pressure of pressure-reducing valves.
3. Check settings and operation of automatic temperature-control valves, self-contained control valves, and pressure-reducing valves. Record final settings.

4. Check settings and operation of each safety valve. Record settings.
 5. Verify the operation of each steam trap.
- O. Procedures For Heat Exchangers
1. Measure water flow through all circuits.
 2. Adjust water flow to within specified tolerances.
 3. Measure inlet and outlet water temperatures.
 4. Measure inlet steam pressure.
 5. Check settings and operation of safety and relief valves. Record settings.
- P. Procedures For Motors
1. Motors, 1/2 HP and Larger: Test at final balanced conditions and record the following data:
 - a. Manufacturer's name, model number, and serial number.
 - b. Motor horsepower rating.
 - c. Motor rpm.
 - d. Efficiency rating.
 - e. Nameplate and measured voltage, each phase.
 - f. Nameplate and measured amperage, each phase.
 - g. Starter thermal-protection-element rating.
 2. Motors Driven by Variable-Frequency Controllers: Test for proper operation at speeds varying from minimum to maximum. Test the manual bypass of the controller to prove proper operation. Record observations including name of controller manufacturer, model number, serial number, and nameplate data.
- Q. Procedures For Chillers
1. Balance water flow through each evaporator and condenser, **as directed**, to within specified tolerances of indicated flow with all pumps operating. With only one chiller operating in a multiple chiller installation, do not exceed the flow for the maximum tube velocity recommended by the chiller manufacturer. Measure and record the following data with each chiller operating at design conditions:
 - a. Evaporator-water entering and leaving temperatures, pressure drop, and water flow.
 - b. For water-cooled chillers, condenser-water entering and leaving temperatures, pressure drop, and water flow.
 - c. Evaporator and condenser refrigerant temperatures and pressures, using instruments furnished by chiller manufacturer.
 - d. Power factor if factory-installed instrumentation is furnished for measuring kilowatts.
 - e. Kilowatt input if factory-installed instrumentation is furnished for measuring kilowatts.
 - f. Capacity: Calculate in tons of cooling.
 - g. For air-cooled chillers, verify condenser-fan rotation and record fan and motor data including number of fans and entering- and leaving-air temperatures.
- R. Procedures For Cooling Towers
1. Shut off makeup water for the duration of the test, and verify that makeup and blowdown systems are fully operational after tests and before leaving the equipment. Perform the following tests and record the results:
 - a. Measure condenser-water flow to each cell of the cooling tower.
 - b. Measure entering- and leaving-water temperatures.
 - c. Measure wet- and dry-bulb temperatures of entering air.
 - d. Measure wet- and dry-bulb temperatures of leaving air.
 - e. Measure condenser-water flow rate recirculating through the cooling tower.
 - f. Measure cooling-tower spray pump discharge pressure.
 - g. Adjust water level and feed rate of makeup water system.
 - h. Measure flow through bypass.
- S. Procedures For Condensing Units
1. Verify proper rotation of fans.
 2. Measure entering- and leaving-air temperatures.

3. Record compressor data.
- T. Procedures For Boilers
1. Hydronic Boilers: Measure and record entering- and leaving-water temperatures and water flow.
 2. Steam Boilers: Measure and record entering-water temperature and flow and leaving-steam pressure, temperature, and flow.
- U. Procedures For Heat-Transfer Coils
1. Measure, adjust, and record the following data for each water coil:
 - a. Entering- and leaving-water temperature.
 - b. Water flow rate.
 - c. Water pressure drop.
 - d. Dry-bulb temperature of entering and leaving air.
 - e. Wet-bulb temperature of entering and leaving air for cooling coils.
 - f. Airflow.
 - g. Air pressure drop.
 2. Measure, adjust, and record the following data for each electric heating coil:
 - a. Nameplate data.
 - b. Airflow.
 - c. Entering- and leaving-air temperature at full load.
 - d. Voltage and amperage input of each phase at full load and at each incremental stage.
 - e. Calculated kilowatt at full load.
 - f. Fuse or circuit-breaker rating for overload protection.
 3. Measure, adjust, and record the following data for each steam coil:
 - a. Dry-bulb temperature of entering and leaving air.
 - b. Airflow.
 - c. Air pressure drop.
 - d. Inlet steam pressure.
 4. Measure, adjust, and record the following data for each refrigerant coil:
 - a. Dry-bulb temperature of entering and leaving air.
 - b. Wet-bulb temperature of entering and leaving air.
 - c. Airflow.
 - d. Air pressure drop.
 - e. Refrigerant suction pressure and temperature.
- V. Procedures For Testing, Adjusting, And Balancing Existing Systems
1. Perform a preconstruction inspection of existing equipment that is to remain and be reused.
 - a. Measure and record the operating speed, airflow, and static pressure of each fan.
 - b. Measure motor voltage and amperage. Compare the values to motor nameplate information.
 - c. Check the refrigerant charge.
 - d. Check the condition of filters.
 - e. Check the condition of coils.
 - f. Check the operation of the drain pan and condensate-drain trap.
 - g. Check bearings and other lubricated parts for proper lubrication.
 - h. Report on the operating condition of the equipment and the results of the measurements taken. Report deficiencies.
 2. Before performing testing and balancing of existing systems, inspect existing equipment that is to remain and be reused to verify that existing equipment has been cleaned and refurbished. Verify the following:
 - a. New filters are installed.
 - b. Coils are clean and fins combed.
 - c. Drain pans are clean.
 - d. Fans are clean.
 - e. Bearings and other parts are properly lubricated.
 - f. Deficiencies noted in the preconstruction report are corrected.

3. Perform testing and balancing of existing systems to the extent that existing systems are affected by the renovation work.
 - a. Compare the indicated airflow of the renovated work to the measured fan airflows, and determine the new fan speed and the face velocity of filters and coils.
 - b. Verify that the indicated airflows of the renovated work result in filter and coil face velocities and fan speeds that are within the acceptable limits defined by equipment manufacturer.
 - c. If calculations increase or decrease the air flow rates and water flow rates by more than 5 percent, make equipment adjustments to achieve the calculated rates. If increase or decrease is 5 percent or less, equipment adjustments are not required.
 - d. Balance each air outlet.

W. Tolerances

- X. Set HVAC system's air flow rates and water flow rates within the following tolerances:
- a. Supply, Return, and Exhaust Fans and Equipment with Fans: Plus or minus 10 percent.
 - b. Air Outlets and Inlets: Plus or minus 10 percent.
 - c. Heating-Water Flow Rate: Plus or minus 10 percent.
 - d. Cooling-Water Flow Rate: Plus or minus 10 percent.

Y. Reporting

1. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in "Examination" Article, prepare a report on the adequacy of design for systems' balancing devices. Recommend changes and additions to systems' balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices.
2. Status Reports: Prepare weekly **OR** biweekly **OR** monthly, **as directed**, progress reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced. Prepare a separate report for each system and each building floor for systems serving multiple floors.

Z. Final Report

1. General: Prepare a certified written report; tabulate and divide the report into separate sections for tested systems and balanced systems.
 - a. Include a certification sheet at the front of the report's binder, signed and sealed by the certified testing and balancing engineer.
 - b. Include a list of instruments used for procedures, along with proof of calibration.
2. Final Report Contents: In addition to certified field-report data, include the following:
 - a. Pump curves.
 - b. Fan curves.
 - c. Manufacturers' test data.
 - d. Field test reports prepared by system and equipment installers.
 - e. Other information relative to equipment performance; do not include Shop Drawings and product data.
3. General Report Data: In addition to form titles and entries, include the following data:
 - a. Title page.
 - b. Name and address of the TAB contractor.
 - c. Project name.
 - d. Project location.
 - e. Architect's name and address.
 - f. Engineer's name and address.
 - g. Contractor's name and address.
 - h. Report date.
 - i. Signature of TAB supervisor who certifies the report.
 - j. Table of Contents with the total number of pages defined for each section of the report. Number each page in the report.
 - k. Summary of contents including the following:
 - 1) Indicated versus final performance.

- 2) Notable characteristics of systems.
- 3) Description of system operation sequence if it varies from the Contract Documents.
- l. Nomenclature sheets for each item of equipment.
- m. Data for terminal units, including manufacturer's name, type, size, and fittings.
- n. Notes to explain why certain final data in the body of reports vary from indicated values.
- o. Test conditions for fans and pump performance forms including the following:
 - 1) Settings for outdoor-, return-, and exhaust-air dampers.
 - 2) Conditions of filters.
 - 3) Cooling coil, wet- and dry-bulb conditions.
 - 4) Face and bypass damper settings at coils.
 - 5) Fan drive settings including settings and percentage of maximum pitch diameter.
 - 6) Inlet vane settings for variable-air-volume systems.
 - 7) Settings for supply-air, static-pressure controller.
 - 8) Other system operating conditions that affect performance.
4. System Diagrams: Include schematic layouts of air and hydronic distribution systems. Present each system with single-line diagram and include the following:
 - a. Quantities of outdoor, supply, return, and exhaust airflows.
 - b. Water and steam flow rates.
 - c. Duct, outlet, and inlet sizes.
 - d. Pipe and valve sizes and locations.
 - e. Terminal units.
 - f. Balancing stations.
 - g. Position of balancing devices.
5. Air-Handling-Unit Test Reports: For air-handling units with coils, include the following:
 - a. Unit Data:
 - 1) Unit identification.
 - 2) Location.
 - 3) Make and type.
 - 4) Model number and unit size.
 - 5) Manufacturer's serial number.
 - 6) Unit arrangement and class.
 - 7) Discharge arrangement.
 - 8) Sheave make, size in inches (mm), and bore.
 - 9) Center-to-center dimensions of sheave, and amount of adjustments in inches (mm).
 - 10) Number, make, and size of belts.
 - 11) Number, type, and size of filters.
 - b. Motor Data:
 - 1) Motor make, and frame type and size.
 - 2) Horsepower and rpm.
 - 3) Volts, phase, and hertz.
 - 4) Full-load amperage and service factor.
 - 5) Sheave make, size in inches (mm), and bore.
 - 6) Center-to-center dimensions of sheave, and amount of adjustments in inches (mm).
 - c. Test Data (Indicated and Actual Values):
 - 1) Total air flow rate in cfm (L/s).
 - 2) Total system static pressure in inches wg (Pa).
 - 3) Fan rpm.
 - 4) Discharge static pressure in inches wg (Pa).
 - 5) Filter static-pressure differential in inches wg (Pa).
 - 6) Preheat-coil static-pressure differential in inches wg (Pa).
 - 7) Cooling-coil static-pressure differential in inches wg (Pa).
 - 8) Heating-coil static-pressure differential in inches wg (Pa).
 - 9) Outdoor airflow in cfm (L/s).
 - 10) Return airflow in cfm (L/s).
 - 11) Outdoor-air damper position.
 - 12) Return-air damper position.
 - 13) Vortex damper position.

6. Apparatus-Coil Test Reports:
 - a. Coil Data:
 - 1) System identification.
 - 2) Location.
 - 3) Coil type.
 - 4) Number of rows.
 - 5) Fin spacing in fins per inch (mm) o.c.
 - 6) Make and model number.
 - 7) Face area in sq. ft. (sq. m).
 - 8) Tube size in NPS (DN).
 - 9) Tube and fin materials.
 - 10) Circuiting arrangement.
 - b. Test Data (Indicated and Actual Values):
 - 1) Air flow rate in cfm (L/s).
 - 2) Average face velocity in fpm (m/s).
 - 3) Air pressure drop in inches wg (Pa).
 - 4) Outdoor-air, wet- and dry-bulb temperatures in deg F (deg C).
 - 5) Return-air, wet- and dry-bulb temperatures in deg F (deg C).
 - 6) Entering-air, wet- and dry-bulb temperatures in deg F (deg C).
 - 7) Leaving-air, wet- and dry-bulb temperatures in deg F (deg C).
 - 8) Water flow rate in gpm (L/s).
 - 9) Water pressure differential in feet of head or psig (kPa).
 - 10) Entering-water temperature in deg F (deg C).
 - 11) Leaving-water temperature in deg F (deg C).
 - 12) Refrigerant expansion valve and refrigerant types.
 - 13) Refrigerant suction pressure in psig (kPa).
 - 14) Refrigerant suction temperature in deg F (deg C).
 - 15) Inlet steam pressure in psig (kPa).
7. Gas- and Oil-Fired Heat Apparatus Test Reports: In addition to manufacturer's factory startup equipment reports, include the following:
 - a. Unit Data:
 - 1) System identification.
 - 2) Location.
 - 3) Make and type.
 - 4) Model number and unit size.
 - 5) Manufacturer's serial number.
 - 6) Fuel type in input data.
 - 7) Output capacity in Btu/h (kW).
 - 8) Ignition type.
 - 9) Burner-control types.
 - 10) Motor horsepower and rpm.
 - 11) Motor volts, phase, and hertz.
 - 12) Motor full-load amperage and service factor.
 - 13) Sheave make, size in inches (mm), and bore.
 - 14) Center-to-center dimensions of sheave, and amount of adjustments in inches (mm).
 - b. Test Data (Indicated and Actual Values):
 - 1) Total air flow rate in cfm (L/s).
 - 2) Entering-air temperature in deg F (deg C).
 - 3) Leaving-air temperature in deg F (deg C).
 - 4) Air temperature differential in deg F (deg C).
 - 5) Entering-air static pressure in inches wg (Pa).
 - 6) Leaving-air static pressure in inches wg (Pa).
 - 7) Air static-pressure differential in inches wg (Pa).
 - 8) Low-fire fuel input in Btu/h (kW).
 - 9) High-fire fuel input in Btu/h (kW).
 - 10) Manifold pressure in psig (kPa).
 - 11) High-temperature-limit setting in deg F (deg C).

- 12) Operating set point in Btu/h (kW).
- 13) Motor voltage at each connection.
- 14) Motor amperage for each phase.
- 15) Heating value of fuel in Btu/h (kW).
8. Electric-Coil Test Reports: For electric furnaces, duct coils, and electric coils installed in central-station air-handling units, include the following:
 - a. Unit Data:
 - 1) System identification.
 - 2) Location.
 - 3) Coil identification.
 - 4) Capacity in Btu/h (kW).
 - 5) Number of stages.
 - 6) Connected volts, phase, and hertz.
 - 7) Rated amperage.
 - 8) Air flow rate in cfm (L/s).
 - 9) Face area in sq. ft. (sq. m).
 - 10) Minimum face velocity in fpm (m/s).
 - b. Test Data (Indicated and Actual Values):
 - 1) Heat output in Btu/h (kW).
 - 2) Air flow rate in cfm (L/s).
 - 3) Air velocity in fpm (m/s).
 - 4) Entering-air temperature in deg F (deg C).
 - 5) Leaving-air temperature in deg F (deg C).
 - 6) Voltage at each connection.
 - 7) Amperage for each phase.
9. Fan Test Reports: For supply, return, and exhaust fans, include the following:
 - a. Fan Data:
 - 1) System identification.
 - 2) Location.
 - 3) Make and type.
 - 4) Model number and size.
 - 5) Manufacturer's serial number.
 - 6) Arrangement and class.
 - 7) Sheave make, size in inches (mm), and bore.
 - 8) Center-to-center dimensions of sheave, and amount of adjustments in inches (mm).
 - b. Motor Data:
 - 1) Motor make, and frame type and size.
 - 2) Horsepower and rpm.
 - 3) Volts, phase, and hertz.
 - 4) Full-load amperage and service factor.
 - 5) Sheave make, size in inches (mm), and bore.
 - 6) Center-to-center dimensions of sheave, and amount of adjustments in inches (mm).
 - 7) Number, make, and size of belts.
 - c. Test Data (Indicated and Actual Values):
 - 1) Total airflow rate in cfm (L/s).
 - 2) Total system static pressure in inches wg (Pa).
 - 3) Fan rpm.
 - 4) Discharge static pressure in inches wg (Pa).
 - 5) Suction static pressure in inches wg (Pa).
10. Round, Flat-Oval, and Rectangular Duct Traverse Reports: Include a diagram with a grid representing the duct cross-section and record the following:
 - a. Report Data:
 - 1) System and air-handling-unit number.
 - 2) Location and zone.
 - 3) Traverse air temperature in deg F (deg C).
 - 4) Duct static pressure in inches wg (Pa).
 - 5) Duct size in inches (mm).

- 6) Duct area in sq. ft. (sq. m).
 - 7) Indicated air flow rate in cfm (L/s).
 - 8) Indicated velocity in fpm (m/s).
 - 9) Actual air flow rate in cfm (L/s).
 - 10) Actual average velocity in fpm (m/s).
 - 11) Barometric pressure in psig (Pa).
11. Air-Terminal-Device Reports:
- a. Unit Data:
 - 1) System and air-handling unit identification.
 - 2) Location and zone.
 - 3) Apparatus used for test.
 - 4) Area served.
 - 5) Make.
 - 6) Number from system diagram.
 - 7) Type and model number.
 - 8) Size.
 - 9) Effective area in sq. ft. (sq. m).
 - b. Test Data (Indicated and Actual Values):
 - 1) Air flow rate in cfm (L/s).
 - 2) Air velocity in fpm (m/s).
 - 3) Preliminary air flow rate as needed in cfm (L/s).
 - 4) Preliminary velocity as needed in fpm (m/s).
 - 5) Final air flow rate in cfm (L/s).
 - 6) Final velocity in fpm (m/s).
 - 7) Space temperature in deg F (deg C).
12. System-Coil Reports: For reheat coils and water coils of terminal units, include the following:
- a. Unit Data:
 - 1) System and air-handling-unit identification.
 - 2) Location and zone.
 - 3) Room or riser served.
 - 4) Coil make and size.
 - 5) Flowmeter type.
 - b. Test Data (Indicated and Actual Values):
 - 1) Air flow rate in cfm (L/s).
 - 2) Entering-water temperature in deg F (deg C).
 - 3) Leaving-water temperature in deg F (deg C).
 - 4) Water pressure drop in feet of head or psig (kPa).
 - 5) Entering-air temperature in deg F (deg C).
 - 6) Leaving-air temperature in deg F (deg C).
13. Pump Test Reports: Calculate impeller size by plotting the shutoff head on pump curves and include the following:
- a. Unit Data:
 - 1) Unit identification.
 - 2) Location.
 - 3) Service.
 - 4) Make and size.
 - 5) Model number and serial number.
 - 6) Water flow rate in gpm (L/s).
 - 7) Water pressure differential in feet of head or psig (kPa).
 - 8) Required net positive suction head in feet of head or psig (kPa).
 - 9) Pump rpm.
 - 10) Impeller diameter in inches (mm).
 - 11) Motor make and frame size.
 - 12) Motor horsepower and rpm.
 - 13) Voltage at each connection.
 - 14) Amperage for each phase.
 - 15) Full-load amperage and service factor.

- 16) Seal type.
 - b. Test Data (Indicated and Actual Values):
 - 1) Static head in feet of head or psig (kPa).
 - 2) Pump shutoff pressure in feet of head or psig (kPa).
 - 3) Actual impeller size in inches (mm).
 - 4) Full-open flow rate in gpm (L/s).
 - 5) Full-open pressure in feet of head or psig (kPa).
 - 6) Final discharge pressure in feet of head or psig (kPa).
 - 7) Final suction pressure in feet of head or psig (kPa).
 - 8) Final total pressure in feet of head or psig (kPa).
 - 9) Final water flow rate in gpm (L/s).
 - 10) Voltage at each connection.
 - 11) Amperage for each phase.
 14. Instrument Calibration Reports:
 - a. Report Data:
 - 1) Instrument type and make.
 - 2) Serial number.
 - 3) Application.
 - 4) Dates of use.
 - 5) Dates of calibration.
- AA. Inspections
1. Initial Inspection:
 - a. After testing and balancing are complete, operate each system and randomly check measurements to verify that the system is operating according to the final test and balance readings documented in the final report.
 - b. Check the following for each system:
 - 1) Measure airflow of at least 10 percent of air outlets.
 - 2) Measure water flow of at least 5 percent of terminals.
 - 3) Measure room temperature at each thermostat/temperature sensor. Compare the reading to the set point.
 - 4) Verify that balancing devices are marked with final balance position.
 - 5) Note deviations from the Contract Documents in the final report.
 2. Final Inspection:
 - a. After initial inspection is complete and documentation by random checks verifies that testing and balancing are complete and accurately documented in the final report, request that a final inspection be made by The University **OR** Owner **OR** Commissioning Authority, **as directed**.
 - b. The TAB contractor's test and balance engineer shall conduct the inspection in the presence of The University **OR** Owner **OR** Commissioning Authority, **as directed**.
 - c. The University **OR** Owner **OR** Commissioning Authority, **as directed**, shall randomly select measurements, documented in the final report, to be rechecked. Rechecking shall be limited to either 10 percent of the total measurements recorded or the extent of measurements that can be accomplished in a normal 8-hour business day.
 - d. If rechecks yield measurements that differ from the measurements documented in the final report by more than the tolerances allowed, the measurements shall be noted as "FAILED."
 - e. If the number of "FAILED" measurements is greater than 10 percent of the total measurements checked during the final inspection, the testing and balancing shall be considered incomplete and shall be rejected.
 3. TAB Work will be considered defective if it does not pass final inspections. If TAB Work fails, proceed as follows:
 - a. Recheck all measurements and make adjustments. Revise the final report and balancing device settings to include all changes; resubmit the final report and request a second final inspection.

- b. If the second final inspection also fails, Owner may contract the services of another TAB contractor to complete TAB Work according to the Contract Documents and deduct the cost of the services from the original TAB contractor's final payment.
- 4. Prepare test and inspection reports.

BB. Additional Tests

- 1. Within 90 days of completing TAB, perform additional TAB to verify that balanced conditions are being maintained throughout and to correct unusual conditions.
- 2. Seasonal Periods: If initial TAB procedures were not performed during near-peak summer and winter conditions, perform additional TAB during near-peak summer and winter conditions.

SECTION 23 01 30 51 - HVAC AIR-DISTRIBUTION SYSTEM CLEANING**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for HVAC air-distribution system cleaning. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section includes cleaning HVAC air-distribution equipment, ducts, plenums, and system components.

C. Definitions

1. ASCS: Air systems cleaning specialist.
2. NADCA: National Air Duct Cleaners Association.

D. Submittals

1. Qualification Data: For an ASCS.
2. Strategies and procedures plan.
3. Cleanliness verification report.

E. Quality Assurance

1. ASCS Qualifications: A certified member of NADCA.
 - a. Certification: Employ an ASCS certified by NADCA on a full-time basis.
 - b. Supervisor Qualifications: Certified as an ASCS by NADCA.
2. UL Compliance: Comply with UL 181 and UL 181A for fibrous-glass ducts.
3. Cleaning Conference: Conduct conference at Project site.

1.2 PRODUCTS**A. Fosters 40/30, USDA tested, 10 year warranty****B. Diffuser filters****1.3 EXECUTION****A. Examination**

1. Examine HVAC air-distribution equipment, ducts, plenums, and system components to determine appropriate methods, tools, and equipment required for performance of the Work.
2. Perform "Project Evaluation and Recommendation" according to NADCA ACR 2006.
3. Prepare written report listing conditions detrimental to performance of the Work.
4. Proceed with work only after unsatisfactory conditions have been corrected.

B. Preparation

1. Prepare a written plan that includes strategies and step-by-step procedures. At a minimum, include the following:
 - a. Supervisor contact information.
 - b. Work schedule including location, times, and impact on occupied areas.
 - c. Methods and materials planned for each HVAC component type.
 - d. Required support from other trades.

- e. Equipment and material storage requirements.
- f. Exhaust equipment setup locations.
- 2. Use the existing service openings, as required for proper cleaning, at various points of the HVAC system for physical and mechanical entry and for inspection.
- 3. Comply with NADCA ACR 2006, "Guidelines for Constructing Service Openings in HVAC Systems" Section.

C. Cleaning

- 1. Comply with NADCA ACR 2006.
- 2. Remove visible surface contaminants and deposits from within the HVAC system.
- 3. Systems and Components to Be Cleaned:
 - a. Air devices for supply and return air.
 - b. Air-terminal units.
 - c. Ductwork:
 - 1) Supply-air ducts, including turning vanes and reheat coils, to the air-handling unit.
 - 2) Return-air ducts to the air-handling unit.
 - 3) Exhaust-air ducts.
 - d. Air-Handling Units:
 - 1) Interior surfaces of the unit casing.
 - 2) Coil surfaces compartment.
 - 3) Condensate drain pans.
 - 4) Fans, fan blades, and fan housings.
 - e. Filters and filter housings.
- 4. Collect debris removed during cleaning. Ensure that debris is not dispersed outside the HVAC system during the cleaning process.
- 5. Particulate Collection:
 - a. For particulate collection equipment, include adequate filtration to contain debris removed. Locate equipment downwind and away from all air intakes and other points of entry into the building.
 - b. HEPA filtration with 99.97 percent collection efficiency for particles sized 0.3 micrometer or larger shall be used where the particulate collection equipment is exhausting inside the building.
- 6. Control odors and mist vapors during the cleaning and restoration process.
- 7. Mark the position of manual volume dampers and air-directional mechanical devices inside the system prior to cleaning. Restore them to their marked position on completion of cleaning.
- 8. System components shall be cleaned so that all HVAC system components are visibly clean. On completion, all components must be returned to those settings recorded just prior to cleaning operations.
- 9. Clean all air-distribution devices, registers, grilles, and diffusers.
- 10. Clean visible surface contamination deposits according to NADCA ACR 2006 and the following:
 - a. Clean air-handling units, airstream surfaces, components, condensate collectors, and drains.
 - b. Ensure that a suitable operative drainage system is in place prior to beginning wash-down procedures.
 - c. Clean evaporator coils, reheat coils, and other airstream components.
- 11. Duct Systems:
 - a. Create service openings in the HVAC system as necessary to accommodate cleaning.
 - b. Mechanically clean duct systems specified to remove all visible contaminants so that the systems are capable of passing the HVAC System Cleanliness Tests (see NADCA ACR 2006).
- 12. Debris removed from the HVAC system shall be disposed of according to applicable Federal, state, and local requirements.
- 13. Mechanical Cleaning Methodology:
 - a. Source-Removal Cleaning Methods: The HVAC system shall be cleaned using source-removal mechanical cleaning methods designed to extract contaminants from within the HVAC system and to safely remove these contaminants from the facility. No cleaning

method, or combination of methods, shall be used that could potentially damage components of the HVAC system or negatively alter the integrity of the system.

- 1) Use continuously operating vacuum-collection devices to keep each section being cleaned under negative pressure.
- 2) Cleaning methods that require mechanical agitation devices to dislodge debris that is adhered to interior surfaces of HVAC system components shall be equipped to safely remove these devices. Cleaning methods shall not damage the integrity of HVAC system components or damage porous surface materials such as duct and plenum liners.
- b. Cleaning Mineral-Fiber Insulation Components:
 - 1) Fibrous-glass thermal or acoustical insulation elements present in equipment or ductwork shall be thoroughly cleaned with HEPA vacuuming equipment while the HVAC system is under constant negative pressure and shall not be permitted to get wet according to NADCA ACR 2006.
 - 2) Cleaning methods used shall not cause damage to fibrous-glass components and will render the system capable of passing the HVAC System Cleanliness Tests (see NADCA ACR 2006).
 - 3) Fibrous materials that become wet shall be discarded and replaced.
14. Coil Cleaning:
 - a. Measure static-pressure differential across each coil.
 - b. See NADCA ACR 2006, "Coil Surface Cleaning" Section. Type 1, or Type 1 and Type 2, cleaning methods shall be used to render the coil visibly clean and capable of passing Coil Cleaning Verification (see applicable NADCA ACR 2006).
 - c. Coil drain pans shall be subject to NADCA ACR 2006, "Non-Porous Surfaces Cleaning Verification." Ensure that condensate drain pans are operational.
 - d. Electric-resistance coils shall be de-energized, locked out, and tagged before cleaning.
 - e. Cleaning methods shall not cause any appreciable damage to, cause displacement of, inhibit heat transfer, or cause erosion of the coil surface or fins, and shall comply with coil manufacturer's written recommendations when available.
 - f. Rinse thoroughly with clean water to remove any latent residues.
15. Antimicrobial Agents, Coatings, and Sanitizers:
 - a. Apply antimicrobial agents, coatings, and sanitizers if active fungal growth is reasonably suspected or where unacceptable levels of fungal contamination have been verified. Apply antimicrobial agents and coatings according to manufacturer's written recommendations and EPA registration listing after the removal of surface deposits and debris.
 - b. When used, antimicrobial treatments, coatings, and sanitizers shall be applied after the system is rendered clean.
 - c. Apply antimicrobial agents, coatings, and sanitizers directly onto surfaces of interior ductwork. Fogging is prohibited.
 - d. Sanitizing agent products shall be registered by the EPA as specifically intended for use in HVAC systems and ductwork.

D. Cleanliness Verification

1. Prior to cleanliness verification install filter material in the diffuser. White side facing supply air.
2. 2 weeks later inspect filter material
3. If the filter material is clean then the distribution system is clean
 - a. If the filter has particulates then replace the filter material
 - b. Verify cleanliness 3 days later
4. If filter material is clean then the distribution system is clean
 - a. If the filter has particulates then re-clean back to the branch ductwork

E. Restoration

1. Restore and repair HVAC air-distribution equipment, ducts, plenums, and components according to NADCA ACR 2006, "Restoration and Repair of Mechanical Systems" Section.
2. Restore service openings capable of future reopening. Comply with requirements in Division 23 Section "Metal Ducts". Include location of service openings in Project closeout report.

3. Replace fibrous-glass materials that cannot be restored by cleaning or resurfacing. Comply with requirements in Division 23 Section(s) "Metal Ducts" AND "Nonmetal Ducts"
4. Replace damaged insulation according to Division 23 Section "Hvac Insulation",
5. Ensure that closures do not hinder or alter airflow.
6. New closure materials, including insulation, shall match opened materials and shall have removable closure panels fitted with gaskets and fasteners.
7. Reseal fibrous-glass ducts. Comply with requirements in Division 23 Section "Nonmetal Ducts".

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 05 00 00 - MOTORS**PART 1 GENERAL**

1.01 The following sections are to be included as if written herein:

- A. Section 23 00 00 – Basic Mechanical Requirements
- B. Section 23 05 29 – Sleeves, Flashings, Supports and Anchors
- C. Section 23 05 53 – Mechanical Identification

1.02 SECTION INCLUDES

- A. Single phase electric motors
- B. Three phase electric motors
- C. The Contractor shall provide all motors required for equipment supplied under this Division of the work

1.03 RELATED WORK

- A. Section 22 15 19 - Reciprocating Air Compressors
- B. Section 23 22 00.A - Steam and Steam Condensate Specialties: Condensate pumps
- C. Section 23 20 00 - HVAC Pumps
- D. Section 23 73 00 – Fan Coil Units Fan motors
- E. Section 23 34 00 - Fans

1.04 REFERENCES

- A. AFBMA 9 - Load Ratings and Fatigue Life for Ball Bearings
- B. AFBMA 11 - Load Ratings and Fatigue Life for Roller Bearings
- C. ANSI/IEEE 112 Test Method B - Test Procedure for Polyphase Induction Motors and Generators
- D. ANSI/NEMA MG 1 - Motors and Generators
- E. ANSI/NFPA 70 - National Electrical Code

1.05 SUBMITTALS

- A. Submit product data under provisions of Section 23 00 00
- B. Submit test results verifying nominal efficiency and power factor for motors 1 horsepower and larger.
- C. Submit manufacturer's installation instructions under provisions of Section 23 00 00

1.06 OPERATION AND MAINTENANCE DATA

- A. Submit operation and maintenance data under provisions of Section 23 00 00
- B. Include assembly drawings, bearing data including replacement sizes, and lubrication instructions.

1.07 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacture of electric motors for commercial use, and their accessories, with minimum three—years documented product development, testing, and manufacturing experience.

1.08 REGULATORY REQUIREMENTS

- A. Conform to ANSI/NFPA 70.

1.09 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to site under provisions of Section 23 00 00.
- B. Store and protect products under provisions of Section 23 00 00.
- C. Protect motors stored on site from weather and moisture by maintaining factory covers and suitable weather-proof covering. For extended outdoor storage, remove motors from equipment and store separately.

1.10 WARRANTY

- A. Provide three year manufacturer's warranty under provisions of Section 23 00 00.
- B. Motors failing during warranty shall be replaced with a new motor.
- C. Warranty: Include coverage for motors 1 horsepower and larger.

PART 2 PRODUCTS

2.01 GENERAL CONSTRUCTION AND REQUIREMENTS

- A. Electrical Service: Refer to Drawing Schedules for required electrical characteristics.
- B. All Motors: Design for continuous operation in 40 degrees C environment, and for temperature rise in accordance with ANSI/NEMA MG 1 limits for insulation class, Service Factor, and motor enclosure type.
- C. Totally Enclosed Motors: Design for a service factor of 1.15 and an 80 degrees C maximum temperature rise in the same conditions.
- D. Visible Stainless Steel Nameplate: Indicating motor horsepower, voltage, phase, cycles, RPM, full load amps, locked rotor amps, frame size, bearing sizes, wiring diagram, manufacturer's name and model number, Service Factor, Power Factor and Nominal Efficiency, efficiency.
- E. Electrical Connection: Conduit connection boxes, threaded for conduit. For fractional horsepower motors where connection is made directly, provide threaded conduit connection in end frame.
- F. Motors shall be built in accordance with the latest ANSI, IEEE, and NEMA Standards, and shall be fully coordinated with the equipment served, shall be of sizes and electrical characteristics scheduled, and of approved manufacture as described herein or of the same manufacture as the equipment which they serve. All motors provided by the Contractor shall be of the same manufacture unless they are an integral part of the piece of equipment to which they are attached. Nameplate rating of motors shall match the characteristics scheduled.
- G. All motors shall be designed for NEMA Design B starting torque unless the driven machine requires high starting torque and shall be selected for quiet operation, free from magnetic hum.
- H. In addition, all motors shall be provided with adequately sized electrical connection box with threaded hub for attachment of flexible conduit, unless bus duct connection is indicated. Where motors are connected to driven equipment by the use of a V-belt drive, they shall be furnished with adjustable rails.
- I. Dynamic Balance shall be no greater than the vibration limits of the driven equipment as defined in Section 23 34 00 for fans and Section 23 20 00 for pumps.
- J. All motors shall be provided with all copper windings, terminal wiring, and copper or bronze lugs. AL/CU rated connectors are not allowed.

2.02 SINGLE PHASE POWER - SPLIT PHASE MOTORS

- A. Starting Torque: Less than 150 percent of full load torque.
- B. Starting Current: Up to seven times full load current.
- C. Breakdown Torque: Approximately 200 percent of full load torque.

- D. Drip-proof Enclosure: Class A (50 degrees C temperature rise) insulation, NEMA Service Factor, pre-lubricated sleeve or ball bearings.
- E. Enclosed Motors: Class A (50 degrees C temperature rise) insulation, 1.0 Service Factor, pre-lubricated ball bearings.
- F. Single phase motors, in general, shall be less than 3/4 horsepower and shall be permanent split phase, capacitor start, induction run, 120 volt, 60 hertz motors with drip-proof enclosures except as hereinafter specified. These motors shall have built-in thermal overload protection with automatic reset, and shall be rated for temperature rise as hereinbefore specified for 3-phase motors.

2.03 SINGLE PHASE POWER - PERMANENT-SPLIT CAPACITOR MOTORS

- A. Starting Torque: Exceeding one fourth of full load torque.
- B. Starting Current: Up to six times full load current.
- C. Multiple Speed: Through tapped windings.
- D. Open Drip-proof or Enclosed Air Over Enclosure: Class A (50 degrees C temperature rise) insulation, minimum 1.0 Service Factor, pre-lubricated sleeve or ball bearings, automatic reset overload protector.
- E. Single phase motors, in general, shall be less than 3/4 horsepower and shall be permanent split phase, capacitor start, induction run, 120 volt, 60 hertz motors. These motors shall have built-in thermal overload protection with automatic reset, and shall be rated for temperature rise as hereinbefore specified for 3-phase motors.

2.04 SINGLE PHASE POWER - CAPACITOR START MOTORS

- A. Starting Torque: Three times full load torque.
- B. Starting Current: Less than five times full load current.
- C. Pull-up Torque: Up to 350 percent of full load torque.
- D. Breakdown Torque: Approximately 250 percent of full load torque.
- E. Motors: Capacitor in series with starting winding; capacitor-start/capacitor-run motors shall have two capacitors in parallel with run capacitor remaining in circuit at operating speeds.
- F. Enclosures shall be of the open drip-proof type with a service factor of 1.15 and Class B insulation rated at 90 degrees C temperature rise measured above 40 degrees C room ambient condition at full load, unless otherwise noted.
- G. Enclosed Motors: Class A (50 degrees C temperature rise) insulation, 1.0 Service Factor, pre-lubricated ball bearings.
- H. Single phase motors, in general, shall be less than 3/4 horsepower and shall be permanent split phase, capacitor start, induction run, 120 volt, 60 hertz motors. These motors shall have built-in thermal overload protection with automatic reset, and shall be rated for temperature rise as hereinbefore specified for 3-phase motors.

2.05 THREE PHASE POWER - SQUIRREL CAGE MOTORS

- A. Enclosures shall be of the open drip-proof type with a service factor of 1.15 and Class F insulation.
- B. In general, all motors 3/4 horsepower and larger, unless smaller motors are indicated to be supplied as 3-phase, shall be 480V 3-phase and shall be squirrel cage premium efficiency induction type with standard NEMA frame sizes.
- C. Motors 1 HP and larger shall have integral frames and be provided with copper grounding lug.
- D. Starting Torque: Between one and one and one-half times full load torque.
- E. Starting Current: Six times full load current.

- F. Power Output, Locked Rotor Torque, Breakdown or Pullout Torque: NEMA Design B Characteristics.
- G. Design, Construction, Testing, and Performance: Conform to ANSI/NEMA MG 1 for Design B motors.
- H. Insulation System: NEMA Class F or better.
- I. Testing Procedure: In accordance with ANSI/IEEE 112, Test Method B. Load test motors to determine freedom from electrical or mechanical defects and compliance with performance data. Test and balance motors to limits defined in 2.01J.
- J. Motor Frames: NEMA standard T-frames of cast iron with end brackets of cast iron.
- K. Bearings: Ball or roller type, double shielded with continuous grease relief to accommodate excessive pressure caused by thermal expansion or over lubrication. All motor bearings shall be factory pre-packed with a non-detergent lubricant, and shall be provided with lubrication fitting arranged to provide easy access when installed on the driven apparatus except as noted hereinafter. Permanently lubricated factory-sealed motors may be provided in fractional HP sizes only where they are an integral part of a piece of approved apparatus. All bearings shall be designed for B-10, 200,000 hour minimum life hours of continuous service. Calculate bearing load with NEMA minimum V- belt pulley with belt center line at end of NEMA standard shaft extension. Stamp bearing sizes on nameplate.
- L. Sound Power Levels: Refer to ANSI/NEMA MG 1.
- M. Weatherproof Epoxy Treated Motors (Where Indicated): Epoxy coat windings with rotor and starter surfaces protected with epoxy enamel. Bearings shall be double shielded with waterproof non-washing grease.
- N. Nominal Efficiency: Meet or exceed values for NEMA premium efficiency electric motors at full load and rated voltage when tested in accordance with ANSI/IEEE 112, Test Method B.
- O. Nominal Power Factor: Meet or exceed values per EPACT 2001 at full load and rated voltage when tested in accordance with ANSI/IEEE 112, Test Method B.
- P. Motors 1 HP and larger shall be provided with a copper frame grounding lug of hydraulic compression design, for installation by the electrical subcontractor.
- Q. Motors 10HP and larger shall be inverter duty rated and shall be provided with shaft grounding device.

2.06 STARTING EQUIPMENT:

- A. Each motor shall be provided with proper starting equipment. This equipment, unless hereinafter specified or scheduled to the contrary, shall be provided by the trade furnishing the motor. All motor starting equipment provided by any one trade shall be of the same manufacture unless such starting equipment is an integral part of the equipment on which the motor is mounted. The Mechanical Subcontractor shall furnish all starters for Division 23 work, except those starters scheduled to be provided in Division 26 Motor Control Centers.
- B. Control transformers shall have two primary fuses and one secondary fuse.
- C. Motor starters shall conform to NEMA Standards for Industrial Control, #IC-1, latest issue, and shall be housed in NEMA Standard enclosures. Control voltage in each starter shall be not more than 120 volts to ground, with an individual control transformer provided in each starter as required. Manual starters for fractional horsepower single-phase motors shall be on-off or snap switch type combined with thermal overload device. The switch shall be so constructed so that it cannot be held closed under a sustained motor overload.
- D. Magnetic starters shall have thermal overload protection in each of the ungrounded legs and shall be solenoid operated. Provide the correct size heater element to protect the motor and allow it to operate based on motor nameplate amperes and ambient temperatures anticipated for each individual motor. Each starter shall be provided with a control power transformer or 120v control power circuit.
- E. Pushbuttons with or without pilot lights, hand-off-automatic switches, red-run/green-off lights and other

scheduled apparatus shall be standard duty type mounted in NEMA enclosures or in cover of starter as specified or scheduled, and shall be furnished by the trade furnishing the starter except as specifically indicated elsewhere.

- F. Hand-Off-Automatic switches for equipment which could damage itself if left in the "hand" position (such as sump pumps), shall be spring return to "off" from the "hand" position.

PART 3 EXECUTION

3.01 APPLICATION

- A. Motors drawing less than 250 Watts and intended for intermittent service may be germane to equipment manufacturer and need not conform to these specifications.
- B. Motors shall be open drip-proof type, except where specifically noted otherwise.
- C. Motors shall be premium energy efficient type.
- D. Single phase motors for shaft mounted fans or blowers shall be permanent split capacitor type.
- E. Motors located in exterior locations for direct drive axial fans shall be totally enclosed type.

3.02 NEMA OPEN MOTOR SERVICE FACTORS

HP	3600_RPM	1800_RPM	1200_RPM	900_RPM

SECTION 23 05 13 00 - ELECTRICAL RENOVATION**DESCRIPTION OF WORK**

This specification covers the furnishing and installation of materials for electrical renovation. Products shall be as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

GENERAL**Quality Assurance**

1. Regulatory Requirements: Comply with following:
 - a. Electrical: National Fire Protection Association (NFPA): NFPA 70 - National Electrical Code (NEC).
 - b. Accessibility:
 - 1) Architectural Barriers Act of 1968 as amended (42 USC 4152-4157) and HUD implementing regulations (24 CFR Part 40).
 - a) Uniform Federal Accessibility Standards (UFAS).
 - 2) Section 504 of the Rehabilitation Act of 1973 as amended (29 USC 794) and HUD implementing regulations 24 CFR Part 8.
 - 3) Fair Housing Accessibility Guidelines (24 CFR Chapter 1).
 - 4) Americans with Disabilities Act of 1990 (ADA) (28 CFR Part 35).

Project Conditions

2. Existing Conditions: Buildings will be occupied during construction. See Division 1 Section "Summary of Work." Do not interfere with use of occupied portions of building. Maintain free and safe passage to and from occupied areas.

Scheduling And Sequencing

3. Scheduling and Completion: Comply with requirements of Detailed Scope of Work.

Alterations, Cutting And Protection

4. Protection: Protect existing finishes, equipment, utilities and adjacent work, which is scheduled to remain, from damage.
5. Existing Operating Facilities: Confine operations to immediate vicinity of new work and do not interfere with or obstruct ingress or egress to and from adjacent facilities.

PRODUCTS**Materials**

6. Electrical Materials and Devices: Comply with NFPA 70 (NEC):
 - a. Boxes: Galvanized steel, not less than 1.6 mm (0.0625 inch) thickness (NEC 370-20) grounded in accordance with NEC, Article 250, suitable for recess mounting.
 - 1) Provide boxes of appropriate shape and size for intended purpose.
 - b. Devices:
 - 1) Duplex Receptacles: 20 A 115 V, UL Listed with screw side connections and corrugated bearing pads.
 - a) GFI Outlets: 115 V, 60 Hz, 20 A rating, UL Listed.
 - 2) Switches: 20 A. 115 V, single pole, single throw switch, UL Listed, with side screw connections and corrugated bearing pads.
 - a) Garbage Disposal: Heavy duty, 120/277 VAC, 60 Hz, single pole, single throw, 20 A rate, UL listed and CSA certified.

- 3) Cover Plates: Smooth plastic in color to match existing.
- c. Wiring: Insulated wire, Type NM 600 V with ground wire, sized as appropriate for intended purpose and in accordance with NEC.
 - 1) Aluminum Wire: Not allowed unless existing wiring is aluminum.
 - 2) Provide necessary fittings in accordance with NEC.

EXECUTION

Examination

7. Units, Spaces and Areas to be Renovated: Inspect to become familiar with existing conditions and to take measurements which are necessary for renovation work to be completed in accordance with contract requirements.
 - a. Carefully inspect condition of existing spaces including, but not limited to walls, floors, plumbing, electrical, etc. as essential to successful completion of renovation work.
 - b. Survey each space and verify dimensions for work.

Preparation

8. Building Occupation: Carry out renovation work to cause as little inconvenience to occupants as possible. See Division 1 Section "Summary of Work."
9. Protection: Protect and be responsible for existing buildings, facilities, utilities, and improvements within areas of construction operations.
 - a. Tenant's Property: Be responsible for any damage or loss to residents' property and to other work. Replace any material, which, in opinion of The University, has become damaged to extent that it could not be restored to its original condition.
 - b. Take precautions to protect residents and public from injury from construction operations.

Laying Out Work

10. Discrepancies: Verify dimensions and elevations indicated in layout of existing work.
 - a. Prior to commencing work, carefully compare and check Drawings (if any), for discrepancies in locations or elevations of work to be executed.
 - b. Refer discrepancies among Drawings (if any), Specifications and existing conditions to The University for adjustment before work affected is performed.
 - 1) Failure to make such notification shall place responsibility on Contractor to carry out work in satisfactory, workmanlike manner.
11. Contractor: Responsible for location and elevation of construction contemplated by Construction Documents.

Location Of Equipment And Piping

12. Drawings (if any) indicating location of equipment, piping, ductwork, etc. are diagrammatic and job conditions shall not always permit their installation in location shown. When this situation occurs, bring condition to The University's attention immediately. Relocation will be determined in joint conference.
13. Contractor: Do not relocate any items without first obtaining The University's acceptance. Remove and relocate such relocated items at own expense if so directed.

Electrical Work

14. General: Install boxes, wiring, and devices as indicated and required to connect and control electrical devices in accordance with NFPA 70 (NEC).
 - a. Boxes: Solidly anchor to framing or blocking.
15. Removing Electrical Switch or Duplex Outlet (Non-Hazardous Locations):
 - a. Box to Remain:
 - 1) Remove electrical device; cap hot and neutral with set-screw wire connectors.
 - 2) Attach ground wire to remaining box with solid screw attachment.
 - 3) Provide and install natural finish aluminum blank cover plate with screw fasteners integral to match size of box remaining.
 - b. Box to be removed:

- 1) Remove electrical device and box and pull wire out of wall back to first circuit panel, disconnecting from circuit panel.
 - 2) Patch and repair hole in partition to match existing.
16. Garbage Disposal Electrical Hook-up: See Division 15 Section "Plumbing." Comply with NFPA 70 (NEC):
 - a. Wiring: Install from disposal through concealed spaces to house panel, anchoring wire, and providing necessary fittings.
 - b. Switch: Install above counter top backsplash.
17. Range Hood Electrical Hook-up: See Division 11 Section "Residential Appliances." Comply with NFPA 70 (NEC):
 - a. Electric service: Install insulated wire from range hood through concealed spaces to house panel, anchoring wire, and providing necessary fittings.
18. Water Heater Electrical Hook-up: See Division 15 Section "Domestic Water Heaters." Comply with NFPA 70 (NEC).
19. Furnace Electrical Hook-up: See Division 15 Section "Furnaces." Comply with NFPA 70 (NEC).
20. Smoke Detector Electrical Hook-up: See Division 13 Section "Fire Alarm." Comply with NFPA 70 (NEC).

Integrating Existing Work

21. Protection: Protect existing improvements from damage.
 - a. Where new work is to be connected to existing work, exercise special care not to disturb or damage existing work more than necessary.
 - b. Damaged Work: Replace, repair and restored to its original condition at no cost to Owner.

END OF SECTION 23 05 13 00

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 05 19 00 - METERS AND GAGES FOR HVAC PIPING**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for meters and gages for HVAC piping. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the products manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Bimetallic-actuated thermometers.
 - b. Filled-system thermometers.
 - c. Liquid-in-glass thermometers.
 - d. Light-activated thermometers.
 - e. Thermowells.
 - f. Dial-type pressure gages.
 - g. Gage attachments.
 - h. Test plugs.
 - i. Test-plug kits.
 - j. Sight flow indicators.
 - k. Orifice flowmeters.
 - l. Pitot-tube flowmeters.
 - m. Turbine flowmeters.
 - n. Venturi flowmeters.
 - o. Vortex-shedding flowmeters.
 - p. Impeller-turbine, thermal-energy meters.
 - q. Ultrasonic, thermal-energy meters.

C. Submittals

1. Product Data: For each type of product indicated.
2. Wiring Diagrams: For power, signal, and control wiring.
3. Product Certificates: For each type of meter and gage, from manufacturer.
4. Operation and Maintenance Data: For meters and gages to include in operation and maintenance manuals.

1.2 PRODUCTS**A. Bimetallic-Actuated Thermometers**

1. Standard: ASME B40.200.
2. Case: Liquid-filled and sealed type(s); stainless steel with 3-inch (76-mm) **OR** 5-inch (127-mm), **as directed**, nominal diameter.
3. Dial: Nonreflective aluminum with permanently etched scale markings and scales in deg F (deg C) **OR** deg F and deg C, **as directed**.
4. Connector Type(s): Union joint, adjustable angle **OR** rigid, back **OR** rigid, bottom, **as directed**, with unified-inch screw threads.
5. Connector Size: 1/2 inch (13 mm), with ASME B1.1 screw threads.
6. Stem: 0.25 or 0.375 inch (6.4 or 9.4 mm) in diameter; stainless steel.
7. Window: Plain glass or plastic.
8. Ring: Stainless steel.
9. Element: Bimetal coil.
10. Pointer: Dark-colored metal.

11. Accuracy: Plus or minus 1 **OR** 1.5, **as directed**, percent of scale range.

B. Filled-System Thermometers

1. Direct-Mounted, Metal-Case, Vapor-Actuated Thermometers:
 - a. Standard: ASME B40.200.
 - b. Case: Sealed type, cast aluminum or drawn steel; 4-1/2-inch (114-mm) **OR** 5-inch (127-mm) **OR** 6-inch (152-mm), **as directed**, nominal diameter.
 - c. Element: Bourdon tube or other type of pressure element.
 - d. Movement: Mechanical, dampening type, **as directed**, with link to pressure element and connection to pointer.
 - e. Dial: Nonreflective aluminum with permanently etched scale markings graduated in deg F (deg C) **OR** deg F and deg C, **as directed**.
 - f. Pointer: Dark-colored metal.
 - g. Window: Glass or plastic.
 - h. Ring: Metal **OR** Stainless steel.
 - i. Connector Type(s): Union joint, adjustable, 180 degrees in vertical plane, 360 degrees in horizontal plane, with locking device **OR** rigid, back **OR** rigid, bottom, **as directed**; with ASME B1.1 screw threads.
 - j. Thermal System: Liquid-filled bulb in copper-plated steel, aluminum, or brass stem and of length to suit installation.
 - 1) Design for Air-Duct Installation: With ventilated shroud.
 - 2) Design for Thermowell Installation: Bare stem.
 - k. Accuracy: Plus or minus 1 percent of scale range.
2. Direct-Mounted, Plastic-Case, Vapor-Actuated Thermometers:
 - a. Standard: ASME B40.200.
 - b. Case: Sealed type, plastic; 4-1/2-inch (114-mm) **OR** 5-inch (127-mm) **OR** 6-inch (152-mm), **as directed**, nominal diameter.
 - c. Element: Bourdon tube or other type of pressure element.
 - d. Movement: Mechanical, with link to pressure element and connection to pointer.
 - e. Dial: Nonreflective aluminum with permanently etched scale markings graduated in deg F (deg C) **OR** deg F and deg C, **as directed**.
 - f. Pointer: Dark-colored metal.
 - g. Window: Glass or plastic.
 - h. Ring: Metal or plastic.
 - i. Connector Type(s): Union joint, adjustable, 180 degrees in vertical plane, 360 degrees in horizontal plane, with locking device **OR** rigid, back **OR** rigid, bottom, **as directed**; with ASME B1.1 screw threads.
 - j. Thermal System: Liquid-filled bulb in copper-plated steel, aluminum, or brass stem and of length to suit installation.
 - 1) Design for Air-Duct Installation: With ventilated shroud.
 - 2) Design for Thermowell Installation: Bare stem.
 - k. Accuracy: Plus or minus 1 percent of scale range.
3. Remote-Mounted, Metal-Case, Vapor-Actuated Thermometers:
 - a. Standard: ASME B40.200.
 - b. Case: Sealed type, cast aluminum or drawn steel; 4-1/2-inch (114-mm) **OR** 6-inch (152-mm), **as directed**, nominal diameter with back **OR** front, **as directed**, flange and holes for panel mounting.
 - c. Element: Bourdon tube or other type of pressure element.
 - d. Movement: Mechanical, with link to pressure element and connection to pointer.
 - e. Dial: Nonreflective aluminum with permanently etched scale markings graduated in deg F (deg C) **OR** deg F and deg C, **as directed**.
 - f. Pointer: Dark-colored metal.
 - g. Window: Glass or plastic.
 - h. Ring: Metal **OR** Stainless steel, **as directed**.
 - i. Connector Type(s): Union joint, back **OR** bottom, **as directed**; with ASME B1.1 screw threads.

- j. Thermal System: Liquid-filled bulb in copper-plated steel, aluminum, or brass stem and of length to suit installation.
 - 1) Design for Air-Duct Installation: With ventilated shroud.
 - 2) Design for Thermowell Installation: Bare stem.
 - k. Accuracy: Plus or minus 1 percent of scale range.
 - 4. Remote-Mounted, Plastic-Case, Vapor-Actuated Thermometers:
 - a. Standard: ASME B40.200.
 - b. Case: Sealed type, plastic; 4-1/2-inch (114-mm) **OR** 6-inch (152-mm), **as directed**, nominal diameter with back **OR** front, **as directed**, flange and holes for panel mounting.
 - c. Element: Bourdon tube or other type of pressure element.
 - d. Movement: Mechanical, with link to pressure element and connection to pointer.
 - e. Dial: Nonreflective aluminum with permanently etched scale markings graduated in deg F (deg C) **OR** deg F and deg C, **as directed**.
 - f. Pointer: Dark-colored metal.
 - g. Window: Glass or plastic.
 - h. Ring: Metal or plastic.
 - i. Connector Type(s): Union joint, threaded, back **OR** bottom, **as directed**; with ASME B1.1 screw threads.
 - j. Thermal System: Liquid-filled bulb in copper-plated steel, aluminum, or brass stem and of length to suit installation.
 - 1) Design for Air-Duct Installation: With ventilated shroud.
 - 2) Design for Thermowell Installation: Bare stem.
 - k. Accuracy: Plus or minus 1 percent of scale range or one scale division, to a maximum of 1.5 percent of scale range.
- C. Liquid-In-Glass Thermometers
 - 1. Metal-Case, Compact-Style, Liquid-in-Glass Thermometers:
 - a. Standard: ASME B40.200.
 - b. Case: Cast aluminum; 6-inch (152-mm) nominal size.
 - c. Case Form: Back angle **OR** Straight, **as directed**, unless otherwise indicated.
 - d. Tube: Glass with magnifying lens and blue or red, **as directed**, organic liquid.
 - e. Tube Background: Nonreflective aluminum with permanently etched scale markings graduated in deg F (deg C) **OR** deg F and deg C, **as directed**.
 - f. Window: Glass or plastic.
 - g. Stem: Aluminum or brass and of length to suit installation.
 - 1) Design for Air-Duct Installation: With ventilated shroud.
 - 2) Design for Thermowell Installation: Bare stem.
 - h. Connector: 3/4 inch (19 mm), with ASME B1.1 screw threads.
 - i. Accuracy: Plus or minus 1 percent of scale range or one scale division, to a maximum of 1.5 percent of scale range.
 - 2. Plastic-Case, Compact-Style, Liquid-in-Glass Thermometers:
 - a. Standard: ASME B40.200.
 - b. Case: Plastic; 6-inch (152-mm) nominal size.
 - c. Case Form: Back angle **OR** Straight, **as directed**, unless otherwise indicated.
 - d. Tube: Glass with magnifying lens and blue or red, **as directed**, organic liquid.
 - e. Tube Background: Nonreflective with permanently etched scale markings graduated in deg F (deg C) **OR** deg F and deg C, **as directed**.
 - f. Window: Glass or plastic.
 - g. Stem: Aluminum or brass and of length to suit installation.
 - 1) Design for Air-Duct Installation: With ventilated shroud.
 - 2) Design for Thermowell Installation: Bare stem.
 - h. Connector: 3/4 inch (19 mm), with ASME B1.1 screw threads.
 - i. Accuracy: Plus or minus 1 percent of scale range or one scale division, to a maximum of 1.5 percent of scale range.
 - 3. Metal-Case, Industrial-Style, Liquid-in-Glass Thermometers:
 - a. Standard: ASME B40.200.

- b. Case: Cast aluminum; 7-inch (178-mm) **OR** 9-inch (229-mm), **as directed**, nominal size unless otherwise indicated.
 - c. Case Form: Adjustable angle **OR** Back angle **OR** Straight, **as directed**, unless otherwise indicated.
 - d. Tube: Glass with magnifying lens and blue or red, **as directed**, organic liquid.
 - e. Tube Background: Nonreflective aluminum with permanently etched scale markings graduated in deg F (deg C) **OR** deg F and deg C, **as directed**.
 - f. Window: Glass or plastic.
 - g. Stem: Aluminum and of length to suit installation.
 - 1) Design for Air-Duct Installation: With ventilated shroud.
 - 2) Design for Thermowell Installation: Bare stem.
 - h. Connector: 1-1/4 inches (32 mm), with ASME B1.1 screw threads.
 - i. Accuracy: Plus or minus 1 percent of scale range or one scale division, to a maximum of 1.5 percent of scale range.
4. Plastic-Case, Industrial-Style, Liquid-in-Glass Thermometers:
- a. Standard: ASME B40.200.
 - b. Case: Plastic; 7-inch (178-mm) **OR** 9-inch (229-mm), **as directed**, nominal size unless otherwise indicated.
 - c. Case Form: Adjustable angle **OR** Back angle **OR** Straight, **as directed**, unless otherwise indicated.
 - d. Tube: Glass with magnifying lens and blue or red, **as directed**, organic liquid.
 - e. Tube Background: Nonreflective aluminum with permanently etched scale markings graduated in deg F (deg C) **OR** deg F and deg C, **as directed**.
 - f. Window: Glass or plastic.
 - g. Stem: Aluminum **OR** Brass **OR** Stainless steel, **as directed**, and of length to suit installation.
 - 1) Design for Air-Duct Installation: With ventilated shroud.
 - 2) Design for Thermowell Installation: Bare stem.
 - h. Connector: 1-1/4 inches (32 mm), with ASME B1.1 screw threads.
 - i. Accuracy: Plus or minus 1 percent of scale range or one scale division, to a maximum of 1.5 percent of scale range.
- D. Light-Activated Thermometers
- 1. Direct-Mounted, Light-Activated Thermometers:
 - a. Case: Plastic **OR** Metal, **as directed**; 7-inch (178-mm) **OR** 9-inch (229-mm), **as directed**, nominal size unless otherwise indicated.
 - b. Scale(s): Deg F (Deg C) **OR** Deg F and deg C, **as directed**.
 - c. Case Form: Adjustable angle.
 - d. Connector: 1-1/4 inches (32 mm), with ASME B1.1 screw threads.
 - e. Stem: Aluminum and of length to suit installation.
 - 1) Design for Air-Duct Installation: With ventilated shroud.
 - 2) Design for Thermowell Installation: Bare stem.
 - f. Display: Digital.
 - g. Accuracy: Plus or minus 2 deg F (1 deg C).
 - 2. Remote-Mounted, Light-Activated Thermometers:
 - a. Case: Plastic, for wall mounting.
 - b. Scale(s): Deg F (Deg C) **OR** Deg F and deg C, **as directed**.
 - c. Sensor: Bulb and thermister wire.
 - 1) Design for Air-Duct Installation: With ventilated shroud.
 - 2) Design for Thermowell Installation: Bare stem.
 - d. Display: Digital.
 - e. Accuracy: Plus or minus 2 deg F (1 deg C).
- E. Duct-Thermometer Mounting Brackets
- 1. Description: Flanged bracket with screw holes, for attachment to air duct and made to hold thermometer stem.

F. Thermowells

1. Thermowells:
 - a. Standard: ASME B40.200.
 - b. Description: Pressure-tight, socket-type fitting made for insertion into piping tee fitting.
 - c. Material for Use with Copper Tubing: CNR **OR** CUNI, **as directed**.
 - d. Material for Use with Steel Piping: CRES **OR** CSA, **as directed**.
 - e. Type: Stepped shank unless straight or tapered shank is indicated.
 - f. External Threads: NPS 1/2, NPS 3/4, or NPS 1, (DN 15, DN 20, or NPS 25,) ASME B1.20.1 pipe threads.
 - g. Internal Threads: 1/2, 3/4, and 1 inch (13, 19, and 25 mm), with ASME B1.1 screw threads.
 - h. Bore: Diameter required to match thermometer bulb or stem.
 - i. Insertion Length: Length required to match thermometer bulb or stem.
 - j. Lagging Extension: Include on thermowells for insulated piping and tubing.
 - k. Bushings: For converting size of thermowell's internal screw thread to size of thermometer connection.
2. Heat-Transfer Medium: Mixture of graphite and glycerin.

G. Pressure Gages

1. Direct-Mounted, Metal-Case, Dial-Type Pressure Gages:
 - 1) Standard: ASME B40.100.
 - 2) Case: Liquid-filled **OR** Sealed **OR** Open-front, pressure relief **OR** Solid-front, pressure relief, **as directed**, type(s); cast aluminum or drawn steel; 4-1/2-inch (114-mm) **OR** 6-inch (152-mm), **as directed**, nominal diameter.
 - 3) Pressure-Element Assembly: Bourdon tube unless otherwise indicated.
 - 4) Pressure Connection: Brass, with NPS 1/4 (DN 8) **OR** NPS 1/2 (DN 15), **as directed**, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
 - 5) Movement: Mechanical, with link to pressure element and connection to pointer.
 - 6) Dial: Nonreflective aluminum with permanently etched scale markings graduated in psi (kPa) **OR** psi and kPa, **as directed**.
 - 7) Pointer: Dark-colored metal.
 - 8) Window: Glass or plastic.
 - 9) Ring: Metal **OR** Brass **OR** Stainless steel, **as directed**.
 - 10) Accuracy: Grade A, plus or minus 1 percent of middle half of **OR** Grade B, plus or minus 2 percent of middle half of **OR** Grade C, plus or minus 3 percent of middle half of **OR** Grade D, plus or minus 5 percent of whole, **as directed**, scale range.
2. Direct-Mounted, Plastic-Case, Dial-Type Pressure Gages:
 - a. Standard: ASME B40.100.
 - b. Case: Sealed type; plastic; 4-1/2-inch (114-mm) **OR** 6-inch (152-mm), **as directed**, nominal diameter.
 - c. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.
 - d. Pressure Connection: Brass, with NPS 1/4 (DN 8) **OR** NPS 1/2 (DN 15), **as directed**, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
 - e. Movement: Mechanical, with link to pressure element and connection to pointer.
 - f. Dial: Nonreflective aluminum with permanently etched scale markings graduated in psi (kPa) **OR** psi and kPa, **as directed**.
 - g. Pointer: Dark-colored metal.
 - h. Window: Glass or plastic.
 - i. Accuracy: Grade A, plus or minus 1 percent of middle half of **OR** Grade B, plus or minus 2 percent of middle half of **OR** Grade C, plus or minus 3 percent of middle half of **OR** Grade D, plus or minus 5 percent of whole, **as directed**, scale range.
3. Remote-Mounted, Metal-Case, Dial-Type Pressure Gages:
 - a. Standard: ASME B40.100.
 - b. Case: Liquid-filled **OR** Sealed, **as directed**, type; cast aluminum or drawn steel **OR** metal, **as directed**; 4-1/2-inch (114-mm) **OR** 6-inch (152-mm), **as directed**, nominal diameter with back **OR** front, **as directed**, flange and holes for panel mounting.

- c. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.
 - d. Pressure Connection: Brass, with NPS 1/4 (DN 8) **OR** NPS 1/2 (DN 15), **as directed**, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
 - e. Movement: Mechanical, with link to pressure element and connection to pointer.
 - f. Dial: Nonreflective aluminum with permanently etched scale markings graduated in psi (kPa) **OR** psi and kPa, **as directed**.
 - g. Pointer: Dark-colored metal.
 - h. Window: Glass or plastic.
 - i. Ring: Metal **OR** Stainless steel, **as directed**.
 - j. Accuracy: Grade A, plus or minus 1 percent of middle half of **OR** Grade B, plus or minus 2 percent of middle half of **OR** Grade C, plus or minus 3 percent of middle half of **OR** Grade D, plus or minus 5 percent of whole, **as directed**, scale range.
4. Remote-Mounted, Plastic-Case, Dial-Type Pressure Gages:
- a. Standard: ASME B40.100.
 - b. Case: Sealed type; plastic; 4-1/2-inch (114-mm) **OR** 6-inch (152-mm), **as directed**, nominal diameter with back **OR** front, **as directed**, flange and holes for panel mounting.
 - c. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.
 - d. Pressure Connection: Brass, with NPS 1/4 (DN 8) **OR** NPS 1/2 (DN 15), **as directed**, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
 - e. Movement: Mechanical, with link to pressure element and connection to pointer.
 - f. Dial: Nonreflective aluminum with permanently etched scale markings graduated in psi (kPa) **OR** psi and kPa, **as directed**.
 - g. Pointer: Dark-colored metal.
 - h. Window: Glass or plastic.
 - i. Accuracy: Grade A, plus or minus 1 percent of middle half of **OR** Grade B, plus or minus 2 percent of middle half of **OR** Grade C, plus or minus 3 percent of middle half of **OR** Grade D, plus or minus 5 percent of whole, **as directed**, scale range.

H. Gage Attachments

- 1. Snubbers: ASME B40.100, brass; with NPS 1/4 (DN 8) **OR** NPS 1/2 (DN 15), **as directed**, ASME B1.20.1 pipe threads and piston-type **OR** porous-metal-type, **as directed**, surge-dampening device. Include extension for use on insulated piping.
- 2. Siphons: Loop-shaped section of brass **OR** stainless-steel **OR** steel, **as directed**, pipe with NPS 1/4 (DN 8) **OR** NPS 1/2 (DN 15), **as directed**, pipe threads.
- 3. Valves: Brass ball **OR** Brass or stainless-steel needle, **as directed**, with NPS 1/4 (DN 8) **OR** NPS 1/2 (DN 15), **as directed**, ASME B1.20.1 pipe threads.

I. Test Plugs

- 1. Description: Test-station fitting made for insertion into piping tee fitting.
- 2. Body: Brass or stainless steel with core inserts and gasketed and threaded cap. Include extended stem on units to be installed in insulated piping.
- 3. Thread Size: NPS 1/4 (DN 8) **OR** NPS 1/2 (DN 15), **as directed**, ASME B1.20.1 pipe thread.
- 4. Minimum Pressure and Temperature Rating: 500 psig at 200 deg F (3450 kPa at 93 deg C).
- 5. Core Inserts: Chlorosulfonated polyethylene synthetic **OR** EPDM, **as directed**, self-sealing rubber.

J. Test-Plug Kits

- 1. Furnish one test-plug kit(s) containing one **OR** two, **as directed**, thermometer(s), one pressure gage and adapter, and carrying case. Thermometer sensing elements, pressure gage, and adapter probes shall be of diameter to fit test plugs and of length to project into piping.
- 2. Low-Range Thermometer: Small, bimetallic insertion type with 1- to 2-inch- (25- to 51-mm-) diameter dial and tapered-end sensing element. Dial range shall be at least 25 to 125 deg F (minus 4 to plus 52 deg C).
- 3. High-Range Thermometer: Small, bimetallic insertion type with 1- to 2-inch- (25- to 51-mm-) diameter dial and tapered-end sensing element. Dial range shall be at least 0 to 220 deg F (minus 18 to plus 104 deg C).

4. Pressure Gage: Small, Bourdon-tube insertion type with 2- to 3-inch- (51- to 76-mm-) diameter dial and probe. Dial range shall be at least 0 to 200 psig (0 to 1380 kPa).
 5. Carrying Case: Metal or plastic, with formed instrument padding.
- K. Sight Flow Indicators
1. Description: Piping inline-installation device for visual verification of flow.
 2. Construction: Bronze or stainless-steel body, with sight glass and ball, flapper, or paddle wheel indicator, and threaded or flanged ends.
 3. Minimum Pressure Rating: 125 psig (860 kPa) **OR** 150 psig (1034 kPa), **as directed**.
 4. Minimum Temperature Rating: 200 deg F (93 deg C).
 5. End Connections for NPS 2 (DN 50) and Smaller: Threaded.
 6. End Connections for NPS 2-1/2 (DN 65) and Larger: Flanged.
- L. Flowmeters
1. Orifice Flowmeters:
 - a. Description: Flowmeter with sensor, hoses or tubing, fittings, valves, indicator, and conversion chart.
 - b. Flow Range: Sensor and indicator shall cover operating range of equipment or system served.
 - c. Sensor: Wafer-orifice-type, calibrated, flow-measuring element; for installation between pipe flanges.
 - 1) Design: Differential-pressure-type measurement for gas **OR** oil **OR** steam **OR** water, **as directed**.
 - 2) Construction: Cast-iron body, brass valves with integral check valves and caps, and calibrated nameplate.
 - 3) Minimum Pressure Rating: 300 psig (2070 kPa).
 - 4) Minimum Temperature Rating: 250 deg F (121 deg C).
 - d. Permanent Indicators: Meter suitable for wall or bracket mounting, calibrated for connected sensor and having 6-inch- (152-mm-) diameter, or equivalent, dial with fittings and copper tubing for connecting to sensor.
 - 1) Scale: Gallons per minute (Liters per second).
 - 2) Accuracy: Plus or minus 1 percent between 20 and 80 percent of scale range.
 - e. Portable Indicators: Hand-held, differential-pressure type, calibrated for connected sensor and having two 12-foot (3.7-m) hoses, with carrying case.
 - 1) Scale: Gallons per minute (Liters per second).
 - 2) Accuracy: Plus or minus 2 percent between 20 and 80 percent of scale range.
 - f. Display: Shows rate of flow, with register to indicate total volume in gallons (liters).
 - g. Conversion Chart: Flow rate data compatible with sensor and indicator.
 - h. Operating Instructions: Include complete instructions with each flowmeter.
 2. Pitot-Tube Flowmeters:
 - a. Description: Flowmeter with sensor and indicator.
 - b. Flow Range: Sensor and indicator shall cover operating range of equipment or system served.
 - c. Sensor: Insertion type; for inserting probe into piping and measuring flow directly in gallons per minute (liters per second).
 - 1) Design: Differential-pressure-type measurement for oil **OR** water, **as directed**.
 - 2) Construction: Stainless-steel probe of length to span inside of pipe, with integral transmitter and direct-reading scale.
 - 3) Minimum Pressure Rating: 150 psig (1035 kPa).
 - 4) Minimum Temperature Rating: 250 deg F (121 deg C).
 - d. Indicator: Hand-held meter; either an integral part of sensor or a separate meter.
 - e. Integral Transformer: For low-voltage power connection.
 - f. Accuracy: Plus or minus 3 percent.
 - g. Display: Shows rate of flow, with register to indicate total volume in gallons (liters).
 - h. Operating Instructions: Include complete instructions with each flowmeter.
 3. Turbine Flowmeters:
 - a. Description: Flowmeter with sensor and indicator.

- b. Flow Range: Sensor and indicator shall cover operating range of equipment or system served.
 - c. Sensor: Impeller turbine; for inserting into pipe fitting or for installing in piping and measuring flow directly in gallons per minute (liters per second).
 - 1) Design: Device or pipe fitting with inline turbine and integral direct-reading scale for gas **OR** oil **OR** steam **OR** water, **as directed**.
 - 2) Construction: Bronze or stainless-steel body, with plastic turbine or impeller.
 - 3) Minimum Pressure Rating: 150 psig (1035 kPa).
 - 4) Minimum Temperature Rating: 180 deg F (82 deg C).
 - d. Indicator: Hand-held meter; either an integral part of sensor or a separate meter.
 - e. Accuracy: Plus or minus 1-1/2 percent.
 - f. Display: Shows rate of flow, with register to indicate total volume in gallons (liters).
 - g. Operating Instructions: Include complete instructions with each flowmeter.
4. Venturi Flowmeters:
- a. Description: Flowmeter with calibrated flow-measuring element, hoses or tubing, fittings, valves, indicator, and conversion chart.
 - b. Flow Range: Sensor and indicator shall cover operating range of equipment or system served.
 - c. Sensor: Venturi-type, calibrated, flow-measuring element; for installation in piping.
 - 1) Design: Differential-pressure-type measurement for gas **OR** oil **OR** steam **OR** water, **as directed**.
 - 2) Construction: Bronze, brass, or factory-primed steel, with brass fittings and attached tag with flow conversion data.
 - 3) Minimum Pressure Rating: 250 psig (1725 kPa).
 - 4) Minimum Temperature Rating: 250 deg F (121 deg C).
 - 5) End Connections for NPS 2 (DN 50) and Smaller: Threaded.
 - 6) End Connections for NPS 2-1/2 (DN 65) and Larger: Flanged or welded.
 - 7) Flow Range: Flow-measuring element and flowmeter shall cover operating range of equipment or system served.
 - d. Permanent Indicators: Meter suitable for wall or bracket mounting, calibrated for connected flowmeter element, and having 6-inch- (152-mm-) diameter, or equivalent, dial with fittings and copper tubing for connecting to flowmeter element.
 - 1) Scale: Gallons per minute (Liters per second).
 - 2) Accuracy: Plus or minus 1 percent between 20 and 80 percent of scale range.
 - e. Portable Indicators: Hand-held, differential-pressure type, calibrated for connected flowmeter element and having two 12-foot (3.7-m) hoses, with carrying case.
 - 1) Scale: Gallons per minute (Liters per second).
 - 2) Accuracy: Plus or minus 2 percent between 20 and 80 percent of scale range.
 - f. Display: Shows rate of flow, with register to indicate total volume in gallons (liters).
 - g. Conversion Chart: Flow rate data compatible with sensor.
 - h. Operating Instructions: Include complete instructions with each flowmeter.
5. Vortex-Shedding Flowmeters:
- a. Description: Flowmeter with sensor and indicator.
 - b. Flow Range: Sensor and indicator shall cover operating range of equipment or system served.
 - c. Sensor: Inline type; for installing between pipe flanges and measuring flow directly in gallons per minute (liters per second).
 - 1) Design: Flow obstruction device, vortex-measurement type for gas **OR** steam **OR** liquids, **as directed**.
 - 2) Construction: Stainless-steel body, with integral transmitter and direct-reading scale.
 - 3) Minimum Pressure Rating: 1000 psig (6900 kPa).
 - 4) Minimum Temperature Rating: 500 deg F (260 deg C).
 - 5) Integral Transformer: For low-voltage power operation.
 - d. Indicator: Hand-held meter; either an integral part of sensor or a separate meter.
 - e. Accuracy: Plus or minus 0.25 percent for liquids and 0.75 percent for gases.
 - f. Display: Shows rate of flow, with register to indicate total volume in gallons (liters).

- g. Operating Instructions: Include complete instructions with each flowmeter.

M. Thermal-Energy Meters

1. Impeller-Turbine, Thermal-Energy Meters:
 - a. Description: System with strainer, **as directed**, flow sensor, temperature sensors, transmitter, indicator, and connecting wiring.
 - b. Flow Sensor: Impeller turbine with corrosion-resistant-metal body and transmitter; for installing in piping.
 - 1) Design: Total thermal-energy measurement.
 - 2) Minimum Pressure Rating: 150 psig (1035 kPa).
 - 3) Minimum Temperature Range: 40 to 250 deg F (5 to 121 deg C).
 - c. Temperature Sensors: Insertion-type transducer.
 - d. Indicator: Solid-state, integrating-type meter with integral battery pack, **as directed**; for wall mounting.
 - 1) Data Output: Six-digit electromechanical counter with readout in kilowatts per hour or British thermal units (joules).
 - 2) Battery Pack: Five-year lithium battery.
 - e. Accuracy: Plus or minus 1 percent.
 - f. Display: Visually indicates total fluid volume in gallons (liters) and thermal-energy flow in kilowatts per hour or British thermal units (joules).
 - g. Strainer: Full size of main line piping.
 - h. Operating Instructions: Include complete instructions with each thermal-energy meter system.
2. Ultrasonic, Thermal-Energy Meters:
 - a. Description: Meter with flow sensor, temperature sensors, transmitter, indicator, and connecting wiring.
 - b. Flow Sensor: Transit-time ultrasonic type with transmitter.
 - c. Temperature Sensors: Insertion-type or strap-on transducer.
 - d. Indicator: Solid-state, integrating-type meter with integral battery pack, **as directed**.
 - 1) Data Output: Six-digit electromechanical counter with readout in kilowatts per hour or British thermal units (joules).
 - 2) Battery Pack: Five-year lithium battery.
 - e. Accuracy: Plus or minus 1 percent.
 - f. Display: Visually indicates total fluid volume in gallons (liters) and thermal-energy flow in kilowatts per hour or British thermal units (joules).
 - g. Operating Instructions: Include complete instructions with each thermal-energy meter system.

1.3 EXECUTION

A. Installation

1. Install thermowells with socket extending a minimum of 2 inches (51 mm) into fluid **OR** one-third of pipe diameter **OR** to center of pipe, **as directed**, and in vertical position in piping tees.
2. Install thermowells of sizes required to match thermometer connectors. Include bushings if required to match sizes.
3. Install thermowells with extension on insulated piping.
4. Fill thermowells with heat-transfer medium.
5. Install direct-mounted thermometers in thermowells and adjust vertical and tilted positions.
6. Install remote-mounted thermometer bulbs in thermowells and install cases on panels; connect cases with tubing and support tubing to prevent kinks. Use minimum tubing length.
7. Install duct-thermometer mounting brackets in walls of ducts. Attach to duct with screws.
8. Install direct-mounted pressure gages in piping tees with pressure gage located on pipe at the most readable position.
9. Install remote-mounted pressure gages on panel.
10. Install valve and snubber in piping for each pressure gage for fluids (except steam).

11. Install valve and syphon fitting in piping for each pressure gage for steam.
12. Install test plugs in piping tees.
13. Install flow indicators in piping systems in accessible positions for easy viewing.
14. Assemble and install connections, tubing, and accessories between flow-measuring elements and flowmeters according to manufacturer's written instructions.
15. Install flowmeter elements in accessible positions in piping systems.
16. Install wafer-orifice flowmeter elements between pipe flanges.
17. Install differential-pressure-type flowmeter elements, with at least minimum straight lengths of pipe, upstream and downstream from element according to manufacturer's written instructions.
18. Install permanent indicators on walls or brackets in accessible and readable positions.
19. Install connection fittings in accessible locations for attachment to portable indicators.
20. Mount thermal-energy meters on wall if accessible; if not, provide brackets to support meters.
21. Install thermometers in the following locations:
 - a. Inlet and outlet of each hydronic zone.
 - b. Inlet and outlet of each hydronic boiler.
 - c. Two inlets and two outlets of each chiller.
 - d. Inlet and outlet of each hydronic coil in air-handling units.
 - e. Two inlets and two outlets of each hydronic heat exchanger.
 - f. Inlet and outlet of each thermal-storage tank.
 - g. Outside-, return-, supply-, and mixed-air ducts.
22. Install pressure gages in the following locations:
 - a. Discharge of each pressure-reducing valve.
 - b. Inlet and outlet of each chiller chilled-water and condenser-water connection.
 - c. Suction and discharge of each pump.

B. Connections

1. Install meters and gages adjacent to machines and equipment to allow service and maintenance of meters, gages, machines, and equipment.
2. Connect flowmeter-system elements to meters.
3. Connect flowmeter transmitters to meters.
4. Connect thermal-energy meter transmitters to meters.

C. Adjusting

1. After installation, calibrate meters according to manufacturer's written instructions.
2. Adjust faces of meters and gages to proper angle for best visibility.

D. Thermometer Schedule

1. Thermometers at inlet and outlet of each hydronic zone shall be one of the following:
 - a. Liquid-filled **OR** Sealed, **as directed**, bimetallic-actuated type.
 - b. Direct-mounted **OR** Remote-mounted, **as directed**, metal-case **OR** plastic-case, **as directed**, vapor-actuated type.
 - c. Compact-style **OR** Industrial-style, **as directed**, liquid-in-glass type.
 - d. Direct-mounted **OR** Remote-mounted, **as directed**, light-activated type.
 - e. Test plug with chlorosulfonated polyethylene synthetic **OR** EPDM, **as directed**, self-sealing rubber inserts.
2. Thermometers at inlet and outlet of each hydronic boiler shall be one of the following:
 - a. Liquid-filled **OR** Sealed, **as directed**, bimetallic-actuated type.
 - b. Direct-mounted **OR** Remote-mounted, **as directed**, metal-case **OR** plastic-case, **as directed**, vapor-actuated type.
 - c. Compact-style **OR** Industrial-style, **as directed**, liquid-in-glass type.
 - d. Direct-mounted **OR** Remote-mounted, **as directed**, light-activated type.
 - e. Test plug with chlorosulfonated polyethylene synthetic **OR** EPDM, **as directed**, self-sealing rubber inserts.
3. Thermometers at inlets and outlets of each chiller shall be one of the following:
 - a. Liquid-filled **OR** Sealed, **as directed**, bimetallic-actuated type.
 - b. Direct-mounted **OR** Remote-mounted, **as directed**, metal-case **OR** plastic-case, **as directed**, vapor-actuated type.

- c. Compact-style **OR** Industrial-style, **as directed**, liquid-in-glass type.
- d. Direct-mounted **OR** Remote-mounted, **as directed**, light-activated type.
- e. Test plug with chlorosulfonated polyethylene synthetic **OR** EPDM, **as directed**, self-sealing rubber inserts.
- 4. Thermometers at inlet and outlet of each hydronic coil in air-handling units and built-up central systems shall be one of the following:
 - a. Liquid-filled **OR** Sealed, **as directed**, bimetallic-actuated type.
 - b. Direct-mounted **OR** Remote-mounted, **as directed**, metal-case **OR** plastic-case, **as directed**, vapor-actuated type.
 - c. Compact-style **OR** Industrial-style, **as directed**, liquid-in-glass type.
 - d. Direct-mounted **OR** Remote-mounted, **as directed**, light-activated type.
 - e. Test plug with chlorosulfonated polyethylene synthetic **OR** EPDM, **as directed**, self-sealing rubber inserts.
- 5. Thermometers at inlets and outlets of each hydronic heat exchanger shall be one of the following:
 - a. Liquid-filled **OR** Sealed, **as directed**, bimetallic-actuated type.
 - b. Direct-mounted **OR** Remote-mounted, **as directed**, metal-case **OR** plastic-case, **as directed**, vapor-actuated type.
 - c. Compact-style **OR** Industrial-style, **as directed**, liquid-in-glass type.
 - d. Direct-mounted **OR** Remote-mounted, **as directed**, light-activated type.
 - e. Test plug with chlorosulfonated polyethylene synthetic **OR** EPDM, **as directed**, self-sealing rubber inserts.
- 6. Thermometers at inlet and outlet of each hydronic heat-recovery unit shall be one of the following:
 - a. Liquid-filled **OR** Sealed, **as directed**, bimetallic-actuated type.
 - b. Direct-mounted **OR** Remote-mounted, **as directed**, metal-case **OR** plastic-case, **as directed**, vapor-actuated type.
 - c. Compact-style **OR** Industrial-style, **as directed**, liquid-in-glass type.
 - d. Direct-mounted **OR** Remote-mounted, **as directed**, light-activated type.
 - e. Test plug with chlorosulfonated polyethylene synthetic **OR** EPDM, **as directed**, self-sealing rubber inserts.
- 7. Thermometers at inlet and outlet of each thermal-storage tank shall be one of the following:
 - a. Liquid-filled **OR** Sealed, **as directed**, bimetallic-actuated type.
 - b. Direct-mounted **OR** Remote-mounted, **as directed**, metal-case **OR** plastic-case, **as directed**, vapor-actuated type.
 - c. Compact-style **OR** Industrial-style, **as directed**, liquid-in-glass type.
 - d. Direct-mounted **OR** Remote-mounted, **as directed**, light-activated type.
 - e. Test plug with chlorosulfonated polyethylene synthetic **OR** EPDM, **as directed**, self-sealing rubber inserts.
- 8. Thermometers at outside-, return-, supply-, and mixed-air ducts shall be one of the following:
 - a. Liquid-filled **OR** Sealed, **as directed**, bimetallic-actuated type.
 - b. Direct-mounted **OR** Remote-mounted, **as directed**, metal-case **OR** plastic-case, **as directed**, vapor-actuated type.
 - c. Compact-style **OR** Industrial-style, **as directed**, liquid-in-glass type.
 - d. Direct-mounted **OR** Remote-mounted, **as directed**, light-activated type.
- 9. Thermometer stems shall be of length to match thermowell insertion length.
- E. Thermometer Scale-Range Schedule
 - 1. **Scale shall be as near 2X system temperature being measured, as available in commonly manufactured gauges.**
 - 2.
- F. Pressure-Gage Schedule
 - 1. Pressure gages at discharge of each pressure-reducing valve shall be one of the following:
 - a. Liquid-filled **OR** Sealed **OR** Open-front, pressure-relief **OR** Solid-front, pressure-relief, **as directed**, direct-mounted **OR** remote-mounted, **as directed**, metal case.
 - b. Sealed, direct-mounted **OR** remote-mounted, **as directed**, plastic case.
 - c. Test plug with chlorosulfonated polyethylene synthetic **OR** EPDM, **as directed**, self-sealing rubber inserts.

2. Pressure gages at inlet and outlet of each chiller chilled-water and condenser-water connection shall be one of the following:
 - a. Liquid-filled **OR** Sealed **OR** Open-front, pressure-relief **OR** Solid-front, pressure-relief, **as directed**, direct-mounted **OR** remote-mounted, **as directed**, metal case.
 - b. Sealed, direct-mounted **OR** remote-mounted, **as directed**, plastic case.
 - c. Test plug with chlorosulfonated polyethylene synthetic **OR** EPDM, **as directed**, self-sealing rubber inserts.
3. Pressure gages at suction and discharge of each pump shall be one of the following:
 - a. Liquid-filled **OR** Sealed **OR** Open-front, pressure-relief **OR** Solid-front, pressure-relief, **as directed**, direct-mounted **OR** remote-mounted, **as directed**, metal case.
 - b. Sealed, direct-mounted **OR** remote-mounted, **as directed**, plastic case.
 - c. Test plug with chlorosulfonated polyethylene synthetic **OR** EPDM, **as directed**, self-sealing rubber inserts.

G. Pressure-Gage Scale-Range Schedule

1. **Scale shall be as near 2X system pressure being measured, as available in commonly manufactured gauges.**

H. Flowmeter Schedule

1. Flowmeters for Chilled-Water Piping: Orifice **OR** Pitot-tube **OR** Turbine **OR** Venturi **OR** Vortex-shedding, **as directed**, type.
2. Flowmeters for Condenser-Water Piping: Orifice **OR** Pitot-tube **OR** Turbine **OR** Venturi **OR** Vortex-shedding, **as directed**, type.
3. Flowmeters for Heating, Hot-Water Piping: Orifice **OR** Pitot-tube **OR** Turbine **OR** Venturi **OR** Vortex-shedding, **as directed**, type.
4. Flowmeters for Steam and Steam-Condensate Piping: Orifice **OR** Turbine **OR** Venturi **OR** Vortex-shedding, **as directed**, type.

I. Thermal-Energy Meter Schedule

1. Thermal-Energy Meters for Chilled-Water Piping: Impeller-turbine **OR** Ultrasonic, **as directed**, type.
2. Thermal-Energy Meters for Condenser-Water Piping: Impeller-turbine **OR** Ultrasonic, **as directed**, type.
3. Thermal-Energy Meters for Heating, Hot-Water Piping: Impeller-turbine **OR** Ultrasonic, **as directed**, type.
4. Thermal-Energy Meters for Steam and Steam-Condensate Piping: Impeller-turbine **OR** Ultrasonic, **as directed**, type.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 07 13 00 - DUCTWORK INSULATION**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Perform all Work required to provide and install ductwork insulation and jackets indicated by the Contract Documents with supplementary items necessary for proper installation.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. ASTM B209 - Aluminum and Aluminum-Alloy Sheet and Plate.
 - 2. ASTM C168 - Terminology Relating to Thermal Insulation Materials.
 - 3. ASTM C518 - Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus.
 - 4. ASTM C553 - Mineral Fiber Blanket Thermal Insulation for Commercial and Industrial Applications.
 - 5. ASTM C612 - Mineral Fiber Block and Board Thermal Insulation.
 - 6. ASTM C1071 - Standard Specification for Fibrous Glass Duct Lining Insulation (Thermal and Sound Absorbing Material).
 - 7. ASTM C1104 - Standard Test Method for Determining the Water Vapor Sorption of Unfaced Mineral Fiber Insulation.
 - 8. ASTM C1290 - Standard Specification for Flexible Fibrous Glass Blanket Insulation Used to Externally Insulate HVAC Ducts.
 - 9. ASTM C1136 - Standard Specification for Flexible, Low Permeance Vapor Retarders for Thermal Insulation.
 - 10. ASTM C1338 - Standard Test Method for Determining Fungi Resistance of Insulation Materials and Facings.
 - 11. ASTM E84 - Surface Burning Characteristics of Building Materials.
 - 12. ASTM E96 - Water Vapor Transmission of Materials.

13. ASTM E119 - Standard Test Methods for Fire Tests of Building Construction and Materials.
14. ASTM G21 - Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Fungi.
15. NFPA 255 - Surface Burning Characteristics of Building Materials.
16. SMACNA - HVAC Duct Construction Standards - Metal and Flexible.
17. UL 181 - Standard for Factory-Made Air Ducts and Air Connectors.
18. UL 723 - Surface Burning Characteristics of Building Materials.
19. UL 1978 - Standard for Grease Ducts.

1.04 QUALITY ASSURANCE

- A. All ductwork requiring insulation shall be insulated as specified herein and as required for a complete system. In each case, the insulation shall be equivalent to that specified and materials applied and finished as described in these Specifications.
- B. All insulation, jacket, adhesives, mastics, sealers, etc., utilized in the fabrication of these systems shall meet NFPA for fire resistant ratings (maximum of 25 flame spread and 50 smoke developed ratings) and shall be approved by the insulation manufacturer for guaranteed performances when incorporated into their insulation system, unless a specific product is specified for a specific application and is stated as an exception to this requirement. Certificates to this effect shall be submitted along with Contractor's submittal data for this Section of the Specifications. No material may be used that, when tested by the ASTM E84-89 test method, is found to melt, drip or delaminate to such a degree that the continuity of the flame front is destroyed, thereby resulting in an artificially low flame spread rating.
- C. Application Company Qualifications: Company performing the Work of this Section must have minimum three (3) years experience specializing in the trade.
- D. All insulation shall be applied by mechanics skilled in this particular Work and regularly engaged in such occupation.
- E. All insulation shall be applied in strict accordance with these Specifications and with factory printed recommendations on items not herein mentioned. Unsightly, inadequate, or sloppy Work will not be acceptable.

1.05 SUBMITTALS

- A. Product Data:
 1. Provide product description, list of materials, "k" value, "R" value, mean temperature range, and thickness for each service and location.
- B. Record Documents:
 1. Submit under provisions of Division 01.
- C. Operation and Maintenance Data:
 1. Samples: When requested, submit three (3) samples of any representative size illustrating each insulation type.
 2. Manufacturer's Installation Instructions: Indicate procedures that ensure acceptable standards will be achieved. Submit certificates to this effect

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, protect, and handle products to the Project Site under provisions of Division 01 and Division 20.
- B. Deliver materials to Site in original factory packaging, labeled with manufacturer's identification including product thermal ratings and thickness.
- C. Store insulation in original wrapping and protect from weather and construction traffic. Protect insulation against dirt, water, chemical, and mechanical damage.
- D. Maintain ambient temperatures and conditions required by manufacturers of adhesives, mastics and insulation cements.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Knauf Corporation.
- B. Or approved equal.

2.03 INSULATION MATERIALS

- A. Type D1: Flexible glass fiber; ASTM C553 and ASTM C1290; commercial grade; 'k' value of 0.25 at 75 degrees F; 1.5 lb/cu ft minimum density; 0.002 inch foil scrim kraft facing for air ducts.
- B. Type D2: Rigid glass fiber; ASTM C612, Class 1; 'k' value of 0.23 at 75 degrees F; 3.0 lb/cu ft minimum density; 0.002 inch foil scrim kraft facing for air ducts.
- C. Type D3: Ductliner (to be used in return air sound boots only), flexible glass fiber; ASTM C1071; Type II, 'k' value of 0.23 at 75 degrees F; 3.0 lb/cu ft minimum density; coating air side for maximum 4,000 feet per minute air velocity. The airstream surface must be protected with a durable acrylic surface coating specifically formulated to:
 - 1. Be no more corrosive than sterile cotton when tested in accordance with the test method for corrosiveness in ASTM C665.
 - 2. Absorb no more than 3 percent by weight when tested in accordance with the test method for moisture vapor sorption in ASTM C1104.
 - 3. Not support the growth of fungus or bacteria, when tested in accordance with the test method for fungi resistance in ASTM C1071, ASTM C1338, ASTM G21, and ASTM G22.
 - 4. Show no signs of warpage, cracking, delamination, flaming, smoking, glowing, or any other visibly negative changes when tested in accordance with the test method for temperature resistance in ASTM C411.
 - 5. Have a flame spread rating of 25 or less and a smoke developed rating of 50 or less when tested in accordance with the test method for surface burning in ASTM E 84.
 - 6. Meet the sound absorption requirements when tested in accordance with the test method for sound absorption in ASTM C423.

7. Show no evidence of continued erosion, cracking, flaking, peeling, or delamination when tested in accordance with the test method for erosion resistance in UL181.
- D. Type D4: Fire Rated Grease Duct Insulation (High Temperature Flexible Blanket); 1-1/2-inch thick refractory grade fibrous fire barrier material with minimum service temperature design of 2,000 degrees F; aluminum foil laminated on both sides; with a minimum 'k' value of 0.25 and a minimum density of 6 lbs/cu ft; containing no asbestos. UL listed and tested to meet UL Standard 1978, ASTM E119, and with flame spread/smoke developed rating of 0 / 0 when tested as per ASTM E84/UL 723.
- E. Type D5: Outdoor Duct Insulation (Closed Cell Flexible Elastomeric Insulation); 1 inch thick material that has a service temperature range from -60 degrees F to 180 degrees F. This outdoor duct insulation meets ASTM C 177 or C 518 and shall have minimum 'k' value of 0.27 Btu-in. / hr-ft²-degrees F at minimum density measurement of 3 lb/cu ft. The insulation and outside surface must be protected with a white Thermo Plastic Rubber Membrane formulated to:
 1. Be resistant to UV, and ozone, acid rain, and physical elements produced from outdoor weather per ASTM E 96 Procedure A.
 2. Have a flame spread rating of 25 or less and a smoke developed rating of 50 or less when tested in accordance with the test method for surface burning in ASTM E 84.
 3. Show no evidence of continued erosion, cracking, flaking, peeling, or delamination when tested in accordance with the test method for erosion resistance in UL181. Be resistant to mold growth resistance, ASTM G 21/C 1338 resistant to fungi, and resistant to bacteria growth per ASTM G 22.

2.04 INSULATION ACCESSORIES

- A. Adhesives: Waterproof vapor barrier type, meeting requirements of ASTM C916; Childers CP-82.
- B. Finish: Vapor barrier finish coating, Childers CP-11.
- C. Jacket: Presized glass cloth, minimum 7.8 oz/sq yd.
- D. Type D4 Insulation Adhesive: Fire resistive to ASTM E84, Childers CP-82.
- E. Impale Anchors: Galvanized steel, 12 gage self-adhesive pad.
- F. Joint Tape: Glass fiber cloth, open mesh.
- G. Tie Wire and Wire Mesh: Annealed steel, 16 gage.
- H. Stainless Steel Banding: 3/4-inch wide, minimum 22 gage, 304 stainless.
- I. Armaflex 520 or 520 BLV contact adhesive.
- J. Armatuff 25 white seal seam tape.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Verify that ductwork has been tested before applying insulation materials.
- B. Verify that surfaces are clean, foreign material removed, and dry.
- C. Maintain required ambient temperature during and after installation for a minimum period of 24 hours.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Provide external insulation on all round ductwork connectors to ceiling diffusers and on top of diffusers as indicated in the Ductwork Insulation Application and Thickness Schedule and the Drawings. Secure insulation to ceiling diffuser frame with vapor barrier adhesive or tape to match jacket.
- D. Flexible and Rigid fiberglass insulation (Types D1 and D2) application for exterior of duct:
 - 1. Secure insulation with vapor barrier with wires and seal jacket joints with vapor barrier adhesive or tape to match jacket.
 - 2. Install without sag on underside of ductwork. Use 4-inch wide strips of adhesive on 8-inch centers and mechanical fasteners where necessary to prevent sagging. Seal vapor barrier penetrations by mechanical fasteners with vapor barrier adhesive. Stop and point insulation around access doors and damper operators to allow operation without disturbing wrapping.
 - 3. Insulate standing seams and stiffeners that protrude through the insulation with 1-1/2 inch thick, unfaced, flexible blanket insulation. Cover with glass cloth and coat with vapor barrier finish coating.
 - 4. On circumferential joints, the 2-inch flange on the facing shall be secured with 9/16 inch outward clinch steel staples on 2-inch centers, and taped with minimum 3-inch wide strip of glass fabric and finish coating.
 - 5. Cover seams, joints, pin penetrations and other breaks finish coating reinforced with glass cloth.
- E. Duct Liner (Type D3) application for interior of return air sound boots:
 - 1. Secure insulation with 100 percent coverage of lagging adhesive, pins and clips not more than 18 inches on center.
 - 2. Secure bottom of duct insulation using alternate single and double clips. The first pin will secure the insulation and the second clip will be used to secure the cladding. Isolate the exterior clip from the cladding by using two 1/8 inch closed cell neoprene (Armaflex) washers on either side of the cladding. Predrill holes in cladding and avoid contact with pin during installation.
 - 3. For round duct, secure insulation with 100 percent coverage of lagging adhesive. Secure cladding with 3/4 inch, 0.020 inch stainless steel bands on 12-inch centers.
 - 4. For joints and overlaps, fold cladding to form a double thickness hem 2 inches minimum. Seal with a non-shrink, non-hardening sealing compound.
- F. Insulation (Type D4) application for exterior of grease ducts:
 - 1. External duct wrap system requires two (2) 1.5-inch layers of lightweight, flexible wrap overlapped to provide an effective fire barrier. The barrier is installed in 24-inch or 48-inch wide sections. Insulation pins are welded in certain locations to maintain the fire barrier material up against the duct.
 - 2. Typical installation of a rectangular duct with clean-out/access door and through floor/roof penetrations is as follows:

- a. Insulation Pin Installation: Insulation pins shall be CD welded at various locations on the bottom, sides, and vertical sections of the ducts when the dimensions equal or exceed 18-inch. Pins shall be evenly spaced 8-inch to 12-inch apart from each other and from the bottom or side edges of the duct. To accommodate the overlaps rows of pins shall be spaced on 10.5-inch centers when straight runs of 24-inch wide pieces are being used and 11.25-inch centers when straight runs of 48-inch wide pieces are used. In transition areas (at bends and elbows) and at access door openings additional pins shall be used to assure integrity of the fire barrier.
 - b. The first layer of external duct wrap is composed of bottom and top pieces. The length of the pieces is dictated by the perimeter of the duct with allowances for a 3-inch overlap of the ends and radiuses at the corners. In straight runs, the bottom layers shall be installed so that the edges of the blankets are 18-inch from each other when using 24-inch wide material and 42-inch from each other when using 48-inch wide material. The top piece of the first layer shall be laid over the bottom pieces so that a 3-inch minimum overlap is achieved with the two bottom pieces it contacts. Tape shall be used to hold the pieces in position. A perimeter joint shall be formed where the ends of the blankets meet and overlapped a minimum of 3-inch. These perimeter joints shall be minimum of 3-inch. These perimeter joints shall be staggered at least 12-inch from one another.
 - c. The second layer of external duct wrap shall be composed of bottom and top pieces. Second layer pieces shall be longer than the first layer pieces but installation is the same as the first layer, except that the edges of top wrap are offset from the bottom layer. In the case of 24-inch wide wraps the offset shall be 12-inch and for 48-inch the offset shall be 24-inch. Perimeter joints shall be staggered at least 12-inch from one another on the top piece. Exposed edges of the blankets shall be taped down so that the top piece is bonded to the adjacent bottom piece. The second layer shall be banded with SS bands 1.5-inch from the edges of the top pieces of the second layer. Additional bands shall be spaced 10.5-inch (for 24-inch wide) or 11.25-inch (for 48-inch wide) between the edge bands. Sufficient tension shall be applied to ensure compression between the layers but not to the extent that the insulation cut or the duct itself is distorted.
 - d. Vertical and horizontal members of the support hanger system shall be wrapped with one layer of the insulation. Insulation shall be secured with stainless steel banding on 6-inch to 8-inch centers. Vertical and horizontal portions shall be wrapped independent of one another. The horizontal hanger shall be removed from the vertical support rods and wrapped and then immediately replaced so that an adjacent horizontal support can be removed, wrapped, and reinstalled. The end of the threaded vertical rod shall extend 6-inch past the horizontal member at the beginning of the installation.
3. Insulation for Access Door Installation in Grease Duct:
- a. External duct wrap system around the access door assembly shall be cut to allow for 1.5-inch step joints around the perimeter of the door opening. A door with a 12-inch x 12-inch opening shall have the first layer of external duct wrap cut to a size of 15-inch x 15-inch.
 - b. The second layer of duct wrap should be cut to a size of 18-inch x 18-inch. The exposed edges of these cut layers shall be covered with 2-mil aluminum foil tape. The first steel access door (inner) plate (16 gage or heavier) shall overlap the opening so that a 12-inch x 12-inch opening would require a 14-inch x 14-inch plate.
 - c. Holes shall be installed to accommodate the 6-inch long by 5/16-inch diameter steel all thread studs that are welded to the perimeter of the access door opening (at the corners and 12-inch on centers between corners). This inner steel plate shall be installed after a bead of Nelson CLK Firestop Sealant is applied around the door opening. Nuts shall be tightened to provide a good liquid tight seal between the opening and the inner access door plate.

- d. Three pads of external duct wrap shall be cut to accommodate the stepped joints in the door assembly. The first step joint at 15-inch x 15-inch shall use a pad that has been cut to 15.5-inch x 15.5-inch. The next pad shall have a dimension of 18.5-inch x 18.5-inch. The final pad shall have a dimension of 21-inch x 21-inch. Each of these pads shall be impaled over the threaded studs.
 - e. In the first two layers the joints between the pads and duct wrap shall be equally tight. The third pad shall be placed over the second layer of duct wrap and overlap the edges by 1.5-inch around the perimeter. Second or outer plates will be cut to a size to cover the third pad. The outer plate shall be cut to 21-inch x 21-inch with holes placed in the plate to coincide with the inner plate. The outer plate shall be pushed over the studs and tightened to firmly compress the pads over the inner plate and the third pad against the outer jacket of the external duct wrap system.
4. Penetrations: Where ducts penetrate walls, floors and roofs, duct wrap shall be used in conjunction with Nelson FSP Firestop Putty. The grease duct shall be wrapped with two layers of external duct wrap though the penetration and then the annular space shall be stuffed with loose fiber or loose ceramic fiber bulk. In floor penetrations, a space 1-inch below the top of the floor shall be filled with the Nelson FSP Firestop Putty in such a way that a tight seal is obtained between the putty and the external duct wrap and also between the putty and the floor slab. In wall penetrations, a 1-inch space for the Firestop Putty shall be provided on both sides of the penetration.
- G. Insulation (Type D5) application for outdoor ducts:
- 1. Horizontal ductwork located outdoors shall be sloped at a minimum 2-degree angle to prevent the accumulation of water on top of the finished insulated duct. Support members that connect directly to the ductwork are to be insulated with this same material. Keep compression or sharp creases of outdoor insulation to a minimum by distributing the weight of the duct resting on horizontal duct support members.
 - 2. Follow the insulation manufacturer's installation instructions and procedures to assure the ductwork is properly insulated and that the insulation will meet the manufacturer's warranty requirements.
- H. All ductwork, accessories, and all plenums including metal and masonry construction, etc., shall be insulated as indicated on the Drawings, as specified herein and as required for a complete system. In each case, the insulation shall be equal to that specified and materials applied and finished as described in these Specifications.
- I. Flexible ductwork connections to equipment shall not be insulated.
- J. Where vapor barriers are required, the vapor barrier shall be on the outside. Extreme care shall be taken that the vapor barrier is unbroken. Joints, etc., shall all be sealed. Where insulation with a vapor barrier terminates, it shall be sealed off with the vapor barrier being continuous to the surface being insulated. Ends shall not be left raw.
- K. Extreme care shall be taken in insulating high and medium pressure ductwork including all ductwork between the fan discharge and all mixing boxes to ensure the duct is not pierced with sheet metal screws or other fasteners. All high and medium pressure ducts in these Specifications are classified as high velocity ductwork.
- L. Where canvas finish is specified use lagging adhesive to prevent mildew in securing canvas. Do not use wheat paste. In addition, cover all canvas insulation with a fire retardant coating.
- M. All ductwork in the Project except toilet exhaust and fume hood exhaust ductwork, shall be insulated externally unless specifically excluded.

N. Flexible round ducts shall be factory insulated.

3.03 DUCTWORK INSULATION APPLICATION AND THICKNESS SCHEDULE

Ductwork System	Application	Insulation Type	Insulation Thickness
Supply Air (Hot, Cold, Combination)	Outside of Mechanical Rooms	D1	2"
	Inside of Mechanical Rooms	D2	1-1/2"
Return Air, Relief Air, and Exhaust Air	All	D1	1"
Outside Air	Treated and Untreated	D1	2"
Kitchen Grease Hood Exhaust Air	All	D4	3"
Supply Air Diffusers	Top of Diffuser	D1	2"
Supply Air Duct	Outdoor Environment	D5	2"
Return, Exhaust Air Duct	Outdoor Environment	D5	1-1/2"
Return Air Sound Boots/Elbows	All	D3	1"

END OF SECTION 23 07 13 0007 10 0007 13

SECTION 23 07 13 00A - SYSTEM TESTING, ADJUSTING, AND BALANCING FOR HVAC**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Testing, adjusting, and balancing (TAB) of the air conditioning systems and related ancillary equipment will be performed by a technically qualified TAB Firm.
- B. TAB Firm shall be capable of performing the TAB services as specified in accordance with the Contract Documents, including the preparation and submittal of a detailed report of the actual TAB Work performed.
- C. TAB Firm shall check, adjust, and balance components of the air conditioning system which will result in optimal noise, temperature, and airflow conditions in the conditioned spaces of the building while the system equipment is operating economically and efficiently. This is intended to be accomplished after the system components are installed and operating as specified in the Contract Documents. It is the responsibility of the Contractor to place the equipment into service. Variable air volume systems shall be balanced in accordance with AABC Standard, Latest Edition or NEBB Standards for Testing, Adjusting, Balancing of Environmental Systems (Latest Edition).
- D. TAB Firm shall check, adjust, and balance all hydronic systems including pumps, water distribution systems, chillers, cooling towers, boilers, heat exchangers, coils, and related equipment.
- E. Liaison and Early Field Inspection:
 - 1. TAB Firm shall act as a liaison between The University, Architect and Contractor. TAB Firm shall perform the following reviews (observations) and tests:
 - a. During construction, review all HVAC submittals such as control diagrams, air handling devices, etc., that pertain to the ability to satisfactorily balance systems.
 - b. Test at least one or at least 10 percent of the single and fan-powered terminal units if the number of units are greater than twenty (20), for casing and damper leakage when the shipment arrives at the Project Site. All testing (except for the initial terminal units) shall be performed at the Project Site.
 - c. Test one (1) lab configuration including fume hood with air valve, general exhaust air with air valve and supply air with air valve for performance capability through a full range of inlet pressures. The tracking capability of the exhaust air versus the supply air will be with the submitted hood sash fully open and as the sash is closed in 2 inch increments until fully closed. Track the valves' response time in relation to sash movement and the lab differential.
 - 2. During the balancing process, as the TAB Firm discovers abnormalities and malfunctions of equipment or components, the TAB Firm shall advise the Contractor in writing so that the condition can be corrected by the Contractor prior to finishing the TAB scope of Work. Data from malfunctioning equipment shall not be recorded in the final TAB report.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. AABC - National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems.
 - 2. ASHRAE HVAC Applications Chapter 37: Testing, Adjusting and Balancing.
 - 3. ANSI/ASHRAE Standard 111: Practices for Measurement, Testing, Adjusting and Balancing of Buildings, Heating, Ventilation, Air Conditioning and Refrigeration Systems.
 - 4. CTI - Cooling Technology Institute CODE ATC-105.

1.04 QUALITY ASSURANCE

- A. TAB Firm shall have operated a minimum of five (5) years under TAB Firm's current name and shall be in good standing with the State of Texas, Franchise Tax Board. TAB Firm shall submit full incorporated name, Charter Number, and Taxpayer's I.D. Number for proper verification of TAB Firm's status.
- B. TAB Firm's personnel performing Work at the Project Site shall be either professional engineers or certified air and water balance technicians, who shall have been permanent, full time employees of the TAB Firm for a minimum of six (6) months prior to the start of Work for this Project.
- C. TAB firm shall have a background record of at least five (5) years of specialized experience in the field of air and hydronic system balancing and shall possess properly calibrated instrumentation.

1.05 SUBMITTALS

- A. The activities described in this Section shall culminate in a report to be provided in quadruplicate (4), individually bound and also provided electronically to the Contractor to be presented to The University. Neatly type and arrange data. Include with the data, the dates tested, personnel present, weather conditions, nameplate record of test instrument and list all measurements taken after all corrections are made to the system. Record all failures and corrective action taken to remedy incorrect situation. The intent of the report is to provide a reference of actual operating conditions for The University's operations personnel.
- B. All measurements and recorded readings (of air, water, electricity, etc.) that appear in the report must have been made at the Project Site by the permanently employed technicians or engineers of the TAB Firm.
- C. At The University's option, all data sheets tabulated each day by TAB Firm personnel shall be submitted for review and sign-off by The University's Construction Inspector. Those data sheets, as initialed by Owner's Construction Inspector, shall be presented as a supplement to the final TAB report.
- D. Submit reports on electronic forms approved by The University and Architect/Engineer which will include the following information as a minimum:
 - 1. Title Page:

- a. Company name.
 - b. Company address.
 - c. Company telephone number.
 - d. Project name.
 - e. Project location.
 - f. Project Manager.
 - g. Project Engineer.
 - h. Project Contractor.
 - i. Project identification number.
2. Instrument List:
- a. Instrument.
 - b. Manufacturer.
 - c. Model.
 - d. Serial number.
 - e. Range.
 - f. Calibration date.
 - g. What test instrument was used for.
3. Fan Data (Supply and Exhaust):
- a. Identification and location.
 - b. Manufacturer.
 - c. Model.
 - d. Air flow, specified and actual.
 - e. Total static pressure (total external), specified and actual.
 - f. Inlet pressure.
 - g. Discharge pressure.
 - h. Fan RPM.
4. Air Handler Return Air/Outside Air Data (If fans are used, provide fan data as noted above):
- a. Identification and location.
 - b. Design return air flow.
 - c. Actual return air flow.
 - d. Design outside air flow.

- e. Return air temperature.
 - f. Outside air temperature.
 - g. Required mixed air temperature.
 - h. Actual mixed air temperature.
5. Electric Motors:
- a. Manufacturer.
 - b. Horsepower/brake horsepower.
 - c. Phase, voltage, amperage, nameplate, actual.
 - d. RPM.
 - e. Service factor.
 - f. Starter size, heater elements, rating.
6. V-Belt Drive:
- a. Identification and location.
 - b. Required driven RPM.
 - c. Driven sheave, diameter and RPM, manufacturer & model #.
 - d. Belt, size and quantity.
 - e. Motor sheave, diameter and RPM, manufacturer & model #.
 - f. Center-to-center distance, maximum, minimum and actual.
7. Duct Traverse:
- a. System zone/branch.
 - b. Duct size.
 - c. Area.
 - d. Design velocity.
 - e. Design air flow.
 - f. Test velocity.
 - g. Test air flow.
 - h. Duct static pressure.
 - i. Air temperature.
 - j. Air correction factor.
8. Air Monitoring Station Data:

- a. Identification and location. (equipment ID, manufacturer & model #)
 - b. System.
 - c. Size.
 - d. Area.
 - e. Design velocity.
 - f. Design air flow.
 - g. Test velocity.
 - h. Test air flow.
9. Variable or Constant Volume Terminal Unit Test Sheet:
- a. Identification number.
 - b. Room number/location.
 - c. Terminal type (FP if fan powered) and / or (SDVV, SDCV, DDVV, DDCV), and (HWRH or ERH if reheat coil is used).
 - d. Terminal size.
 - e. Area factor.
 - f. Design velocity.
 - g. Design maximum and minimum air flow.
 - h. Test (final) velocity.
 - i. Test (final) maximum and minimum air flow.
 - j. For DDC instrumentation: Measure and record computer readout and calibration factor at the final measurement conditions.
 - k. Air dry bulb temperature at the discharge of the terminal unit.
10. Pump Data:
- a. Identification and location.
 - b. Manufacturer.
 - c. Size/model.
 - d. Impeller size.
 - e. Service (CTW, CHW, CDW, HW, etc.).
 - f. Developed head pressure and BHP at design flow rate.
 - g. Developed head pressure and BHP at actual flow rate.
 - h. Pump discharge pressure.
 - i. Pump suction pressure.

- j. Total operating head pressure at final balance.
- k. Shut off, discharge and suction pressure.
- l. Shut off, total head pressure.
- m. Pressure differential settings.
- n. Fluid temperature.

11. Cooling Coil Data:

- a. Identification number.
- b. Location.
- c. Service.
- d. Manufacturer.
- e. Entering air DB temperature, design and actual.
- f. Entering air WB temperature, design and actual.
- g. Leaving air DB temperature, design and actual.
- h. Leaving air WB temperature, design and actual.
- i. Water pressure flow, design and actual.
- j. Water pressure drop, design and actual.
- k. Entering water temperature, design and actual.
- l. Leaving water temperature, design and actual.
- m. Air quantity CFM design, and CFM actual.
- n. Air pressure drop, design and actual.
- o. Sensible Btu/hr design, and actual.
- p. Total Btu/hr design, and actual.

12. Heating Coil Data:

- a. Identification number.
- b. Location.
- c. Service.
- d. Manufacturer.
- e. Air flow, design and actual.
- f. Water flow (gpm) or Steam mass flow rate (lbs per hour) design and actual.
- g. Pressure drop water (feet w.g.) or steam (psid), design and actual.

- h. Entering water or steam temperature, design and actual.
- i. Leaving water or steam temperature, design and actual.
- j. Entering air temperature, design and actual.
- k. Leaving air temperature, design and actual.
- l. Air quantity CFM design, and CFM actual.
- m. Air pressure drop, design and actual.
- n. Sensible Btu/hr design, and actual.
- o. Electric heat kW, number of stages, kW per stage – specified and actual (if applicable).

13. Heat Exchanger Data:

- a. Identification and location.
- b. Service.
- c. Manufacturer.
- d. Steam flow rate, design and actual.
- e. Water flow rate, design and actual.
- f. Water pressure drop, design and actual.
- g. Entering steam temperature and pressure, design and actual.
- h. Entering water temperature, design and actual.
- i. Leaving water temperature, design and actual.
- j. Electric heat, full load kW, number of stages, kW per stage – specified and actual (if applicable).

14. Chiller:

- a. Identification and location.
- b. Manufacturer and model number.
- c. Condenser cooling medium (water or air cooled).
- d. Number of compressor types and number of stages.
- e. Chilled water entering and leaving temperature - specified and actual - one hour log.
- f. Condenser water entering and leaving temperature - specified and actual - one hour log.
- g. Evaporator section and condenser section water side pressure drop - specified and actual.
- h. Air cooled condenser entering and leaving dry bulb temperatures.
- i. Compressors full load amperage - specified and actual.
- j. Voltage, phase, and cycle - specified and actual.

- k. Ambient temperature, DB/WB, time of day, and weather conditions at time of test.
- l. Cooler tons, condenser tons, and measured operating kW / ton compared to factory certified performance test data.

15. Cooling Tower:

- a. Identification and location.
- b. Manufacturer.
- c. Model number.
- d. Size and serial number.
- e. Motor horsepower and RPM.
- f. Voltage, phase, hertz.
- g. Full load amps.
- h. Running amps.
- i. Cooling tower water flow rate through the tower.
- j. Cooling water flow rate through the bypass piping.
- k. Air entering and leaving dry bulb and wet bulb temperatures.
- l. Record airflow velocities and rates at the tower air inlets.
- m. Specified and actual tons capacity at design conditions.
- n. Cooling tower water temp entering and leaving.

16. Hot Water Boiler or Steam Boiler:

- a. Identification and location.
- b. Unit manufacturer and model number.
- c. Heating water flow gpm - specified and actual (if applicable).
- d. Steam capacity lbs per hour - specified and actual (if applicable).
- e. Steam temperature and pressure - specified and actual.
- f. MBtuh Input / output - specified and actual.
- g. MBtuh output - specified and actual.
- h. Gas / Fuel oil burner CFH / gpm.
- i. Gas / Fuel oil inlet pressure, in water / psig.
- j. Blower motor horsepower and FLA .
- k. Fire rate - gas, therm. / oil, btu per lbm.
- l. High fire set point(s).

- m. Low fire set point(s).
 - n. NO_x measurement (based on capacity of boiler per the Texas Commission on Environmental Quality). CO₂, CO and O₂.
17. Sound Level Report:
- a. Location (Location established by the Engineer).
 - b. Baseline background NC curve for eight (8) bands – with equipment off.
 - c. Operating NC curve for eight (8) bands – with equipment on.
18. Vibration Test on equipment having 10 horsepower motors or greater:
- a. Location of points:
 - 1) Fan bearing, drive end.
 - 2) Fan bearing, opposite end.
 - 3) Motor bearing, center (if applicable).
 - 4) Motor bearing, drive end.
 - 5) Motor bearing, opposite end.
 - 6) Casing (bottom or top).
 - 7) Casing (side).
 - 8) Duct after flexible connection (discharge outlet).
 - 9) Duct after flexible connection (suction inlet).
 - b. Test readings:
 - 1) Horizontal, velocity and displacement.
 - 2) Vertical, velocity and displacement.
 - 3) Axial, velocity and displacement.
 - c. Normally acceptable readings, velocity and acceleration.
 - d. Unusual conditions at time of test.
 - e. Vibration source (if non-complying).
19. Control verification indicating date performed and any abnormalities identified:
- a. Point Location/Description.
 - b. EMS Readout (Setpoint and Actual).
 - c. Actual Readout.
 - d. Interlocks.
 - e. Safeties:

- 1) VSD Normal Operation.
 - 2) VSD Bypass Operation.
 - f. Alarms.
 - g. Sequences of Operation.
20. Include in the appendix all submittals for air handling units, pumps, fans, heat exchangers, energy recovery units control system, etc.

PART 2 - PRODUCTS

Not used.

PART 3 - EXECUTION

3.01 AIR BALANCE

- A. When systems are installed and ready for operation, the TAB Firm shall perform an air balance for all air systems and record the results. The outside, supply, exhaust and return air volume for each air handling unit, supply fan and exhaust fan and the supply, exhaust or return air volume for each distribution device shall be adjusted to within +/- 5 percent of the value shown on the Drawings. Air handling unit and fan volumes shall be adjusted by changing fan speed and adjusting volume dampers associated with the unit. Air distribution device volume shall be adjusted using the branch damper for flexible duct connected devices and the device opposed blade damper (OBD) for duct connected devices. Air distribution devices shall be balanced with air patterns as specified. Duct volume dampers shall be adjusted to provide air volume to branch ducts where such dampers are shown.
- B. For lab renovations the entire exhaust fan riser shall be balanced.
- C. For all renovations air balance data shall be noted on a set of the mechanical drawings, in addition to the required report, and shall reflect supply air at each diffuser, exhaust at each device and return air device as applicable.
- D. The general scope of balancing by the TAB Firm shall include, but is not limited to, the following:
 1. Filters: Check air filters and filter media and balance only systems with essentially clean filters and filter media. The Contractor shall install new filters and filter media prior to the final air balance.
 2. Blower Speed: Measure RPM at each fan or blower to design requirements. Where a speed adjustment is required, the Contractor shall make any required changes.
 3. Ampere Readings: Measure and record full load amperes for motors.
 4. Static Pressure: Static pressure gains or losses shall be measured across each supply fan, cooling coil, heating coil, return air fan, air handling unit filter and exhaust fan. These readings shall be measured and recorded for this report at the furthest air device or terminal unit from the air handler supplying that device. Static pressure readings shall also be provided for systems, which do not perform as designed.
 5. Equipment Air Flow: Adjust and record exhaust, return, outside and supply air CFM(s) and temperatures, as applicable, at each fan, blower and coil.

6. Coil Temperatures: Set controls for full cooling and for full heating loads. Read and record entering and leaving dry bulb and wet bulb temperatures (cooling only) at each cooling coil, heating coil and reheat coil at each VAV terminal unit. At the time of reading record water flow and entering and leaving water temperatures (In variable flow systems adjust the water flow to design for all the above readings).
7. Zone Air Flow: Adjust each HVAC VAV terminal unit and VAV air handling unit for design CFM.
8. Outlet Air Flow: Adjust each exhaust inlet and supply diffuser, register and grille to within + 5 percent of design air CFM. Include all terminal points of air supply and all points of exhaust. Note: For Labs and rooms that are negative exhaust air flow shall be set to design + 10 percent and supply to design - 5 percent. Positive areas will have opposite tolerances.
9. Pitot Tube Traverses: For use in future troubleshooting by Owner, all exhaust ducts, main supply ducts and return ducts shall have air velocity and volume measured and recorded by the traverse method. Locations of these traverse test stations shall be described on the sheet containing the data.
10. Maximum and minimum air flow on terminal units.

3.02 HYDRONIC SYSTEM BALANCE

- A. When systems are installed and ready for operation, the TAB Firm shall perform water balance for each chilled and heating hot water system.
- B. The general scope of balancing by the TAB Firm shall include, but not be limited to, the following:
 1. Adjusted System Tests: Adjust balancing valves at each coil and heat exchanger for design flow, +/- 5 percent. Adjust balancing valves at pumps to obtain design water flow. Record pressure rise across pumps and GPM flow from pump curve. Permanently mark the balanced position for each valve. (Note: If discharge valves on the pumps are used for balancing record the head being restricted by the valves).
 2. Temperature Readings: Read and record entering and leaving water temperature at each water coil, converter and heat exchanger. Adjust as necessary to design conditions. Provide final readings at all thermometer well locations.
 3. Test cooling towers in accordance with CTI Code ATC – 105.
 4. Pressure Readings: Water pressure shall be recorded at all gauge connections. Pressure readings at coils and pumps shall be related to coil and pump curves in terms of GPM flow through flow measuring status, if provided and installed, at each air handler. The flow of water through all water coils shall be adjusted by manipulating valves until the rated pressure drops across each coil is obtained and total water flow is verified by flow measuring status. For coils equipped with 3-way valves, the rated pressure drop shall first be adjusted through the coils. The bypass valve shall then be adjusted on each coil until an equal pressure drop between supply and return connections is the same as with the flow through the coil.
 5. Ampere Readings: Reading and record full load amperes for each pump motor.

3.03 SOUND VIBRATION AND ALIGNMENT

- A. Sound: Read and record sound levels at up to fifteen (15) locations per floor in the building as designated by the Architect/Engineer. All measurements shall be made using an Octave Band Analyzer. All tests shall be conducted when the building is quiet and in the presence of the Architect/Engineer, at the Architect/Engineer's option.

- B. Vibration: Read and record vibration for all water circulating pumps, air handling units, and fans which have motors larger than 10 horsepower. Include equipment vibration, bearing housing vibration, foundation vibration, building structure vibration, and other tests as approved by the Architect/Engineer. Readings will be made using portable IRD (or approved equal) equipment capable of filtering out various unwanted frequencies and standard reporting forms. Maximum vibration at any point listed above, or specified, shall not exceed one mil on fans and one mil on pumps unless otherwise specified. Equipment manufacturer shall rectify all systems exceeding vibration tolerances.

3.04 BUILDING AUTOMATION SYSTEMS

- A. In the process of performing the TAB Work, the Contractor shall:
1. Work with the Building Automation System (BAS) Provider and Owner to ensure the most effective total system operation within the design limitations, and to obtain mutual understanding of intended control performance.
 2. Verify that all control devices are properly connected.
 3. Verify that the intended controllers operate all dampers, valves and other controlled devices.
 4. Verify that all dampers and valves are in the position indicated by the controller; open, closed, or modulating.
 5. Verify the integrity of valves and dampers in terms of tightness of close-off and full-open positions. This includes all duct-mounted dampers, dampers in terminal units, and fire/smoke dampers.
 6. Observe that all valves are properly installed in the piping system in relation to direction of flow and location.
 7. Observe the calibration and operation of all controllers.
 8. Verify the proper application of all normally opened and normally closed valves.
 9. Observe the locations of all thermostats and humidistats for potential erratic operation from outside influences such as sunlight, drafts, or cold walls.
 10. Observe the locations of all sensors to determine whether their position will allow them to sense only the intended temperatures or pressures of the media. BAS Provider will relocate sensors as deemed necessary by the TAB Firm or Contractor.
 11. Verify that the sequence of operation for any control mode is in accordance with approved Shop Drawings and Specifications. Verify that no demand for simultaneous heating and cooling occurs at the terminal units.
 12. Verify that all controller setpoints meet the Contract Documents.
 13. Check all dampers for free travel.
 14. Verify the operation of all interlock systems.
 15. Perform variable volume system verification to assure the system and system components track with changes from full flow to minimum flow.

3.05 STAIRWELL PRESSURIZATION SYSTEMS

- A. With all doors closed, measure the door pull to determine that the opening force required is less than or no greater than 30 pound-force.

- B. With all doors closed, measure the pressure differential across each door to verify the pressure differentials at each floor. Pressure differential shall not exceed 0.15 inches w.g. and shall be greater than 0.05 inches w.g.
- C. Measure the airflow in the stairwell with the maximum number of doors fully open by pitot tube traverse, if traverse locations are available. If traverse locations are not available, TAB Firm shall measure air flow at each outlet.
- D. Verify with smoke that the smoke detector in the stair pressurization fan inlet shuts down the fan.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 11 23 00 - FACILITY NATURAL-GAS PIPING**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for facility natural gas piping. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Pipes, tubes, and fittings.
 - b. Piping specialties.
 - c. Piping and tubing joining materials.
 - d. Valves.
 - e. Pressure regulators.
 - f. Service meters.
 - g. Mechanical sleeve seals.
 - h. Grout.
 - i. Concrete bases.

C. Definitions

1. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.
2. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.
3. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

D. Performance Requirements

1. Minimum Operating-Pressure Ratings:
 - a. Piping and Valves: 100 psig (690 kPa) minimum unless otherwise indicated.
 - b. Service Regulators: 65 psig (450 kPa) **OR** 100 psig (690 kPa), **as directed**, minimum unless otherwise indicated.
 - c. Minimum Operating Pressure of Service Meter: 5 psig (34.5 kPa) **OR** 10 psig (69 kPa) **OR** 20 psig (138 kPa) **OR** 65 psig (450 kPa), **as directed**.
2. Natural-Gas System Pressure within Buildings: 0.5 psig (3.45 kPa) or less **OR** More than 0.5 psig (3.45 kPa) but not more than 2 psig (13.8 kPa) **OR** More than 2 psig (13.8 kPa) but not more than 5 psig (34.5 kPa), **as directed**.
OR
Natural-Gas System Pressures within Buildings: Two pressure ranges. Primary pressure is more than 0.5 psig (3.45 kPa) but not more than 2 psig (13.8 kPa), and is reduced to secondary pressure of 0.5 psig (3.45 kPa) or less.
OR
Natural-Gas System Pressures within Buildings: Two pressure ranges. Primary pressure is more than 2 psig (13.8 kPa) but not more than 5 psig (34.5 kPa), and is reduced to secondary pressure of more than 0.5 psig (3.45 kPa) but not more than 2 psig (13.8 kPa).
OR
Natural-Gas System Pressures within Buildings: Three pressure ranges. Primary pressure is more than 2 psig (13.8 kPa) but not more than 5 psig (34.5 kPa), and is reduced to secondary pressures of more than 0.5 psig (3.45 kPa) but not more than 2 psig (13.8 kPa), and is reduced again to pressures of 0.5 psig (3.45 kPa) or less.

3. Delegated Design: Design restraints and anchors for natural-gas piping and equipment, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

E. Submittals

1. Product Data: For each type of product indicated.
2. Shop Drawings: For facility natural-gas piping layout. Include plans, piping layout and elevations, sections, and details for fabrication of pipe anchors, hangers, supports for multiple pipes, alignment guides, expansion joints and loops, and attachments of the same to building structure. Detail location of anchors, alignment guides, and expansion joints and loops.
3. Delegated-Design Submittal: For natural-gas piping and equipment indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
 - a. Detail fabrication and assembly of seismic restraints.
 - b. Design Calculations: Calculate requirements for selecting seismic restraints.
4. Welding certificates.
5. Field quality-control reports.
6. Operation and maintenance data.

F. Quality Assurance

1. Steel Support Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.
3. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

G. Delivery, Storage, And Handling

1. Handling Flammable Liquids: Remove and dispose of liquids from existing natural-gas piping according to requirements of authorities having jurisdiction.
2. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.
3. Store and handle pipes and tubes having factory-applied protective coatings to avoid damaging coating, and protect from direct sunlight.
4. Protect stored PE pipes and valves from direct sunlight.

H. Project Conditions

1. Interruption of Existing Natural-Gas Service: Do not interrupt natural-gas service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide purging and startup of natural-gas supply according to requirements indicated:
 - a. Notify Owner no fewer than two days in advance of proposed interruption of natural-gas service.
 - b. Do not proceed with interruption of natural-gas service without Owner's written permission.

1.2 PRODUCTS

A. Pipes, Tubes, And Fittings

1. Steel Pipe: ASTM A 53/A 53M, black steel, Schedule 40, Type E or S, Grade B.
 - a. Malleable-Iron Threaded Fittings: ASME B16.3, Class 150, standard pattern.
 - b. Wrought-Steel Welding Fittings: ASTM A 234/A 234M for butt welding and socket welding.
 - c. Unions: ASME B16.39, Class 150, malleable iron with brass-to-iron seat, ground joint, and threaded ends.

- d. Forged-Steel Flanges and Flanged Fittings: ASME B16.5, minimum Class 150, including bolts, nuts, and gaskets of the following material group, end connections, and facings:
 - 1) Material Group: 1.1.
 - 2) End Connections: Threaded or butt welding to match pipe.
 - 3) Lapped Face: Not permitted underground.
 - 4) Gasket Materials: ASME B16.20, metallic, flat, asbestos free, aluminum o-rings, and spiral-wound metal gaskets.
 - 5) Bolts and Nuts: ASME B18.2.1, carbon steel aboveground and stainless steel underground.
- e. Protective Coating for Underground Piping: Factory-applied, three-layer coating of epoxy, adhesive, and PE.
 - 1) Joint Cover Kits: Epoxy paint, adhesive, and heat-shrink PE sleeves.
- f. Mechanical Couplings:
 - 1) Stainless-steel **OR** Steel, **as directed**, flanges and tube with epoxy finish.
 - 2) Buna-nitrile seals.
 - 3) Stainless-steel **OR** Steel, **as directed**, bolts, washers, and nuts.
 - 4) Coupling shall be capable of joining PE pipe to PE pipe, steel pipe to PE pipe, or steel pipe to steel pipe.
 - 5) Steel body couplings installed underground on plastic pipe shall be factory equipped with anode.
2. Corrugated, Stainless-Steel Tubing: Comply with ANSI/IAS LC 1.
 - a. Tubing: ASTM A 240/A 240M, corrugated, Series 300 stainless steel.
 - b. Coating: PE with flame retardant.
 - 1) Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - a) Flame-Spread Index: 25 or less.
 - b) Smoke-Developed Index: 50 **OR** 450, **as directed**, or less.
 - c. Fittings: Copper-alloy mechanical fittings with ends made to fit and listed for use with corrugated stainless-steel tubing and capable of metal-to-metal seal without gaskets. Include brazing socket or threaded ends complying with ASME B1.20.1.
 - d. Striker Plates: Steel, designed to protect tubing from penetrations.
 - e. Manifolds: Malleable iron or steel with factory-applied protective coating. Threaded connections shall comply with ASME B1.20.1 for pipe inlet and corrugated tubing outlets.
 - f. Operating-Pressure Rating: 5 psig (34.5 kPa).
- B. Piping Specialties
 1. Appliance Flexible Connectors:
 - a. Indoor, Fixed-Appliance Flexible Connectors: Comply with ANSI Z21.24.
 - b. Indoor, Movable-Appliance Flexible Connectors: Comply with ANSI Z21.69.
 - c. Outdoor, Appliance Flexible Connectors: Comply with ANSI Z21.75.
 - d. Corrugated stainless-steel tubing with polymer coating.
 - e. Operating-Pressure Rating: 0.5 psig (3.45 kPa).
 - f. End Fittings: Zinc-coated steel.
 - g. Threaded Ends: Comply with ASME B1.20.1.
 - h. Maximum Length: 72 inches (1830 mm).
 2. Quick-Disconnect Devices: Comply with ANSI Z21.41.
 - a. Copper-alloy convenience outlet and matching plug connector.
 - b. Nitrile seals.
 - c. Hand operated with automatic shutoff when disconnected.
 - d. For indoor or outdoor applications.
 - e. Adjustable, retractable restraining cable.
 3. Y-Pattern Strainers:
 - a. Body: ASTM A 126, Class B, cast iron with bolted cover and bottom drain connection.
 - b. End Connections: Threaded ends for NPS 2 (DN 50) and smaller; flanged ends for NPS 2-1/2 (DN 65) and larger.

- c. Strainer Screen: 40 **OR** 60, **as directed**, -mesh startup strainer, and perforated stainless-steel basket with 50 percent free area.
 - d. CWP Rating: 125 psig (862 kPa).
 - 4. Basket Strainers:
 - a. Body: ASTM A 126, Class B, high-tensile cast iron with bolted cover and bottom drain connection.
 - b. End Connections: Threaded ends for NPS 2 (DN 50) and smaller; flanged ends for NPS 2-1/2 (DN 65) and larger.
 - c. Strainer Screen: 40 **OR** 60, **as directed**, -mesh startup strainer, and perforated stainless-steel basket with 50 percent free area.
 - d. CWP Rating: 125 psig (862 kPa).
 - 5. T-Pattern Strainers:
 - a. Body: Ductile or malleable iron with removable access coupling and end cap for strainer maintenance.
 - b. End Connections: Grooved ends.
 - c. Strainer Screen: 40 **OR** 60, **as directed**, -mesh startup strainer, and perforated stainless-steel basket with 57 percent free area.
 - d. CWP Rating: 750 psig (5170 kPa).
 - 6. Weatherproof Vent Cap: Cast- or malleable-iron increaser fitting with corrosion-resistant wire screen, with free area at least equal to cross-sectional area of connecting pipe and threaded-end connection.
- C. Joining Materials
 - 1. Joint Compound and Tape: Suitable for natural gas.
 - 2. Welding Filler Metals: Comply with AWS D10.12/D10.12M for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.
- D. Manual Gas Shutoff Valves
 - 1. See "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles for where each valve type is applied in various services.
 - 2. General Requirements for Metallic Valves, NPS 2 (DN 50) and Smaller: Comply with ASME B16.33.
 - a. CWP Rating: 125 psig (862 kPa).
 - b. Threaded Ends: Comply with ASME B1.20.1.
 - c. Dryseal Threads on Flare Ends: Comply with ASME B1.20.3.
 - d. Tamperproof Feature: Locking feature for valves indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
 - e. Listing: Listed and labeled by an NRTL acceptable to authorities having jurisdiction for valves 1 inch (25 mm) and smaller.
 - f. Service Mark: Valves 1-1/4 inches (32 mm) to NPS 2 (DN 50) shall have initials "WOG" permanently marked on valve body.
 - 3. General Requirements for Metallic Valves, NPS 2-1/2 (DN 65) and Larger: Comply with ASME B16.38.
 - a. CWP Rating: 125 psig (862 kPa).
 - b. Flanged Ends: Comply with ASME B16.5 for steel flanges.
 - c. Tamperproof Feature: Locking feature for valves indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
 - d. Service Mark: Initials "WOG" shall be permanently marked on valve body.
 - 4. One-Piece, Bronze Ball Valve with Bronze Trim: MSS SP-110.
 - a. Body: Bronze, complying with ASTM B 584.
 - b. Ball: Chrome-plated brass.
 - c. Stem: Bronze; blowout proof.
 - d. Seats: Reinforced TFE; blowout proof.
 - e. Packing: Separate packnut with adjustable-stem packing threaded ends.
 - f. Ends: Threaded, flared, or socket as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
 - g. CWP Rating: 600 psig (4140 kPa).

- h. Listing: Valves NPS 1 (DN 25) and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
 - i. Service: Suitable for natural-gas service with "WOG" indicated on valve body.
5. Two-Piece, Full-Port, Bronze Ball Valves with Bronze Trim: MSS SP-110.
 - a. Body: Bronze, complying with ASTM B 584.
 - b. Ball: Chrome-plated bronze.
 - c. Stem: Bronze; blowout proof.
 - d. Seats: Reinforced TFE; blowout proof.
 - e. Packing: Threaded-body packnut design with adjustable-stem packing.
 - f. Ends: Threaded, flared, or socket as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
 - g. CWP Rating: 600 psig (4140 kPa).
 - h. Listing: Valves NPS 1 (DN 25) and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
 - i. Service: Suitable for natural-gas service with "WOG" indicated on valve body.
6. Two-Piece, Regular-Port Bronze Ball Valves with Bronze Trim: MSS SP-110.
 - a. Body: Bronze, complying with ASTM B 584.
 - b. Ball: Chrome-plated bronze.
 - c. Stem: Bronze; blowout proof.
 - d. Seats: Reinforced TFE.
 - e. Packing: Threaded-body packnut design with adjustable-stem packing.
 - f. Ends: Threaded, flared, or socket as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
 - g. CWP Rating: 600 psig (4140 kPa).
 - h. Listing: Valves NPS 1 (DN 25) and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
 - i. Service: Suitable for natural-gas service with "WOG" indicated on valve body.
7. Bronze Plug Valves: MSS SP-78.
 - a. Body: Bronze, complying with ASTM B 584.
 - b. Plug: Bronze.
 - c. Ends: Threaded, socket, or flanged as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
 - d. Operator: Square head or lug type with tamperproof feature where indicated.
 - e. Pressure Class: 125 psig (862 kPa).
 - f. Listing: Valves NPS 1 (DN 25) and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
 - g. Service: Suitable for natural-gas service with "WOG" indicated on valve body.
8. Cast-Iron, Nonlubricated Plug Valves: MSS SP-78.
 - a. Body: Cast iron, complying with ASTM A 126, Class B.
 - b. Plug: Bronze or nickel-plated cast iron.
 - c. Seat: Coated with thermoplastic.
 - d. Stem Seal: Compatible with natural gas.
 - e. Ends: Threaded or flanged as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
 - f. Operator: Square head or lug type with tamperproof feature where indicated.
 - g. Pressure Class: 125 psig (862 kPa).
 - h. Listing: Valves NPS 1 (DN 25) and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
 - i. Service: Suitable for natural-gas service with "WOG" indicated on valve body.
9. Cast-Iron, Lubricated Plug Valves: MSS SP-78.
 - a. Body: Cast iron, complying with ASTM A 126, Class B.
 - b. Plug: Bronze or nickel-plated cast iron.
 - c. Seat: Coated with thermoplastic.
 - d. Stem Seal: Compatible with natural gas.
 - e. Ends: Threaded or flanged as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
 - f. Operator: Square head or lug type with tamperproof feature where indicated.

- g. Pressure Class: 125 psig (862 kPa).
 - h. Listing: Valves NPS 1 (DN 25) and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
 - i. Service: Suitable for natural-gas service with "WOG" indicated on valve body.
10. Valve Boxes:
- a. Cast-iron, two-section box.
 - b. Top section with cover with "GAS" lettering.
 - c. Bottom section with base to fit over valve and barrel a minimum of 5 inches (125 mm) in diameter.
 - d. Adjustable cast-iron extensions of length required for depth of bury.
 - e. Include tee-handle, steel operating wrench with socket end fitting valve nut or flat head, and with stem of length required to operate valve.

E. Motorized Gas Valves

- 1. Automatic Gas Valves: Comply with ANSI Z21.21.
 - a. Body: Brass.
 - b. Seats and Disc: Nitrile rubber.
 - c. Springs and Valve Trim: Stainless steel.
 - d. Normally closed.
 - e. Visual position indicator.
 - f. Electrical **OR** Mechanical, **as directed**, operator for actuation by appliance automatic shutoff device.
- 2. Electrically Operated Valves: Comply with UL 429.
 - a. Pilot operated.
 - b. Body: Brass.
 - c. Seats and Disc: Nitrile rubber.
 - d. Springs and Valve Trim: Stainless steel.
 - e. 120-V ac, 60 Hz, Class B, continuous-duty molded coil, and replaceable.
 - f. NEMA ICS 6, Type 4, coil enclosure.
 - g. Normally closed.
 - h. Visual position indicator.

F. Pressure Regulators

- 1. General Requirements:
 - a. Single stage and suitable for natural gas.
 - b. Steel jacket and corrosion-resistant components.
 - c. Elevation compensator.
 - d. End Connections: Threaded for regulators NPS 2 (DN 50) and smaller; flanged for regulators NPS 2-1/2 (DN 65) and larger.
- 2. Service Pressure Regulators: Comply with ANSI Z21.80.
 - a. Body and Diaphragm Case: Cast iron or die-cast aluminum.
 - b. Springs: Zinc-plated steel; interchangeable.
 - c. Diaphragm Plate: Zinc-plated steel.
 - d. Seat Disc: Nitrile rubber resistant to gas impurities, abrasion, and deformation at the valve port.
 - e. Orifice: Aluminum; interchangeable.
 - f. Seal Plug: Ultraviolet-stabilized, mineral-filled nylon.
 - g. Single-port, self-contained regulator with orifice no larger than required at maximum pressure inlet, and no pressure sensing piping external to the regulator.
 - h. Pressure regulator shall maintain discharge pressure setting downstream, and not exceed 150 percent of design discharge pressure at shutoff.
 - i. Overpressure Protection Device: Factory mounted on pressure regulator.
 - j. Atmospheric Vent: Factory- or field-installed, stainless-steel screen in opening if not connected to vent piping.
 - k. Maximum Inlet Pressure: 100 psig (690 kPa).
- 3. Line Pressure Regulators: Comply with ANSI Z21.80.
 - a. Body and Diaphragm Case: Cast iron or die-cast aluminum.

- b. Springs: Zinc-plated steel; interchangeable.
 - c. Diaphragm Plate: Zinc-plated steel.
 - d. Seat Disc: Nitrile rubber resistant to gas impurities, abrasion, and deformation at the valve port.
 - e. Orifice: Aluminum; interchangeable.
 - f. Seal Plug: Ultraviolet-stabilized, mineral-filled nylon.
 - g. Single-port, self-contained regulator with orifice no larger than required at maximum pressure inlet, and no pressure sensing piping external to the regulator.
 - h. Pressure regulator shall maintain discharge pressure setting downstream, and not exceed 150 percent of design discharge pressure at shutoff.
 - i. Overpressure Protection Device: Factory mounted on pressure regulator.
 - j. Atmospheric Vent: Factory- or field-installed, stainless-steel screen in opening if not connected to vent piping.
 - k. Maximum Inlet Pressure: 2 psig (13.8 kPa) **OR** 5 psig (34.5 kPa) **OR** 10 psig (69 kPa), **as directed**.
4. Appliance Pressure Regulators: Comply with ANSI Z21.18.
- a. Body and Diaphragm Case: Die-cast aluminum.
 - b. Springs: Zinc-plated steel; interchangeable.
 - c. Diaphragm Plate: Zinc-plated steel.
 - d. Seat Disc: Nitrile rubber.
 - e. Seal Plug: Ultraviolet-stabilized, mineral-filled nylon.
 - f. Factory-Applied Finish: Minimum three-layer polyester and polyurethane paint finish.
 - g. Regulator may include vent limiting device, instead of vent connection, if approved by authorities having jurisdiction.
 - h. Maximum Inlet Pressure: 1 psig (6.9 kPa) **OR** 2 psig (13.8 kPa) **OR** 5 psig (34.5 kPa), **as directed**.

G. Service Meters

- 1. Diaphragm-Type Service Meters: Comply with ANSI B109.1 **OR** ANSI B109.2, **as directed**.
 - a. Case: Die-cast aluminum.
 - b. Connections: Steel threads.
 - c. Diaphragm: Synthetic fabric.
 - d. Diaphragm Support Bearings: Self-lubricating.
 - e. Compensation: Continuous temperature and pressure, **as directed**.
 - f. Meter Index: Cubic feet **OR** Liters **OR** Cubic feet and liters, **as directed**.
 - g. Meter Case and Index: Tamper resistant.
 - h. Remote meter reader compatible.
 - i. Maximum Inlet Pressure: 100 psig (690 kPa).
 - j. Pressure Loss: Maximum 0.5-inch wg (124 Pa) **OR** 2.0-inch wg (498 Pa), **as directed**.
 - k. Accuracy: Maximum plus or minus 1.0 percent.
- 2. Rotary-Type Service Meters: Comply with ANSI B109.3.
 - a. Case: Extruded aluminum.
 - b. Connection: Flange.
 - c. Impellers: Polished aluminum.
 - d. Rotor Bearings: Self-lubricating.
 - e. Compensation: Continuous temperature and pressure, **as directed**.
 - f. Meter Index: Cubic feet **OR** Liters **OR** Cubic feet and liters, **as directed**.
 - g. Tamper resistant.
 - h. Remote meter reader compatible.
 - i. Maximum Inlet Pressure: 100 psig (690 kPa).
 - j. Accuracy: Maximum plus or minus 2.0 percent.
- 3. Turbine Meters: Comply with ASME MFC-4M.
 - a. Housing: Cast iron or welded steel.
 - b. Connection Threads or Flanges: Steel.
 - c. Turbine: Aluminum or plastic.
 - d. Turbine Bearings: Self-lubricating.
 - e. Compensation: Continuous temperature and pressure, **as directed**.

- f. Meter Index: Cubic feet **OR** Liters **OR** Cubic feet and liters, **as directed**.
 - g. Tamper resistant.
 - h. Remote meter reader compatible.
 - i. Maximum Inlet Pressure: 100 psig (690 kPa).
 - j. Accuracy: Maximum plus or minus 2.0 percent.
 - 4. Service-Meter Bars:
 - a. Malleable- or cast-iron frame for supporting service meter.
 - b. Include offset swivel pipes, meter nuts with o-ring seal, and factory- or field-installed dielectric unions.
 - c. Omit meter offset swivel pipes if service-meter bar dimensions match service-meter connections.
 - 5. Service-Meter Bypass Fittings:
 - a. Ferrous, tee, pipe fitting with capped side inlet for temporary natural-gas supply.
 - b. Integral ball-check bypass valve.
- H. Dielectric Fittings
- 1. Dielectric Unions:
 - a. Minimum Operating-Pressure Rating: 150 psig (1034 kPa).
 - b. Combination fitting of copper alloy and ferrous materials.
 - c. Insulating materials suitable for natural gas.
 - d. Combination fitting of copper alloy and ferrous materials with threaded, brazed-joint, plain, or welded end connections that match piping system materials.
 - 2. Dielectric Flanges:
 - a. Minimum Operating-Pressure Rating: 150 psig (1034 kPa).
 - b. Combination fitting of copper alloy and ferrous materials.
 - c. Insulating materials suitable for natural gas.
 - d. Combination fitting of copper alloy and ferrous materials with threaded, brazed-joint, plain, or welded end connections that match piping system materials.
 - 3. Dielectric-Flange Kits:
 - a. Minimum Operating-Pressure Rating: 150 psig (1034 kPa).
 - b. Companion-flange assembly for field assembly.
 - c. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or PE bolt sleeves, phenolic washers, and steel backing washers.
 - d. Insulating materials suitable for natural gas.
 - e. Combination fitting of copper alloy and ferrous materials with threaded, brazed-joint, plain, or welded end connections that match piping system materials.
- I. Sleeves
- 1. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends.
 - 2. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.
- J. Mechanical Sleeve Seals
- 1. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
 - a. Sealing Elements: EPDM **OR** NBR, **as directed**, interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe and sleeve.
 - b. Pressure Plates: Plastic **OR** Carbon steel **OR** Stainless steel, **as directed**.
 - c. Connecting Bolts and Nuts: Carbon steel with corrosion-resistant coating **OR** Stainless steel, **as directed**, of length required to secure pressure plates to sealing elements. Include one nut and bolt for each sealing element.
- K. Escutcheons
- 1. General Requirements for Escutcheons: Manufactured wall and ceiling escutcheons and floor plates, with ID to fit around pipe or tube, and OD that completely covers opening.

2. One-Piece, Deep-Pattern Escutcheons: Deep-drawn, box-shaped brass with polished chrome-plated finish.
3. One-Piece, Cast-Brass Escutcheons: With set screw.
 - a. Finish: Polished chrome-plated **OR** Rough brass, **as directed**.
4. Split-Casting, Cast-Brass Escutcheons: With concealed hinge and set screw.
 - a. Finish: Polished chrome-plated **OR** Rough brass, **as directed**.
5. One-Piece, Stamped-Steel Escutcheons: With set screw **OR** spring clips, **as directed**, and chrome-plated finish.
6. Split-Plate, Stamped-Steel Escutcheons: With concealed **OR** exposed-rivet, **as directed**, hinge, set screw **OR** spring clips, **as directed**, and chrome-plated finish.
7. One-Piece, Floor-Plate Escutcheons: Cast-iron floor plate.
8. Split-Casting, Floor-Plate Escutcheons: Cast brass with concealed hinge and set screw.

L. Grout

1. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
 - a. Characteristics: Post-hardening, volume adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
 - b. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.
 - c. Packaging: Premixed and factory packaged.

M. Labeling And Identifying

1. Detectable Warning Tape: Acid- and alkali-resistant, PE film warning tape manufactured for marking and identifying underground utilities, a minimum of 6 inches (150 mm) wide and 4 mils (0.1 mm) thick, continuously inscribed with a description of utility, with metallic core encased in a protective jacket for corrosion protection, detectable by metal detector when tape is buried up to 30 inches (750 mm) deep; colored yellow.

1.3 EXECUTION

A. Preparation

1. Close equipment shutoff valves before turning off natural gas to premises or piping section.
2. Inspect natural-gas piping according to NFPA 54 **OR** the International Fuel Gas Code, **as directed**, to determine that natural-gas utilization devices are turned off in piping section affected.
3. Comply with NFPA 54 **OR** the International Fuel Gas Code, **as directed**, requirements for prevention of accidental ignition.

B. Outdoor Piping Installation

1. Comply with NFPA 54 **OR** the International Fuel Gas Code, **as directed**, for installation and purging of natural-gas piping.
2. Install underground, natural-gas piping buried at least 36 inches (900 mm) below finished grade. Comply with requirements in Division 31 Section "Earth Moving" for excavating, trenching, and backfilling.
 - a. If natural-gas piping is installed less than 36 inches (900 mm) below finished grade, install it in containment conduit.
3. Install underground, PE, natural-gas piping according to ASTM D 2774.
4. Steel Piping with Protective Coating:
 - a. Apply joint cover kits to pipe after joining to cover, seal, and protect joints.
 - b. Repair damage to PE coating on pipe as recommended in writing by protective coating manufacturer.
OR
Replace pipe having damaged PE coating with new pipe.
5. Copper Tubing with Protective Coating:
 - a. Apply joint cover kits over tubing to cover, seal, and protect joints.
 - b. Repair damage to PE coating on pipe as recommended in writing by protective coating manufacturer.

6. Install fittings for changes in direction and branch connections.
7. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch (25-mm) annular clear space between pipe and sleeve for installing mechanical sleeve seals.
 - a. Install steel pipe for sleeves smaller than 6 inches (150 mm) in diameter.
 - b. Install cast-iron "wall pipes" for sleeves 6 inches (150 mm) and larger in diameter.
8. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch (25-mm) annular clear space between pipe and sleeve for installing mechanical sleeve seals.
9. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
10. Install pressure gage downstream **OR** upstream and downstream, **as directed**, from each service regulator. Pressure gages are specified in Division 23 Section "Meters And Gages For Hvac Piping".

C. Indoor Piping Installation

1. Comply with NFPA 54 **OR** the International Fuel Gas Code, **as directed**, for installation and purging of natural-gas piping.
2. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
3. Arrange for pipe spaces, chases, slots, sleeves, and openings in building structure during progress of construction, to allow for mechanical installations.
4. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.
5. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
6. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
7. Locate valves for easy access.
8. Install natural-gas piping at uniform grade of 2 percent down toward drip and sediment traps.
9. Install piping free of sags and bends.
10. Install fittings for changes in direction and branch connections.
11. Install escutcheons at penetrations of interior walls, ceilings, and floors.
 - a. New Piping:
 - 1) Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
 - 2) Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
OR
Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, stamped-steel type.
 - 3) Piping at Ceiling Penetrations in Finished Spaces: One-piece **OR** Split-casting, **as directed**, cast-brass type with polished chrome-plated finish.
OR
Piping at Ceiling Penetrations in Finished Spaces: One-piece, stamped-steel type **OR** Split-plate, stamped-steel type with concealed hinge, **as directed**, and set screw.
 - 4) Piping in Unfinished Service Spaces: One-piece, cast-brass type with polished chrome-plated **OR** rough-brass, **as directed**, finish.
OR
Piping in Unfinished Service Spaces: One-piece, stamped-steel type with set screw **OR** spring clips, **as directed**.
 - 5) Piping in Equipment Rooms: One-piece, cast-brass type.

- Piping in Equipment Rooms: One-piece, stamped-steel type with set screw **OR** spring clips, **as directed**.
 - 6) Piping at Floor Penetrations in Equipment Rooms: One-piece, floor-plate type.
- b. Existing Piping:
 - 1) Piping at Wall and Floor Penetrations in Finished Spaces: Split-casting, cast-brass type with chrome-plated finish.
OR
Piping at Wall and Floor Penetrations in Finished Spaces: Split-plate, stamped-steel type with concealed hinge and spring clips.
 - 2) Piping at Ceiling Penetrations in Finished Spaces: Split-casting, cast-brass type with chrome-plated finish.
OR
Piping at Ceiling Penetrations in Finished Spaces: Split-plate, stamped-steel type with concealed hinge and set screw.
 - 3) Piping in Unfinished Service Spaces: Split-casting, cast-brass type with polished chrome-plated **OR** rough-brass, **as directed**, finish.
OR
Piping in Unfinished Service Spaces: Split-plate, stamped-steel type with concealed **OR** exposed-rivet, **as directed**, hinge and set screw or spring clips.
 - 4) Piping in Equipment Rooms: Split-casting, cast-brass type.
OR
Piping in Equipment Rooms: Split-plate, stamped-steel type with set screw or spring clips.
 - 5) Piping at Floor Penetrations in Equipment Rooms: Split-casting, floor-plate type.
- 12. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements in Division 07 Section "Penetration Firestopping".
- 13. Verify final equipment locations for roughing-in.
- 14. Comply with requirements in Sections specifying gas-fired appliances and equipment for roughing-in requirements.
- 15. Drips and Sediment Traps: Install drips at points where condensate may collect, including service-meter outlets. Locate where accessible to permit cleaning and emptying. Do not install where condensate is subject to freezing.
 - a. Construct drips and sediment traps using tee fitting with bottom outlet plugged or capped. Use nipple a minimum length of 3 pipe diameters, but not less than 3 inches (75 mm) long and same size as connected pipe. Install with space below bottom of drip to remove plug or cap.
- 16. Extend relief vent connections for service regulators, line regulators, and overpressure protection devices to outdoors and terminate with weatherproof vent cap.
- 17. Conceal pipe installations in walls, pipe spaces, utility spaces, above ceilings, below grade or floors, and in floor channels unless indicated to be exposed to view.
- 18. Concealed Location Installations: Except as specified below, install concealed natural-gas piping and piping installed under the building in containment conduit constructed of steel pipe with welded joints as described in Part 2. Install a vent pipe from containment conduit to outdoors and terminate with weatherproof vent cap.
 - a. Above Accessible Ceilings: Natural-gas piping, fittings, valves, and regulators may be installed in accessible spaces without containment conduit.
 - b. In Floors: Install natural-gas piping with welded or brazed joints and protective coating in cast-in-place concrete floors. Cover piping to be cast in concrete slabs with minimum of 1-1/2 inches (38 mm) of concrete. Piping may not be in physical contact with other metallic structures such as reinforcing rods or electrically neutral conductors. Do not embed piping in concrete slabs containing quick-set additives or cinder aggregate.
 - c. In Floor Channels: Install natural-gas piping in floor channels. Channels must have cover and be open to space above cover for ventilation.
 - d. In Walls or Partitions: Protect tubing installed inside partitions or hollow walls from physical damage using steel striker barriers at rigid supports.

- 1) Exception: Tubing passing through partitions or walls does not require striker barriers.
 - e. Prohibited Locations:
 - 1) Do not install natural-gas piping in or through circulating air ducts, clothes or trash chutes, chimneys or gas vents (flues), ventilating ducts, or dumbwaiter or elevator shafts.
 - 2) Do not install natural-gas piping in solid walls or partitions.
 19. Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.
 20. Connect branch piping from top or side of horizontal piping.
 21. Install unions in pipes NPS 2 (DN 50) and smaller, adjacent to each valve, at final connection to each piece of equipment. Unions are not required at flanged connections.
 22. Do not use natural-gas piping as grounding electrode.
 23. Install strainer on inlet of each line-pressure regulator and automatic or electrically operated valve.
 24. Install pressure gage downstream **OR** upstream and downstream, **as directed**, from each line regulator. Pressure gages are specified in Division 23 Section "Meters And Gages For Hvac Piping".
- D. Service-Meter Assembly Installation
1. Install service-meter assemblies aboveground, on concrete bases.
 2. Install metal shutoff valves upstream from service regulators. Shutoff valves are not required at second regulators if two regulators are installed in series.
 3. Install strainer on inlet of service-pressure regulator and meter set.
 4. Install service regulators mounted outside with vent outlet horizontal or facing down. Install screen in vent outlet if not integral with service regulator.
 5. Install metal shutoff valves upstream from service meters. Install dielectric fittings downstream from service meters.
 6. Install service meters downstream from pressure regulators.
 7. Install metal bollards to protect meter assemblies. Comply with requirements in Division 05 Section "Metal Fabrications" for pipe bollards.
- E. Valve Installation
1. Install manual gas shutoff valve for each gas appliance ahead of corrugated stainless-steel tubing, aluminum, or copper connector.
 2. Install underground valves with valve boxes.
 3. Install regulators and overpressure protection devices with maintenance access space adequate for servicing and testing.
 4. Install earthquake valves aboveground outside buildings according to listing.
 5. Install anode for metallic valves in underground PE piping.
- F. Piping Joint Construction
1. Ream ends of pipes and tubes and remove burrs.
 2. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
 3. Threaded Joints:
 - a. Thread pipe with tapered pipe threads complying with ASME B1.20.1.
 - b. Cut threads full and clean using sharp dies.
 - c. Ream threaded pipe ends to remove burrs and restore full inside diameter of pipe.
 - d. Apply appropriate tape or thread compound to external pipe threads unless dryseal threading is specified.
 - e. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
 4. Welded Joints:
 - a. Construct joints according to AWS D10.12/D10.12M, using qualified processes and welding operators.
 - b. Bevel plain ends of steel pipe.

- c. Patch factory-applied protective coating as recommended by manufacturer at field welds and where damage to coating occurs during construction.
 5. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter.
 6. Flanged Joints: Install gasket material, size, type, and thickness appropriate for natural-gas service. Install gasket concentrically positioned.
 7. Flared Joints: Cut tubing with roll cutting tool. Flare tube end with tool to result in flare dimensions complying with SAE J513. Tighten finger tight, then use wrench. Do not overtighten.
 8. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D 2657.
 - a. Plain-End Pipe and Fittings: Use butt fusion.
 - b. Plain-End Pipe and Socket Fittings: Use socket fusion.
- G. Hanger And Support Installation
 1. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices specified in Division 23 Section "Vibration And Seismic Controls For Hvac Piping And Equipment".
 2. Comply with requirements for pipe hangers and supports specified in Division 23 Section "Hangers And Supports For Hvac Piping And Equipment".
 3. Install hangers for horizontal steel piping with the following maximum spacing and minimum rod sizes:
 - a. NPS 1 (DN 25) and Smaller: Maximum span, 96 inches (2438 mm); minimum rod size, 3/8 inch (10 mm).
 - b. NPS 1-1/4 (DN 32): Maximum span, 108 inches (2743 mm); minimum rod size, 3/8 inch (10 mm).
 - c. NPS 1-1/2 and NPS 2 (DN 40 and DN 50): Maximum span, 108 inches (2743 mm); minimum rod size, 3/8 inch (10 mm).
 - d. NPS 2-1/2 to NPS 3-1/2 (DN 65 to DN 90): Maximum span, 10 feet (3 m); minimum rod size, 1/2 inch (13 mm).
 - e. NPS 4 (DN 100) and Larger: Maximum span, 10 feet (3 m); minimum rod size, 5/8 inch (15.8 mm).
 4. Install hangers for horizontal drawn-temper copper tubing with the following maximum spacing and minimum rod sizes:
 - a. NPS 3/8 (DN 10): Maximum span, 48 inches (1220 mm); minimum rod size, 3/8 inch (10 mm).
 - b. NPS 1/2 and NPS 5/8 (DN 15 and DN 18): Maximum span, 72 inches (1830 mm); minimum rod size, 3/8 inch (10 mm).
 - c. NPS 3/4 and NPS 7/8 (DN 20 and DN 22): Maximum span, 84 inches (2134 mm); minimum rod size, 3/8 inch (10 mm).
 - d. NPS 1 (DN 25): Maximum span, 96 inches (2440 mm); minimum rod size, 3/8 inch (10 mm).
 5. Install hangers for horizontal, corrugated stainless-steel tubing with the following maximum spacing and minimum rod sizes:
 - a. NPS 3/8 (DN 10): Maximum span, 48 inches (1220 mm); minimum rod size, 3/8 inch (10 mm).
 - b. NPS 1/2 (DN 15): Maximum span, 72 inches (1830 mm); minimum rod size, 3/8 inch (10 mm).
 - c. NPS 3/4 (DN 20) and Larger: Maximum span, 96 inches (2440 mm); minimum rod size, 3/8 inch (10 mm).
- H. Connections
 1. Connect to utility's gas main according to utility's procedures and requirements.
 2. Install natural-gas piping electrically continuous, and bonded to gas appliance equipment grounding conductor of the circuit powering the appliance according to NFPA 70.
 3. Install piping adjacent to appliances to allow service and maintenance of appliances.

4. Connect piping to appliances using manual gas shutoff valves and unions. Install valve within 72 inches (1800 mm) of each gas-fired appliance and equipment. Install union between valve and appliances or equipment.
5. Sediment Traps: Install tee fitting with capped nipple in bottom to form drip, as close as practical to inlet of each appliance.

I. Labeling And Identifying

1. Comply with requirements in Division 23 Section "Identification For Hvac Piping And Equipment" for piping and valve identification.

OR

Install detectable warning tape directly above gas piping, 12 inches (300 mm) below finished grade, except 6 inches (150 mm) below subgrade under pavements and slabs.

J. Painting

1. Comply with requirements in Division 07 for painting interior and exterior natural-gas piping.
2. Paint exposed, exterior metal piping, valves, service regulators, service meters and meter bars, earthquake valves, and piping specialties, except components, with factory-applied paint or protective coating.
 - a. Alkyd System: MPI EXT 5.1D.
 - 1) Prime Coat: Alkyd anticorrosive metal primer.
 - 2) Intermediate Coat (for a Premium Grade system): Exterior alkyd enamel matching topcoat.
 - 3) Topcoat: Exterior alkyd enamel (flat) **OR** (semigloss) **OR** (gloss), **as directed**.
 - 4) Color: Gray, **unless directed otherwise**.
3. Paint exposed, interior metal piping, valves, service regulators, service meters and meter bars, earthquake valves, and piping specialties, except components, with factory-applied paint or protective coating.
 - a. Latex Over Alkyd Primer System: MPI INT 5.1Q.
 - 1) Prime Coat: Alkyd anticorrosive **OR** Quick-drying alkyd, **as directed**, metal primer.
 - 2) Intermediate Coat (for a Premium Grade system): Interior latex matching topcoat.
 - 3) Topcoat: Interior latex (flat) **OR** (low sheen) **OR** (eggshell) **OR** (satin) **OR** (semigloss) **OR** (gloss), **as directed**.
 - 4) Color: Gray, **unless directed otherwise**.
 - b. Alkyd System: MPI INT 5.1E.
 - 1) Prime Coat: Alkyd anticorrosive **OR** Quick-drying alkyd, **as directed**, metal primer.
 - 2) Intermediate Coat (for a Premium Grade system): Interior alkyd matching topcoat.
 - 3) Topcoat: Interior alkyd (flat) **OR** (eggshell) **OR** (semigloss) **OR** (gloss), **as directed**.
 - 4) Color: Gray, **unless directed otherwise**.
4. Damage and Touchup: Repair marred and damaged factory-applied finishes with materials and by procedures to match original factory finish.

K. Concrete Bases

1. Concrete Bases: Anchor equipment to concrete base according to seismic codes at Project.
 - a. Construct concrete bases of dimensions indicated, but not less than 4 inches (100 mm) larger in both directions than supported unit.
 - b. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of the base.
 - c. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
 - d. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - e. Install anchor bolts to elevations required for proper attachment to supported equipment.
 - f. Use 3000-psig (20.7-MPa), **unless directed otherwise**, 28-day, compressive-strength concrete and reinforcement as specified in Division 03 Section "Cast-in-place Concrete".

L. Field Quality Control

1. Perform tests and inspections.
2. Tests and Inspections:
 - a. Test, inspect, and purge natural gas according to NFPA 54 **OR** the International Fuel Gas Code, **as directed**, and authorities having jurisdiction.
3. Natural-gas piping will be considered defective if it does not pass tests and inspections.
4. Prepare test and inspection reports.

M. Outdoor Piping Schedule

1. Underground natural-gas piping shall be one of the following:
 - a. PE pipe and fittings joined by heat fusion, or mechanical couplings; service-line risers with tracer wire terminated in an accessible location.
 - b. Steel pipe with wrought-steel fittings and welded joints, or mechanical couplings. Coat pipe and fittings with protective coating for steel piping.
 - c. Annealed **OR** Drawn, **as directed**,-temper copper tube with wrought-copper fittings and brazed joints. Coat pipe and fittings with protective coating for copper tubing.
2. Aboveground natural-gas piping shall be one of the following:
 - a. Steel pipe with malleable-iron fittings and threaded joints.
 - b. Steel pipe with wrought-steel fittings and welded joints.
 - c. Annealed **OR** Drawn, **as directed**,-temper copper tube with wrought-copper fittings and brazed joints.
3. Branch Piping in Cast-in-Place Concrete to Single Appliance: Annealed-temper copper tube with wrought-copper fittings and brazed **OR** flared, **as directed**, joints. Install piping embedded in concrete with no joints in concrete.
4. Containment Conduit: Steel pipe with wrought-steel fittings and welded joints. Coat pipe and fittings with protective coating for steel piping.

N. Indoor Piping Schedule For System Pressures Less Than 0.5 psig (3.45 kPa)

1. Aboveground, branch piping NPS 1 (DN 25) and smaller shall be one of the following:
 - a. Corrugated stainless-steel tubing with mechanical fittings having socket or threaded ends to match adjacent piping.
 - b. Annealed-temper, tin-lined copper tube with flared joints and fittings.
 - c. Annealed-temper, copper tube with wrought-copper fittings and brazed **OR** flared, **as directed**, joints.
 - d. Aluminum tube with flared fittings and joints.
 - e. Steel pipe with malleable-iron fittings and threaded joints.
2. Aboveground, distribution piping shall be one of the following:
 - a. Steel pipe with malleable-iron fittings and threaded joints.
 - b. Steel pipe with wrought-steel fittings and welded joints.
 - c. Drawn-temper copper tube with wrought-copper fittings and brazed joints.
3. Underground, below building, piping shall be one of the following:
 - a. Steel pipe with malleable-iron fittings and threaded joints.
 - b. Steel pipe with wrought-steel fittings and welded joints.
4. Containment Conduit: Steel pipe with wrought-steel fittings and welded joints. Coat pipe and fittings with protective coating for steel piping.
5. Containment Conduit Vent Piping: Steel pipe with malleable-iron fittings and threaded or wrought-steel fittings with welded joints. Coat underground pipe and fittings with protective coating for steel piping.

O. Indoor Piping Schedule For System Pressures More Than 0.5 psig (3.45 kPa) And Less Than 5 psig (34.5 kPa)

1. Aboveground, branch piping NPS 1 (DN 25) and smaller shall be one of the following:
 - a. Corrugated stainless-steel tubing with mechanical fittings having socket or threaded ends to match adjacent piping.
 - b. Annealed-temper, tin-lined copper tube with flared joints and fittings.
 - c. Annealed-temper, copper tube with wrought-copper fittings and brazed **OR** flared, **as directed**, joints.

- d. Aluminum tube with flared fittings and joints.
 - e. Steel pipe with malleable-iron fittings and threaded joints.
 - 2. Aboveground, distribution piping shall be one of the following:
 - a. Steel pipe with malleable-iron fittings and threaded joints.
 - b. Steel pipe with steel welding fittings and welded joints.
 - c. Drawn-temper copper tube with wrought-copper fittings and brazed joints.
 - 3. Underground, below building, piping shall be one of the following:
 - a. Steel pipe with malleable-iron fittings and threaded joints.
 - b. Steel pipe with wrought-steel fittings and welded joints.
 - 4. Containment Conduit: Steel pipe with wrought-steel fittings and welded joints. Coat underground pipe and fittings with protective coating for steel piping.
 - 5. Containment Conduit Vent Piping: Steel pipe with malleable-iron fittings and threaded or wrought-steel fittings with welded joints. Coat underground pipe and fittings with protective coating for steel piping.
- P. Indoor Piping Schedule For System Pressures More Than 5 psig (34.5 kPa)
 - 1. Aboveground Piping: Maximum operating pressure more than 5 psig (34.5 kPa).
 - 2. Aboveground, Branch Piping: Steel pipe with steel welding fittings and welded joints.
 - 3. Aboveground, distribution piping shall be one of the following:
 - a. Steel pipe with steel welding fittings and welded joints.
 - b. Drawn-temper copper tube with wrought-copper fittings and brazed joints.
 - 4. Underground, below building, piping shall be one of the following:
 - a. Steel pipe with malleable-iron fittings and threaded joints.
 - b. Steel pipe with wrought-steel fittings and welded joints.
 - 5. Containment Conduit: Steel pipe with wrought-steel fittings and welded joints. Coat pipe and fittings with protective coating for steel piping.
 - 6. Containment Conduit Vent Piping: Steel pipe with malleable-iron fittings and threaded or wrought-steel fittings with welded joints. Coat underground pipe and fittings with protective coating for steel piping.
- Q. Underground Manual Gas Shutoff Valve Schedule
 - 1. Connections to Existing Gas Piping: Use valve and fitting assemblies made for tapping utility's gas mains and listed by an NRTL.
 - 2. Underground:
 - a. PE valves.
 - b. NPS 2 (DN 50) and Smaller: Bronze plug valves.
 - c. NPS 2-1/2 (DN 65) and Larger: Cast-iron, lubricated **OR** nonlubricated, **as directed**, plug valves.
- R. Aboveground Manual Gas Shutoff Valve Schedule
 - 1. Valves for pipe sizes NPS 2 (DN 50) and smaller at service meter shall be one of the following:
 - a. One-piece, bronze ball valve with bronze trim.
 - b. Two-piece, full **OR** regular, **as directed**, -port, bronze ball valves with bronze trim.
 - c. Bronze plug valve.
 - 2. Valves for pipe sizes NPS 2-1/2 (DN 65) and larger at service meter shall be one of the following:
 - a. Two-piece, full **OR** regular, **as directed**, -port, bronze ball valves with bronze trim.
 - b. Bronze plug valve.
 - c. Cast-iron, nonlubricated plug valve.
 - 3. Distribution piping valves for pipe sizes NPS 2 (DN 50) and smaller shall be one of the following:
 - a. One-piece, bronze ball valve with bronze trim.
 - b. Two-piece, full **OR** regular, **as directed**, -port, bronze ball valves with bronze trim.
 - c. Bronze plug valve.
 - 4. Distribution piping valves for pipe sizes NPS 2-1/2 (DN 65) and larger shall be one of the following:
 - a. Two-piece, full **OR** regular, **as directed**, -port, bronze ball valves with bronze trim.
 - b. Bronze plug valve.
 - c. Cast-iron, nonlubricated **OR** lubricated, **as directed**, plug valve.

5. Valves in branch piping for single appliance shall be one of the following:
 - a. One-piece, bronze ball valve with bronze trim.
 - b. Two-piece, full **OR** regular, **as directed**, -port, bronze ball valves with bronze trim.
 - c. Bronze plug valve.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 21 13 00 - HYDRONIC PIPING**PART 1 GENERAL**

1.00 The following sections are to be included as if written herein:

- A. Section 20 01 00 00 – Basic Fire Suppression, Plumbing, and HVAC Requirements
- B. Section 20 05 20 00 – Supports and Sleeves
- C. Section 20 05 50 00 – Piping and Equipment Identification

1.01 WORK INCLUDED

- A. Pipe and Pipe Fittings
- B. Valves
- C. Heating Water Piping System
- D. Chilled Water Piping System
- E. Condenser Water Piping System

1.02 SCOPE OF WORK: Furnish and install all labor, materials, equipment, tools and services and perform all operations required in connection with, or properly incidental to, the construction of complete HVAC piping and accessories systems as indicated on the Drawings, reasonably implied there from, or as specified herein unless specifically excluded.

1.03 RELATED WORK

- A. Section 08 31 13 - Access Doors
- B. Section 09 91 00 - Painting
- C. Section 23 21 00 00A – Hydronic Specialties
- D. Section 20 05 10 00 – Piping Expansion Compensation
- E. Section 21 05 40 00 - Vibration Isolation
- G. Section 23 07 10 00 - Piping Insulation
- H. Section 23 21 10 00a - Hydronic Specialties

BB. ASTM F477 - Elastomeric Seals (Gaskets) for Joining Plastic Pipe

1.05 REGULATORY REQUIREMENTS

A. Conform to ANSI/ASME B31.9

1.06 QUALITY ASSURANCE

A. Valves: Manufacturer's name and pressure rating marked on valve body.

B. Welding Materials and Procedures: Conform to ANSI/ASME SEC. 9, and applicable state labor regulations.

C. Welders Certification: In accordance with ANSI/AWS D1.1.

1.07 SUBMITTALS

A. Submit product data under provisions of Section 23 00 00.

B. Include data on pipe materials, pipe fittings, valves, and accessories.

C. Include welder's certification of compliance with ANSI/AWS D1.1.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to site under provisions of Section 23 00 00.

B. Store and protect products under provisions of Section 23 00 00.

C. Deliver and store valves in shipping containers with labeling in place.

PART 2 PRODUCTS

2.01 WALL, FLOOR AND CEILING PLATES:

A. See Section 20 01 00 00.

2.02 SLEEVES, INSERTS, AND FASTENINGS:

A. See Section 23 05 29.

2.03 UNDERGROUND PIPING (Including Chilled Water):

A. See Section 23 21 10 00a Hydronic specialties

1. Piping: Factory Pre-insulated Underground Piping.

2. Valves: Class 150.

3. Fittings: Class 150.

4. Strainers and suction diffusers: Class 150

5. Unions: Class 300.

6. Flanges: Weld neck Class 150.

2.05 CHILLED/HEATING WATER PIPING - ABOVE GROUND:

A. See Section 23 21 10 00a.

1. All piping shall be Standard Weight-black steel pipe.

2. All unions: Class 300.

3. Low Zone (0' to 150' elevation)

a. Fittings on piping 2-1/2" and larger shall be standard weight butt welding type. Flanges shall be 150# welding neck type. Standard weight Weld-O-Lets, Thread-O-Lets, and shaped nipples may be used only when take-off is 1/3 or less nominal size of main. Bushings shall not be used.

b. Fittings on piping 2" and smaller shall be Class 150 black malleable iron screw fittings. (Class 300 for unions.)

c. Valves and strainers: Class 150.

4. High Zone (150' + elevation)

a. All fittings to be Class 300, welded construction.

b. Valves and strainers: Class 300.

5. Alternate:

a. For chilled water piping 2" and smaller: Copper tubing type L is permitted.

2.06 CONDENSING WATER:

A. See Section 23 21 10 00a

1. Piping: Schedule 40 black steel.

2. Valves: Class 150.

3. Fittings: Class 150.

4. Strainers and suction diffusers: Class 150 - See Section 23 06 20.13.

5. Unions: Class 300.

6. Flanges: Weld neck Class 150.

2.07 HEATING HOT WATER - SECONDARY:

- A. See Section 23 21 10 00a.
 - 1. Piping: Standard Weight black steel.
 - 2. Valves: Class 150.
 - 3. Fittings: Class 150.
 - 4. Strainers and suction diffusers: Class 150 - See Section 23 06 20.13.
 - 5. Unions: Class 300.
 - 6. Flanges: Weld neck Class 150.

2.08 EQUIPMENT DRAIN PIPING:

- A. All factory fabricated or field erected air conditioning units with drain pans, all centrifugal water pumps and all other items or equipment or apparatus that require drains shall be connected with drain line run with adequate slope to a floor drain or other point of discharge as shown on the Drawings. On A.C. units the drain line shall include a properly sized water-sealed trap.
- B. All drain piping shall be one inch (1") size minimum or larger as may be indicated on the Drawings. Such piping shall be Type L hard copper tube. The drain piping shall be assembled with adapter tees at each change in direction. Install screw plugs in unused openings for access to rod and clean.

PART 3 EXECUTION**3.01 PREPARATION**

- A. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.
- B. Remove scale and dirt on inside and outside before assembly.
- C. Prepare piping connections to equipment with flanges or unions.
- D. After completion, fill, clean, and treat systems. Refer to Section 22 13 16.UT

3.02 INSTALLATION

- A. Route piping in orderly manner, plumb and parallel to building structure, and maintain gradient.
- B. Install piping to conserve building space, and not interfere with use of space and other work.
- C. Group piping whenever practical at common elevations.
- D. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment. Refer to Section 23 05 16.
- E. Provide clearance for installation of insulation, and access to valves and fittings.

- F. Provide access where valves and fittings are not exposed. Coordinate size and location of access doors with Section 08 31 10 00 Access Doors.
- G. Slope piping and arrange systems to drain at low points. Use eccentric reducers to maintain top of pipe level.
- H. Where pipe support members are welded to structural building framing, scrape, brush clean, and apply one coat of zinc rich primer to weld area.
- I. Prepare pipe, fittings, supports, and accessories for finish painting. Refer to Section 09 91 00.
- J. Install valves with stems upright or horizontal, not inverted.

3.03 FABRICATION OF PIPE:

- A. All the various piping systems shall be made up straight and true and run at proper grades to permit proper flow of the contained material. Lines shall also be graded for proper drainage.
- B. Piping shall follow as closely as possible the routes shown on Drawings which take into consideration conditions to be met at the site.
- C. Should any unforeseen conditions arise, lines shall be changed or rerouted as required after proper approval has been obtained.
- D. All piping shall be installed with due regard to expansion and contraction and so as to prevent excessive strain and stress in the piping, in connections, and in equipment to which the lines are connected.
- E. All piping shall be clean when it is installed. Before installation it shall be checked, upended, swabbed, if necessary, and all rust or dirt from storage or from lying on the ground shall be removed.
- F. Procedure of Assembling Screw Pipe Fittings: All screw joints shall be made with taper threads, properly cut. Joints shall be made tight with Teflon applied to the pipe threads only and not to fittings. When threads are cut on pipes, the ends shall be carefully reamed to remove any burrs. Before installing pipe that has been cut and threaded, the lengths of pipe shall be upended and hammered to remove all shavings and foreign material.
- G. Procedure for Assembling Other Joints: Procedures for assembling joints in cast iron and copper lines have been set forth elsewhere in these Specifications. For any special materials, consult the manufacturers for the recommended procedures in assembling the joints.

3.04 APPLICATION

- A. Grooved mechanical couplings and fasteners may be used only in accessible locations and for pump fit-up assemblies, when approved by Owner in writing.
- B. Install unions downstream of valves and at equipment or apparatus connections.
- C. Install brass male adapters each side of valves in copper piped system. Sweat solder adapters to pipe.

- D. Install [ball] [butterfly] valves for shut-off and to isolate equipment, part of systems, or vertical risers.
- E. Install [ball] [butterfly] valves for throttling, bypass, or manual flow control services.
- F. Provide spring loaded check valves on discharge of condenser water pumps.
- G. Use gas plug cocks for throttling service. Use non-lubricated plug cocks only when shut-off or isolating valves are also provided.
- H. Use butterfly valves [in heating water systems] [in chilled and condenser water systems] [in heating, chilled and condenser water systems].
- I. Use only butterfly valves in chilled and condenser water systems for throttling and isolation service.
- J. Use lug end butterfly valves to isolate equipment.
- K. Provide 3/4 inch (20 mm) ball drain valves at main shut-off valves, low points of piping, bases of vertical risers, and at equipment. [Pipe to nearest drain.]

3.05 PIPE PRESSURE TESTS:

- A. See Section 23 00 00.

3.06 CLEANING AND FLUSHING OF WATER SYSTEMS

- A. Water circulating Systems shall be thoroughly cleaned before placing in operation to rid systems of rust, dirt, piping compound, mill scale, oil, grease, any and all other material foreign to water being circulated.
- B. Extreme care shall be exercised during construction to prevent dirt and other foreign matter from entering the pipe or other parts of systems. Pipe stored on the project shall have open ends capped and equipment shall have openings fully protected. Before erection, each piece of pipe, fitting, or valve shall be visually examined and dirt removed.
- C. At pipe end locations a temporary bypass will be installed. Bypass shall be *same* size as the supply and return pipe. Prior to flushing the distribution system, the Contractor shall install the temporary bypass and a temporary line size strainer between the supply and return pipes. Contractor shall verify that the isolation valves are open.
- D. After the temporary bypasses are installed, the Contractor shall provide and operate one pump which will cause a velocity of 10 feet per second in the main piping. Pump required will provide approximately XXX gpm at XXX' of head. This pump will be provided with a shot chemical feeder and a strainer assembly. Pump shall be connected to system at the point where piping goes into the building from the tunnel. If the pump is electric driven, rather than engine driven, the Contractor shall provide all temporary electrical disconnects, wiring, fuses, and other electrical devices that are required for safe operation.
- E. Circulation will be started using the temporary pump. A non-hazardous cleaning compound (Entec 324 or approved equal) shall be added using the shot feeder until the concentration level of 20 parts per million is reached. Once this 20 parts per million concentration is

reached, circulation will be maintained for 48 hours. After this period of time, the cleaning water shall be dumped to the sanitary sewer.

- F. The distribution system will then be refilled with city water and circulated with continual bleed and make-up until the water is certified clean by the water treatment consultant, and accepted by The University. At the completion of this step an inhibitor shall be introduced. All waste water shall be dumped into the sanitary sewer system.
- G. After the system is certified as clean, the Contractor shall close the valves. The bypass piping shall be removed as final connections to the building are accomplished.
- H. During the flushing procedure, strainers shall be cleaned as often as necessary to remove debris and, in any event, all strainers shall be cleaned by physically removing the strainer screen from the body of the strainer at the end of flushing. Replace strainer basket and gasket. Contractor shall not flush through control valves, coils, etc. Contractor shall provide temporary bypasses at coils and spool pieces at control valves. Flush the coils individually wasting water to sanitary sewer. Connect coils and install control valves after flushing.
- I. Test samples shall be taken at all bypass locations and all tests shall indicate that the entire system has reached a PH, conductivity, and chemical concentration level as approved by The University to match present systems. Contractor shall purchase needed chemicals from Owner's chemical treatment supplier.
- J. Contractor shall provide a smaller assembly to clean and flush any miscellaneous piping that can not be included in the initial system flush. All other criteria shall remain the same.
- K. Contractor shall add inhibitor to the cleaning and flushing chemicals if, once the system is approved as clean, there is any delay in connecting the new system to the existing system. This is to prevent any corrosion after the new pipe is clean.
- L. Use stainless steel nipples for all take-offs to first isolation valves on pipe sizes 2" or less. Nipple diameter shall not be smaller than $\frac{3}{4}$ ".

END OF SECTION 23 21 13 00

SECTION 23 21 13 23 - HYDRONIC SPECIALTIES**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Perform all Work required to provide and install air vents, pressure gauges, thermometers, strainers, air separators, expansion tanks, relief valves, water flow measuring and balancing systems, and water flow integrating meters as indicated by the Contract Documents with supplementary items necessary for their proper installation and operation.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. ANSI/ASME Boilers and Pressure Vessel Code, Section VIII, Division 1 Design and Fabrication of Pressure Vessels.

1.04 QUALITY ASSURANCE

- A. Manufacturer: For each product specified, provide components by the same manufacturer throughout.

1.05 SUBMITTALS

- A. Product Data:
 - 1. Submit Shop Drawings and product data, including component sizes, rough-in requirements, service sizes, and finishes.
 - 2. Submit manufacturer's installation instructions.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. No take-offs from header less than ½ inch.
- B. Provide Stainless Steel nipples on header take-offs to isolation valves on sizes 2 inch or smaller.
- C. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. Expansion Tanks: Bell & Gossett, Taco, C. Adamson, Woods.
- B. Automatic Air Vents: Armstrong.
- C. Air Separators: Bell & Gossett, Taco, P. Wood, Armstrong.
- D. Water Relief Valves: Keckley, Watts, Bell & Gossett.
- E. Integrating Flowmeters: Panametrics, Balance Master, Controlotron, EMCO.
- F. Pressure Gauges: Ashcroft, Dwyer, Weksler, Marsh Instrument, H.O. Terice, Moeller Instrument Co, Weiss.
- G. Thermometers: Ashcroft, Dwyer, Marsh Instrument, Weksler, Moeller Instrument, H.O. Terice, Weiss, Controlotron Corporation.
- H. Pump Suction Fittings: Bell and Gossett, Taco, Victaulic.
- I. Strainers: Keckley, Mueller, Muessco, Strainers, Inc., Grinnell.

2.03 EXPANSION TANKS

- A. Tank Construction: Closed, welded steel, tested and stamped in accordance with Section VIII, Division 1, of ANSI/ASME Boiler and Pressure Vessel Code, 125 psig rating. Clean, prime coat, and supply with steel support saddles. Supply with renewable heavy duty butyl rubber bladder. Construct tank with tapings for installation of accessories.
- B. Provide compatible/similar metals on all piping assemblies.
- C. Provide with quick connect air charging valve connection (standard tire valve) tank drain.
- D. Provide automatic cold water fill assembly complete with pressure relief valve, pressure reducing valve and valved bypass.
- E. Set expansion tank pressure relief valve and pressure reducing valve at pressures indicated on Drawings.
- F. Tank dimensions are as scheduled on Drawings.

2.04 AUTOMATIC AIR VENTS

- A. Provide air vents at the highest points of the hydraulic piping systems and on the uppermost connections to all hydraulic coils; 125 psig pressure rating. Provide shutoff valves to facilitate maintenance of air vents.
- B. Locate all air vents and their discharge lines in accessible locations, preferably clustered.
- C. Route discharge lines to nearest floor drain without air traps.

2.05 AIR SEPARATORS

- A. Steel tank, flanged inlet and outlet connections, separate top fittings for make-up line connection, automatic air vent, and bottom connection for blow-down and cleaning. ASME construction and stamped for 125 psig design pressure.
- B. Provide stainless steel strainer with 3/16 inch diameter perforations and total free area of not less than five (5) times the cross sectional area of the connecting pipe.

- C. Provide full port or butterfly valves for unit isolation and bypass.
- D. Units shall be full line size.
- E. Provide redundant units or bypass piping.

2.06 WATER RELIEF VALVES

- A. Pressure relief valves installed for the protection of the water circulating circuits shall be single seated diaphragm and spring type valve with screwed connections, similar to Watts No. 174A.
- B. $\frac{3}{4}$ inch size of bronze construction with bronze seat, composition shut-off disc, and rubber diaphragm.
- C. For hot water systems components must be of similar metal piping.

2.07 INTEGRATING BTU METERS

A. General:

- 1. Engineered BTU and/or ton hour measuring systems utilizing best practices for reducing entire system error.
- 2. Install in main building chilled and hot water piping systems and elsewhere as shown on the Drawings.
- 3. Flow element shall be installed in a straight run of pipe in accordance to manufacturer's guidelines for the specific installation in order to maintain rated accuracy.
- 4. Provide in writing manufacturers length straight run pipe recommendations for each meter installation, provide curves.

B. Flow Stations:

- 1. Provide laminated or metal identification tag on chain giving pipe size, meter series, and station identification.
- 2. Maximum fluid operating ranges:
 - a. Pressure: 0 to 150 psig.
 - b. Temperature: 32 degrees F to 250 degrees F.
- 3. Flow stations shall be of steel construction.

C. Portable:

- 1. Provide a hand-held, portable meter that instantaneously displays flow and/or changes in flow by means of a high-visibility, integral, backlit LCD, dual channel (one for chilled water, the other for steam condensate or hot water as noted on Drawings) that displays instantaneous flow rate in GPM and total gallons. Charts and tables are not acceptable.
- 2. Each channel shall have dual outputs for each of the displayed values. Outputs shall be 4– 20 mA and TTL pulse rate, each proportional to display values.
- 3. Meter shall have positive zero flow indication.
- 4. Meter shall be complete with adequate lengths of flow cables attached to sensors, with installation and operating instructions.

5. Meter shall be capable of interfacing with and delivering a signal to the building automation system.

2.08 FLEXIBLE HOSE

- A. Must be similar metals and compatible with connected piping.
- B. Install connector in a straight line without offset. Piping shall be supported so that connector does not carry pipe load.
- C. Install in line without twisting connector.
- D. For pipe sizes ½ inch to 2 inches only.

2.09 PRESSURE GAUGES

- A. Application: Provide pressure gauges as indicated on Drawings; 2-½ inch face diameter with 0.5 percent accuracy of full span, Grade 2A, ANSI B40.1.
- B. Gauge Ranges:
 1. Provide 0 - 160 psi gauges for 150 psi chilled/hot water service.
 2. Provide 0 – 300 psi gauges for 300 psi, chilled/hot water service.
 3. Provide 0 - 200 psi gauges for domestic cold water service.
 4. Provide 0 – 150 psi gauges for condenser water and generator cooling water service.
 5. Provide liquid glycerin filled compound pressure gauges with a graduation ratio of 30 psi to 30 inches of mercury across basket strainer at suction of condensing water pump.
- C. For each gauge, provide bronze gauge lock and globe type bleed valve:
 1. Similar to Jenkins 750, Crane 362E, Stockham B-66, Powell 120 or accepted substitution of the pressure rating for the system installed.

2.10 THERMOMETERS

- A. PROVIDE NO MERCURY THERMOMETERS
- B. Placement: Provide, where shown on Drawings and as indicated below, thermometers of suitable range for the service required. Provide thermometers on the inlet and outlet sides of all coils, heat exchangers, and heat generators.
- C. Furnish thermometers for services in the following ranges and divisions with English scales:
 1. Domestic hot water:
 - a. Range: 30 to 200 degrees F.
 - b. Division: 1 degrees F.
 2. Heating hot water and generator cooling water:
 - a. Range: 30 to 240 degrees F.
 - b. Division: 2 degrees F.

3. Chilled water:
 - a. Range: 0 to 100 degrees F.
 - b. Division: 1 degrees F.
 4. Condenser water:
 - a. Range: 0 to 120 degrees F.
 - b. Division: 1 degrees F.
 - D. Thermowells: Provide thermometer thermowells at all thermometer locations. Provide thermometer thermowells only, fitted with plug and chain and conforming to the requirements specified for thermometers. Install all thermowells vertical or at a 45-degree vertical angle to permit filling with conducting liquid for tests.
 - E. Construction: Provide thermometers that are 9 inches long with an etched glass enclosed scale of 2-degree increments, a cast aluminum case. Furnish an adjustable, angle-type scale with a swivel nut connection into 3/4-inch brass separable thermowells. Use a 3-1/2 inch stem length for all pipe sizes up through 8 inches, a 6-inch stem length for 10 inch pipe size, and a 9-inch stem length for pipe sizes larger than 10 inches.
 - F. Extensions: Where thermometers are installed in insulated lines, use extension-neck separable thermowells.
 - G. Remote Thermostats: Furnish remote bulb thermometers where specified and shown. Provide thermometers with corrosion-resistant movements set in cast aluminum cases with black enamel finish.
 1. Furnish dials 4-1/2 inches in diameter, with black numbers on white dials.
 2. Use copper capillary tubing protected by a spiral or double-braided bronze armor.
 3. Single unit scales (metric or SAE) owner specified.
- 2.11 PUMP SUCTION STRAINER- CLOSED LOOP SYSTEM (CHILLED & HOT WATER)
- A. Fitting: Angle pattern, cast iron body, flanged for over 2 inches, rated for 125 psig working pressure with inlet vanes, cylinder strainer with 3/16-inch diameter openings, disposable fine mesh strainer to fit over cylinder strainer, and permanent magnet located in flow stream and removable for cleaning.
 - B. Accessories: Adjustable foot support, blowdown tapping in bottom, gauge tapping inside.
 - C. Provide mated flanges at all pump suction.
- 2.12 STRAINERS-OPEN LOOP (CONDENSER WATER SYSTEM)
- A. 2 inches and smaller: Screwed brass or iron body, Y pattern with 1/32 inch stainless steel perforated screen. 150 psi or 300 psi pressure rating to match system pressure.
 - B. 2-1/2 inches to 4 inches: Flanged iron body, Y pattern with 3/64 inch stainless steel perforated screen. 150 psi or 300 psi pressure rating to match system pressure.
 - C. Over 4 inches: Flanged carbon steel Y type with 3/16 inch stainless steel perforated screen. 150 psi or 300 psi pressure rating to match system pressure.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Flush and clean expansion tanks prior to delivery to the Project Site, and keep sealed during construction.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Support expansion tanks from building structure in accordance with manufacturer's instructions.
- D. Provide automatic air vents at system high points and as indicated.
- E. Provide manual air vents at entrance to all heating hot water coils, with a "cane" shaped discharge tube, positioned to permit draining to a portable receptacle.
- F. For automatic air vents in above-ceiling spaces or other concealed locations, extend vent tubing to nearest drain.
- G. Provide air separator on suction side of system circulation pump and connect as shown on Drawings.
- H. Provide valved drain and hose connection on strainer blow down connection.
- I. Provide pump suction strainer on suction side of base mounted centrifugal pumps. Remove temporary strainers after cleaning systems. Clean all permanent strainers after circulating systems for a minimum of 48 hours at full capacity.
- J. Support pump fittings with floor mounted pipe and flange supports.
- K. Provide relief valves on pressure tanks, low-pressure side of reducing valves, heat exchangers, and expansion tanks.
- L. Select system relief valve capacity so that capacity is greater than make-up pressure reducing valve capacity. Select equipment relief valve capacity to exceed rating of connected equipment.
- M. Pipe relief valve outlet as approved by engineer.
- N. Pipe condensate line to nearest floor drain
- O. Where one line vents several relief valves, make cross sectional area equal to sum of individual vent areas.
- P. Install all pressure gauges so that they are easily readable.
- Q. Provide glycerin-filled compound pressure gauge upstream and downstream of each strainer.
- R. Provide liquid glycerin-filled gauges across all pumps and air compressors of ranges indicated above. This does not include control air compressor.
- S. Pressure gauges need not be furnished across in-the-line circulators. Where air compressors and receivers are for control air only, standard 2-inch instrument gauges will be acceptable. Equip stem gauges with coil siphons.

- T. Utilize SS tubing no less than 3/8" diameter for control devices and metering connections. Dirt legs shall be installed prior to any tubing connection to control device or meter. Dirt leg shall have a full port ball valve for blow down.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 21 16 00 - PIPING, VALVES, AND FITTINGS**PART 1 – GENERAL****1.01 RELATED DOCUMENTS**

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SECTION INCLUDES

A. Pipe and pipe fittings.

B. Valves.

1.03 RELATED SECTIONS

A. SECTION 20 01 00 00 - BASIC FIRE SUPPRESSION, PLUMBING AND HVAC REQUIREMENTS.

B. SECTION 20 05 20 00 - SUPPORTS AND SLEEVES

C. SECTION 20 05 50 00 - PIPING AND EQUIPMENT IDENTIFICATION

D. SECTION 20 07 10 00 - PIPING INSULATION

1.04 REFERENCE STANDARDS

A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.

B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.

C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:

A. ANSI B31.9 – Building Services Piping.

B. ASME Sec. 9 - Welding and Brazing Qualifications.

C. ASME B16.3 - Malleable Iron Threaded Fittings.

D. ASME B16.9 – Factory Made Wrought Buttwelding Fittings

E. ASME B16.18 - Cast Bronze Solder-Joint Pressure fittings.

- F. ASME B16.22 - Wrought Copper and Bronze Solder-Joint Pressure Fittings
- G. ASME B16.23 - Cast Copper Alloy Solder-Joint Drainage Fittings - DWV.
- H. ASME B16.26 - Cast Bronze Fittings for Flared Copper Tubes.
- I. ASTM A47 - Ferric Malleable Iron Castings.
- J. ASTM A135 - Pipe, Steel, Black and Hot-Dipped Zinc Coated, Welded and Seamless.
- K. ASTM A234 - Pipe Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and Elevated Temperatures.
- L. ASTM B32 - Solder Metal.
- M. ASTM B42 - Seamless Copper Pipe.
- N. ASTM B75 - Seamless Copper Tube.
- O. ASTM B88 - Seamless Copper Water Tube.
- P. ASTM B251 - Wrought Seamless Copper and Copper-Alloy Tube.
- Q. ASTM B302 - Threadless Copper Pipe (TP).
- R. NCPWB - Procedure Specifications for Pipe Welding.
- S. TDH - Texas Department of Health, Water System Regulations

1.05 QUALITY ASSURANCE

- A. Valves: Manufacturer's name and pressure rating marked on valve body.
- B. Welding Materials and Procedures: Conform to ASME Code and applicable state labor regulations.
- C. Welders Certification: In accordance with ASME Sec. 9. **Submit welder's certifications prior to any shop or field fabrication. Welder's certifications shall be current within six months of submission.**
- D. Maintain one copy of each document on site.

1.06 SUBMITTALS

A. Product Data:

1. Provide data on pipe materials, pipe fittings, valves, and accessories. Provide manufacturers catalog information. Indicate valve data and ratings.
2. Submit manufacturer's installation instructions.

1.07 PROJECT RECORD DOCUMENTS

- A. Submit under provisions of Section 20 01 00 00.

1.08 OPERATION AND MAINTENANCE DATA

- A. Submit under provisions of Section 20 01 00 00.
- B. Maintenance Data: Include installation instructions, spare parts lists, exploded assembly views.

1.09 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Installer: Company specializing in performing the work of this section with minimum of three years documented experience.

1.10 DELIVERY, STORAGE, AND HANDLING

- A. Deliver, store, protect and handle products to site under provisions of Section 15010.
- B. Accept valves on site in shipping containers with labeling in place. Inspect for damage.
- C. Provide temporary protective coating on cast iron and steel valves.
- D. Provide temporary end caps and closures on piping and fittings. Maintain in place until installation.
- E. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the work, and isolating parts of completed system.

1.11 EXTRA MATERIALS

- A. Furnish under provisions of Section 20 01 00 00.

PART 2 PRODUCTS**2.01 STEEL PIPING:**

- A. Scope: This section applies to all piping systems providing for welded piping, fittings, and other appurtenances. Specific systems requiring welded piping include, but are not limited to: chilled water, hot water, steam, steam condensate, and fire protection systems.
- B. Pipe: Unless otherwise indicated, chiller and boiler plants piping shall be Schedule 40, and underground and building piping shall be Standard weight, Grade A or B, seamless black steel

pipe conforming in all details to Standard ASTM Designation A135, A106, and A53, latest revisions. Steam condensate shall be Schedule 80.

C. FITTINGS:

1. All weld fittings shall be domestic made wrought carbon steel butt-welding fittings conforming to ASTM A234 and ASME/ANSI B16.9, latest edition, as made by Weld Bend, Tube Turn, Hackney, or Ladish Company. Attach to only pipe with a hole for the entire length. Each fitting shall be stamped as specified by ASME/ANSI B16.9 and, in addition, shall have the laboratory control number metal stenciled on each fitting for ready reference as to physical properties required for any fittings selected at random. Fittings which have been machined, remarked, printed or otherwise produced domestically from non-domestic forgings or materials will not be acceptable. Each fitting is to be marked in accordance with MSS SP-25. Markings shall be placed on the fittings at the farthest point from the edge to be welded to prevent disfiguring from the welding process. Submittal data for these fittings shall include a letter signed by an official of the manufacturing firm certifying compliance with these specifications.
2. All screwed pattern fittings specifically called for shall be Class 150 malleable iron fittings of Grinnell Company, Crane Company or Walworth Company manufacture (300 lb. for unions).
3. Forged steel fittings shall be domestic.

D. FABRICATION:

1. Welded piping and fittings shall be fabricated in accordance with ASME/ANSI the latest edition of Standard B31.9 –Building Services Piping may be used within buildings. Machine beveling in shop is preferred. Field beveling may be done by flame cutting to recognized standards.
2. Ensure complete penetration of deposited metal with base metal. Contractor shall provide filler metal suitable for use with base metal. Contractor shall keep inside of fittings free from globules of weld metal. All welded pipe joints shall be made by the fusion welding process, employing a metallic arc or gas welding process. All pipe shall have the ends beveled 37-1/2 degrees and all joints shall be aligned true before welding. Except as specified otherwise, all changes in direction, intersection of lines, reduction in pipe size and the like shall be made with factory-fabricated welding fittings. Mitering of pipe to form elbows, notching of straight runs to form tees, or any similar construction will not be permitted.
3. Align piping and equipment so that no part is offset more than 1/16 inch. Set all fittings and joints square and true, and preserve alignment during welding operation. Use of alignment rods inside pipe is prohibited.
4. Do not permit any weld to project within the pipe so as to restrict it. Tack welds, if used, must be of the same material and made by the same procedure as the completed weld. Otherwise, remove tack welds during welding operation.

5. Do not split, bend, flatten or otherwise damage piping before, during or after installation.
6. Remove dirt, scale and other foreign matter from the inside of piping, by swabbing or flushing, prior to the connection of other piping sections, fittings, valves or equipment.
7. In no cases shall Schedule 40 pipe be welded with less than three passes including one stringer/root, one filler and one lacer. Schedule 80 pipe shall be welded with not less than four passes including one stringer/root, two filler and one lacer. In all cases, however, the weld must be filled before the cap weld is added.
8. Procedure of Assembling Screw Pipe Fittings: All screw joints shall be made with taper threads, properly cut. Joints shall be made tight with Teflon applied to the pipe threads only and not to fittings. When threads are cut on pipes, the ends shall be carefully reamed to remove any burrs. Before installing pipe that has been cut and threaded, the lengths of pipe shall be upended and hammered to remove all shavings and foreign material.

E. WELD TESTING:

1. All welds are subject to inspection, visual and/or X-ray, for compliance with specifications. The University will, at The University's option, provide employees or employ a testing laboratory for the purposes of performing said inspections and/or X-ray testing. Initial visual and X-ray inspections will be provided by The University. The contractor shall be responsible for all labor, material and travel expenses involved in the re-inspection and retesting of any welds found to be unacceptable. In addition, the contractor shall be responsible for the costs involved in any and all additional testing required or recommended by ASME/ANSI Standards B31.9 due to the discovery of poor, unacceptable or rejected welds.
2. Welds lacking penetration, containing excessive porosity or cracks, or are found to be unacceptable for any reason, must be removed and replaced with an original quality weld as specified herein. All qualifying tests, welding and stress relieving procedures shall, moreover, be in accord with Standard Qualification for Welding Procedures, Welders and Welding Operators, Appendix A, Section 6 of the Code, current edition.

2.02 COPPER PIPE

- A. Copper Pipe: Piping four inches (4") and smaller shall be fabricated of Type K, hard drawn, copper pipe made of deoxidized copper (99.9% pure). This Type K copper pipe shall conform in every detail to ASTM Standard Specifications for COPPER WATER TUBE, Serial Designation B-88-66, and it shall be provided in 20 foot straight lengths. Copper pipe 4" and smaller may only be joined using non-lead-bearing solder, such as 95-5 silver or antimony solder (95 percent tin, and 5 percent silver or antimony). Copper pipe 4" and larger may be joined using roll grooved fittings.
- B. Fittings: All fittings for four inch (4") and smaller water lines shall be Streamline Solder Fittings manufactured by Streamline Pipe and Fittings Division, Mueller Brass Company, or approved equal. These wrought copper fittings shall be rigid and strong with openings machined to accurate capillary fit for the pipe.

- C. Lead: It is forbidden that lead in any form be used in any water system other than waste. If lead is used in the fabrication or installation of any water system other than waste, then ALL of the installed equipment and material, which may have come in contact with the lead, shall be marked with bright red or orange spray paint, and shall be removed from the project site. The system(s) shall then be restored and reinstalled using ALL NEW MATERIALS.

2.03 Stainless Steel Piping

- A. Stainless steel piping, tubing and nipples shall be 316 SS.

2.04 VALVES:

- A. All valves shall be located such that the removal of their bonnets is possible. All flanged valves shown in horizontal lines with the valve stem in a horizontal position shall be positioned so that the valve stem is inclined one bolt hole above the horizontal position. Screw pattern valves placed in horizontal lines shall be installed with their valve stems inclined at an angle of a minimum of 30 degrees above the horizontal position. All valves must be true and straight at the time the system is tested and inspected for final acceptance. Valves shall be installed as nearly as possible to the locations indicated in the Construction Drawings. Any change in valve location must be so indicated on the Record Drawings. All valves must be of threaded or flanged type. No solder connected or grooved fitting valves shall be used on this project. All bronze and iron body gate and globe valves shall be the product of one manufacture for each project. Manufacturers of other types may not be mixed on the same project; i.e., all butterfly valves shall be of the same manufacture, all ball valves shall be of the same manufacture, etc.
- B. All valves used in circulating systems, plumbing and steam systems (low and medium pressure) shall be Class 150 SWP. Class 300 valves shall be constructed of all ASTM B-61 composition. All gate, globe and angle valves shall be union bonnet design. Metal used in the stems of all bronze gate, globe and angle valves shall conform to ASTM B371 Alloy 694, ASTM B99 Alloy 651, or other corrosion resistant equivalents. Written approvals must be secured for the use of alternative materials. Alloys used in all bronze ball, gate, globe, check, or angle valves shall contain no more than 15% zinc. No yellow brass valves will be allowed.
- C. All iron body valves shall have the pressure containing parts constructed of ASTM designated of 126 class B iron. Stem material shall meet ASTM B16 Alloy 360 or ASTM 371 Alloy 876 silicon bronze or its equivalent. Gates and globes shall be bolted bonnet with OS&Y (outside screw and yoke) and rising stem design. A lubrication fitting is preferred on yoke cap for maintenance lubrication of the yoke bushing.
- D. All cast steel body valves shall have the pressure containing parts constructed of ASTM designation A-216-GR-WCB carbon steel. Gate and globe valves shall be bolted bonnet outside and screw and yoke design with pressure-temperature rating conforming to ANSI B16-34-1977. Stems shall meet ASTM designation A-186-F6 chromium stainless steel. Wedge (gate valves) may be solid or flexible type and shall meet ASTM A-182-F6 chromium stainless steel on valves from 2" to 6". Sizes 8" and larger may be A-216-WCB with forged rings or overlay equal to 182-F6. Seat ring shall be hard faced carbon steel or 13% chromium A-182-F6 stainless. Handwheels shall be A47 Grade 35018 malleable iron or Ductile Iron ASTM A536.

- E. All forged steel body valves shall have the pressure containing parts constructed of ASTM 105, Grade 2 forged carbon steel. Seat and wedges shall meet ASTM A-182-F6 chromium stainless steel. Seat rings shall be hard faced. Valves shall conform to ANSI B16-34 pressure-temperature rating.
- F. All valves shall be repackable, under pressure, with the valve in the full open position. All gate valves, globe valves, angle valves and shutoff valves of every character shall have malleable iron hand wheels, except iron body valves 2-1/2" and larger which may have either malleable iron or ASTM A-126 Class B, gray iron hand wheels.
- G. Packing for all valves shall be free of asbestos fibers and selected for the pressure-temperature service of the valve. It is incumbent upon the manufacturer to select the best quality, standard packing for the intended valve service. At the end of one year, period spot checks will be made, and should the packing show signs of hardening or causing stem corrosion then all valves supplied by the manufacturer shall be repacked by the Contractor, at no expense to The University, with a packing material selected by The University.
- H. Not Used.
- I. Balancing and/or Shutoff Valves for Hot Water Systems: Two inches and smaller, three piece full port bronze body ball valve, stainless steel ball and stem. Teflon seats, packing and gasket, bronze gland follower, adjustable stuffing box, steel lever type handle, with plastic sheathed operating handle, adjustable memory stops, and shall be class 150 SWP/600 WOG, screwed pattern. Manufacturer shall certify ball valves for use in throttling service. Stem extensions shall be furnished for use in insulated lines. Cold water service valves shall be as above, except two piece construction. All valves 2 1/2" and larger shall be tapped full lug butterfly valves with aluminum bronze discs of ASTM B148 Alloy C955 and 316, 416, or 420 stainless steel shafts. Design must incorporate bushing between shafts and body of material suitable to provide a bearing surface to eliminate seizing or galling. Valve must be capable of providing a bubble tight seal at 200 psi for valves up to 12" (150 psi for larger valves) when used for end of line service without requiring the installation of a blind flange on the downstream side. Liners shall be resilient material suitable for 225 °F temperature and bodies of ductile iron. Butterfly valves 8" and larger and butterfly valves used for balancing service, regardless of size, shall have heavy duty weather proof encased gear operators, with malleable iron handwheel or crank. Valves 2 1/2" through 6" shall have lever handles which can be set in interim positions between full open and full closed. All butterfly valves shall be absolutely tight against a pressure differential of 150 psi.
- J. Check Valves for Water Systems: Forged valves shall be used on high pressure systems and cast valves shall be used on low pressure systems
- K. Standards of Quality for Valves:

23 - Heating,
Ventilating,
And Air-
Conditioning
(HVAC)

May 2013

2.04 UNIONS:

- A. Provide and install unions at proper points to permit removal of pipe and various equipment and machinery items without injury to other parts of the system. No unions will be required in welded lines or lines assembled with solder joint fittings except at equipment items, machinery items and other special pieces of apparatus. Unions in 2" and smaller in ferrous lines shall be Class 300 AAR malleable iron unions with iron to brass seats, and 2 1/2" and larger shall be ground flange unions. Unions in copper lines shall be Class 125 ground joint brass unions or Class 150 brass flanges if required by the mating item of equipment. Companion flanges on lines at various items of equipment, machines and pieces of apparatus shall serve as unions to permit removal of the particular items. See particular Specifications for special fittings and pressure.
- B. Unions connecting ferrous pipe to copper or brass pipe shall be dielectric type equal to Epco.
- C. In all water lines where the material of the pipe is changed from ferrous to copper or brass, a dielectric coupling shall be used at the transition.

2.05 FLANGES:

- A. All 150 lb. and 300 lb. ANSI flanges shall be weld neck and shall be domestically manufactured, forged carbon steel, conforming to ANSI B16.5 and ASTM A-181 Grade I or II or A-105-71 as made by Tube Turn, Hackney or Ladish Company. Slip on flanges shall not be used. Each fitting shall be stamped as specified by ANSI B16.9 and, in addition, shall have the laboratory control number stenciled on each fitting for ready reference as to physical properties and chemical composition of the material. Complete test reports may be required for any fitting selected at random. Flanges which have been machined, remarked, painted or otherwise produced domestically from imported forges will not be acceptable. Flanges shall have the manufacturer's trademark permanently identified in accordance with MSS SP-25. Contractor shall submit data for firm certifying compliance with these Specifications. Bolts used shall be carbon steel bolts with semi-finished hexagon nuts of American Standard Heavy dimensions. Allthread rods will not be an acceptable for flange bolts. Steam system flange bolts shall have a tensile strength of 105,000 psi and an elastic limit of 81,000 psi and rated at least ANSI Grade V. Other bolts shall have a tensile strength of 80,000 psi and an elastic limit of 36,000 psi and rated at least ANSI Grade I.
- B. Flat faced flanges shall be furnished to match 125 lb cast iron flanges on pumps, check valves, strainers, etc. with full flange gaskets. Bolting of raised face flanges to flat faced flanges is not allowed.

C. FLANGE GASKETS

- 1. Gaskets shall be placed between the flanges of all flanged joints.
- 2. Gaskets shall be ring form gaskets fitting within the bolt circle of their respective flanges. Gaskets shall be 1/16" thick asbestos free material recommended for service by Anchor, Garlock, or John Crane. The inside diameter of such gaskets shall conform to the nominal pipe size and the outside diameter shall be such that the gasket extends outward to the studs or bolts employed in the flanged joint.

D. Flange Bolt Installation:

1. Bolt Lubrication: Bolts shall be well lubricated with a heavy graphite and oil mixture.
2. Torque Requirements - Bolts shall be stressed to 45,000 psi.

Nominal Bolt Dia. (Inch)	Torque (Ft-Lbs)
.25	6
.3125	12
.375	18
.4375	30
.5	45
.5625	68
.625	90
.75	150
.875	240
1.0	368
1.125	533
1.25	750
1.375	1020
1.5	1200

3. Torque shall be checked with a calibrated breaking action torque wrench on the final torque round. Bolts shall be cold and hot torqued.
4. Torque Pattern - Shall be a cross or star pattern with at least four passes. Limit each pass to 30% of full torque increases.
5. Hot Torque - Re-torque the flange bolts with system at normal operating pressure and temperature for at least four hours.
6. Inspection - Owner shall verify hot torquing of all medium and high pressure steam flange bolts.

2.06 Flanges

- A. Gaskets shall be flexatalllic, spiral wound, SS graphite with carbon outer ring.

PART 3 EXECUTION

Refer to other Sections for service specific requirements.

3.01 EXAMINATION

- A. Verify excavations under provisions of Section 20 01 00 00.
- B. Verify that excavations are to required grade, dry, and not over-excavated.

3.02 PREPARATION

- A. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.
- B. Remove scale and dirt, on inside and outside, before assembly.
- C. Prepare piping connections to equipment with flanges or unions.

3.03 INSTALLATION

- A. Provide non-conducting dielectric connections wherever jointing dissimilar metals.
- B. Route piping in orderly manner and maintain gradient.
- C. Install piping to conserve building space and not interfere with use of space.
- D. Group piping whenever practical at common elevations.
- E. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment.
- F. Provide clearance for installation of insulation and access to valves and fittings.
- G. Provide access where valves and fittings are not exposed. Coordinate access door location with architectural features.
- H. Where pipe support members are welded to structural building framing, scrape, brush clean, and apply one coat of zinc rich primer to welding.
- I. Provide support for utility meters in accordance with requirements of utility companies.
- J. Install valves with stems upright or horizontal, not inverted.

3.04 ERECTION TOLERANCES

- A. Establish invert elevations, slopes for drainage to 1/8 inch per foot (one percent) minimum. Maintain gradients through each joint of pipe and throughout system.
- B. Slope water piping and arrange to drain at low points.

SECTION 23 22 23 13 - STEAM CONDENSATE PUMPS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for steam condensate pumps. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the products manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes electric-driven and pressure-powered steam condensate pumps.

C. Submittals

1. Product Data: For each type of product indicated.
2. Shop Drawings: Include details of installation.
 - a. Include wiring diagrams.
3. Operation and maintenance data.

D. Quality Assurance

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
2. ASME Compliance: Fabricate and label steam condensate pumps to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

E. Delivery, Storage, and Handling

1. Manufacturer's Preparation for Shipping: Clean flanges and exposed machined metal surfaces and treat with anticorrosion compound after assembly and testing. Protect flanges, pipe openings, and nozzles with wooden flange covers or with screwed-in plugs.
2. Store steam condensate pumps in dry location.
3. Retain protective covers for flanges and protective coatings during storage.
4. Protect bearings and couplings against damage from sand, grit, and other foreign matter.
5. Comply with pump manufacturer's written rigging instructions.

1.2 PRODUCTS**A. Electric-Driven Steam Condensate Pumps**

1. Description: Factory-fabricated, packaged, electric-driven pumps; with receiver, pump(s), controls, and accessories suitable for operation with steam condensate.
2. Configuration: Simplex **OR** Duplex, **as directed**, floor-mounting pump with receiver and float switch(es); rated to pump 200 deg F (93 deg C) steam condensate.
 - a. Receiver: Floor-mounting, close-grained cast iron **OR** welded steel, **as directed**; with externally adjustable float switch(es), and flange(s) for pump mounting.
 - b. Pump(s): Centrifugal, close coupled, vertical design, permanently aligned, and bronze fitted; with replaceable bronze case ring and mechanical seal; mounted on receiver flange.
 - c. Factory Wiring: Between pump(s) and float switch(es), for single external electrical connection. Fused control power transformer if voltage exceeds 230 V.
 - d. Electrical **OR** Mechanical, **as directed**, pump alternator to operate pumps in lead-lag sequence and allow both pumps to operate if the normal start level for a single pump is exceeded.
3. Configuration: Duplex floor-mounting pump with receiver and float switches; rated to pump 210 deg F (99 deg C) steam condensate.

- a. Receiver: Floor-mounting, close-grained cast iron **OR** welded steel, **as directed**; with externally adjustable float switches and flanges for pump mounting.
- b. Pumps: Regenerative turbine, close coupled, permanently aligned, and bronze fitted; with mechanical seals and an independent pump control circuit for each pump; mounted on base or receiver flange; rated to operate with a minimum of 2 feet (6 kPa) of NPSH.
- c. Factory Wiring: Between pumps and float switches, for single external electrical connection. Fused control power transformer if voltage exceeds 230 V.
- d. Electrical **OR** Mechanical, **as directed**, pump alternator to operate pumps in lead-lag sequence and allow both pumps to operate if the normal start level for a single pump is exceeded.
4. Configuration: Duplex floor-mounting pumps with receiver and float switches; rated to pump minimum 200 deg F (93 deg C) **OR** 210 deg F (99 deg C), **as directed**, steam condensate.
 - a. Receiver: Floor-mounting, close-grained cast iron **OR** welded steel, **as directed**; externally adjustable float switches; with water-level gage, steam condensate thermometer, discharge-pressure gage for each pump, bronze gate valves between receiver and pumps, flanges for pump mounting, and lifting eyebolts.
 - b. Inlet Strainer: Cast iron with self-cleaning bronze screen, dirt pocket, and cleanout plug on receiver inlet.
 - c. Pumps: Centrifugal, close coupled, vertical design, permanently aligned, and bronze fitted; with replaceable bronze case rings, stainless-steel shafts, and mechanical seals; mounted on receiver flanges; rated to operate with a minimum of 2 feet (6 kPa) of NPSH.
 - d. Control Panel: NEMA 250, Type 1 **OR** 2 **OR** 12, **as directed**, enclosure with hinged door and grounding lug, mounted on pump; factory wired for single external electrical connection; and with the following components within cabinet:
 - 1) Motor controller for each pump.
 - 2) Electrical pump alternator to operate pumps in lead-lag sequence and allow both pumps to operate on receiver high level.
 - 3) Manual lead-lag control to override electrical pump alternator to manually select the lead pump.
 - 4) Momentary contact "TEST" push button on cover for each pump.
 - 5) Numbered terminal strip.
 - 6) Disconnect switch.
 - 7) Fused transformer for control circuit.
5. Configuration: Duplex floor-mounting pump with elevated receiver, float switches, and connecting piping; rated to pump 212 deg F (100 deg C) steam condensate.
 - a. Receiver: Close-grained cast iron **OR** Welded steel, **as directed**, mounted on fabricated-steel supports; externally adjustable float switches; with water-level gage, steam condensate thermometer, pump discharge pressure gages, bronze isolation valves between receiver and pumps, and lifting eyebolts.
 - b. Inlet Strainer: Cast iron with self-cleaning bronze screen, dirt pocket, and cleanout plug on receiver inlet.
 - c. Pumps: Centrifugal, close coupled, permanently aligned, and bronze fitted; with replaceable bronze case rings, stainless-steel shafts, and mechanical seals; mounted on base below receiver; rated to operate with a minimum of 2 feet (6 kPa) of NPSH.
 - d. Pipe: ASTM A 53/A 53M, Type S, Grade B or ASTM A 106; Schedule 80; seamless steel.
 - e. Fittings NPS 2 (DN 50) and Smaller: ASME B16.1, Class 125 cast iron, threaded.
 - f. Fittings NPS 2-1/2 (DN 65) and Larger: ASTM A 234/A 234M, steel, for welded connections.
 - g. Control Panel: NEMA 250, Type 1 **OR** 2 **OR** 12, **as directed**, enclosure with hinged door and grounding lug; mounted on pump; factory wired for single external electrical connection; and with the following components within cabinet:
 - 1) Motor controller for each pump.
 - 2) Electrical pump alternator to operate pumps in lead-lag sequence and allow both pumps to operate on receiver high level.
 - 3) Manual lead-lag control to override electrical alternator to manually select the lead pump.
 - 4) Momentary contact "TEST" push button on cover for each pump.

- 5) Numbered terminal strip.
- 6) Disconnect switch.
- 7) Fused transformer for control circuit.
6. Configuration: Underground duplex pump with basin and float switches; rated to pump 200 deg F (93 deg C) steam condensate.
 - a. Basin: Cast iron, with hub-type inlets.
 - b. Basin Cover: Cast iron or steel with gasketed openings for access, pumps, pump shafts, control rods, discharge piping, and vent connections.
 - 1) Anchor Flange: Cast iron, attached to basin, in location and of size required to anchor basin to concrete slab.
 - c. Pumps: Wet-pit mounted, vertical, flexible coupled, and suspended.
 - 1) Casing: Cast iron with open inlet.
 - 2) Shaft and Bearings: Stainless-steel shaft with oil-lubricated, bronze, intermediate sleeve bearings; 48-inch (1200-mm) maximum intervals where basin depth is more than 48 inches (1200 mm); and grease-lubricated, ball-type, thrust bearings.
 - 3) Shaft Couplings: Flexible, capable of absorbing vibration.
 - 4) Seals: Mechanical; with carbon rotating ring, bearing on a ceramic seat held by a stainless-steel spring, and enclosed by a flexible bellows and gasket.
 - 5) Motors: Vertically mounted on cast-iron pedestal.
 - 6) Pump Discharge Piping: Manufacturer's standard steel or bronze pipe, unless otherwise indicated.
 - d. Control Panel: NEMA 250, Type 1 **OR** 2 **OR** 12, **as directed**, enclosure with hinged door and grounding lug; mounted on pump; factory wired for single external electrical connection; and with the following components within cabinet:
 - 1) Motor controller for each pump.
 - 2) Electrical pump alternator to operate pumps in lead-lag sequence and allow both pumps to operate on receiver high level.
 - 3) Manual lead-lag control to override electrical alternator to manually select the lead pump.
 - 4) Momentary contact "TEST" push button on cover for each pump.
 - 5) Numbered terminal strip.
 - 6) Disconnect switch.
 - 7) Fused transformer for control circuit.
- B. Pressure-Powered Steam Condensate Pumps
 1. Description: Factory-fabricated, pressure-powered pumps with mechanical controls, valves, piping connections, and accessories suitable for pumping steam condensate using steam **OR** compressed air, **as directed**.
 2. Configuration: Simplex **OR** Duplex, **as directed**, pump with float-operated valve control.
 - a. Pump Body: Cast iron **OR** Welded steel, **as directed**.
 - b. Piping Connections: Threaded; for steam condensate, operating medium, vent, and indicated accessories.
 - c. Level Gage: Glass site gage with shutoff cocks.
 - d. Valves: Manufacturer's standard check valves on inlet and outlet.
 - e. Internal Parts: Stainless-steel float, springs, and actuating mechanism.
 - f. Valve Seals: Replaceable from exterior.
 - g. Receiver: Cast iron **OR** Welded steel, **as directed**, factory mounted on steel supports; with water-level site glass and threaded piping connections.
 - h. Pipe: ASTM A 53/A 53M, Type S, Grade B or ASTM A 106; Schedule 80; seamless steel.
 - i. Fittings: ASME B16.1, Class 125 cast iron, threaded.
- C. Motors
 1. Comply with requirements in Division 23 Section "Common Motor Requirements For Hvac Equipment".

1.3 EXECUTION

A. Installation

1. Install pumps according to HI 1.1-1.5, "Centrifugal Pumps for Nomenclature, Definitions, Application and Operation."
2. Install pumps to provide access for periodic maintenance including removing motors, impellers, couplings, and accessories.
3. Support pumps and piping separately so piping is not supported by pumps.
4. Install pumps on concrete bases. Anchor pumps to bases using inserts or anchor bolts.
5. Install thermometers and pressure gages.

B. Connections

1. Install piping adjacent to machine to allow service and maintenance.
2. Install steam supply for pressure-powered pumps as required by Division 23 Section "Steam And Condensate Heating Piping".
3. Install compressed-air supply for pressure-powered pumps as required by Division 22 Section "General-service Compressed-air Piping".
4. Install gate and check valves on inlet and outlet of pressure-powered pumps.
5. Install check valve, gate valve, and globe valve at pump discharge connections for each electric-driven pump.
6. Pipe drain to nearest floor drain for overflow and drain piping connections.
7. Install full-size vent piping to outdoors, terminating in 180-degree elbow at point above highest steam system connection or as indicated.
8. Ground equipment according to Division 26 Section "Grounding And Bonding For Electrical Systems".
9. Connect wiring according to Division 26 Section "Low-voltage Electrical Power Conductors And Cables".
10. Install isolation valves on pump inlets.

END OF SECTION 23 22 23 13

Task	Specification	Specification Description
23 23 16 00	20 01 00 00	Basic Fire Suppression, Plumbing and HVAC Requirements
23 23 16 00	20 08 00 00	Fire Supression/Plumbing/HVAC Systems Commissioning
23 23 16 00	22 11 16 00a	Sanitary Waste And Vent Piping

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 31 13 13 - DUCTWORK**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Perform Work required to provide and install ductwork, flexible duct, hangers, supports, sleeves, flashings, vent flues, and all necessary accessories as indicated in the Contract Documents. Provide any supplementary items necessary for proper installation.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. ASHRAE - Handbook of Fundamentals; Duct Design.
 - 2. ASHRAE - Handbook of HVAC Systems and Equipment; Duct Construction.
 - 3. ASTM A 90 - Weight of Coating on Zinc-Coated (Galvanized) Iron or Steel Articles.
 - 4. ASTM E 96 - Standard Test Methods for Water Vapor Transmission of Materials.
 - 5. ASTM A 167 - Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.
 - 6. ASTM A 525 - General Requirements for Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process.
 - 7. ASTM A 527 - Steel Sheet, Zinc-Coated (Galvanized) by Hot-Dip Process, Lock Forming Quality.
 - 8. ASTM B209 - Aluminum and Aluminum Alloy Sheet and Plate.
 - 9. NFPA 90A - Installation of Air Conditioning and Ventilating Systems.
 - 10. NFPA 90B - Installation of Warm Air Heating and Air Conditioning Systems.
 - 11. NFPA 96 - Installation of Equipment for the Removal of Smoke and Grease-Laden Vapors from Commercial Cooling Equipment.
 - 12. NFPA 45 - Laboratory Ventilating Systems and Hood Requirements.
 - 13. SMACNA - HVAC Duct Construction Standards.
 - 14. SMACNA - Rectangular Industrial Duct Construction Standards.

15. SMACNA – Round Industrial Duct Construction Standards.
16. SMACNA – HVAC Air Duct Leakage Test Manual.
17. UL 181 - Factory-Made Air Ducts and Connectors.
18. Engineering Design Manual for Air Handling Systems, United McGill Corporation (UMC).
19. Assembly and Installation of Spiral Ducts and Fittings, UMC.
20. Engineering Report No. 132 (Spacing of Duct Hangers), UMC.
21. AWS D1.1 American Welding Society Structural Welding Code.

1.04 DEFINITIONS

A. Low Pressure

1. 2 inch W.G. Pressure Class: Ductwork systems up to 2 inch w.g. positive or negative static pressure with velocities less than or equal to 1500 fpm.

B. Medium Pressure

1. 3 inch W.G. Pressure Class: Ductwork systems over 2 inch w.g. and up to 3 inch w.g. positive or negative static pressure with velocities less than or equal to 2500 fpm.
2. 4 inch W.G. Pressure Class: Ductwork systems over 3 inch w.g. and up to 4 inch w.g. positive or negative static pressure with velocities less than or equal to 2500 fpm.
3. 6 inch W.G. Pressure Class: Ductwork systems over 4 inch w.g. and up to 6 inch w.g. positive or negative static pressure with velocities less than or equal to 2500 fpm.

C. High Pressure

1. 10 inch W.G. Pressure Class: Ductwork systems over 6 inch w.g. and up to 10 inch w.g. positive or negative static pressure with velocities greater than 2500 fpm.

1.05 SUBMITTALS

A. Product Data:

1. Provide the following information for each sheet metal system furnished on the Project:
 - a. System name and type.
 - b. Duct system design pressure.
 - c. Duct material.
 - d. Duct gage.
 - e. Transverse joint methods.
 - f. Longitudinal seam type.
 - g. Sealant type.
 - h. SMACNA rectangular reinforcement type.
 - i. SMACNA intermediate reinforcement type.

- j. SMACNA transverse reinforcement type.

B. Record Documents:

1. Submit Shop Drawings on all items of ductwork, plenums, and casings including construction details and accessories specified herein in accordance with Division 01. Ductwork construction details and materials used for duct sealant, flexible connections, etc. shall be submitted and approved prior to the fabrication of any ductwork.
2. [Option if no Shop Drawings are required: Prepare Shop Drawings for the purpose of coordination with other trades including structural, piping, plumbing, electrical, lighting, and architectural. When Shop Drawings are not required to be submitted for the Project, field sketches and shop tickets must be available to The University upon request. Changes required during construction to accommodate coordination issues will be performed at no additional cost to The University.]
3. Draw ductwork Shop Drawings on minimum 1/4 inch equal to one foot scale building floor plans and shall indicate duct sizes, material, insulation type, locations of transverse joints, fittings, ductwork bottom elevation, offsets, ductwork specialties, fire and fire/smoke dampers, and other information required for coordination with other trades. Clearly designate fire and fire/smoke partitions on the Shop Drawings. Detail Drawings for mechanical rooms and air handling unit locations shall be submitted at a minimum scale of 1/4 inch equal to one foot.
4. Coordinate with all other trades and building construction prior to submitting Shop Drawings for review. Indicate location of all supply, return, exhaust, and light fixtures from approved reflected ceiling plans on Shop Drawings.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver products to the Project Site and store and protect products under provisions of Division 01 and Division 20.
- B. Protect materials from rust both before and after installation.

1.07 WARRANTY

- A. All ductwork shown on the Drawings, specified or required for the air conditioning and ventilating systems shall be constructed and erected in a first class workmanlike manner.
- B. The Work shall be guaranteed for a period of one (1) year from the Project Substantial Completion date against noise, chatter, whistling, vibration, and free from pulsation under all conditions of operation. After the system is in operation, should these defects occur, they shall be corrected as approved by The University at Contractor's expense.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 APPLICATION

- A. Ductwork systems shall be constructed in accordance with the following Materials as a minimum standard. Refer to Drawings for any deviation from this Table.

AIR SYSTEM	MATERIAL	MINIMUM PRESSURE CLASSIFICATION ⁽¹⁾
Supply and Return Systems:		
Untreated Outside Air Intake (Louver) to AHU Plenum	304 Stainless Steel	Low Pressure
Treated Outside Air to AHU	Galvanized Steel	Medium Pressure
Single Zone FCU Supply	Galvanized Steel	Low Pressure
Single Zone AHU Supply	Galvanized Steel	Medium Pressure
Mixed Air (AHU Plenum)	Galvanized Steel	Medium Pressure
AHU Discharge/Vertical Supply Riser	Galvanized Steel	Medium Pressure
Vertical Supply Riser to Terminal Unit	Galvanized Steel	Medium Pressure
Terminal Unit Connection	Metal Flexible Duct	As Specified
Terminal Units to Supply Air Device	Galvanized Steel ⁽²⁾	Low Pressure
Vivarium Supply Air Valve to Air Device	316L Stainless Steel ⁽⁵⁾	Low Pressure
Return Air Device to Return Distribution	Galvanized Steel ⁽²⁾	Low Pressure
Return Air Distribution	Galvanized Steel	Medium Pressure
Return Air Distribution/Vertical Riser	Galvanized Steel	Medium Pressure
Ductwork in MRI Rooms	Aluminum	As Specified
Exhaust Systems:		
Exhaust Air Device to Exhaust Distribution	Galvanized Steel ⁽²⁾	Low Pressure
Exhaust Air Distribution	Galvanized Steel	Medium Pressure
General Exhaust Vertical Riser to Fan	Galvanized Steel	Medium Pressure
Kitchen Hood Exhaust	316L Stainless Steel	Medium Pressure ⁽³⁾
Dishwasher Exhaust	316L Stainless Steel	Medium Pressure
General Lab Exhaust Air Device to Horizontal Distribution	Galvanized Steel	Low Pressure
Hood/Biosafety Cabinet Exhaust to Horizontal Distribution	316L Stainless Steel	Medium Pressure

AIR SYSTEM	MATERIAL	MINIMUM PRESSURE CLASSIFICATION ⁽¹⁾
Combination Lab and General Exhaust Horizontal Distribution (Serving General Exhaust and 3 or fewer CFHs)	316L Stainless Steel	Medium Pressure ⁽⁴⁾
Combination Lab and General Exhaust Horizontal Distribution (Serving General Exhaust and 4 or more CFHs)	Galvanized Steel	Medium Pressure ⁽⁴⁾
Combination Lab and General Exhaust Vertical Riser	Galvanized Steel	Medium Pressure ⁽⁴⁾
Combination Lab and General Exhaust Riser to Filter Housing/Exhaust Plenum	Galvanized Steel	Medium Pressure ⁽⁴⁾
Combination Lab and General Exhaust Fan to Exhaust Stack (including Exhaust Stack)	316L Stainless Steel	Medium Pressure ⁽⁴⁾
Emergency Generator Exhaust	Double Wall or Black Steel	As Specified
MRI Cryogen Vents	304 Stainless Steel or 6061 Aluminum	As Specified
Vivarium General Exhaust Air Valve to Air Device	316L Stainless Steel ⁽⁵⁾	Low Pressure

B. Notes to Table:

1. Positive pressure unless noted otherwise in Table.
2. Air device connections may be made with insulated flexible duct as specified herein.
3. Verify minimum pressure classification per NFPA 96 requirements.
4. Applies to exhaust system for general laboratory exhaust, fume hoods, and biosafety cabinets. Refer to Drawings for construction of any additional exhaust systems.
5. Where ductwork systems are subject to routine decontamination (HPV, Clidox, etc.), provide 316L stainless steel ductwork as indicated.

C. [Note to Specifier: the above Table can be modified to suit Project requirements. If Project conditions differ from the Table, changes shall be noted on the Drawings and in the submittals.]

2.03 DUCTWORK MATERIAL AND CONSTRUCTION

- A. All ductwork indicated on the Drawings, specified or required for the air conditioning and ventilating systems shall be of materials as hereinafter specified unless indicated otherwise on Drawings. All air distribution ductwork shall be fabricated, erected, supported, etc., in accordance with all applicable standards of SMACNA where such standards do not conflict with NFPA 90A and where class of construction equals or exceeds that noted herein.
- B. Ductwork shall be constructed of G-90 coated galvanized steel of ASTM A653 and A924 Standards.
- C. Minimum gage of round, oval or rectangular ductwork shall be 26 gage per SMACNA Standards.
- D. All duct sizes shown on the Drawings are clear inside dimensions. Allowance shall be made for internal lining, where specified, to provide the required free area.
- E. All holes in ducts for damper rods and other necessary devices shall be either drilled or machine punched (not pin punched), and shall not be any larger than necessary. All duct openings shall be provided with sheet metal caps if the openings are to be left unconnected for any length of time.

- F. Except for specific duct applications specified herein, all sheet metal shall be constructed from prime galvanized steel sheets and/or coils up to 60 inches in width. Each sheet shall be stenciled with manufacturer's name and gage.
- G. Sheet metal must conform to SMACNA sheet metal tolerances as outlined in SMACNA's "HVAC Duct Construction Standards."
- H. Where ducts are exposed to view (including equipment rooms) and where ducts pass through walls, floors or ceilings; furnish and install sheet metal collars around the duct.
- I. Spin-in fittings shall be as specified under Section 23 33 00 – Ductwork Accessories.
- J. Duct Sealing: All ductwork, regardless of system pressure classification, shall be sealed in accordance with Seal Class A, as referenced in SMACNA Standards. All transverse joints, longitudinal seams, and duct wall penetrations shall be sealed.
 - 1. All seams and joints in shop and field fabricated ductwork shall be sealed by applying one layer of sealant, then immediately spanning the joint with a single layer of 3 inches wide open weave fiberglass scrim tape. Sufficient additional sealant shall then be applied to completely embed the cloth.
 - 2. Sealant shall be water based, latex UL 181B-M sealant with flame spread of 0 and smoke developed of 0. Sealants shall be similar to Hard Cast Iron Grip 601, Ductmate Pro Seal or Design Polymeric DP 1010.
 - 3. Scrim tape shall be fiberglass open weave tape, 3 inches wide, with maximum 20/10 thread count, similar to Hardcast FS-150.
 - 4. Sealer shall be rated by the manufacturer and shall be suitable for use at the system pressure classification of applicable ductwork.
 - 5. Except as noted, oil or solvent-based sealants are specifically prohibited.
 - 6. For exterior applications, "Uni-Weather" (United McGill Corporation) solvent-based sealant shall be used.

2.04 RECTANGULAR AND ROUND DUCTWORK

- A. Metal gages listed in SMACNA HVAC Duct Construction Standards, Metal and Flexible Duct, are the minimum gages which shall be used. Select metal gage heavy enough to withstand the physical abuse of the installation. In no case shall ductwork be less than 26 gage per SMACNA Standards.
- B. All longitudinal seams for rectangular duct shall be selected for the specified material and pressure classification. Seams shall be as referenced in SMACNA Standards.
- C. Longitudinal seams in laboratory hood exhaust ducts shall be welded.
- D. All transverse joints and intermediate reinforcement on rectangular duct shall be as shown in SMACNA Standards. Transverse joints shall be selected consistent with the specified pressure classification, material, and other provisions for proper assembly of ductwork.
- E. Spiral round duct and fittings shall be as manufactured by United McGill Sheet Metal Company or approved equivalent. All fittings shall be factory fabricated, machine formed and welded from galvanized sheet metal.
- F. Joints in spiral duct and fittings shall be assembled, suspended, sealed, and taped per manufacturer's published assembly and installation instructions.

- G. Contractor may use DUCTMATE or Ward Industries coupling system, as an option, on rectangular ductwork. The DUCTMATE or Ward Industries system shall be installed in strict accordance with manufacturer's recommendations.

2.05 FLAT OVAL DUCTWORK AND FITTINGS

- A. Oval ducts shall be spiral flat oval or welded flat oval equivalent to those of United McGill Sheet Metal Company with gage and reinforcing as recommended by the manufacturer. Duct may be shop fabricated or completely welded construction in accordance with SMACNA Standards.
- B. Oval ducts greater than 24 inch x 72 inch shall be longitudinal seam, flat oval duct, rolled, welded and provided in standard lengths of 5 and 10 feet. Transverse joints shall be factory welded or field connected with flanges or slip couplings. Duct will be fabricated from galvanized steel meeting ASTM A 527 standards.
- C. Duct reinforcing angles shall be of sizes specified for same size rectangular duct. Galvanized angles shall be used where standing seams are specified for rectangular duct.
- D. Oval fittings shall comply with requirements, sealing, etc., similar to that specified for round ductwork. Manifolding taps may be permitted without increasing the length of run in the branch duct system.
- E. Elbows in oval ducts may be smooth long radius or 5-piece 90-degree elbows and 3-piece 45-degree elbows. Joints in sectional elbows shall be sealed as specified for duct sealing.

2.06 CONICAL BELLMOUTH FITTINGS AND TAPS

- A. Conical bellmouth fittings shall be made from 26-gage G-90 coated galvanized steel. Two-piece construction with a minimum overall length of 6 inches and factory sealed for high-pressure requirements. Average of loss coefficient for sizes 6, 8 and 10 shall be less than 0.055.
- B. Provide each fitting with minimum 24-gage damper plate with locking quadrant operator and sealed end bearings. Damper blade shall be securely attached to shaft to prevent damper from rotating around shaft. Shaft shall be extended to clear insulation.
- C. Provide a flange and gasket with adhesive peel-back paper for ease of application. The fittings shall be further secured by sheet metal screws spaced evenly at no more than 4 inches on center with a minimum of four (4) screws per fitting.
- D. Conical bellmouth fittings shall be Series 3000G as manufactured by Flexmaster U.S.A., Inc. or Buckley Air Products, Inc., "AIR-TITE".

2.07 CASINGS AND PLENUMS - 2 INCH W.G. PRESSURE CLASS

- A. All 2 inch w.g. pressure class casings and plenums for mixed air plenums shall be constructed in accordance with SMACNA Standards.
- B. All casings shall enclose the filter and automatic dampers as shown on the Drawings. Casings shall be fabricated of galvanized sheet metal erected with three-foot center maximum standing seams reinforced with ¼-inch bars. The casing shall be stiffened on three-foot centers maximum with angle irons tack welded in place.
- C. All openings to the casing shall be properly sealed to prevent any air leakage. Access doors shall be installed as indicated on the Drawings and shall be air tight, double skin insulated construction with frames welded in place. Doors shall be rubber gasketed with #390 Ventlok gasketing and equipped with fasteners equal to Ventlok #310 latches and #370 hinges that can be operated from both the inside and the outside.

- D. Casings shall be anchored by the use of angle irons sealed and bolted to the curb and floor of the apparatus casing. Casings shall be tested and provided tight at a pressure of three inches water column.
- E. Insulate per Section 23 07 13.

2.08 CASINGS AND PLENUMS – 6 INCH W.G. PRESSURE CLASS

- A. Shall enclose filters and automatic dampers at air handling unit systems. Casings shall be constructed of cellular, standing seam panels with 3 inch deep reinforced “hat” sections as manufactured by metal deck manufacturers and as described in SMACNA Standards.
- B. All openings to the casing shall be properly sealed to prevent air leakage. Install access doors for easy access to equipment. Access doors shall be air tight, double skin insulated construction with frames welded in place. Doors shall be rubber gasketed with #390 Ventlok gasketing and equipped with fasteners equal to Ventlok #310 latches that can be operated from both the inside and outside. Hinges shall be equivalent to Ventlok #370.
- C. Anchor casing by the use of galvanized angle irons sealed and bolted to the curb and floor of the apparatus casing as indicated in SMACNA Standards.
- D. A fan discharge diffuser plate shall be located on the fan discharge and shall be constructed of 10 gage steel perforated plate installed in 6 inch channel iron frames (8.2#) rigidly supported to withstand the fan discharge velocity. Perforations shall be 3/8 inch (0.375 inch) staggered on 11/16 inch centers (27 percent open area). One section shall be hinged to provide an access door between the discharge side of the fan and the entering side of the coils. After fabrication of the diffuser plate, coat with rust-resistant paint. After installation, touch up diffuser plate and paint channel iron frames with rust-resistant paint.
- E. Provide sufficient access openings to allow access for maintenance of all parts of the apparatus. Access door size shall be as large as feasible for the duty required.
- F. Insulate per Section 23 07 13.

2.09 ELBOWS RECTANGULAR DUCTS

- A. Construct elbows as follows in order of preference:
 - 1. Long radius, unvaned elbows.
 - 2. Short radius, single thickness vaned elbows.
 - 3. Rectangular, double thickness vaned elbows.
- B. Long radius elbows shall have a centerline radius of not less than one and one-half (1-1/2) times the duct width. Short radius elbows shall have a centerline radius of not less than one times the duct width.
- C. Contractor shall have the option to substitute short radius vaned elbows, but shall request the substitution at the time of submittal of Product Data.
- D. Provide turning vanes in all rectangular elbows and offsets.
- E. Job fabricated turning vanes, if used, shall be fabricated of the same gage and type of material as the duct in which they are installed. Vanes must be fabricated for same angle as duct offset. Submit Shop Drawings on factory fabricated and job fabricated turning vanes.

- F. All turning vanes shall be anchored to the cheeks of the elbow in such a way that the cheeks will not breathe at the surfaces where the vanes touch the cheeks. In most cases, this will necessitate the installation of an angle iron support on the outside of the cheek parallel to the line of the turning vanes.
- G. In 90-degree turns that are over 12 inches wide in the plane of the turn, provide and install double thickness vanes on integral side rails. For ducts under 12 inches in width, use single thickness vanes. The installation of the turning vanes shall be as described for single thickness vanes. On other types of turns or elbows, single thickness trailing edge vanes shall be used.

2.10 FLEXIBLE DUCT

- A. Flexible duct shall be used where flexible duct connections are shown on the Drawings to air distribution devices and terminal units and as scheduled under "Ductwork System Applications."
- B. Acoustical Flexible Duct to Diffusers, Grilles, and Terminal Units:
 - 1. Maximum length 6'-0" (six feet), installed with no more than 90 degrees of bend. Where longer duct runs or more bends are necessary, provide rigid round ductwork.
 - 2. Acoustical flexible duct shall be manufactured with an acoustically rated CPE inner film as the core fabric, mechanically locked by a corrosion-resistant galvanized steel helix.
 - 3. Core shall be factory pre-insulated with a total thermal performance of R-3.5 or greater. Outer jacket shall be a fire retardant polyethylene vapor barrier jacket with a perm rating not greater than 0.10 per ASTM E 96, Procedure A.
 - 4. Duct shall be rated for a minimum positive working pressure of 6 inches w.g. and a negative working pressure of 4 inches w.g. minimum.
 - 5. Temperature range shall be -20 degrees F to 250 degrees F.
 - 6. Duct must comply with the latest NFPA Bulletin 90A and be listed and labeled by Underwriter's Laboratories, Inc., as Class I Air Duct, Standard 181, and meet GSA, FHA and other U. S. Government standards; flame spread less than 25; smoke developed less than 50.
 - 7. Acoustical flexible duct shall be similar to Flexmaster Type 8M for construction and acoustical performance standards.
- C. Metal Flexible Duct:
 - 1. May be used for terminal unit connections from sheet metal ductwork where shown on the Drawings.
 - 2. Maximum length 2'-0" (two feet), installed in straight runs only. Where longer duct runs or direction changes are necessary, provide rigid round ductwork.
 - 3. Duct shall be constructed of 0.005 inch thick 3003-H14 aluminum alloy in accordance with ASTM B209. Duct shall be spiral wound into a tube and spiral corrugated to provide strength and flexibility.
 - 4. Core shall be factory pre-insulated with a total thermal performance of R-3.5 or greater. Outer jacket shall be fire retardant metalized vapor barrier jacket of fiberglass reinforced aluminum foil, with a permeance rating not greater than 0.05 per ASTM E96, Procedure A.
 - 5. The duct shall be rated for a minimum positive and negative working pressure of 10 inch w.g.
 - 6. Temperature range shall be -40 degrees F to 250 degrees F.

7. Duct must comply with the latest NFPA Bulletin 90A and be listed and labeled by Underwriter's Laboratories, Inc., as Class I Air Duct, Standard 181, and meet GSA, FHA and other U. S. Government standards; flame spread less than 25; smoke developed less than 50.
8. Metal flexible duct shall be similar to Flexmaster triple lock Type TL-M.

2.11 STAINLESS STEEL DUCTWORK

- A. Applies to general laboratory exhaust, fume hood, biosafety cabinet, radioisotope hood, vivarium supply and exhaust systems subject to routine decontamination (HPV, Clidox, etc.), and moisture exhaust systems where indicated on the Drawings and as specified herein.
- B. Stainless steel shall be 316-L with welded longitudinal seams and welded transverse joints. Welds on exposed ductwork shall be positioned for minimum view and shall be ground and polished. Duct sealant shall not be used to seal this ductwork.
- C. All ductwork risers shall be installed as vertical as possible within the constraints of the design indicated on the Drawings.
- D. In all cases, ductwork shall be installed so that the washdown water, where installed, shall drain back to the hood.
- E. Metal gages shall be not less than the following:

DUCT SIZE	GAGE
30-inch diameter or less	18
31-inch to 60-inch diameter	16
61-inch diameter or greater	14
Greater than 60 x 42 (rectangular or oval)	Comply with SMACNA

- F. The joining of stainless steel ductwork with galvanized ductwork where indicated in the Drawings shall use ductwork construction methods specified herein for galvanized ductwork.
- G. Connections to Air Devices Cabinets or Hoods:
 1. Where approved by Owner, flexible stainless steel ducting can be used in lieu of hard pipe stainless steel at cabinets or hoods
 2. For all non insulated duct applications flexible ducting shall be 316 TI stainless steel; pressure rated for 12 inches w.g. positive and negative; UL 181, Class 0 air duct rated; Velocity Rated for 5500 fpm. Similar to Flexmaster Type SS-NI-TL.
 3. For all insulated duct applications, flexible ducting shall be 316 stainless steel; pressure rated for 12 inches w.g. positive and negative; UL 181, Class 1 air duct rated; Velocity Rated for 5500 fpm. Similar to Flexmaster Type SS-TLM.

2.12 ALUMINUM DUCTWORK

- A. Provide 6061 Aluminum ductwork only where indicated on the Drawings and as specified herein. Applies typically to ductwork within MRI rooms.
- B. Duct joints shall be all soldered construction, one standard gage heavier than for the same size galvanized steel ducts. Refer to SMACNA for equivalent aluminum thickness and reinforcement.
- C. Construction method shall follow the specified methods for galvanized ductwork, except that no ferrous materials may be used. Only aluminum, copper and brass must be used in construction in locations requiring aluminum ductwork; this includes fasteners, hangers, anchors, etc.
- D. Connections to Equipment:

1. Where approved by Owner, flexible stainless steel ducting can be used in lieu of hard pipe stainless steel.
2. Flexible ducting shall be 316 TI stainless steel; pressure rated for 12 inches w.g. positive and negative; UL 181, Class 0 air duct rated; Velocity Rated for 5500 fpm. Similar to Flexmaster Type SS-NL-TL.

2.13 KITCHEN HOOD EXHAUST

- A. Stainless steel with liquid tight welded longitudinal seams and transverse joints, as specified under "Stainless Steel Ductwork" and as further specified herein.
- B. Construction shall be in accordance with NFPA 96 and applicable SMACNA Standards.
- C. Slope duct toward hood connections and cleanout points as shown on the Drawings.
- D. No turning vanes, dampers, or other interior intrusions shall be installed in the ductwork system.
- E. All changes in direction shall be with radius elbows (centerline radius equal 1.5 x duct width).
- F. Provide rated access doors for installation by the Contractor at all locations necessary.
- G. Coordinate required rated enclosure of kitchen hood exhaust and access points with the Contractor.
- H. Manufactured double wall duct systems with NFPA certification for grease systems may be used in lieu of above referenced materials.

2.14 CAGE AND RACK WASHER EXHAUST SYSTEMMS

- A. Staniless steel with liquid tight welded longitudinal seams and transverse joints, as specified under „Stainless Steel Ductwork“ and as further specified herein
- B. Construction shall be in accordance with NFPA 96 and applicable SMACNA Standards.
- C. Slope duct toward equipment connections and cleanout points as shown on the Drawings.
- D. No turning vanes, dampers, or other interior intrusions shall be installed in the ductwork system.
- E. All changes in direction shall be with radius elbows (centerline radius equal 1.5 x duct width).
- F. Provide rated access doors for installation by the Contractor at all locations necessary
- G. Provide drains at low points and as required.

2.15 MRI CRYOGEN VENT PIPE

- A. For cryogenic venting, welded stainless steel or aluminum pipe shall be used in all MRI or similar rooms where shown on the Drawings.
- B. Stainless steel pipe shall be Type 304 non-ferromagnetic, thickness 0.035 inch minimum and 0.125 inch maximum.
- C. Aluminum pipe shall be Type 6061-T6, thickness 0.083 inch minimum and 0.125 maximum.
- D. Piping shall be installed with bracing as required to withstand the forces encountered during a cryogenic release event.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Cleanliness:
 - 1. Before installing ductwork, wipe ductwork to a visibly clean condition.
 - 2. During construction, provide temporary closures of metal or taped polyethylene on open ductwork and duct taps to prevent construction dust or contaminants from entering ductwork system. Seal ends of ductwork prior to installation to keep ductwork interior clean. Remove closures only for installation of the next duct section.
 - 3. For ductwork supplying Clean Rooms, Operating Rooms and other Critical Care areas, sanitize ductwork with a biocidal agent EPA approved for HVAC systems immediately prior to sealing ductwork.
 - 4. During duration of construction, maintain the integrity of all temporary closures until air systems are activated.
- D. Provide openings in ductwork where required to accommodate thermometers, controllers and other devices. Provide pitot tube openings where required for testing of systems, complete with metal can with spring device or screw to ensure against air leakage. Where openings are provided in insulated ductwork, install insulation material inside a metal ring. Sleeve of pitot tube opening shall be no more than one inch long. Opening shall be one inch wide to accept pitot tube.
- E. Locate ducts with sufficient space around equipment to allow normal operating and maintenance activities.
- F. Slope underground ducts to plenums or low pump out points at 1:500. Provide access doors for inspection.
- G. Coat buried, metal ductwork without factory jacket with one coat and seams and joints with additional coat of asphalt base protective coating.
- H. Set plenum doors 6 to 12 inches above floor. Arrange door swings so that fan static pressure holds door in closed position.
- I. Provide residue traps in kitchen hood exhaust ducts at base of vertical risers with provisions for cleanout. Use stainless steel for ductwork exposed to view and stainless steel for ducts where concealed.
- J. All visible welds in ductwork between biosafety cabinets, canopy hoods and fume hoods and the ceiling shall be ground and polished.
- K. Slope duct toward grilles for moisture-laden ducts. Provide drain and trap at elbow of main moisture exhaust duct system.
- L. Flexible Duct:
 - 1. The terminal ends of the duct core shall be secured by compression coupling or stainless steel worm gear type clamp.

2. Fittings on terminal units and on sheet metal duct shall have flexible duct core slipped over duct and coupling or clamp tightened, then connection sealed with sealant. Insulation of flexible duct shall be slipped over connection to point where insulation abuts terminal unit or insulation on duct.
 3. These insulation connections shall be sealed by embedding fiberglass tape in the sealant and coating with more sealant to provide a vapor barrier.
 4. For 90 degree elbows use Flexmaster USA FlexRight Elbow or approved Equal.
- M. Support flexible ducts as per SMACNA standards to prevent sags, kinks and to have 90 degree turns.
- N. Hangers and Supports:
1. All ductwork supports shall be in accordance with Table 4-1 (rectangular duct) and Table 4-2 (round duct) of the SMACNA Standards, with all supports directly anchored to the building structure.
 2. Rectangular duct shall have at least one pair of supports on minimum 8'-0" (eight feet) centers. All horizontal round and flat oval ducts shall have ducts hangers spaced 10'-0" (ten feet) maximum.
 3. Lower attachment of hanger to duct shall be in accordance with Table 4-4 of the SMACNA Standards.
 4. Vertical ducts shall be supported where they pass through the floor lines with 1-1/2 inch x 1-1/2 inch x 1/4 inch angles for duct widths up to 60 inches. Above 60 inches in width, the angles must be increased in strength and sized on an individual basis considering space requirements.
 5. Hanger straps on duct widths 60 inches and under shall lap under the duct a minimum of 1 inch and have minimum of one fastening screw on the bottom and two on the sides.
 6. Hanger straps on duct widths over 60 inches shall be bolted to duct reinforcing with 3/8 inch bolts minimum.

3.02 DUCTWORK SYSTEM CLEANING

- A. If the system has been operated without scheduled filters or if the integrity of temporary closures has been compromised, Contractor shall have ductwork cleaned according to National Air Duct Cleaners Association (NADCA) Standards by a Certified Regular Member of the NADCA.
1. For ductwork supplying Clean Rooms or patient care areas, also sanitize the ductwork interior per NADCA standards with a biocidal agent approved by the EPA for use in HVAC Systems.
- B. Before turning the installation over to The University, Contractor shall certify that the air handling systems have only been operated with scheduled filters in place. Otherwise, Contractor shall present evidence that the ductwork was cleaned as required above.

3.03 TESTING

- A. All medium and high pressure duct systems (positive or negative) shall be pressure tested according to SMACNA test procedures (HVAC Air Duct Leakage Test Manual). Notify Owner minimum seven (7) calendar days in advance of leakage testing.
1. Design pressure for testing ductwork shall be determined from the maximum pressure generated by the fan at the nominal motor horsepower selected.
 2. Total allowable leakage shall not exceed 1 percent of the total system design airflow rate.

3. When partial sections of the duct system are tested, the summation of the leakage for all sections shall not exceed the total allowable leakage.
 4. Leaks identified during leakage testing shall be repaired by:
 - a. Complete removal of the sealing materials.
 - b. Thorough cleaning of the joint surfaces.
 - c. Installation of multiple layers of sealing materials.
 5. The entire ductwork system shall be tested, excluding connections upstream of the terminal units (i.e. ductwork shall be capped immediately prior to the terminal units, and tested as described above).
 6. After testing has proven that ductwork is installed and performs as specified, the terminal units shall be connected to ductwork and connections sealed with extra care. Contractor shall inform The University when joints may be visually inspected for voids, splits, or improper sealing of the joints. If any leakage exists in the terminal unit connections/joints after the systems have been put into service, leaks shall be repaired as specified for other leaks.
- B. All low-pressure duct systems (positive or negative) shall be inspected for visible and audible signs of leakage.
1. Leaks identified by inspection shall be repaired by:
 - a. Complete removal of the sealing materials.
 - b. Thorough cleaning of the joint surfaces.
 - c. Installation of multiple layers of sealing materials.
 2. Discrepancies found during testing and balancing between duct traverses and diffuser/grille readings shall result in re-inspection, repair and retest until discrepancies are eliminated.
- C. [At the option of The University, if documented in writing, Contractor may be allowed to eliminate testing of terminal units by capping the supply ductwork prior to the terminal units, then inspecting the connection to the terminal units when complete. This option may only be exercised by The University, only if documented in writing prior to testing.]
- D. Ductwork leakage testing and/or inspection shall be performed prior to installation of external ductwork insulation.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 31 13 33 - DUCT ACCESSORIES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Perform all Work required to provide and install the following ductwork accessories indicated by the Contract Documents with supplementary items necessary for proper installation.
 - 1. Airflow control dampers and spin-in fittings.
 - 2. Fire dampers, smoke dampers, and combination fire and smoke dampers.
 - 3. Flexible duct connections.
 - 4. Duct access doors.
 - 5. Screens
 - 6. Duct test holes.
 - 7. Guy wire systems.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. AMCA 500D – Laboratory Method of Testing Dampers for Rating.
 - 2. AMCA 500L – Laboratory Method of Testing Louvers for Rating.
 - 3. NFPA 90A - Installation of Air Conditioning and Ventilating Systems.
 - 4. NFPA 101 - Life Safety Code.
 - 5. SMACNA - HVAC Duct Construction Standards.
 - 6. UL 33 - Heat Responsive Links for Fire-Protection Service.
 - 7. UL 555 – Standard for Fire Dampers.
 - 8. UL 555C – Standard for Ceiling Dampers.
 - 9. UL 555S – Standard for Smoke Dampers.

1.04 SUBMITTALS

A. Product Data:

1. Provide product data for shop fabricated assemblies including, but not limited to, volume control dampers, duct access doors, and duct test holes. Provide product data for hardware used.

B. Record Documents:

1. Fire Dampers: The damper manufacturer's literature submitted for approval prior to the installation shall include performance data developed from testing in accordance with AMCA 500D standards and shall show the pressure drops for all sizes of dampers required at anticipated air flow rates. Maximum pressure drop through fire damper shall not exceed 0.05-inch water gauge.
2. Combination Fire/Smoke Dampers: Assign identification numbers for each damper with corresponding number noted on Drawings. Provide air quantity, size, free area of damper, pressure drop and proposed velocity through each damper. Provide manufacturer's data of damper and its accessories or options. At Owner's request, provide two (2) dampers (18 inch x 12 inch) for the purpose of illustrating damper operation to Owner's operating and maintenance personnel.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

A. Dampers:

1. Greenheck.
2. Louvers and Dampers, Inc.
3. Nailor Industries.
4. Prefco.
5. Ruskin.

B. Regulators, Locking Quadrants:

1. Ventfabrics.

2.03 AIR FLOW CONTROL DAMPERS

- A. Furnish and install dampers where shown on the Drawings and wherever necessary for complete control of airflow, including all supply, return, outside air, and exhaust branches, "division" in main supply, return and exhaust ducts, and each individual air supply outlet. Where access to dampers through a permanent suspended ceiling (gypsum board) is necessary, the Contractor shall be responsible for the proper location of the access doors.
- B. Dampers larger than three (3) square feet in area shall be controlled by a self-locking splitter damper assembly.

- C. Volume damper blades shall not exceed 48 inches (48") in length or twelve inches (12") in width and shall be of the opposed interlocking type. The blades shall be of not less than No. 16 gage galvanized steel supported on one-half inch (1/2") diameter rust-proofed axles. Axle bearings shall be the self-lubricating ferrule type.
- D. Volume dampers and other manual dampers shall be carefully fitted, and shall be manually controlled by damper regulators as follows:
 - 1. On exposed uninsulated ductwork the locking quadrant shall be made with a base plate of 16-gage cold-rolled steel and a heavy die cast handle designed with a 3/8 inch bearing surface. A 1/4 inch-20 zinc plated wing nut shall firmly lock the handle in place.
 - 2. On exposed externally insulated ductwork the regulator shall be 4-1/4 inch diameter, for 1/2 inch rod, designed for use on duct with insulation thickness specified for duct, and shall have four (4) 3/16 inch holes provided to rivet or screw regulator to the duct surface. The flange that covers the raw edge of the insulation shall be high enough so that it slightly compresses the insulation and holds insulation in place. The handle shall be 3/8 inch above the flange, and shall easily turn without roughing up the insulation.
 - 3. On concealed ductwork above inaccessible ceilings, the regulator shall be 2-5/8 inch diameter chromium plated cover plate that telescopes into the base, for 1/2 inch rod. Regulator shall be cast into a box for mounting in ceilings. Base shall be 1-1/2 inch deep. The cover shall be secured by two screws that can be easily removed for damper adjustment.
 - 4. Furnish and install end bearings for the damper rods on the end opposite the quadrant.
- E. Duct taps to air devices and shall include dampers on all duct to air devices (diffusers and grilles) even though a volume damper is specified for the air device. Spin-in fittings shall be similar to Flexmaster STD, nylon bushings, locking quadrant similar to Duro Dyne KR-3, and a 3/8 inch square rod connected to the damper with U-bolts. Fittings shall be sealed at the duct tap with sealant as specified herein. Determine location of spin-in fittings after terminal units are hung or after location of light fixtures are confirmed to minimize flexible duct lengths and sharp bends.

2.04 FIRE DAMPERS

- A. Each fire damper shall be constructed and tested in accordance with Underwriters Laboratories Safety Standard 555, latest edition. Dampers shall possess a 1-1/2 hour or 3 hour (as appropriate for the construction shown in the architectural Drawings) protection rating, 160 or 165 degrees F fusible link, and shall bear a U.L. label in accordance with Underwriters' Laboratories labeling procedures. Construct fire dampers such that damper frame material and curtain material are galvanized.
- B. Fire dampers shall be curtain blade type and damper shall be constructed so that the blades are out of the air stream to provide 100 percent free area of duct in which the damper is housed.
- C. Equip fire dampers for vertical or horizontal installation as required by location shown on Drawings. Install fire dampers in wall and floor openings utilizing steel sleeves, angles and other material and practices as required to provide an installation equivalent to that utilized by the manufacturer when the respective dampers were tested by Underwriters Laboratories. Mounting angles shall be minimum 1-1/2 inch by 1-1/2 inch by 14 gage and bolted, tack welded or screwed to the sleeve at maximum spacing of 12 inches and with a minimum of two connections at all sides. Mounting angles shall overlap at least equal to the duct gage as defined by the appropriate SMACNA Duct Construction Standard, latest edition, and as described in NFPA 90A. The entire assembly, following installation, shall be capable of withstanding 6 inch water gauge static pressure.
- D. All fire dampers shall be dynamic rated type.
- E. Completely seal the damper assembly to the building components using manufacturer recommended material(s).

2.05 COMBINATION FIRE/SMOKE DAMPERS

- A. Provide one damper motor for each 12 square feet of damper area.
- B. Each combination fire/smoke damper shall be 1-1/2 hour fire rated under UL Standard 555, Current Edition, and shall be further classified by Underwriters Laboratories as a Leakage Rated Damper for use in smoke control systems under the latest version of UL555S, and bear a UL label attesting to same. Damper manufacturer shall have tested and qualified with UL, a complete range of damper sizes covering all dampers required by this Specification. Testing and UL qualifying a single damper size is not acceptable. The leakage rating under UL555S shall be no higher than Leakage Class II (4 CFM per square foot at one-inch water gauge pressure and 8 CFM per square foot at 4 inches water gauge pressure). Maximum air pressure drop through each combination fire/smoke damper shall not exceed 0.10-inch water gauge at the design air quantity. (Note that this may require a larger damper than the connected duct size.) All ratings shall be dynamic.
- C. Damper frame shall be minimum 20-gage galvanized steel formed into a structural hat channel shape with tabbed corners for reinforcement, as approved in testing by Underwriters Laboratories. Bearings shall be integral high surface area non electrolytic materials construction to incorporate a friction free frame blade lap seal, or molybdenum disulfide impregnated stainless steel or bronze oilite sleeve type turning in an extruded hole in the frame or an extruded frame raceway. Dampers may be either parallel or opposed blade type. Blades shall be constructed with a minimum of 14-gage equivalent thickness. Blade edge seal material shall be able to withstand 450 degrees F. Jamb seals shall be flexible stainless steel compression type or lap seal type.
- D. In addition to the leakage ratings specified herein, combination fire/smoke dampers and their operators shall be qualified under UL555S to an elevated temperature of 350 degrees F. Electric operators shall be installed by the damper manufacturer at the time of damper fabrication. Damper and operator shall be supplied as a single entity that meets all applicable UL555 and UL555S qualifications for both dampers and operators. Manufacturer shall provide a factory-assembled sleeve. Sleeve shall be minimum 20-gage for dampers where neither width nor height exceeds 48 inches or 16-gage where either dimension equals or exceeds 48 inches.
- E. As part of the UL qualification, dampers shall have demonstrated a capacity to operate (open and close) under HVAC system operation conditions, with pressures at least 4 inches water gauge in the closed position, and 2500 fpm air velocity in the open position.
- F. Each combination fire/smoke damper, except as noted hereinafter, shall be equipped with a UL Classified firestat/releasing device. The firestat/releasing device shall electrically (24 VAC) and mechanically (pneumatically) lock the damper in a closed position when the duct temperatures exceed 165 degrees F and still allow the appropriate authority to operate the damper as may be required for smoke control functions. Damper must be operable while the temperature is above 350 degrees F. Actuator/operator package shall include two damper position indicator switches linked directly to damper blade to provide capability of remotely indicating damper position. One switch shall close when the damper is fully open, and the other switch shall close when the damper is fully closed. The firestat/releasing device and position indicator switches shall be capable of interfacing electrically with the smoke detectors, building fire alarm system, and remote indicating/control stations or building automation system (BAS).
- G. Damper releasing device shall be mounted within the airstream. Device shall be activated and the damper shall close and lock when subjected to duct temperatures in excess of approximately 285 degrees F.

- H. Motors for operation of smoke dampers shall be smoke system fail safe, spring return normally open supplies and normally closed returns, or as indicated on the Drawings, and shall be furnished and installed by the damper manufacturer as required by the U.L. rating mentioned above. Motors shall be electric or pneumatic to match the type of temperature control system specified elsewhere in this Specification. Furnish all required relays, EP switches, wiring piping and other labor and material necessary to completely interconnect the smoke detector system.
- I. Furnish each damper in a square or rectangular configuration. Furnish and install sleeves manufactured by the approved damper manufacturer for each damper. Construct sleeves with square or rectangular to square, rectangular, round, or oval adapters as required. Dampers shall be installed in the sleeves in accordance with manufacturer's U.L. installation instructions. The entire assembly, following installation, shall operate smoothly and be capable of withstanding 6 inch water gauge static pressure.
- J. All combination fire/smoke dampers shall be dynamic type.
- K. Completely seal the damper assembly to the building components using manufacturer recommended material(s).

2.06 SMOKE DAMPERS

- A. Provide one damper motor for each 12 square feet of damper area.
- B. Each smoke damper shall be dynamic rated type and shall be further classified by Underwriters Laboratories as a Leakage Rated Damper for use in smoke control systems under the latest version of UL555S, and bear a UL label attesting to same. Damper manufacturer shall have tested, and qualified with UL, a complete range of damper sizes covering all dampers required by this Specification. Testing and UL qualifying a single damper size is not acceptable. Leakage rating under UL555S shall be no higher than Leakage Class II (4 CFM per square foot at one-inch water gauge pressure and 8 CFM per square foot at 4 inches water gauge pressure). Maximum air pressure drop through each smoke damper shall not exceed 0.10-inch water gauge at the design air quantity. (Note that this may required a larger damper than the connected duct size.) All ratings shall be dynamic.
- C. Damper frame shall be minimum 0.125-inch aluminum formed into a structural hat channel shape with corner braces for reinforcement, as approved in testing by Underwriters Laboratories. Bearings shall be stainless steel sleeve type turning in an extruded hole in the frame or an extruded frame raceway. Dampers shall be opposed blade type. Blades shall be airfoil shaped double skin construction. Blade edge seal material shall be silicone rubber designed to withstand 450 degrees F. Jamb seals shall be aluminum flexible metal compression type.
- D. In addition to the leakage ratings specified herein, smoke dampers and their operators shall be qualified under UL555S to an elevated temperature of 350 degrees F. Pneumatic operators shall be installed by the damper manufacturer at the time of damper fabrication. Damper and operator shall be supplied as a single entity that meets all applicable UL555 and UL555S qualifications for both dampers and operators. Manufacturer shall provide factory-assembled sleeve. Sleeve shall be minimum 21-gage for dampers where neither width nor heights exceeds 48 inches or 16-gage where either dimensions equals or exceeds 48 inches.
- E. As part of the UL qualification, dampers shall have demonstrated a capacity to operate (open and close) under HVAC system operation conditions, with pressures of at least 4 inches water gauge in the closed position, and 2000 fpm air velocity in the open position.

- F. The damper must be operable while the temperature is above 350 degrees F. The actuator/operator package shall include two damper position indicator switches linked directly to damper blade to provide capability of remotely indicating damper position. One switch shall close when the damper is fully open, and the other switch shall close when the damper is fully closed. Position indicator switches shall be capable of interfacing electrically with the smoke detectors, building fire alarm systems, and remote indicating/control stations (BAS).
- G. Motors for operation of smoke dampers shall be smoke system fail safe, spring return normally open supplies and normally closed returns, or as indicated on the Drawings, and shall be furnished and installed by the damper manufacturer as required by the UL rating mentioned above. Motors shall be electric or pneumatic to match the type of temperature control system specified elsewhere in this Specification. Furnish all required relays, EP switches, wiring piping and other labor and material necessary to completely interconnect the smoke detector system.
- H. Furnish each damper in a square or rectangular configuration. Furnish and install sleeves manufactured by the approved damper manufacturer for each damper. Construct sleeves with square or rectangular to square, rectangular, round, or oval adapters as required. Install dampers in the sleeves in accordance with manufacturer's UL installation instructions. Entire assembly, following installation, shall operate smoothly and be capable of withstand 6 inch water guage static pressure.
- I. All smoke dampers shall be dynamic type.
- J. Completely seal the damper assembly to the building components.

2.07 FLEXIBLE CONNECTIONS

- A. Where ducts connect to fans, including roof mounted exhaust fans, or at MRI cryogenic vent connections, flexible connections shall be made using "Flexmaster TL-M" or "Ventglas" fabric that is temperature-resistant, fire-resistant, waterproof, mildew-resistant and practically airtight, weighing approximately thirty ounces (30 oz.) per square yard.
- B. Material used outdoors shall be resistant to ultra-violet sunrays. There shall be a minimum of one-half inch (1/2-inch) slack in the connections, and a minimum of two and one-half inches (2-1/2-inch) distance between the edges of the ducts. This does not apply to air handling units with internal isolation.

2.08 ACCESS DOORS

- A. Furnish and install in the ductwork, hinged rectangular, pressure relief, or round "spin-in" access doors to provide access to all fire dampers, mixed air plenums, steam reheat coils (install upstream), automatic dampers, etc.
- B. Where ductwork is insulated, access doors shall be double skin doors with one inch (1") of insulation in the door.
- C. Where duct size permits, doors shall be eighteen inches (18") by sixteen inches (16"), or eighteen inches in diameter, and shall be provided with Ventlok No. 260 latches (latches are not required in round doors).
- D. Latches for rectangular doors smaller than 18 inch x 16 inch shall be Ventlok No. 100 or 140.
- E. Doors for zone heating coils shall be Ventlok, stamped, insulated access doors, minimum 10 inch x 12 inch, complete with latch and two (2) hinges, or twelve inches (12") in diameter.
- F. Round access doors shall be "Inspector Series" spin-in type door as manufactured by Flexmaster USA.

- G. Doors for personnel access to ductwork shall be nominal twenty-four inches (24") in diameter. Doors may be fabricated in a local approved sheet metal shop in accordance with SMACNA Standards.
- H. Where access doors are installed above a suspended ceiling, this Contractor shall be responsible for the proper location of ceiling access doors.

2.09 SCREENS

- A. Furnish and install screens on all duct, fan, etc., openings furnished by this Contractor which lead to, or are located outdoors.
- B. Screens shall be No. 16 gage, one-half inch (1/2") mesh in removable galvanized steel frame.
- C. Provide safety screens meeting OSHA requirements for protection of maintenance personnel on all fan inlets and fan outlets to which no ductwork is connected.

2.10 GUY WIRE SYSTEM

- A. Provide 1/4-inch diameter American Aircraft Steel Cable (plastic coated) with clip for vertical stack off utility fans on roof, with eyebolts for attachment to anchor systems on the roof.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Provide balancing dampers at points on low pressure supply, return, and exhaust systems where branches are taken from larger ducts as required for air balancing.
- D. Provide all dampers furnished by the BAS Provider in strict accordance with manufacturer's written installation instruction and requirements of these Specifications.
- E. Provide fire dampers, and combination fire and smoke dampers at locations indicated, where ducts and outlets pass through fire rated components. Install with required perimeter mounting angles, sleeves, breakaway duct connections, corrosion resistant springs, bearings, bushings and hinges.
- F. Provide backdraft dampers on exhaust fans or exhausts ducts where indicated. Install dampers so that they will open freely.
- G. Provide flexible connections immediately adjacent to equipment in ducts associated with fans and motorized equipment. Cover connections to medium and high pressure fans with leaded vinyl sheet, held in place with metal straps.
- H. Provide duct access doors for inspection and cleaning before and after duct mounted filters, coils, fans, automatic dampers, at fire dampers, and elsewhere as indicated on Drawings. Provide minimum 8 x 8 inch (200 x 200 mm) size for hand access, 18 x 18 inch (450 x 450 mm) size for shoulder access, and as indicated.
- I. Provide duct test holes where indicated and where required for testing and balancing purposes.
 - 1. Furnish and install Ventlok No. 699 instrument test holes in the return air duct and in the discharge duct of each fan unit.
 - 2. Install test holes in locations as required to measure pressure drops across each item in the system, e.g., outside air louvers, filters, fans, coils, intermediate points in duct runs, etc.

- J. Access doors as specified elsewhere shall be provided for access to all parts of the fire and combination fire and smoke dampers. Doors shall open not less than 90 degrees following installation and shall be insulated type where installed in insulated ducts.
- K. Install each fire and combination fire and smoke damper square and true to the building. The installation shall not place pressure on the damper frame, but shall enclose the damper as required by UL555 and UL555S.

3.02 TESTING

- A. After each fire damper, smoke damper and combination fire and smoke damper has been installed and sealed in their prescribed openings and prior to installation of ceilings, Contractor shall, as approved by Owner, activate part or all dampers as required to verify "first-time" closure.
- B. Activation of damper shall be accomplished by manually operating the resettable link, disconnecting the linkage at the fire damper fusible link, and manually operating the fire/smoke damper through the pneumatic or electronic controls as appropriate.
- C. Failure of damper to close properly and smoothly on the first attempt will be cause to replace the entire damper assembly.
- D. Coordinate smoke damper system interlock requirements with the fire alarm system.

SECTION 23 34 19 00 - HIGH PLUME LABORATORY EXHAUST SYSTEM

PART 1 GENERAL

1.1 WORK INCLUDED

- A. High-Plume Laboratory Exhaust System

1.2 RELATED WORK

- A. All sections, drawing plans, specifications and contract documents.

1.3 REFERENCES

- A. AMCA Publication 99, "Standards Handbook"
- B. ANSI/AMCA Standard 210-99, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating"
- C. AMCA Publication 211-05, "Certified Ratings Programme - Product Rating Manual for Fan Air Performance"
- D. AMCA Standard 300-96, "Reverberant Room Method for Sound Testing of Fans"
- E. AMCA Publication 311-05, "Certified Ratings Programme"
- F. AMBA Method of Evaluating Load Ratings of Bearings ANSI-11 (r1999)
- G. ANSI/AMCA Standard 204-96, "Balance Quality and Vibration Levels for Fans"
- H. AMCA Standard 500-D-98, "Laboratory Methods of Testing Dampers For Rating"
- I. AMCA Standard 500-L-99, "Laboratory Methods of Testing Louvers For Rating"
- J. SMACNA - Medium Pressure Plenum Construction Standard
- K. ANSI Z9.5 – Laboratory Design
- L. ASHRAE - Laboratory Design Guide

1.4 QUALITY ASSURANCE

- A. Performance ratings: Conform to AMCA standard 211 and 311. Fans must be tested in accordance with AMCA 211 and 311 in an AMCA accredited laboratory and certified for sound and air performance. Fan shall be licensed to bear the AMCA ratings seal for both sound and air performance.
- B. Classification for Spark Resistant Construction conform to AMCA 99.
- C. Each fan shall be vibration tested before shipping, as an assembly, in accordance with AMCA 204-05. Each assembled fan shall be test run at the factory at the specified fan RPM and vibration signatures shall be taken on each bearing in three planes - horizontal, vertical, and axial. The maximum allowable fan vibration shall be less than 0.15 in./sec peak velocity; filter-in reading as measured at the fan RPM. This report shall be provided in the O&M documentation.
- D. Laboratory exhaust system defined in this section shall have a 12 month warranty from the date of shipment.

1.5 SUBMITTALS

- A. Provide dimensional drawings and product data on each high-plume laboratory exhaust fan assembly.
- B. Provide fan curves for each fan at the specified operation point, with the flow, static pressure and horsepower clearly plotted.
- C. Provide nozzle velocity of exhaust fan, total exhaust flow, and discharge plume height at specified wind velocity.
- D. Strictly adhere to QUALITY ASSURANCE requirements, as stated in section 1.4.
- E. Provide a complete installation manual detailing requirements of installation.
- F. Provide a complete Operations and Maintenance manual describing regular/routine maintenance recommendations, and procedures for repair or replacement of all serviceable components.

PART 2 EQUIPMENT

2.1 GENERAL

- A. Base fan performance at standard conditions (density 0.075 Lb/ft³).
- B. Fans selected shall be capable of accommodating static pressure and flow variations of +/-15% of scheduled values.
- C. Each fan shall be belt driven.
- D. Fans to be equipped with 316 stainless steel lifting lugs for corrosion resistance.
- E. Fasteners exposed to corrosive exhaust shall be stainless steel.
- F. Fan assembly shall be designed for a minimum of 125 MPH wind loading, without the use of guy wires.

2.15 CORROSION RESISTANT COATING

- A. All fan and system components (fan, nozzle, wind band, plenum) shall be corrosion resistant coated with LabCoat™, a two part electrostatically applied and baked, sustainable, corrosion resistant coating system; or Heresite P-413C. Standard finish color to be gray.

All parts shall be cleaned and chemically prepared for coating using a multi-stage wash system which includes acid pickling that removes oxide, increases surface area, and improves coating bond to the substrate.

The first powder coat applied over the prepared surface shall be a zinc rich epoxy primer (no less than 70% zinc) and heated to a gelatinous consistency (partial cure) at which the second powder coat of polyester resin shall be electrostatically applied and simultaneously be cured at a uniform temperature of 400°F.

The coating system, a total thickness of up to 6 mils, is not affected by the UV component of sunlight (does not chalk), and has superior corrosion resistance to acid, alkali, and solvents. Coating system shall exceed 4000 hour ASTM B117 Salt Spray Resistance and must have a 30% gloss retention and no more than a 5 Delta E change after 5 yrs to meet an AAMA 2604 specification.

Manually applied coatings shall not be acceptable.

2.2 FAN HOUSING AND OUTLET

- A. Fan housing to be aerodynamically designed with high-efficiency inlet, engineered to reduce incoming air turbulence.
- B. Fan housing shall be welded steel and meet specification section 2.15 for corrosion resistant coating. No uncoated metal fan parts shall be acceptable.
- C. Fan housings that are fabricated of materials that have lower mechanical properties than steel, have rough interior surfaces in which corrosive, hazardous compounds can collect, and / or which chalk and structurally degrade due to the UV component of the sunlight shall not be acceptable.
- D. A high velocity conical discharge nozzle shall be supplied by the fan manufacturer and be designed to efficiently handle an outlet velocity of up to 6000 FPM. Discharge stack caps or hinged covers, impeding exhaust flow shall not be permitted.
- E. Provide housing drain for removal of rain and condensation.
- F. A bolted and gasketed access door shall be supplied in the fan housing allowing for impeller inspection or removal of impeller, shaft and bearings without removal of the fan housing.
- G. Standard finish color to be gray.

2.3 FAN IMPELLER

- A. Fan impeller shall be centrifugal, backward inclined, with non-stall characteristics. The impeller shall be electronically balanced both statically and dynamically per AMCA Standard 204.
- B. Fan impeller shall be manufactured of aluminum (AMCA type B spark resistant), fully welded and meet specification section 2.15 for corrosion resistant coating.

2.4 FAN BYPASS AIR PLENUM

- A. A bypass air plenum shall be provided as shown on drawings. The plenum shall be equipped with a bypass air damper and intake air hood with bird screen for introducing outside air at roof level upstream of the fan.
- B. The plenum shall be constructed of fully welded steel, meet specification section 2.15 for corrosion resistant coating, and mount on roof curb as shown on the project drawings. Plenums that are fabricated of materials that have mechanical properties less than steel shall not be acceptable.
- C. Plenum shall be constructed with a solid steel floor welded into the bottom. Plenum shall be designed for side intake, and shall not expose the building roof to the airstream, or negative pressure created in the bypass plenum.
- D. The bypass air plenum shall be mounted on factory fabricated roof curb provided by the fan manufacturer, as shown on the project drawings (see section 2.5)
- E. Fan designs that use inlet flexible connectors that can leak causing loss of lab exhaust shall not be accepted.
- F. Bypass air dampers shall be opposed-blade design, and coated with up to 4 mils of Hi-Pro Polyester resin, electrostatically applied and baked. Damper shall include a galvanized manual quadrant actuator.
- G. A fan isolation damper, shall **not** be required for single fan systems.

H. Blower / Plenum vibration isolation shall be limited to neoprene / cork vibration pads.

2.5 BYPASS AIR PLENUM CURB

- A. Exhaust system manufacturer shall supply a structural support curb for the plenum, of specified height, as shown on the drawings.
- B. Curb shall be fabricated of a minimum of 14 gauge corrosion resistant coated steel and structurally reinforced.
- C. Curbs shall be insulated.
- D. When properly anchored to the roof structure, the standard curb / plenum / blower assembly shall withstand wind loads of up to 125 mph without additional structural support.

2.6 FAN MOTORS AND DRIVE

- A. Motors shall be premium efficiency, standard NEMA frame, 1800 RPM, TEFC with a 1.15 service factor. A factory-mounted NEMA 3R disconnect switch shall be provided for each fan. Motor maintenance shall be accomplished without fan impeller removal or requiring maintenance personnel to access the contaminated exhaust components.
- B. Motors shall have cast iron end brackets/bearing housings. Aluminum end brackets will not be accepted.
- C. Drive belts and sheaves shall be sized for 200% of the motor horsepower, and shall be readily and easily accessible for service. Drive shall consist of a minimum of two belts under all circumstances.
- D. Shaft to be polished and ground steel.
- E. Fan shaft bearings shall be Air Handling Quality, ball or roller pillow block type and be sized for an L-10 life of no less than 100,000 hours. Bearings shall be fixed to the fan shaft using concentric mounting locking collars, which reduce vibration, increase service life, and improve serviceability. Bearings that use set screws shall not be allowed.
- F. All shaft bearings shall have extended lube lines with zerk fittings.

PART 3 INSTALLATION

- A. Install fans as indicated, with flexible electrical leads.
- B. Pipe housing drain to nearest drain.
- C. Install fans in accordance with manufacturers instructions.

END OF SECTION 23 34 19 00

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 34 23 00 - POWER VENTILATORS**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Perform all Work required to provide and install the following fans indicated by the Contract Documents with supplementary items necessary for proper installation.
 - 1. Centrifugal roof, up-blast, and sidewall exhausters.
 - 2. Centrifugal roof supply fan.
 - 3. Make-up air unit.
 - 4. Centrifugal up-blast grease hood exhaust fan.
 - 5. Tube axial up-blast smoke control exhaust fan.
 - 6. Motors and drives.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. AFBMA 9 - Load Ratings and Fatigue Life for Ball Bearings.
 - 2. AFBMA 11 - Load Ratings and Fatigue Life for Roller Bearings.
 - 3. AMCA 99 - Standards Handbook.
 - 4. ACMA 203 - Fan Application Manual - Field Performance Measurements.
 - 5. AMCA 204 - Balance Quality and Vibration Levels For Fans
 - 6. AMCA 210 - Laboratory Methods of Testing Fans for Aerodynamic Performance Rating.
 - 7. AMCA 300 - Reverberant Room Method for Sound Testing of Fans.
 - 8. AMCA 301 - Methods for Calculating Fan Sound Ratings from Laboratory Test Data.
 - 9. NEMA MG1 - Motors and Generators.
 - 10. NFPA 70 - National Electrical Code.

11. SMACNA - HVAC Duct Construction Standards - Metal and Flexible.

12. UL 705 – Power Ventilators.

1.04 QUALITY ASSURANCE

- A. Performance Ratings: Conform to AMCA 210 and bear the AMCA Certified Rating Seal.
- B. Sound Ratings: AMCA 301, tested to AMCA 300, and bear AMCA Certified Sound Rating Seal. The sound power levels must not exceed those indicated on Drawings.
- C. Fabrication: Conform to AMCA 99.
- D. Performance Base: 50 feet above sea level.
- E. Fans shall be capable of operating stably at reduced loads imposed by means of variable speed drives, inlet guide vanes or controlling pitch of fan blades.

1.05 SUBMITTALS

- A. Product Data:
 - 1. Submittal data for approval for all fans of every description furnished under this section of these Specifications.
 - 2. Provide literature that indicates dimensions, weights, capacities, ratings, fan performance, gages and finishes of materials, special coatings and construction, electrical characteristics and connection requirements.
 - 3. Fan curves with specified operating point clearly plotted. The recommended range of operation shall be stable.
 - 4. Data on sound power levels for both fan inlet and outlet at rated capacity.
 - 5. All data on fan accessories.
- B. Operation and Maintenance Data:
 - 1. Manufacturer's installation instructions and operating and maintenance data.
 - a. Submit under provisions of Division 01.
 - b. Include instructions for lubrication, motor and drive replacement, spare parts list, and wiring diagrams.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, protect and handle products to the Project Site under provisions of Division 01 and Division 20.
- B. Accept products on Site in factory-fabricated protective containers or coverings, with factory-installed shipping skids and lifting lugs. Inspect for damage.
- C. Store in clean dry place and protect from weather and construction traffic. Handle carefully to avoid damage to components, enclosures, and finish.

- D. Check and maintain equipment on a monthly basis to ensure equipment is being stored in accordance with manufacturer's recommended practices. Additionally, during each check, fans and motors shall be rotated and greased and shafts shall be left approximately 180 degrees from that of previous month. Maintain storage records that indicate these maintenance requirements have been met.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Fans shall be either belt or direct drive as scheduled on Drawings.
- C. Select fans such that they do not increase motor size, increase noise level, or increase tip speed by more than 10 percent, or increase inlet air velocity by more than 20 percent, from specified criteria. Provide fans capable of accommodating static pressure variations of plus or minus 10 percent.
- D. Statically and dynamically balance fans to eliminate vibration or noise transmission to occupied areas.

2.02 MANUFACTURERS

- A. Greenheck.
- B. Or Approved Equal

2.03 CENTRIFUGAL ROOF, UPBLAST, AND SIDEWALL EXHAUSTER

- A. Backward inclined fan wheel with spun aluminum housing; resilient mounted motor and drive assembly; 16 gage aluminum birdscreen; square base to suit roof curb with continuous curb gaskets; secured to roof curb with cadmium plated or stainless steel bolts and screws.
- B. Roof Curb: Roof curb shall be coordinated with Owner and Contractor.
- C. Backdraft Damper: Gravity activated or motorized as indicated. Where type is not indicated on Drawings or Specifications, provide gravity-activated damper. Aluminum construction, felt edged with nylon bearings.
- D. Upblast exhausters shall have integral drain trough.
- E. Apply three coats of air-dried Heresite coating by fan manufacturer both internal and external to all roof exhausters for corrosive applications.

2.04 CENTRIFUGAL ROOF SUPPLY FAN

- A. Forward curved, double width double inlet, with heavy gage galvanized steel housing; resiliently mounted motor and drive assembly.
- B. Backdraft Damper: Gravity activated or motorized as indicated. Where type is not indicated on Drawings or Specifications, provide gravity-activated damper. Aluminum construction, felt edged with nylon bearings.
- C. Roof Curb: Roof Curb shall be coordinated with Owner and Contractor.
- D. Filters: 1-inch washable, aluminum, permanent type as furnished with unit.
- E. Hood shall be easily removable for service.

2.05 MAKE-UP AIR UNIT

- A. Unit: Internal frame type construction of G90 galvanized steel with all metal-to-metal surfaces sealed. All components shall be accessible through removable panels. Provide unit on prefabricated roof curb. Installed unit shall be in total compliance with NFPA 96.
- B. Where scheduled, electrical, hot water, steam, gas-fired, chilled water, or direct expansion (DX) coils shall be installed in unit. Water and steam coils shall be rated in accordance with ARI 410. Electric coils shall be UL listed with integral heater control cabinet and a separate power connection for the coils. Downstream components of tempered units shall be double wall construction and insulated in accordance with local energy codes.
- C. Fan Section: Forward curved, double width double inlet, with heavy gage galvanized steel housing; resiliently mounted motor and drive assembly.
- D. Weather Hood: Construct of G90 galvanized steel with 1-inch washable, aluminum, permanent type as furnished with unit at unit intake. Extended weatherhood shall be provided where necessary to ensure minimum ten (10) foot separation between air intake and exhaust air. Weather hood extensions shall be mounted on adjustable legs.
- E. Electrical: All electrical components shall be factory wired for a single point power connection. Control center shall include motor starter, control circuit fusing, control transformer (120VAC), integral door interlocking disconnect switch with separate motor fusing and terminal strip with overload protected motor.
- F. Backdraft Damper: Gravity activated or motorized as indicated. Where type is not indicated on Drawings or Specifications, provide gravity-activated damper.

2.06 CENTRIFUGAL UPBLAST GREASE HOOD EXHAUST FAN

- A. Backward inclined fan wheel, upblast roof fan with spun aluminum housing; resilient mounted motor and drive assembly; square base to suit roof curb with continuous curb gaskets; secured to roof curb with cadmium plated or stainless steel bolts and screws. External fan wiring.
- B. Roof Curb: Roof curb shall be coordinated with Owner and Contractor. Vented roof extension, to maintain fan discharge a minimum of 40-inches above roof, shall be provided by fan manufacturer.
- C. Integral drain trough, cleanout port, and grease trap.
- D. Maximum continuous operating temperature of 400 degrees F.
- E. UL 762 Listed and constructed in compliance with NFPA 96.

2.07 TUBE AXIAL UP-BLAST SMOKE CONTROL EXHAUST FAN

- A. Propeller shall be fabricated steel. Provide with statically and dynamically balanced steel blades and hubs, securely attached to the fan shafts, ground and polish steel fan shafts, galvanized formed channel steel drive frame assembly, deep formed inlet venture fan panels, heavy gage galvanized steel windbands with reinforced edges and bolted seams, square base to suit roof curb gaskets; secured with stainless steel bolts and screws.
- B. Roof curb: Roof curb shall be coordinated with Owner and Contractor.
- C. Butterfly Dampers: Steel or aluminum construction based on the required minimum fan speed required to open damper blades. Provide with magnetic damper latches.

- D. Fan shall meet requirements and be listed for AMCA Certified Rating Seal for sound and air performance and UL Listed Power Ventilators for Smoke Control Systems to include the IRI requirements for 500 degrees F for a minimum of 4 hours, SBCCI Standard Fire Prevention Code for requirements of 1000 degrees F for a minimum of 15 minutes.

2.08 AIR CURTAIN UNIT

- A. Rigid welded construction for support at each end without need for intermediate support. Air curtain fans shall be provided with a weatherproof housing constructed of minimum 16-gage rigid welded steel with baked enamel finish by fan manufacturer.
- B. Fan wheels shall be forward curved, non-overloading, centrifugal type, double inlet, double width with brazed hubs, statically and dynamically balanced. Wheels and housings shall be galvanized steel.
- C. Each curtain shall be furnished with a door switch to energize curtain whenever the door is open, and actuate the hot water control valve to maintain the temperature set point. Units shall be provided with factory mounted, factory wired control panels including motor starters, transformer for low voltage door switch and terminal strip for connection to power source. Provide a discharge grille and conduit box for single point connection for fan and controls.
- D. Air curtains shall attain air velocities specified within 2 seconds following activation. Air intake and discharge openings shall be protected by bird screens. Air curtain shall be at least as wide as the opening to be protected. Air discharge opening shall be so designed and equipped as to permit outward adjustment of the discharge air. Installation and adjustment shall be in accordance with the manufacturer's written instructions. Interior surfaces of the air curtain shall be accessible for cleaning.
- E. Fan noise levels shall not exceed 45 dBA when measured at a distance of ten (10) feet from fan discharge opening.
- F. Air curtains designed for use in service entranceways shall develop an air curtain not less than three (3) inches thick at the discharge nozzle. The air velocity shall not be less than 1600 fpm across the entire entryway when measured 3 feet above the floor.
- G. Where scheduled, include hot water coils with copper tubes and copper fins. Coil shall be rated at 230 psig and 300 degrees F with capacities per ARI 410. Provide UL approved, factory-mounted and factory-wired electric coils where scheduled.
- H. Provide control panel with motor starter, terminal strip, motor overloads, and control transformer. Provide field adjustable time delay relay, ON-OFF-AUTOMATIC switch.

2.09 MOTORS AND DRIVES (ALL UNITS UNLESS OTHERWISE SPECIFIED)

- A. Motors: In total compliance with motors and controllers Specification sections.
- B. Disconnect Switches: Provide for each fan under Division 26. No switches shall be provided in fan housing. All disconnects shall be external to fan housing.
- C. Bearings: L-10 life at 200,000 hours self-aligning, ball or roller bearings.
- D. Shafts: Hot rolled steel, ground and polished, with key-way, protectively coated with lubricating oil. Provide 316 stainless steel shafts for corrosive applications.
- E. Belt Drive: All belt drives shall be designed for a minimum of 50 percent overload. Cast iron or steel sheaves, dynamically balanced, keyed. Variable and adjustable pitch sheaves for motors 15 horsepower and under, selected so required rpm is obtained with sheaves set at mid-position. Fixed sheave for 20 horsepower and over. Where more than one belt is required, matched sets shall be used. Include an additional set of drives for each fan to be used for final adjustments. After correct speed has been determined with variable sheave, provide fixed sheaves.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Roof Curbs: Roof curb installation shall be coordinated with Owner and Contractor.
- D. Disconnect Switches: Disconnect switches shall be installed adjacent to fan on unistrut per Division 26. Coordinate installation with Owner.

3.02 PAINTING

- A. Provide equipment with factory finish in accordance with the manufacturer's standards. Touch up scratches and marks from handling and installation with masking enamel to match manufacturer's color.
- B. Where exhaust fans are required to have Heresite coating, have units factory finished with required number of coats prior to shipping to the Project Site.
- C. Refer to Division 09 for Site-applied finishes.

SECTION 23 36 00 00 - AIR TERMINAL UNITS

Date: 3/13/2013

PART 1 GENERAL

1.00 The following sections are to be included as if written herein:

- A. Section 20 01 00 00 – Basic Mechanical Requirements
- B. Section 20 05 29 00 – Supports and Sleeves
- C. Section 20 05 53 – Piping and Equipment Identification

1.01 **SECTION INCLUDES**

- A. Air Terminal Units:
 - a. Single Duct Boxes
 - b. Dual Duct Boxes
 - c. Series Fan Powered Boxes
- B. Variable Volume Regulators
- C. Integral Controls

1.02 **RELATED SECTIONS**

- A. Section 23 31 13 13 - Ductwork
- B. Section 23 31 13 33 - Ductwork Accessories
- C. Section 23 36 13 00a - Air Outlets and Inlets
- D. Section 23 01 10 00 – Sequence of Operations
- E. Section 23 01 10 00a - Testing, Adjusting and Balancing
- F. Section 26 05 19 00 - Cable, Wire and Connectors, 600-Volt
- G. Section 26 27 26 00 - Wiring Devices and Floor Boxes

1.03 **REFERENCES**

- A. NFPA 90A - Installation of Air Conditioning and Ventilation Systems
- B. UL 181 - Factory-Made Air Ducts and Connectors
- C. ADC 1062 - Air Distribution and Control Device Test Code

1.04 **SUBMITTALS**

- A. Submit shop drawings under provisions of Section 23 00 00.

- B. Submit shop drawings indicating configuration, general assembly, and materials used in fabrication.
- C. Submit product data under provisions of Section 23 00 00.
- D. Submit product data indicating configuration, general assembly, and materials used in fabrication. Include catalog performance ratings which indicate air flow, static pressure, and NC designation.
- E. Include schedules listing discharge and radiated sound power level for each of second through seventh octave bands at inlet static pressures of one inch wg.
- F. Submit manufacturer's installation instructions under provisions of Section 23 00 00.

1.05 OPERATION AND MAINTENANCE DATA

- A. Submit operation and maintenance data under provisions of Section 23 00 00.
- B. Include manufacturer's descriptive literature, operating instructions, maintenance and repair data, and parts lists.

1.06 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the products specified in this Section with minimum three years' documented experience.

1.07 WARRANTY

- A. Provide one-year manufacturer's warranty under provisions of Section 23 00 00.

PART 2 PRODUCTS

2.01 AIR TERMINAL UNITS:

- A. Units shall be primary air distribution assemblies (single duct type, series fan powered type, or dual duct type) complete with casing, insulation, (electric, hot water) heating coil (if scheduled), dampers, actuators, (fan, if fan powered type) controls, transformers, and other appurtenances required for a complete installation. Units shall be of the sizes and capacities scheduled.
- B. Casing assembly shall be 22-gauge (minimum) zinc coated galvanized steel. Interior surfaces of casing shall be acoustically and thermally lined with a 1" thick, 4-pound density aluminum foil facing fiberglass insulation with a 4.1 R-value. Casing leakage shall not exceed 2% of the box's maximum scheduled CFM at 3" static pressure. Insulation shall be UL-listed and in compliance with NFPA 90A requirements (i.e. UL-181, UL 723, ASTM: E 84, C 665, C1071).
- C. Damper (air valve), with solid steel shaft, shall have a leakage rate of less than 2% of the box's maximum scheduled CFM at two times primary supply air duct static pressure or 6" (whichever is smaller). Dual duct mixing terminals shall contain two air inlet valves (cold duct and hot duct). Unit shall incorporate primary air flow sensing devices to provide input for volume regulation as indicated hereinafter.

-
- E. The air terminal unit shall be provided with a flow cross sensor located in the primary air inlet duct(s) suitable for interfacing with the DDC system flow transducer (if required). Sensor shall provide accuracy within 5% with a 90 degree sheet metal elbow at the inlet of the unit and amplify the sensed airflow signal. Dual duct mixing terminals shall contain three flow sensors, one located in the cold deck inlet, one at the hot deck inlet and a total flow sensor located downstream in the unit casing.
 - F. The boxes shall be provided with a 24 VAC transformer connected to the unit's incoming power source and properly protected. The transformer shall be of adequate size to provide 24 VAC power for all DDC system components associated with the box.
 - G. The electric heating coils are factory mounted (if scheduled). Terminal assembly is UL 1995 and ETL certified. Overall length of assembly from inlet panel to discharge is a maximum of 35 inches. The heater frame and cabinet is constructed of heavy gauge galvanized steel. Heating elements are constructed of High Grade wire. Elements are low density and designed to minimize hot spots and nuisance cycling of the thermal protectors. Elements are insulated from the steel frame by floating ceramic bushings. An automatic reset thermal cut-out is provided as primary protection against overheating. Heaters are equipped with a manual reset cut-out for secondary protection. Electric heaters are supplied with air flow switch; disconnect switch, single stage, mercury contactors, terminal blocks, and wiring insulated for 105 °F.
 - G1. Hot water heating units as scheduled shall include 1, 2, 3 or 4-row coils. Coil capacities shall be as scheduled. A quick opening access panel (optional) shall be provided to allow cleaning and inspection of the coil. The coils shall be constructed of 0.500 in. x 0.016 in. copper tube. Fins shall be 0.0045 in. thick aluminum sine wave configuration. The coil shall be contained in a 0.030 in. galvanized steel casing. The coils shall be tested and certified according to AHRI Standard 410. Coil connections can be right hand or left hand as detailed on the drawings. Control valves, automatic air vents and drain vents, if required, shall be supplied and field installed by others.
 - H. Motors (if scheduled) shall be ECM motors with field adjustable fan speed control. Size and voltage as scheduled. Steel Fan blower shall have forward curved blades and be direct coupled to the motor.
 - I. Dual duct mixing box terminals shall be provided with an access panel located on the bottom side of the terminal, for access to the mixing air section. Panels shall be dual wall insulated with a sheet metal liner, and secured with screws for easy removal and re-attachment.
 - J. Room temperature sensors associated with these single duct boxes shall be furnished by the Automation Contractor and installed under Section "Direct Digital Control System".
 - K. The Automation Contractor shall furnish a DDC Controller and an electronic inlet damper actuator for installation on each VAV box by the VAV box manufacturer. These DDC (Direct Digital Control) devices shall be delivered to the VAV box manufacturer's factory in sufficient time for the manufacturer to meet its scheduled delivery obligations. The VAV box manufacturer shall factory mount and connect these devices as required for proper operation as required under Division 23, Section 23 01 10 00. The cost of factory-mounting these devices shall be included in the cost of the VAV single inlet boxes.
 - L. Performance shall be AHRI certified.
 - M. **CONTROL PERFORMANCE:** Assemblies shall be able to reset the primary air to any airflow between zero and the maximum CFM shown on Drawings. To allow for maximum flexibility and future changes, it shall be necessary to make only keyboard adjustments to arrange each unit for any maximum air flow within the ranges for each inlet size as scheduled on the Drawings. The

control devices shall be designed to maintain the desired flow regardless of inlet flow deflection. All terminal units shall be installed with a minimum of four diameters of straight duct directly prior to the entry into each terminal unit connection.

- N. **GENERAL PERFORMANCE:** Devices using mechanical CFM limiters will not be accepted, nor shall it be necessary to change control components to make airflow rate changes. If used, Automation Contractor furnished flow stations shall be furnished, mounted and adjusted by the Automation Contractor with assistance from the Terminal Unit Manufacturer to assure their proper placement. The terminal unit manufacturer shall be responsible only for the construction of the terminal unit and the installation of internal control components installed at the manufacturer's factory, and shall not be responsible for the installation of controls not installed at the terminal unit manufacturer's factory, and shall not be responsible for the performance of the DDC controls. The performance of DDC controls, especially in connection with terminal units, shall be the responsibility of the DDC Trades and the Automation Contractor.
- O. Provide single point electrical connection.
- P. **CONTROL SEQUENCE:** The control sequence arrangements shall be as described below and the terminal units shall be shipped from the manufacturer with all necessary control devices to accomplish each sequence, except as may be provided by the controls manufacturer. The desired sequence shall be adjustable according to space usage or a change in space conditions.
- Q. **DDC SYSTEMS:**
1. Electronic operators and controllers shall be installed by the terminal unit manufacturer. The Direct Digital Control System Trades and the Automation Contractor shall be responsible for the operational performance of the entire system. The terminal unit manufacturer shall be responsible for the performance of the mechanical components of the unit.
 2. **DDC Controls Description:**
 - a. These air terminal units shall each be provided with a unit-mounted DDC terminal equipment controller (TEC) provided by the DDC Trades to accept input signals from a room space temperature sensor, the box's velocity sensor and the DDC system controller and a modulating signal to the unit's primary damper, and a signal to the unit's SCR electric heat as required to start/stop the unit and maintain the desired space temperature via the DDC System.
 - b. These air terminal units served by primary air handling units shall be energized before the air handling unit is energized. The boxes shall be individually energized by the DDC System when the respective air handling unit is to operate or when a Space Sensor is below its "Low Limit" setpoint.
 - c. A DDC Trades furnished electronic space sensor shall modulate, through the unit's TEC, the unit's primary air damper and its respective heating coil valve as required to maintain the desired space temperature.
 - d. The air terminal units shall be furnished by the box manufacturer complete with all necessary operating hardware and sensing devices to accept the modulating signals from the Terminal/Equipment Controller (TEC) for the unit's DDC Trades furnished electronic damper operator and DDC Trades furnished electronic

controls for the electric heating coil and a contact closure to energize/de-energize the unit controls operations.

- e. Coordinate requirements for all controls components for proper operation of air terminal units with the DDC Trades.
- R. MANUFACTURER: All Terminal Units shall be Price Industries SDV 5000, DDS 5000, FDC 5000 with CRAF1 liner. Other units such as manufactured by Titus , Metal*Aire , or Nailor Hart may be considered providing sufficient evidence is provided showing alternate products are of the same or better construction and performance in every respect. Other manufacturers are subject to owner approval and must meet or exceed ALL provisions of the specification WITHOUT exception. Even though specific manufacturers may be named herein, the material supplied by any approved manufacturer shall meet all of the provisions of this specification without exception.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Refer also to requirements included in Part 2 of this specification.
- B. Install in accordance with manufacturer's instructions.
- C. Provide clearance for inspection, repair, replacement, and service. The mechanical contractor shall ensure all VAV terminal unit controllers and operators are located a minimum of 30" from all obstructions (walls, pipes, etc.).
- D. Provide ceiling access doors or locate units above easily removable ceiling components.
- E. Support units individually from structure. Do not support from adjacent ductwork.
- F. Connect to ductwork in accordance with Section 23 31 13 13.

And Air-
Conditioning
(HVAC)

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 36 13 00 - FAN-COIL UNITS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Fan coil units.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. NFPA 70 – National Electrical Code.
 - 2. ASHRAE Standard 90.1 – “Energy Standard for Buildings Except Low-Rise Residential Buildings”.
 - 3. ARI 440 – “Room Fan-Coils”.
 - 4. ANSI/UL-883 – “Safety Standards for Fan Coil Units and Room Fan Heater Units”.
 - 5. NFPA 90A – “Standard for the Installation of Air Conditioning and Ventilation Systems”.

1.04 QUALITY ASSURANCE

- A. Manufacturer: Company specializing in manufacturing the products specified in this Section with minimum three (3) years documented experience.

1.05 SUBMITTALS

- A. Product Data:
 - 1. Submit product data indicating typical catalog of information including dimensions, weights, capacities, ratings, fan performance, gages and finishes of materials, electrical characteristics and connection requirements.
 - 2. Submit fan curves with specified operating point clearly plotted. Fan curves shall clearly demonstrate that the fan coil unit will operate stably within the range of performance scheduled.
 - 3. Submit coil performance data as tested and certified per ARI standards.
 - 4. Submit electrical requirements for power supply wiring, clearly indicating factory-installed and field-installed wiring.

5. The submittal shall indicate that all materials meet NFPA 90 flame/smoke spread levels of 25/50 or better.

B. Record Documents:

1. Shop Drawings: Indicate materials and methods of assembly, unit dimensions, weight loading, required clearances, field connection details, electrical characteristics and dimensional views as required to adequately describe the unit.
2. Submit manufacturer's installation instructions.
3. Submit Record Drawings in accordance with Division 01.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, and protect products to the Project Site under provisions of Division 01 and Division 20.
- B. Protect units from physical damage by storing in protected areas and leaving factory covers in place.

1.07 WARRANTY

- A. Provide one (1) year manufacturer's warranty.
- B. Include coverage of fan-coil unit and motors.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Units shall bear an ARI stamp.
- C. Fan coil units shall be of the size and configuration as described on the Drawings.
- D. Performance as scheduled on the Drawings shall be a minimum requirement. Base coil unit performance on sea level conditions.
- E. Fan coil unit height shall be less than or equal to the unit scheduled.
- F. Fan coil unit sizes shall be such that the units can be transported to the area of work and installed within the physical space available.
- G. This Section does not apply to units that condition raw unconditioned outside air. Refer to Section 23 73 23.
- H. [Note: Sound data must be added]

2.02 MANUFACTURERS

- A. Envirotec.
- B. International Environmental Corp.
- C. McQuay.
- D. Temtrol

E. Trane.

F. York.

G. Greenheck.

2.03 CASING AND FRAME

A. 18 gage enclosure, galvanized steel. Frame shall be galvanized steel members.

B. Units exposed below deck shall have a baked enamel finish.

C. Internally insulate units throughout the entire enclosure with 1-inch thick insulation. Insulation shall have a foil facing on the interior.

D. Units shall be completely enclosed with all components including the motor, interior to the casing.

E. Primary Drain Pan:

1. Units shall have a rust-inhibiting IAQ style drain pan across the full width of the unit, extending from the cooling coil to the end of the unit.

2. Insulate drain pan.

3. Drain connection shall be minimum 7/8-inch outside diameter, copper construction.

4. Arrange coil and drain pan connections on the side of the unit as shown on the Drawings.

F. Units shall be provided with integral mounting brackets adequate to support the unit's weight.

G. Units shall be provided with a discharge and inlet duct collar.

H. Furnish access doors as required to service all elements of the unit from the sides. It shall not be necessary to access the bottom of the unit to service any component.

2.04 FANS AND RELATED COMPONENTS

A. Provide single or dual fans with integral direct drive multiple-speed motor or demountable belt drive motor. Direct drive motor speed shall be set via easily accessible wall-mounted switches.

B. Motors shall be high efficiency type with built-in thermal overload protection.

C. All units scheduled for capacities of 1200 cfm or greater shall be externally isolated with spring isolators.

2.05 COILS

A. Cooling Coils:

1. Copper tube with aluminum fins.

2. Tubes shall be ½-inch outside diameter with a minimum wall thickness of 0.02 inches.

3. For units scheduled with capacities of 600 cfm or less, fins shall be spaced no closer than 14 fins per inch and shall have a minimum fin thickness of 0.0075 inches.

4. Larger capacity units shall have fins spaced no closer than 9 fins per inch and shall have a minimum fin thickness of 0.0088 inches.

- B. Where required, heating coils shall be copper tube with aluminum fins. Tubes shall be ½-inch outside diameter with a minimum wall thickness of 0.020 inches. Fins shall be spaced no closer than 14 fins per inch with a minimum fin thickness of 0.0075 inches.
- C. Air velocities across cooling coils shall not exceed 500 fpm. Air velocities across heating coils shall not exceed 700 fpm.
- D. Coil headers shall be the full size of the coil connection with manual air vents located at the top.
- E. Coil frames shall be heavy duty galvanized steel construction.

2.06 FILTERS AND RELATED COMPONENTS

- A. All fan coil units shall have provisions for mounting a filter at the unit inlet. Filter shall be a standard ½-inch throwaway filter, 30 percent efficiency.

2.07 UNIT SPECIALTIES

- A. For each unit, provide a 22 gage sheet metal auxiliary drain pan mounted below the entire unit and primary drain pan.
- B. Auxiliary drain pans shall either be drained to an approved condensate receiving location or shall be provided with a float switch that shall de-energize the fan coil unit and send an alarm to the building automation system (BAS).

2.08 ELECTRICAL PROVISIONS

- A. Each unit shall have a single point of power connection pre-wired at the factory.
- B. Starters shall be provided by Division 26.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Verify that areas are ready to receive Work and opening dimensions are as indicated on Shop Drawings.
- B. Verify that required utilities are available, in proper location, and ready for use.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Hang units from building structure with pipe hangers anchored to the building, not from piping. Mount units as high as possible to maintain greatest headroom unless otherwise indicated. Refer to Section 20 05 48 for vibration isolation.
- D. Protect units with protective covers during balance of construction.
- E. Refer to details on the Drawings for piping appurtenances and configuration.
- F. Leave adequate room to access and service all components.
- G. Arrange fan coil units and ductwork such that poor fan performance does not result.

- H. Do not operate units without specified filters being installed.
- I. Mount disconnect switches and starters within sight of the fan motor and independent of the unit to allow for maintenance access.

3.03 CLEANING

- A. After construction and painting is completed, clean exposed surfaces of units. Vacuum clean coils and inside of cabinets.
- B. Touch up marred or scratched surfaces of factory-finished cabinets, using finish materials furnished by manufacturer.
- C. Install new filters after Substantial Completion.

END OF SECTION 23 36 13 0036 10 0082 19

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 36 13 00A - AIR OUTLETS AND INLETS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Perform all Work required to provide and install diffusers, diffuser boots, registers/grilles, louvers, louver penthouses, roof hoods, and goosenecks indicated by the Contract Documents with supplementary items necessary for proper installation.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. AMCA 500 - Test Method for Louvers, Dampers and Shutters.
 - 2. ANSI/NFPA 90A - Installation of Air Conditioning and Ventilating Systems.
 - 3. ARI 890 – Rating of Air Diffusers and Air Diffuser Assemblies.
 - 4. ASHRAE 70 - Method of Testing for Rating the Air Flow Performance of Outlets and Inlets.
 - 5. SMACNA 1035 - HVAC Duct Construction Standards - Metal and Flexible.

1.04 QUALITY ASSURANCE

- A. Test and rate performance of air outlets and inlets in accordance with ASHRAE 70.
- B. Test and rate performance of louvers in accordance with AMCA 500.

1.05 SUBMITTALS

- A. Product Data:
 - 1. Submit product data and Shop Drawings, indicating type, size, location, application, noise level, finish, and type of mounting.
 - 2. Review requirements of outlets and inlets as to size, finish, and type of mounting prior to submitting product data.
- B. Operation and Maintenance Data:
 - 1. Submit manufacturer's installation instructions under provisions of Division 01.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Grilles, registers and diffusers shall be as scheduled on the Drawings. Grilles, registers and diffusers shall be provided with sponge rubber or soft felt gaskets where noted on the Drawings. Grilles, slot diffusers and laminar flow bars shall not be internally insulated. If a manufacturer other than the one scheduled is used, the sizes shown on the Drawings shall be checked for performance, noise level, face velocity, throw, pressure drop, etc., before the submittal is made. Selections shall meet the manufacturer's own published data for the above performance criteria. The throw shall be such that the velocity at the end of the throw in the five (5) foot occupancy zone will not exceed 50 fpm nor be less than 25 fpm except where indicated otherwise. Noise levels shall not exceed those published in ASHRAE for the type of space being served (NC level). In the vicinity of lab hoods, terminal velocity at face of hood shall not exceed 20 fpm.
- C. Locations of air distribution devices on Drawings are approximate and shall be coordinated with other trades to make symmetrical patterns and shall be influenced by the established general pattern of the lighting fixtures or architectural reflected ceiling plan, but primarily located to maintain proper air distribution. Where called for on Drawings, grilles, registers and diffusers shall be provided with deflecting devices and manual dampers. These grilles, registers, and diffusers shall be the standard product of the manufacturer, and subject to review by the Architect.
- D. Provide a frame compatible with the type of ceiling or wall in which the devices are installed. Refer to Architectural Drawings for exact type of ceiling specified.
- E. Coordinate color and finish of the devices with the Architect.

2.02 MANUFACTURERS

- A. Grilles, Registers, and Diffusers:
 - 1. Krueger Manufacturing Company.
 - 2. Titus Products.
 - 3. Price Industries.
 - 4. Nailor Industries.
- B. Louvers:
 - 1. American Warming and Ventilating.
 - 2. Ruskin.
 - 3. Greenheck.
 - 4. Arrow.
- C. Roof Hoods:
 - 1. Greenheck.
 - 2. Cook.

3. Acme.

2.03 ROUND CEILING DIFFUSERS

- A. Round, adjustable pattern, stamped or spun, multicore type diffuser to discharge air in 360-degree pattern, with sector baffles where indicated.
- B. Project diffuser collar above ceiling face and connect to duct with duct ring. In plaster ceilings, provide plaster ring.
- C. Fabricate of aluminum, unless otherwise noted, with factory baked enamel, off-white finish.
- D. Provide multi-louvered equalizing grid where noted on Drawings.

2.04 RECTANGULAR CEILING DIFFUSERS

- A. Rectangular, full louvered face, directional, removable multi-core type diffuser to discharge air in 360-degree pattern. Neck size shall be as scheduled on the Drawings. Provide filler panels, where required, for directional throw diffusers.
- B. Fabricate frame and blades of extruded aluminum with factory baked enamel, off-white finish.
- C. Provide multi-louvered equalizing grid where noted on Drawings.
- D. Provide round neck connection as scheduled on Drawings.

2.05 PERFORATED FACE CEILING DIFFUSERS

- A. Perforated face with fully adjustable pattern and removable face.
- B. Fabricate of aluminum with factory baked enamel, off-white finish.
- C. Provide multi-louvered equalizing grid where noted on Drawings.
- D. Provide round neck connection as scheduled on Drawings.

2.06 SQUARE PANEL FACE SUPPLY AND RETURN AIR CEILING DIFFUSER

- A. Architectural diffuser with a square panel centered within a square housing similar to the Titus OMNI model. Drawings that depict two-way and three-way throw options are achieved with the use of filler panel (where required) for directional throw diffusers.
- B. Opposed blade volume dampers shall be provided with the diffuser, if scheduled on the Drawings. The volume damper design shall be similar to the Titus AG-75.
- C. Although the manufacturers show this model being used only as a supply air device, this same diffuser can also be used as a return air device. The neck connection shall be the largest available neck size provided by the manufacturer.
- D. Provide round neck connection as scheduled on Drawings.

2.07 CEILING EXHAUST AND RETURN REGISTERS/GRILLES

- A. Streamlined blades, depth of which exceeds 3/4-inch spacing, with spring or other device to set blades, vertical face.
- B. Fabricate 1-inch margin frame with concealed mounting.
- C. Fabricate of steel with minimum 20 gage frames and minimum 22 gage blades, steel and aluminum with minimum 20 gage frame, or aluminum extrusions, with factory baked enamel finish.

- D. Opposed blade damper with removable key operator, operable from face shall only be provided with the grille when it is scheduled on the Drawing.

2.08 PERFORATED FACE RETURN/EXHAUST GRILLES

- A. Perforated face with back pan, removable face, and neck sizes as indicated on Drawings.
- B. Provide frame type as indicated on Drawings.
- C. Fabricate completely of 22 gage steel with a baked enamel off-white finish.

2.09 LIGHT TROFFER DIFFUSERS

- A. Single plenum type constructed independent of light troffers with volume and pattern controllers with oval top or side air inlet as scheduled.
- B. Match diffusers to light troffers and connect in airtight connection without tools.
- C. Fabricate of galvanized steel with welded or soldered joints and finish matte black inside.

2.10 PERFORATED FACE CEILING EXHAUST AND RETURN REGISTERS/GRILLES.

- A. 0.0375-inch stainless steel non-aspirating perforated panels with stainless steel plenum for low-velocity applications.
- B. Provide quick-opening fasteners with safety chains.
- C. Provide multi-louvered equalizing grid where noted on Drawings.

2.11 CEILING EGG CRATE EXHAUST AND RETURN REGISTERS/GRILLES

- A. Fixed series of cubes comprised of 1/2 x 1/2 x 1-inch aluminum strips.
- B. Fabricate one-inch margin aluminum frame.
- C. Fabricate of aluminum with factory baked enamel finish.
- D. Provide square uniform height plenum for ducted return and exhaust application of scheduled neck size.

2.12 CEILING LINEAR SLOT DIFFUSERS

- A. Continuous linear flow bar slot with adjustable vanes for left, right, or vertical discharge, with volume control. Provide slot width, length and number of slots as scheduled on the Drawings.
- B. Fabricate of aluminum extrusions with factory baked enamel finish.
- C. Provide support clips and gasket as required for ceiling system.
- D. Provide alignment strips for hairline joints and end caps where the slot terminates. Provide mitered corners.
- E. Provide black matte finish for all interior exposed-to-view components.
- F. Provide externally insulated supply air plenum by diffuser manufacturer.
- G. Provide return slot diffuser same as supply, except without the adjustable vane control. Provide return air plenum for ducted return where indicated on Drawings.

2.13 PLENUM SLOT SUPPLY AND RETURN DIFFUSERS

- A. Supply or return plenum slot, 3/4-inch, with single extruded aluminum curved deflector blade to create a tight horizontal airflow pattern across the ceiling. Provide slot width, length, and number of slots as scheduled on the Drawings.
- B. Diffusers shall discharge air horizontally through two outside sections and vertically through a center down-blow section.
- C. Standard nominal lengths shall be 2, 3, 4, or 5 feet. Units shall be constructed of 24 gage steel. Maximum height of the unit's plenum shall be 7-inches. Inlets shall have a minimum of 1-1/2-inch depth for duct connection. The standard finish shall be black on the face of the diffuser and pattern deflectors.
- D. Diffuser shall be similar to Titus N-1-R diffuser.

2.14 PERIMETER SLOT SUPPLY AND RETURN DIFFUSERS

- A. High induction supply and return plenum slot, the supply is a 3/4-inch fixed slot width that produces a horizontal discharge pattern, and a return air slot with a maximum 1-1/2-inch slot width. Provide length as scheduled on the Drawings.
- B. Standard nominal lengths shall be 2, 3, 4, or 5 feet. Units shall be constructed of 24 gage steel. Maximum height of the units shall be 7-inches. Inlets shall have a minimum of 1-1/2-inch depth for duct connection. The standard finish shall be black on the face of the diffuser and pattern deflectors.
- C. Diffuser shall be similar to the Titus N-1-R diffuser.

2.15 CEILING LINEAR EXHAUST AND RETURN GRILLES

- A. Streamlined blades with 90-degree one-way deflection, 1/8-inch x 3/4-inch on 1/4-inch centers.
- B. Fabricate 1-inch margin frame with countersunk screw mounting.
- C. Fabricate of steel with 22 gage minimum frames and 22 gage minimum blades, steel and aluminum with 20 gage minimum frame, or aluminum extrusions, with factory baked enamel finish.
- D. Opposed blade damper with removable key operator, operable from face shall only be provided with the grille when it is scheduled on the Drawing.

2.16 WALL SUPPLY REGISTERS/GRILLES

- A. Streamlined and individually adjustable curved blades to discharge air along face of grille with two-way deflection.
- B. Fabricate 1-inch margin frame with countersunk screw, concealed mounting and gasket.
- C. Fabricate of aluminum extrusions with factory clear anodized finish.
- D. Provide multi-louvered equalizing grid where noted on Drawings.

2.17 WALL EXHAUST AND RETURN REGISTERS/GRILLES

- A. Streamlined blades, depth of which exceeds 3/4-inch spacing, with spring or other device to set blades, vertical or horizontal face as scheduled.
- B. Fabricate one-inch margin frame with concealed mounting.
- C. Fabricate of aluminum with 20 gage minimum frame, or aluminum extrusions, with factory baked enamel finish.

2.18 LINEAR BAR WALL DIFFUSERS

- A. Streamlined blades with 0 to 15 degree deflection, as scheduled, 1/8-inch x 3/4-inch or 1/4-inch centers.
- B. Fabricate of aluminum extrusions, with factory clear anodized finish.
- C. Fabricate 1/2-inch margin frame with concealed mounting and gasket.
- D. Provide concealed fastening, straightening grids and alignment bars.
- E. Provide externally insulated plenums by diffuser manufacturer.
- F. Provide return bar diffusers same as supply with return air plenum.
- G. Silhouette finish.

2.19 LINEAR FLOOR SUPPLY REGISTERS/GRILLES

- A. Streamlined blades with zero degree deflection, 7/32-inch x 3/4-inch on 1/2-inch centers.
- B. Fabricate of high-grade aluminum extrusions with factory clear anodized finish.
- C. Fabricate 3/16-inch margin heavy margin frame with concealed mounting and gasket and mounting frame. Frameless flange for floor installation. Silhouette finish.
- D. Provide concealed fastening, straightening grids and alignment bars.

2.20 LABORATORY RADIAL AIR SUPPLY DIFFUSERS

- A. High-volume, low velocity performance.
- B. Diffuser shall provide non-aspirating radial air pattern and shall be configured with air supply plenums with inlet collars to assure uniform velocity over the diffuser face.
- C. Furnish stainless steel back pan and stainless steel faced diffusers for animal holding rooms.
- D. Furnish aluminum back pan and aluminum-faced diffusers for laboratories.
- E. Performance face drops below ceiling, single-pane back pan and single piece lower chamber. Sectioned diffuser is not acceptable.

2.21 WALL EXHAUST AND RETURN REGISTERS/GRILLES – SEVERE DUTY

- A. Streamlined 40-degree fixed blades, at 1/2-inch spacing, with horizontal front blades.
- B. Fabricate 1-1/4-inch margin frame with vandal-proof screws.
- C. Fabricate totally of steel with minimum 18 gage frames and minimum 14 gage blades with factory baked enamel finish.

2.22 DOOR GRILLES

- A. V-shaped louvers of 20 gage steel, 1-inch deep on 1/2-inch centers.
- B. Provide 20 gage steel frame with auxiliary frame to give finished appearance on both sides of door, with factory prime coat finish.

2.23 LOUVERS

- A. Provide 6-inch deep louvers with blades on 45-degree slope with center baffle and return bend, heavy channel frame, birdscreen on interior side with 1/2-inch square mesh for exhaust and 3/4-inch for intake.
- B. Fabricate of 12 gage extruded aluminum, welded assembly, with factory prime coat finish.
- C. Furnish with exterior angle flange for installation.
- D. Fabricate louver penthouses with mitered corners and reinforce with structural angles.
- E. Pass 750 feet per minute free velocity with less than 0.10 inches of water pressure drop, based in accordance with AMCA 500. Water penetration less than 0.025 ounce of water per foot of free area at 900 feet per minute. Provide a minimum of 45 percent free area.

2.24 ROOF HOODS

- A. Fabricate air inlet or exhaust hoods in accordance with SMACNA 1035, 1-inch classification Duct Construction Standards.
- B. Fabricate of galvanized steel, minimum 16 gage base and 20 gage hood, or aluminum, minimum 16 gage base and 18 gage hood; suitably reinforced; with removable hood; birdscreen with 1/2-inch square mesh for exhaust and 3/4-inch for intake, and factory prime coat finish.
- C. Roof curb shall be coordinated with Owner and roofing Contractor.
- D. Hood outlet area shall be minimum two times the throat area.

2.25 GOOSENECKS

- A. Fabricate in accordance with SMACNA 1035, 1-inch classification, of minimum 18 gage galvanized steel.
- B. Roof curb shall be coordinated with Owner and roofing Contractor.

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Check location of air outlets and inlets and make necessary adjustments in position to conform to architectural features, reflected ceiling plans, symmetry, and lighting arrangement.
- D. Install air outlets and inlets to ductwork with airtight connection.
- E. Provide balancing dampers on duct take-off to diffusers, grilles and registers, regardless of whether dampers are specified as part of the diffuser, grille, or register assembly.
- F. Paint ductwork visible behind air outlets and inlets matte black. Refer to Division 09.
- G. Provide all specialties and frames for air distribution devices as required for proper installation in ceiling type as indicated on Architectural Drawings. Provide all cutting and patching of T-bars, gypsum board, and other ceiling systems as required for installation of air devices.

SECTION 23 84 13 00 - HUMIDIFIERS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for humidifiers. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following humidifiers:
 - a. Atomizing.
 - b. Steam injection.
 - c. Self-contained.
 - d. Heated pan.
 - e. Heat exchanger.

C. Definition

1. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.

D. Submittals

1. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories.
2. Shop Drawings: Detail fabrication and installation of humidifiers. Include piping details, plans, elevations, sections, details of components, manifolds, and attachments to other work.
 - a. Wiring Diagrams: Power, signal, and control wiring.
3. Field quality-control test reports.
4. Operation and maintenance data.

E. Quality Assurance

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
2. Comply with ARI 640, "Commercial and Industrial Humidifiers."

1.2 Products**A. Water-Pressure Atomizing Humidifiers**

1. Nozzles: ASTM A 666, Type 304 **OR** 316, **as directed**, stainless steel.
2. Manifold: ASTM A 269, Type 304 **OR** 316, **as directed**, stainless-steel piping.
3. Droplet Filter: Biocide-treated polyethylene with maximum 0.30-inch wg (75-Pa) resistance.
4. Piping and Fittings: ASTM A 269, Type 304 **OR** 316, **as directed**, stainless-steel pipe and fittings.
OR
Piping and Fittings: ASTM B 88 (ASTM B 88M), Type L copper pipe and wrought-copper fittings with brazed joints.
5. Water Pump: Enclosed belt-drive ceramic plunger pump with stainless-steel **OR** bronze, **as directed**, heads, and single **OR** variable, **as directed**, speed, totally enclosed, fan-cooled motor.
6. Final Water-Filter Efficiency: Minimum 98 percent retention of suspended particles 10 **OR** 20, **as directed**, microns and larger from makeup water.

7. Final Water-Filter Pressure Drop: Maximum 2 psig (14 kPa) at design flow when clean, and **<Insert value>** when dirty, **as directed**.
 8. Pump Controls:
 - a. Cycle **OR** Vary speed of, **as directed**, motor to satisfy humidistat.
 - b. High-pressure solenoid valve for each control zone shown on Drawings.
 - c. Building automation system interface for each control zone for start/stop and status indication and control at central workstation.
 9. Dispersion Fan:
 - a. Aluminum blade propeller fan with finger guard and single-speed motor interlocked to operate with humidifier.
 - b. Fan Mounting: Above and behind manifold on bracket integral to wall-mounting manifold.
 10. Accessories:
 - a. Humidistat: Wall **OR** Return-duct, **as directed**, -mounting, solid-state, electronic-sensor controller capable of full-modulation or cycling control.
 - b. Duct-mounting, high-limit humidistat.
 - c. Airflow switch for preventing humidifier operation without airflow.
- B. Compressed-Air Atomizing Humidifiers
1. Nozzles: ASTM A 666, Type 304 **OR** 316, **as directed**, stainless steel.
 2. Manifold: ASTM A 269, Type 304 **OR** 316, **as directed**, stainless-steel piping.
 3. Droplet Filter: Biocide-treated polyethylene with maximum 0.30-inch wg (75-Pa) resistance.
 4. Piping and Fittings: ASTM A 269, Type 304 **OR** 316, **as directed**, stainless-steel pipe and fittings.
 5. Compressed-Air and Water, **as directed**, Piping and Fittings: ASTM B 88 (ASTM B 88M), Type L copper pipe and wrought-copper fittings with soldered joints.
 6. Final Water-Filter Efficiency: Minimum 98 percent retention of suspended particles 10 **OR** 20, **as directed**, microns and larger from makeup water.
 7. Final Water-Filter Pressure Drop: Maximum 2 psig (14 kPa) at design flow when clean, and **<Insert value>** when dirty, **as directed**.
 8. Air and Water Solenoid Controls:
 - a. Cycle valves to satisfy humidistat.
 - b. Solenoid valves for each control zone shown on Drawings.
 - c. Building automation system interface for each control zone for start/stop and status indication and control at central workstation.
 9. Dispersion Fan:
 - a. Aluminum blade propeller fan with finger guard and single-speed motor interlocked to operate with humidifier.
 - b. Fan Mounting: Above and behind manifold on bracket integral to wall-mounting manifold.
 10. Accessories:
 - a. Humidistat: Wall **OR** Return-duct, **as directed**, -mounting, solid-state, electronic-sensor controller capable of full-modulation or cycling control.
 - b. Duct-mounting, high-limit humidistat.
 - c. Airflow switch for preventing humidifier operation without airflow.
- C. Steam-Injection Humidifiers
1. Manifold: ASTM A 666, Type 304 stainless steel, steam jacketed, **as directed**; insulated with 1/2-inch (13-mm) fiberglass and stainless-steel jacket; and , **as directed**, extending the full width of duct or plenum with mounting brackets at ends.
 2. Discharge Nozzle and Dispersion Fan:
 - a. Steam-jacketed discharge nozzle, aluminum blade propeller fan with finger guard, and single-speed motor interlocked to operate with humidifier.
 - b. Fan Mounting: Above and behind discharge outlet on bracket integral to discharge outlet.
 3. Steam Separator: Cast iron **OR** ASTM A 666, Type 304 stainless steel, **as directed**, with separate, **as directed**, humidifier control valve.
 4. Humidifier Control Valve:
 - a. Actuator: Pneumatic **OR** Electric, **as directed**, modulating with spring return.
OR

Actuator: As specified in Division 23 Section "Instrumentation And Control For Hvac".

5. Steam Trap: Inverted-bucket type, sized for a minimum of 3 times the maximum rated condensate flow of humidifier at 1/2-psig (3.4-kPa) inlet pressure.
6. Accessories:
 - a. Wall **OR** Return-duct, **as directed**, -mounting humidistat.
 - b. Duct-mounting, high-limit humidistat.
 - c. Aquastat mounted on steam condensate return piping to prevent cold operation of humidifier.
 - d. In-line strainer.
 - e. Airflow switch for preventing humidifier operation without airflow.

D. Self-Contained Humidifiers

1. Electric-Resistance Heater Container: Cleanable, ASTM A 666, Type 304 **OR** 316, **as directed**, stainless steel. Comply with UL 499.
2. Electrode Cylinder: Replaceable plastic assembly with disposable ionic bed inserts, **as directed**. Comply with UL 499.
3. Gas-Fired Steam Generator: Factory assembled and tested.
 - a. Standard: Fabricate and label steam generator to comply with CSA.
 - b. Maximum Steam Pressure: 10 inches wg (2488 Pa).
 - c. Burner Type: Natural-gas **OR** Propane, **as directed**, fired with modulating, low NOx infrared burner, minimum 82 percent efficient.
 - d. Gas Train: Safety shutoff valves, gas cock, strainer, pressure-regulating valve.
 - e. Ignition: Hot-surface ignition with flame safety system.
 - f. Combustion Chamber: Sealed with outdoor-air and flue-vent connections.
 - g. Heat-Exchanger Tank: Cleanable, ASTM A 666, Type 304 **OR** 316, **as directed**, stainless steel with corrosion-resistant coating and disposable ionic bed inserts, **as directed**.
4. Manifold: Stainless-steel tube with integral fan to discharge vapor directly into occupied space.
OR
Manifold: ASTM A 666, Type 304 **OR** 316, **as directed**, stainless-steel tube extending across entire width of duct or plenum and equipped with mounting brackets on ends.
5. Cabinet: Sheet metal enclosure for housing heater cylinder, electrical wiring, components, controls, and control panel. Enclosure shall include baked-enamel finish, hinged or removable access door, and threaded outlet in bottom of cabinet for drain piping.
6. Control Panel:
 - a. Factory-wired disconnect switch.
 - b. Liquid-crystal display.
 - c. Programmable keyboard.
 - d. Set-point adjustment.
 - e. Warning signal indicating end of replaceable cylinder or ionic bed insert, **as directed**, life.
 - f. Low-voltage, control circuit.
 - g. Diagnostic, maintenance, alarm, and status features.
 - h. High-water sensor **OR** float, **as directed**, to prevent overfilling.
7. Controls:
 - a. Microprocessor-based control system for modulating or cycling control, and start/stop and status monitoring for interface to central HVAC instrumentation and controls.
 - b. Solenoid-fill and automatic drain valves to maintain water level and temper hot drain water.
 - c. Field-adjustable timer to control drain cycle for flush duration and interval.
 - d. Controls shall drain tanks if no demand for humidification for more than 72 hours.
 - e. Conductivity **OR** Float, **as directed**, -type level controls.
8. Accessories:
 - a. Humidistat: Wall **OR** Return-duct, **as directed**, -mounting, solid-state, electronic-sensor controller capable of full modulation or cycling control.
 - b. Duct-mounting, high-limit humidistat.
 - c. Airflow switch for preventing humidifier operation without airflow.

E. Heated-Pan Humidifiers

1. Heat Source: Hot water **OR** Steam **OR** Electric resistance, **as directed**.

2. Comply with UL 499.
3. Pan and Heat-Exchange Piping: ASTM A 666, Type 304 **OR** 316, **as directed**, stainless steel with corrosion-resistant coating, overflow, and drain fittings. Include disposable ionic bed inserts, **as directed**.
4. Manifold: ASTM A 666, Type 304 **OR** 316, **as directed**, stainless-steel, duct-mounting, single- or manifold-grid connected to heated-pan housing with flexible hose and extending across width of duct or plenum. Manifold shall have mounting brackets at both ends.
OR
Manifold: Inverted, ASTM A 666, Type 304 **OR** 316, **as directed**, stainless-steel U-tube with humidifier mounted directly under the duct.
OR
Manifold: ASTM A 666, Type 304 **OR** 316, **as directed**, stainless-steel tube with flexible hose to connect to humidifier, integral fan to discharge vapor directly into occupied space, and wall- or ceiling-mounting brackets.
5. Controls:
 - a. Solenoid-fill and automatic drain valves to maintain water level and temper hot drain water.
 - b. Field-adjustable timer to control drain cycle for flush duration and interval.
 - c. Conductivity **OR** Float, **as directed**, -type level controls.
6. Piping Specialties: Inlet strainer, control valve, and steam trap.
7. Piping Specialties: Inlet strainer and control valve.
8. Accessories:
 - a. Humidistat: Wall **OR** Return-duct, **as directed**, -mounting, solid-state, electronic-sensor controller capable of full modulation or cycling control.
 - b. Duct-mounting, high-limit humidistat.
 - c. Airflow switch for preventing humidifier operation without airflow.

F. Heat-Exchanger Humidifiers

1. Fabricate and label steam generator to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
2. Heat Exchanger: ASTM A 666, Type 304 **OR** 316, **as directed**, stainless steel with corrosion-resistant coating, overflow, and drain fittings. Include disposable ionic bed inserts, **as directed**.
3. Manifold: ASTM A 666, Type 304 **OR** 316, **as directed**, stainless-steel, steam-jacketed, **as directed**, duct-mounting, single- or manifold-grid connected to steam generator with flexible hose and extending across width of duct or plenum. Manifold shall have mounting brackets for both ends. Insulate with 1/2-inch (13-mm) fiberglass and stainless-steel jacket extending full width of duct or plenum with mounting brackets at ends, **as directed**.
OR
Manifold: ASTM A 666, Type 304 **OR** 316, **as directed**, stainless-steel tube with flexible hose to connect to humidifier and integral fan to discharge vapor directly into occupied space. Manifold shall have wall- or ceiling-mounting brackets.
4. Controls:
 - a. Solenoid-fill and automatic drain valves to maintain water level and temper hot drain water.
 - b. Field-adjustable timer to control drain cycle for flush duration and interval.
 - c. Conductivity **OR** Float, **as directed**, -type level controls.
5. Accessories:
 - a. Humidistat: Wall **OR** Return-duct, **as directed**, -mounting, solid-state, electronic-sensor controller capable of full modulation.
 - b. Duct-mounting, high-limit humidistat.
 - c. Airflow switch for preventing humidifier operation without airflow.

1.3 EXECUTION

A. Installation

1. Install humidifiers with required clearance for service and maintenance. Maintain path, downstream from humidifiers, clear of obstructions as required by ASHRAE 62.1, **as directed**.
2. Seal humidifier manifold duct or plenum penetrations with flange.

3. Install humidifier manifolds in metal ducts and casings constructed according to SMACNA's "HVAC Duct Construction Standards, Metal and Flexible."
4. Install galvanized **OR** stainless, **as directed**,-steel drain pan under each manifold mounted in duct.
 - a. Construct drain pans with connection for drain; insulated and complying with ASHRAE 62.1, **as directed**.
 - b. Connect to condensate trap and drainage piping.
 - c. Extend drain pan upstream and downstream from manifold a minimum distance recommended by manufacturer but not less than required by ASHRAE 62.1.
5. Install manifold supply piping pitched to drain condensate back to humidifier.
6. Install drip leg upstream from steam trap a minimum of 12 inches (300 mm) tall for proper operation of trap.
7. Install steam generator level on concrete base. Concrete base is specified in Division 23 Section "Common Work Results For Hvac".
8. Concrete Bases: Anchor steam generator to concrete base.
 - a. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around full perimeter of base.
 - b. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
 - c. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - d. Install anchor bolts to elevations required for proper attachment to supported equipment.
 - e. Cast-in-place concrete materials and placement requirements are specified in Division 31.
9. Install seismic restraints on humidifiers. Seismic restraints are specified in Division 23 Section "Vibration And Seismic Controls For Hvac Piping And Equipment".
10. Install gas-fired steam generators according to NFPA 54.

B. Connections

1. Piping installation requirements are specified in other Division 21. Drawings indicate general arrangement of piping, fittings, and specialties.
 - a. Install piping adjacent to humidifiers to allow service and maintenance.
 - b. Install shutoff valve, strainer, backflow preventer, and union in humidifier makeup line.
2. Install electrical devices and piping specialties furnished by manufacturer but not factory mounted.
3. Install piping from safety relief valves to nearest floor drain.
4. Connect gas piping full size to steam-generator, gas-train inlet with union. Gas piping materials and specialties are specified in Division 23 Section(s) "Facility Natural-gas Piping" OR "Facility Liquefied-petroleum Gas Piping", **as directed**.
5. Connect breeching full size to steam-generator outlet. Venting materials are specified in Division 23 Section "Breechings, Chimneys, And Stacks".
6. Connect combustion-air inlet to intake terminal using PVC piping with solvent-cemented joints. Run from boiler connection to outside and terminate adjacent to flue termination.
7. Ground equipment according to Division 26 Section "Grounding And Bonding For Electrical Systems".
8. Connect wiring according to Division 26 Section "Low-voltage Electrical Power Conductors And Cables".

C. Field Quality Control

1. Perform tests and inspections and prepare test reports.
2. Tests and Inspections:
 - a. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - b. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - c. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
3. Remove and replace malfunctioning units and retest as specified above.

D. Demonstration

1. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain humidifiers.

END OF SECTION 23 84 13 00

Task	Specification	Specification Description
23 84 16 00	01 22 16 00	No Specification Required

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 25 55 00 00 - BUILDING AUTOMATION SYSTEMS (BAS) GENERAL**PART 1 - GENERAL**

Note: Reference the “M. D. Anderson Cancer Center Design Guidelines, Element D3060, Controls and Instrumentation – General” document. This document describes how to employ this and other controls-related Specifications. The Engineer is instructed to consult the document for guidance on the nature of these Specifications, methods for deleting non-applicable text, and use and deletion of Editor’s Notes before proceeding with modification of this Specification to suit the Project.

Engineer shall utilize the BAS Retrofit Specifications 25 00 10, 25 11 19, 25 11 10, 25 14 10, 25 15 10, and 25 30 10 for all M. D. Anderson Houston area projects unless specifically directed to utilize Sections 25 00 00, 25 08 00, 25 11 09, 25 11 00, 25 14 00, 25 15 00, and 25 30 00. Engineer shall confirm with the Manager of Building Automation Services located in the department of Environmental Health and Safety before utilizing Sections: 25 00 00, 25 08 00, 25 11 09, 25 11 00, 25 14 00, 25 15 00, and 25 30 00 for a Houston area project.

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Section Includes:
 - 1. Description of Work.
 - 2. Quality Assurance.
 - 3. System Architecture.
 - 4. Distributed Processing Units/Quantity and Location.
 - 5. Demolition and Reuse of Existing Materials and Equipment.
 - 6. Sequence of Work.
- B. Contractor shall furnish and install a direct digital control and building automation system (BAS). The new BAS shall utilize electronic sensing, microprocessor-based digital control, and electronic actuation of dampers and valves (except where noted otherwise) to perform control sequences and functions specified. The BAS for this Project will generally consist of monitoring and control of systems described herein. Reference shall also be made to control Drawings, Sequence of Operation, and points lists.
- C. The HVAC systems being controlled are [describe the type of mechanical systems included in the Project]. This Section defines the manner and method by which these controls function.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.

- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within the following references:
 - 1. American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE).
 - 2. ASHRAE 135: BACnet - A Data Communication Protocol for Building Automation and Control Networks, latest edition. American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc. and all current addenda and annexes.
 - 3. Electronics Industries Alliance:
 - a. EIA-709.1-A-99: Control Network Protocol Specification.
 - b. EIA-709.3-99: Free-Topology Twisted-Pair Channel Specification.
 - c. EIA-232: Interface between Data Terminal Equipment and Data Circuit-Terminating Equipment Employing Serial Binary Data Interchange.
 - d. EIA-458: Standard Optical Fiber Material Classes and Preferred Sizes.
 - e. EIA-485: Standard for Electrical Characteristics of Generator and Receivers for use in Balanced Digital Multipoint Systems.
 - f. EIA-472: General and Sectional Specifications for Fiber Optic Cable.
 - g. EIA-475: Generic and Sectional Specifications for Fiber Optic Connectors and all Sectional Specifications.
 - h. EIA-573: Generic and Sectional Specifications for Field Portable Polishing Device for Preparation Optical Fiber and all Sectional Specifications.
 - i. EIA-590: Standard for Physical Location and Protection of Below-Ground Fiber Optic Cable Plant and all Sectional Specifications.
 - 4. Underwriters Laboratories:
 - a. UL 916: Energy Management Systems.
 - b. UUKL 864: UL Supervised Smoke Control if the BAS is used for smoke control.
 - 5. NEMA Compliance:
 - a. NEMA 250: Enclosure for Electrical Equipment.
 - b. NEMA ICS 1: General Standards for Industrial Controls.
 - 6. NFPA Compliance:
 - a. NFPA 90A "Standard for the Installation of Air Conditioning and Ventilating Systems" where applicable to controls and control sequences.
 - b. NFPA 70 National Electrical Code (NEC).
 - 7. Institute of Electrical and Electronics Engineers (IEEE)

- a. IEEE 142: Recommended Practice for Grounding of Industrial and Commercial Power Systems.
- b. IEEE 802.3: CSMA/CD (Ethernet – Based) LAN.
- c. IEEE 802.4: Token Bus Working Group (ARCNET – Based) LAN.
- d. IEEE 519: Recommended Practices and Requirements for Harmonic Control in Electric Power Systems.

1.04 DEFINITIONS

- A. Advanced Application Controller (AAC): A device with limited resources relative to the Building Controller (BC). It may support a level of programming and may also be intended for application specific applications.
- B. Application Protocol Data Unit (APDU): A unit of data specified in an application protocol and consisting of application protocol control information and possible application user data (ISO 9545).
- C. Application Specific Controller (ASC): A device with limited resources relative to the Advanced Application Controller (AAC). It may support a level of programming and may also be intended for application-specific applications.
- D. BACnet/BACnet Standard: BACnet communication requirements as defined by ASHRAE/ANSI 135 and all current addenda and annexes.
- E. BACnet Interoperability Building Blocks (BIBB): BIBB defines a small portion of BACnet functionality that is needed to perform a particular task. BIBBS are combined to build the BACnet functional requirements for a device in a Specification.
- F. Binding: In the general sense, binding refers to the associations or mappings of the sources network variable and their intended or required destinations.
- G. Building Automation System (BAS): The entire integrated management, monitoring, and control system.
- H. Building Controller (BC): A fully programmable device capable of carrying out a number of tasks including control and monitoring via direct digital control (DDC) of specific systems, acting as a communications router between the LAN backbone and sub-LANs, and data storage for trend information, time schedules, and alarm data.
- I. Change of Value (COV): An event that occurs when a measured or calculated analog value changes by a predefined amount (ASHRAE/ANSI 135).
- J. Client: A device that is the requestor of services from a server. A client device makes requests of and receives responses from a server device.
- K. Continuous Monitoring: A sampling and recording of a variable based on time or change of state (e.g. trending an analog value, monitoring a binary change of state).
- L. Controller or Control Unit (CU): Intelligent stand-alone control panel. Controller is a generic reference and shall include BCs, AACs, and ASCs as appropriate.
- M. Control Systems Server (CSS): This shall be a computer (or computers) that maintains the systems configuration and programming database. This may double as an operator workstation.
- N. Direct Digital Control (DDC): Microprocessor-based control including Analog/Digital conversion and program logic.

- O. Functional Profile: A collection of variables required to define key parameters for a standard application. For the HVAC industry, this would include applications like VAV terminal units, fan coil units, etc.
- P. Gateway (GTWY): A device, which contains two or more dissimilar networks/protocols, permitting information exchange between them (ASHRAE/ANSI 135-2001).
- Q. Hand Held Device (HHD): Manufacturer's microprocessor based device for direct connection to a Controller.
- R. IT LAN: Reference to the facility's Information Technology network, used for normal business-related e-mail and Internet communication.
- S. LAN Interface Device (LANID): Device or function used to facilitate communication and sharing of data throughout the BAS.
- T. Local Area Network (LAN): General term for a network segment within the architecture. Various types and functions of LANs are defined herein.
- U. Local Supervisory LAN: Ethernet-based LAN connecting Primary Controller LANs with each other and OWSs and CSSs and the LAN to which the GEMnet will be interfaced. See System Architecture herein.
- V. Master-Slave/Token Passing (MS/TP): Data link protocol as defined by the BACnet standard (ASHRAE/ANSI 135).
- W. MDACC WAN: Internet-based network connecting multiple facilities with a central data warehouse and server, accessible via standard web-browser.
- X. Open Database Connectivity (ODBC): An open standard application-programming interface (API) for accessing a database developed. ODBC compliant systems make it possible to access any data from any application, regardless of which database management system (DBMS) is handling the data.
- Y. Operator Interface (OI): A device used by the operator to manage the BAS including OWSs, POTs, and HHDs.
- Z. Operator Workstation (OWS): The user's interface with the BAS system. As the BAS network devices are stand-alone, the OWS is not required for communications to occur.
- AA. Point-to-Point (PTP): Serial communication as defined in the BACnet standard.
- BB. Portable Operators Terminal (POT): Laptop PC used both for direct connection to a controller and for remote dial up connection.
- CC. Protocol Implementation Conformance Statement (PICS): A written document, created by the manufacturer of a device, which identifies the particular options specified by BACnet that are implemented in the device (ASHRAE/ANSI 135).
- DD. Primary Controlling LAN: High speed, peer-to-peer controller LAN connecting BCs and optionally AACs and ASCs. Refer to System Architecture herein.
- EE. Router: A device that connects two or more networks at the network layer.
- FF. Secondary Controlling LAN: LAN connecting AACs and ASCs, generally lower speed and less reliable than the Primary Controlling LAN. Refer to System Architecture herein.
- GG. Server: A device that is a provider of services to a client. A client device makes requests of and receives responses from a server device.

HH.SQL: Standardized Query Language, a standardized means for requesting information from a database.

II. Smart Device: A control I/O device such as a sensor or actuator that can directly communicate with the controller network to which it is connected. This differs from an ASC in that it typically deals only with one variable.

JJ. XML (Extensible Markup Language): A specification developed by the World Wide Web Consortium. XML is a pared-down version of SGML, designed especially for Web documents. It allows designers to create their own customized tags, enabling the definition, transmission, validation, and interpretation of data between applications and between organizations.

1.05 QUALITY ASSURANCE

Use “A” to define any specific qualifications needed; otherwise leave “Reserved”.

- A. [Reserved].
- B. Product Line Demonstrated History: The product line being proposed for the Project must have an installed history of demonstrated satisfactory operation for a length of one (1) year since date of final completion in at least ten (10) installations of comparative size and complexity. Submittals shall document this requirement with references.
- C. Installer's Qualifications: Firms specializing and experienced in control system installations for not less than 5 years. Firms with experience in DDC installation projects with point counts equal to this Project and systems of the same character as this Project. If installer is a Value Added Reseller (VAR) of a manufacturer's product, installer must demonstrate at least three years prior experience with that manufacturer's products. Experience starts with awarded Final Completion of previous projects. Submittals must document this experience with references.
- D. Installer's Experience with Proposed Product Line: Firms shall have specialized in and be experienced with the installation of the proposed product line for not less than one year from date of final completion on at least three (3) projects of similar size and complexity. Submittals shall document this experience with references.
- E. Installer's Field Coordinator and Sequence Programmer Qualifications: Individual(s) shall specialize in and be experienced with control system installation for not less than five (5) years. Proposed field coordinator shall have experience with the installation of the proposed product line for not less than two (2) projects of similar size and complexity. Installer shall submit the names of the proposed individual and at least one alternate for each duty. Submittals shall document this experience with references. Proposed individuals must show proof of the following training:
- F. Product Line Training: Individuals overseeing the installation and configuration of the proposed product line must provide evidence of the most advanced training offered by the manufacturer on that product line for installation and configuration.
- G. Programming Training: Individuals involved with programming the Site-specific sequences shall provide evidence of the most advanced programming training offered by the vendor of the programming application offered by the manufacturer.
- H. Installer's Service Qualifications: The installer must be experienced in control system operation, maintenance and service. Installer must document a minimum five (5) year history of servicing installations of similar size and complexity. Installer must also document at least a one year history of servicing the proposed product line.
- I. Installer's Response Time and Proximity:

1. Installer must maintain a fully capable service facility within a 60 mile radius of the Project Site. Service facility shall manage emergency service dispatches and maintain inventory of spare parts.
 2. Emergency response times are listed below in this Section. Installer must demonstrate ability to meet response times.
- J. The BAS and components shall be listed by Underwriters Laboratories (UL 916) as an Energy Management System.
- K. The BAS shall be listed by Underwriters Laboratories (UUKL 864) for Supervised Smoke Control.

1.06 SUBMITTALS

- A. General: Submit under provisions of Division 01. Two (2) copies of the materials shall be delivered directly to MDACC Monitoring Services staff, in addition to the copies required by other Sections. In addition, an electronic version of the completed materials shall be provided on CD or DVD. Data can be in native file format or scanned where necessary. Refer to Section 25 08 00 for additional Commissioning submittal requirements.
- B. Functional Intent: Throughout the Contract Documents, detailed requirements are specified, some of which indicate a means, method or configuration acceptable to meet that requirement. Contractor may submit products that utilize alternate means, methods, and configurations that meet the functional intent. However these will only be allowed with prior approval.
- C. Electronic Submittals: While all requirements for hard copy submittal apply, control submittals and operation and maintenance (O&M) information shall also be provided in electronic format as follows:
1. Drawings and Diagrams: Shop Drawings shall be provided on electronic media as an AutoCAD drawing per Owner's CAD standards. All 'x reference' and font files must be provided with AutoCAD files.
 2. Other Submittals: All other submittals shall be provided in Adobe Portable Document Format
- D. Qualifications: Manufacturer, Installer, and Key personnel qualifications as indicated for the appropriate items.
- E. Product Data: Submit manufacturer's technical product data for each control device, panel, and accessory furnished, indicating dimensions, capacities, performance and electrical characteristics, and material finishes. Also include installation and start-up instructions.
1. Shop Drawings: Submit Shop Drawings electronically on AutoCAD software for each control system, including a complete drawing for each air handling unit, system, pump, device, etc. with all point descriptors, addresses and point names indicated. Shop Drawings shall contain the following information:
 - a. System Architecture and System Layout:
 - 1) One-line diagram indicating schematic locations of all control units, workstations, LAN interface devices, gateways, etc. Indicate network number, device ID, address, device instance, MAC address, drawing reference number, and controller type for each control unit. Indicate media, protocol, baud rate, and type of each LAN. All optical isolators, repeaters, end-of-line resistors, junctions, ground locations etc. shall be located on the diagram.

- 2) Provide floor plans locating all control units, workstations, servers, LAN interface devices, gateways, etc. Include all WAN and LAN communication wiring routing, power wiring, power originating sources, and low voltage power wiring. Indicate network number, device ID, address, device instance, MAC address, drawing reference number, and controller type for each control unit. Indicate media, protocol, baud rate, and type of each LAN. All optical isolators, repeaters, end-of-line resistors, junctions, ground locations etc. shall be located on the floor plans. Wiring routing as-built conditions shall be maintained accurately throughout the construction period and the drawing shall be updated to accurately reflect accurate, actual installed conditions.
- b. Schematic flow diagram of each air and water system showing fans, coils, dampers, valves, pumps, heat exchange equipment and control devices. Include written description of sequence of operation.
- c. All physical points on the schematic flow diagram shall be indicated with names, descriptors, and point addresses identified as listed in the point summary table.
- d. With each schematic, provide a point summary table listing building number and abbreviation, system type, equipment type, full point name, point description, Ethernet backbone network number, network number, device ID, object ID (object type, instance number). If this information is not available at the time of Shop Drawings submittals, furnish with O&M manual documentation for Owner review and approval. See Section 25 15 00 for additional requirements.
- e. Label each control device with setting or adjustable range of control.
- f. Label each input and output with the appropriate range.
- g. Provide a Bill of Materials with each schematic. Indicate device identification to match schematic and actual field labeling, quantity, actual product ordering number, manufacturer, description, size, voltage range, pressure range, temperature range, etc. as applicable.
- h. With each schematic, provide valve and actuator information including size, Cv, design flow, design pressure drop, manufacturer, model number, close off rating, etc. Indicate normal positions of spring return valves and dampers.
- i. Indicate all required electrical wiring. Electrical wiring diagrams shall include both ladder logic type diagram for motor starter, control, and safety circuits and detailed digital interface panel point termination diagrams with all wire numbers and terminal block numbers identified. Provide panel termination Drawings on separate Drawings. Ladder diagrams shall appear on system schematic. Clearly differentiate between portions of wiring that is existing, factory-installed and portions to be field-installed.
- j. Details of control panels, including controls, instruments, and labeling shown in plan or elevation indicating the installed locations.
- k. Sheets shall be consecutively numbered.
- l. Each sheet shall have a title indicating the type of information included and the HVAC system controlled.
- m. Table of Contents listing sheet titles and sheet numbers.
- n. User Interface Graphic Screens.
- o. Trends.
- p. Alarms.

- q. Legend and list of abbreviations.
 - r. Memory allocation projections.
 - s. Submit along with Shop Drawings but under separate cover calculated and guaranteed system response times of the most heavily loaded LAN in the system.
2. BACnet Protocol Information:
- a. Submit the following:
 - 1) BACnet object description, object ID, and device ID, for each I/O point.
 - 2) Documentation for any non-standard BACnet objects, properties, or enumerations used detailing their structure, data types, and any associated lists of enumerated values.
 - 3) Submit PICS indicating the BACnet functionality and configuration of each controller.
3. Compressed Air Systems:
- a. Product data including rated capacities of selected models, weights (shipping, installed, and operating), furnished specialties, and accessories indicating dimensions, required clearances, and methods of assembly of components, and piping and wiring connections.
 - b. Wiring diagrams from manufacturers detailing electrical power supply wiring to equipment. Include ladder-type wiring diagrams for interlock and control wiring required for final installation. Differentiate between portions of wiring that are factory-installed and portions that are field-installed.
 - c. Pneumatic piping plan and riser layouts including all main air and branch air piping sizes, and calculated pressure losses for all pneumatic lines to all components, devices, and panels.
 - d. Certificates of shop inspection and data report as required by provisions of the ASME Boiler and Pressure Vessel Code.
4. Framed Control Drawings: Laminated control Drawings including system control schematics, Sequence of Operation and panel termination Drawings, shall be provided in panels and mounted in a suitable frame with a .125" Lexan polycarbonate cover for major pieces of equipment, such as air handling units, chillers, boilers, etc. Drawings should be of sufficient size to be easily read. Terminal unit Drawings shall be located in the central plant equipment panel or mechanical room panel.
5. Control Logic Documentation:
- a. Submit control logic program listings (for graphical programming) and logic flow charts illustrating (for line type programs) to document the control software of all control units.
 - b. Control logic shall be annotated to describe how it accomplishes the sequence of operation. Annotations shall be sufficient to allow an operator to relate each program component (block or line) to corresponding portions of the specified Sequence of Operation.
 - c. Include written description of each control sequence.
 - d. Include control response, settings, setpoints, throttling ranges, gains, reset schedules, adjustable parameters and limits.
 - e. Sheets shall be consecutively numbered.

- f. Each sheet shall have a title indicating the controller designations and the HVAC system controlled.
- g. Include Table of Contents listing sheet titles and sheet numbers.
- h. Submit one complete set of programming and operating manuals for all digital controllers concurrently with control logic documentation. This set will count toward the required number of Operation and Maintenance materials specified below and in Division 01.

F. Record Documents:

- 1. Record copies of product data and control Shop Drawings updated to reflect the final installed condition.
- 2. Record copies of approved control logic programming and database on paper and on CD's. Accurately record actual setpoints and settings of controls, final sequence of operation, including changes to programs made after submission and approval of Shop Drawings and including changes to programs made during specified testing.
- 3. Record copies of approved Project specific graphic software on CDs.
- 4. Provide as-built network architecture Drawings showing all nodes including a description field with specific controller identification, description and location information.
- 5. Record copies shall include individual floor plans with controller locations with all interconnecting wiring routing including space sensors, LAN wiring, power wiring, low voltage power wiring. Indicate device instance, MAC address and drawing reference number.
- 6. Provide record riser diagram showing the location of all controllers.
- 7. Maintain Project record documents throughout the Warranty Period and submit final documents at the end of the Warranty Period.

G. Operation and Maintenance Data:

- 1. Submit maintenance instructions and spare parts lists for each type of control device, control unit, and accessory.
- 2. Submit BAS User's Guides (Operating Manuals) for each controller type and for all workstation hardware and software and workstation peripherals.
- 3. Submit BAS advanced Programming Manuals for each controller type and for all workstation software.
- 4. Include all submittals (product data, Shop Drawings, control logic documentation, hardware manuals, software manuals, installation guides or manuals, maintenance instructions and spare parts lists) in maintenance manual; in accordance with requirements of Division 01.
 - a. Contractor shall provide Owner with all product line technical manuals and technical bulletins, to include new and upgraded products, by the same distribution channel as to dealers or branches. This service will be provided for five (5) years as part of the Contract price, and will be offered to Owner thereafter for the same price as to a dealer or branch.
 - b. Manufacturer's Certificates: For all listed and/or labeled products, provide certificate of conformance.
 - c. Product Warranty Certificates: Submit manufacturers product warranty certificates covering the hardware provided.

1.07 SYSTEM ARCHITECTURE

- A. The system provided shall incorporate hardware resources sufficient to meet the functional requirements of these Specifications. Contractor shall include all items not specifically itemized in these Specifications that are necessary to implement, maintain, and operate the system in compliance with the functional intent of these Specifications.
- B. The system shall be configured as a distributed processing network(s) capable of expansion as specified below.
 - 1. Coordinate all requirements of the BAS WAN / Primary LAN with the MDACC IT Department and EH&S Building Automation Services Department..
 - 2. All BAS utilization of the MDACC IT network specified by Division 25 specifications or by the project construction documents shall be compliant with The University's current IT network standards. Reference the Design Guidelines Element Z IS Network Services & Telecommunication Premises Distribution System Standards. The University's IT department solely manages and governs the MDACC IT infrastructure
 - 3. Division 25 shall not configure, provide nor install any devices or network cables within/inside the MDACC IT network infrastructure. BAS Gateways and BAS Routers provided by Division 25 which utilize the MDACC WAN or Primary LAN shall be approved by MDACC IT prior to connection.
 - 4. The MDACC IT department shall grant approval to utilize The University's IT network and provide Ethernet IP address after all their requirements are satisfied. Upon approval an Ethernet drop will be provided with a jackplate, IP address, and computer name specified by MDACC IT for utilization by the Division 25
- C. The system architecture shall consist of an Ethernet-based, wide area network (WAN), a single Local Area Network (LAN) or multi-leveled LANs that support BCs, AACs, ASCs, Operator Workstations (OWS), Smart Devices (SD), and Remote Communication Devices (RCDs) as applicable. The following indicates a functional description of the BAS structure.
 - 1. MDACC WAN: Internet-based network connecting multiple facilities with a central data warehouse and server, accessible via standard web-browser. This is an existing infrastructure and the Division 25 Contractor shall not configure any components of this WAN. Division 25 may request reconfiguration of the MDACC WAN. Only MDACC IT approved reconfigurations requests shall be executed by MDACC IT. Refer to Section 25 30 00 for requirements.
 - 2. Local Supervisory LAN/Primary Controller LAN ('Primary LAN'): The Local Supervisory/Primary Controller LAN shall be an Ethernet-based, 10/100base-T Ethernet LAN connecting Local Supervisory Controllers, Primary Control LANs, BCs, and OWSs. The LAN serves as the inter-BC gateway and OWS-to-BC gateway and communications path and as the connection point for the MDACC WAN. Contractor shall utilize a dedicated LAN for the control system. The Local Supervisory LAN shall be installed in accordance with the Design Guidelines Element Z IS Network Services & Telecommunication Premises Distribution System Standards by others which are not governed by Division 25.. The BAS network configuration shall be the following:
 - a. BACnet/IP as defined in the BACnet standard, and shall share a common network number for the Ethernet backbone, as defined in BACnet Standard. Point/Object naming conventions are specified in Section 25 15 00.

3. Secondary Controller LAN ('Secondary LAN'): Network used to connect AACs and ASCs. Acceptable communication protocols are BACnet over Ethernet (IEEE802.3), ARCNET (IEEE802.4), Master Slave/ Token Passing or polling as defined in the BACnet standard. Secondary LAN shall not directly connect to the MDACC WAN or MDACC Primary LAN. Division 25 shall provide and install all components of the Secondary LAN as specified in Division 25. Network speed vs. the number of controllers on the LAN shall be dictated by the response time and trending requirements and other requirements of the Specifications. The BAS Secondary LAN shall not utilize Network Data cable trays without owner approval. BAS Secondary LAN utilizing Network Data cable trays shall comply with the Design Guidelines Element Z IS Network Services & Telecommunication Premises Distribution System Standards.
- D. Dynamic Data Access: Any data throughout any level of the network shall be available to and accessible by all other devices, Controllers and OWS, whether directly connected or connected remotely.
- E. Remote Data Access: The system shall support the following methods of remote access to the building data. All remote access shall be approved by MDACC Information Security department prior to installation.
 1. Dial-in via minimum of a 56k modem. Dial-in connections shall be secure and shall not allow have the ability to access the MDACC IT network. Dial-in connection will allow access to all control system facilities and graphics with appropriate password (minimum 8 characters, preferably alpha-numeric – typical). The University will provide and pay for the digital grade voice line to support this remote connection.
 2. Browser-based access: A remote user using a standard browser will be able access all control system facilities and graphics with proper password. Owner will secure and pay for the continuous Internet connection. The following paradigms are acceptable for browser-based access:
 - a. Native Internet-based user interfaces (HTML, Java, XML, etc.) that do not require a plug-in.
 - b. User interfaces that via a standard browser use a freely distributed and automatically downloaded and installed plug-in or 'thick' client that presents the user interface across the web.
- F. The communication speed between the controllers, LAN interface devices, CSS, and operator interface devices shall be sufficient to ensure fast system response time under any loading condition. Contractor shall submit guaranteed response times with Shop Drawings including calculations to support the guarantee. In no case shall delay times between an event, request, or command initiation and its completion be greater than those listed herein. Contractor shall modify their BAS control design as necessary to accomplish these performance requirements. Generally requirements do not apply when a remote connection must be established via modem:
 1. 5 seconds between a Level 1 (critical) alarm occurrence and enunciation at operator workstation.
 2. 10 seconds between a Level 2 alarm occurrence and enunciation at operator workstation.
 3. 20 seconds between a Level 3-5 alarm occurrence and enunciation at operator workstation.
 4. 10 seconds between an operator command via the operator interface to change a setpoint and the subsequent change in the controller.
 5. 5 seconds between an operator command via the operator interface to start/stop a device and the subsequent command to be received at the controller.
 6. 10 seconds between a change of value or state of an input and it being updated on the operator interface.

7. 10 seconds between an operator selection of a graphic and it completely painting the screen and updating at least ten (10) points.

- G. Control Systems Server (CSS): This shall be a computer (or computers) that maintain the systems configuration and programming database. It shall hold the backup files of the information downloaded into the individual controllers and as such support uploading and downloading that information directly to/from the controllers. It shall also act as a control information server to non-control system based programs. It shall allow secure multiple-access to the control information. Refer to Section 25 11 09 - BAS Operator Interfaces for CSS requirements.
- H. The Operator Interface shall provide for overall system supervision, graphical user interface, management report generation, alarm annunciation, and remote monitoring. Refer to Section 25 11 09 – BAS Operator Interfaces.
- I. The BCs, AACs, ASCs, and SDs shall monitor, control, and provide the field interface for all points specified. Each BC, AAC, or ASC shall be capable of performing all specified energy management functions, and all DDC functions, independent of other BCs, AACs, or ASCs and operator interface devices as more fully specified in Section 25 14 00 - BAS Field Panels.
- J. Systems Configuration Database: The system architecture shall support maintaining the systems configuration database on a server or workstation on the Local Supervisory LAN. User tools provided to The University shall allow configuring, updating, maintaining, etc. current configurations and settings whether they are initiated at the server or the end device.
 - 1. Database Schema shall be published and provided to The University to facilitate easy access to the data.
 - 2. Database shall be ODBC compliant or a data access driver shall be provided to act as an ODBC or OLE DB data provider.
- K. Interruptions or fault at any point on any Primary Controller LAN shall not interrupt communications between other BAS nodes on the network. If a LAN is severed, two (2) separate networks shall be formed and communications within each network shall continue uninterrupted.
- L. All line drivers, signal boosters, and signal conditioners etc. shall be provided and approved by MDACC IT as necessary for proper data communication.
- M. Anytime any controller's database or program is changed in the field, the controller shall be capable of automatically uploading the new data to the CSS.

1.08 DELIVERY, STORAGE AND HANDLING

- A. Provide factory-shipping cartons for each piece of equipment and control device. Maintain cartons during shipping, storage and handling as required to prevent equipment damage, and to eliminate dirt and moisture from equipment. Store equipment and materials inside and protect from weather.

1.09 WARRANTY

- A. Contractor shall warrant all products and labor for a period of [Insert Warranty Period] after Substantial Completion.
- B. The University reserves the right to make changes to the BAS during the Warranty Period. Such changes do not constitute a waiver of warranty. Contractor shall warrant parts and installation work regardless of any such changes made by Owner, unless the Contractor provides clear and convincing evidence that a specific problem is the result of such changes to the BAS. Any disagreement between Owner and Contractor on such matters shall be subject to resolution through the Contract 'Disputes' clause.

Engineer shall consult with Owner prior to specifying the response times. Quicker response times may be dictated by the type of systems and facility. Edit to suit the Project.

- C. At no cost to The University, during the Warranty Period, Contractor shall provide maintenance services for software, firmware and hardware components as specified below:
1. Maintenance services shall be provided for all devices and hardware specified in the Contract Documents. Service all equipment per the manufacturer's recommendations.
 2. Emergency Service: Any malfunction, failure, or defect in any hardware component or failure of any control programming that would result in property damage or loss of comfort control shall be corrected and repaired following telephonic notification by The University to the Contractor. Emergency service shall be provided 24 hours per day, 7 days per week, and 365 days per year with no exceptions and at no cost to The University.
 - a. Response by telephone to any request for service shall be provided within two (2) hours of The University's initial telephone request for service.
 - b. In the event that the malfunction, failure, or defect is not corrected through the telephonic communication, at least one (1) hardware and software technician, trained in the system to be serviced, shall be dispatched to The University's Site within four (4) hours of The University's initial telephone request for such services, as specified.
 3. Normal Service: Any malfunction, failure, or defect in any hardware component or failure of any control programming that would not result in property damage or loss of comfort control shall be corrected and repaired following telephonic notification by The University to the Contractor.
 - a. Response by telephone to any request for service shall be provided within eight (8) working hours (Contractor specified 40 hours per week normal working period) of The University's initial telephone request for service.
 - b. In the event that the malfunction, failure, or defect is not corrected through the telephonic communication, at least one (1) hardware and software technician, trained in the system to be serviced, shall be dispatched to The University's Site within three (3) working days of The University's initial telephone request for such services, as specified.
 4. At any time during the Warranty Period that Contractor is on Site for maintenance, emergency, or normal service, Contractor shall notify Owner via MDACC Monitoring Services and the local building operating personnel. Contractor shall notify said personnel of all work anticipated being involved for the service work. In addition, no work affecting system operation shall commence until express permission is granted. After the work is completed a work order ticket describing in detail all work performed (i.e. hardware replaced or serviced, software or firmware modifications made, etc.), hours worked, follow-up work required, etc., must be signed by an authorized building operators or Monitoring Services personnel.
 5. Owner's Telephonic Request for Service: Contractor shall specify a maximum of three telephone numbers for Owner to call in the event of a need for service. At least one of the lines shall be attended at any given time at all times. Alternatively, pagers can be used for technicians trained in system to be serviced. One of the three paged technicians shall respond to every call within 15 minutes.
 6. Technical Support: Contractor shall provide technical support by telephone throughout the Warranty Period.
 7. Preventive maintenance shall be provided throughout the Warranty Period in accordance with the hardware component manufacturer's requirements.

8. In the last month of the Warranty Period, all System software and controller firmware, software, drivers, etc. will be upgraded to the latest release (version) in effect at the end of the Warranty Period.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MATERIALS AND EQUIPMENT

- A. Materials shall be new, the best of their respective kinds without imperfections or blemishes, and shall not be damaged in any way. Used equipment shall not be used in any way for the permanent installation except where Drawings or Specifications specifically allow existing materials to remain in place.

2.03 UNIFORMITY

- A. To the extent practical, all equipment of the same type serving the same function shall be identical and from the same manufacturer

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine areas and conditions under which control systems are to be installed. Do not proceed with Work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Refer to additional requirements in other Sections of this Specification.

Digital control stations should specifically be shown on the Drawings. Engineer should select appropriate wall/floor locations that minimize wire and tubing runs, and coordinate these locations with other disciplines. If the Project is a controls renovation only, locate spare breakers in a power panel where the BAS Provider can obtain 120V power and indicate on the Drawings.

3.03 DIGITAL CONTROL STATIONS, CONTROLLER QUANTITY AND LOCATION

Engineer shall designate locations for control stations and specifically reserve wall/floor space and indicate it on the Drawings and coordinate with other disciplines. It is preferable to have the Electrical Contractor provide power (normal, emergency or uninterruptible as applicable). If this is the case, delete the requirement for this Contractor to provide power.

- A. Individual Digital Control Stations (DCS) are referenced to indicate allocation of points to each DCS and DCS location. Digital control stations shall consist of one or multiple controllers to meet requirements of this Specification.

- B. Where a DCS is referenced, Contractor shall provide at least one (1) controller, and additional controllers as required, in sufficient quantity to meet the requirements of this Specification. Restrictions in applying controllers are specified in Section 25 14 00 - BAS Field Panels. Contractor shall extend power to the DCS from an acceptable power panel. If the BAS provider wishes to further distribute panels to other locations, Contractor is responsible for extending power to that location also. Furthermore, Contractor is responsible for ensuring adequate locations for the panels that do not interfere with other requirements of the Project and maintain adequate clearance for maintenance access.
- C. Contractor shall locate DCS's as referenced. It is the Contractor's responsibility to provide enough controllers to ensure a completely functioning system, according to the point list and sequence of operations.

Engineer shall consult with Owner prior to specifying the DCS and Controller requirements. Controller requirements shall be dictated by the type of systems and facility. Edit to suit the Project.

- D. Contractor shall provide a minimum of the following:
 - 1. One DCS (including at least one controller) in each chilled water/hot water plant mechanical room
 - 2. One DCS (including at least one controller) for each air handler located in applicable mechanical room
 - 3. One DCS (including at least one controller) for each critical fan system
 - 4. One DCS (including at least one controller) for each pumping system
 - 5. One DCS (including at least one controller) for each steam pressure reducing station
 - 6. One controller for each piece of terminal equipment located at the equipment.

3.04 SURGE PROTECTION

- A. Contractor shall furnish and install any power supply surge protection, filters, etc. as necessary for proper operation and protection of all BCs, AAC/ASCS operator interfaces, printers, routers, gateways and other hardware and interface devices. All equipment shall be capable of handling voltage variations 10 percent above or below measured nominal value, with no affect on hardware, software, communications, and data storage.

3.05 CONTROL POWER SOURCE AND SUPPLY

It is preferable to have the Division 26 Contractor supply power to DCS locations and provide the appropriate level of power for all control system components as located by the Engineer. For instance, it is good practice to supply emergency power (and sometimes uninterruptible power when available) at critical controllers, control system servers, routers, workstations etc. This Section, however, applies mainly to retrofits with no Division 26 Contractor.

- A. BAS Provider shall extend all power source wiring required for operation of all equipment and devices provided under Division 25 and the Drawings.

The following item will have to be customized for each system and Project. The consideration is where to provide power for controllers. For distributed controllers that are associated with one unit, it is convenient to power them along with the system so the controller can take action based on the presence of power. However on large centralized panels, it may be best to put these on the most reliable source of power that serves the equipment being controlled and then provide for individual monitoring of the various system power sources by the controller. The object is to make a robust system that does not interpret power failures as device failure and therefore in some instances have to take down the unit for manual acknowledged reset. This can compromise reliability.

B. General requirements for obtaining power include the following:

1. In the case where additional power is required, obtain power from a source that feeds the equipment being controlled such that both the control component and the equipment are powered from the same panel. Where equipment is powered from a 460V source, obtain power from the electrically most proximate 120v source fed from a common origin.
2. Where control equipment is located inside a new equipment enclosure, coordinate with the equipment manufacturer and feed the control with the same source as the equipment. If the equipment's control transformer is large enough and is the correct voltage to supply the controls, it may be used. If the equipment's control transformer is not large enough or of the correct voltage to supply the controls, provide separate transformer
3. Where a controller controls multiple systems on varying levels of power reliability (normal, emergency, and/or interruptible), the controller shall be powered by the highest level of reliability served. Furthermore, the controller in that condition shall monitor each power type served to determine so logic can assess whether a failure is due to a power loss and respond appropriately. A three-phase monitor into a digital input shall suffice as power monitoring.

The following item will have to be customized for each system and Project. The consideration is where to provide UPS's for controllers. Engineer shall consult with Owner prior to specifying the UPS requirements. UPS requirements shall be dictated by the type of systems and facility. Edit to suit the Project.

4. Provide an uninterruptible power supply (UPS) system battery backup for each controller or DCS, as shown on the Drawings or specified except terminal equipment controllers. UPS shall protect against blackouts, brownouts, surges and noise.
 - a. UPS shall include LAN port and modem line surge protection.
 - b. UPS shall be sized for a 7-minute full load runtime, 23-minute 1/2 load runtime, with a typical runtime of up to 60 minutes. Transfer time shall be 2-4 milliseconds.
 - c. UPS shall provide a 480-joule suppression rating and current suppression protection for 36,000 amps and provide 90 percent recharge capability in 2-4 hours. Suppression response time shall be instantaneous. UPS low voltage switching shall occur when supply voltage is less than 94 volts.
 - d. Provide a Maintenance Bypass Switch that allows input voltage to bypass the UPS and directly power the connected equipment if an abnormal condition prevents the UPS from supporting the load, or if the UPS is required to be taken out of service. Provide all software, cables, peripherals etc. for a complete system.
5. Standalone Functionality: Refer to Section 25 14 00.

The Engineer shall carefully coordinate the training requirements with the needs of Owner's facilities staff. Expansions of existing systems obviously require less training than new systems. The following generally outlines an on-Site training session. The more advanced training may be better provided off Site on a case-by-case basis. Edit to suit Project.

3.06 BAS START-UP, COMMISSIONING AND TRAINING

- A. Refer to Section 25 08 00.

END OF SECTION 25 55 00 0000 00

SECTION 25 55 00 00A - BAS COMMISSIONING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Section includes:
 - 1. BAS and equipment testing and Start-up.
 - 2. Validation of proper and thorough installation of BAS and equipment.
 - 3. Functional testing of control systems.
 - 4. Documentation of tests, procedures, and installations.
 - 5. Coordination of BAS training.
 - 6. Documentation of BAS Operation and Maintenance materials.
- B. This Section defines responsibilities of the Contractor to commission the BAS.
- C. The term "Owner" shall include a representative from UTHSCSA but is not limited to represent The University exclusively. Coordinate all activities to include all of The University's representatives.
- D. Commissioning is the process of ensuring that all building systems are installed and perform interactively according to the design intent, the systems are efficient and cost effective and meet The University's operational needs, the installation is adequately documented, and that the Operators are adequately trained. It serves as a tool to minimize post-occupancy operational problems. It establishes testing and communication protocols in an effort to advance the building systems from installation to full dynamic operation and optimization.
- E. The Contractor shall direct, coordinate, and oversee the Commissioning process and witness functional performance tests.
- F. The University's TAB Firm may write The University approved control sequence verification sheets for functional performance tests and develop forms using the BAS Provider's point log to test each point back to the graphical interface. The BAS Provider shall furnish the Contractor with an estimated time to complete this task, which Contractor will incorporate in the Project Schedule. In the event Owner's TAB Firm is not under contracted for the Project, the Contractor shall write The University approved sequence verification sheets for functional performance tests.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.

- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within all references.

1.04 CONTRACTOR RESPONSIBILITIES

- A. Completely install and thoroughly inspect, startup, test, adjust, balance, and document all systems and equipment.
- B. Assist Owner and/or TAB Firm in verification and functional performance testing. This will generally include the following:
 - 1. Attend Commissioning progress and coordination meetings.
 - 2. Prepare and submit required draft forms and systems information.
 - 3. Establish trend logs of system operation as specified herein.
 - 4. Demonstrate system operation.
 - 5. Manipulate systems and equipment to facilitate testing.
 - 6. Provide instrumentation necessary for verification and performance testing.
 - 7. Manipulate control systems to facilitate verification and performance testing.
 - 8. Train Owner as specified in this Section.
- C. Compensation for Retesting: Contractor shall compensate Owner for Site time necessitated by incompleteness of systems or equipment at time of functional performance testing. All testing failures, which require on-Site time for retesting, will be considered actual damages to The University. All parties under Contract with The University who are affected by the retesting shall be included in the Contract modification.

1.05 SUBMITTALS

- A. The following list outlines the general sequence of events for submittals and commissioning:
 - 1. Submit product data and Shop Drawings, and receive approval.
 - 2. Submit BAS logic documentation, and receive approval.
 - 3. Submit background graphic screens, and receive approval.
 - 4. Submit Start-Up Checklists and manufacturer's start-up procedures for all equipment provided by the Contractor.
 - 5. Install BAS.
 - 6. Submit BAS Start-Up Test Agenda and Schedule for review.
 - 7. Receive BAS Startup Test Agenda/schedule approval.
 - 8. Submit Training Plan.
 - 9. Simulate sequencing and debug program off-line to the extent practical.
 - 10. Place systems under BAS control where applicable during a scheduled outage.
 - 11. Perform BAS Startup where applicable during a scheduled outage.

12. Prepare and initiate trend log data storage and format trend graphs.
13. Submit completed BAS Start-Up Reports and initial draft of the Operating and Maintenance (O&M) Manuals.
14. Receive BAS Startup Report approval and approval to schedule Demonstrations and Commissioning.
15. Demonstrate systems to Owner.
16. Submit Trend Logs in format specified.
17. Receive demonstration approval and approval to schedule Acceptance Period.
18. Train Owner on BAS operation and maintenance.
19. Substantial Completion.
20. Begin Acceptance Phase.
21. Two-week Operational Test.
22. Perform Functional Performance Testing including point to point verification to graphical interface.
23. Receive Acceptance Period approval, which is Functional Completion for the BAS.
24. Train Owner on final sequences and modes of operation.
25. Install framed control Drawings.
26. Provide Level 1 password access to The University.
27. Revise and re-submit as-built record Drawings and O&M Manuals.
28. Manager of Building Automation Services sign-off required.
29. Final Acceptance.
30. Begin Warranty Phase.
31. Schedule and begin Opposite Season acceptance period.
32. Receive Opposite Season acceptance period approval.
33. Submit as-built record Drawings and O&M Manuals.
34. Update framed control Drawings.
35. Complete Owner Training.
36. End-of-Warranty date/period.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 INSTRUMENTATION

- A. Instrumentation required to verify readings and to test the system and equipment performance shall be provided by Contractor and made available to Owner. Generally, no testing equipment will be required beyond that required to perform Contractor's Work under these Contract Documents. All equipment used for testing and calibration shall be NIST/NBS traceable and calibrated within the preceding 6-month period. Certificates of calibration shall be submitted.

2.03 TAB AND COMMISSIONING PORTABLE OPERATORS TERMINAL

- A. For new Projects, Contractor shall provide portable operators terminal or hand held device to facilitate Testing, Adjusting, and Balancing (TAB) and calibration. This software or device shall support all functions and allow querying and editing of all parameters required for proper calibration and Start-up.
- B. Connections shall be provided local to the device being calibrated. For instance, for terminal units, connection of the operator's terminal shall be either at the sensor or at the terminal unit. Otherwise a wireless system shall be provided to facilitate this local functionality.

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

3.02 BAS START-UP TESTING, ADJUSTING, CALIBRATION

- A. Work and/or systems installed under this Division shall be fully functioning prior to Demonstration and Acceptance Phase. Contractor shall start, test, adjust, and calibrate all work and/or systems under this Contract, as described below:
 - 1. Inspect the installation of all devices. Review the manufacturer's installation instructions and validate that the device is installed in accordance with them.
 - 2. Verify proper electrical voltages and amperages, and verify that all circuits are free from faults.
 - 3. Verify integrity/safety of all electrical connections.
 - 4. Coordinate with Owner's TAB Firm to obtain control settings that are determined from balancing procedures. Record the following control settings as obtained from Owner's TAB Firm, and note any TAB deficiencies in the BAS Start-Up Report:
 - a. Optimum duct static pressure setpoints for VAV air handling units.
 - b. Minimum outside air damper settings for air handling units.
 - c. Optimum differential pressure setpoints for variable speed pumping systems.
 - d. Calibration parameters for flow control devices such as VAV terminal units and flow measuring stations.
- 1) Contractor shall provide hand-held device as a minimum to the TAB Firm to facilitate calibration. Connection for any given device shall be local to it (i.e. at the VAV terminal unit or at the thermostat). Hand-held device or portable operator's terminal shall allow querying and editing of parameters required for proper calibration and start-up.

5. Test, calibrate, and set all digital and analog sensing and actuating devices. Calibrate each instrumentation device by making a comparison between the BAS display and the reading at the device, using an instrument traceable to the National Bureau of Standards, which shall be at least twice as accurate as the device to be calibrated (e.g., if field device is ± 0.5 percent accurate, test equipment shall be ± 0.25 percent accurate over same range). Record the measured value and displayed value for each device in the BAS Start-up Report.
6. Check and set zero and span adjustments for all transducers and transmitters.
7. For dampers and valves:
 - a. Check for adequate installation including free travel throughout range and adequate seal.
 - b. Where loops are sequenced, check for proper control without overlap.
8. For actuators:
 - a. Check to insure that device seals tightly when the appropriate signal is applied to the operator.
 - b. Check for appropriate fail position, and that the stroke and range is as required.
 - c. For pneumatic operators, adjust the operator spring compression as required to achieve close-off. If positioner or volume booster is installed on the operator, calibrate per manufacturer's procedure to achieve spring range indicated. Check split-range positioners to verify proper operation. Record settings for each device in the BAS Pre-Commissioning Report.
 - d. For sequenced electronic actuators, calibrate per manufacturer's instructions to required ranges.
9. Check each digital control point by making a comparison between the control command at the CU and the status of the controlled device. Check each digital input point by making a comparison of the state of the sensing device and the Operator Interface display. Record the results for each device in the BAS Start-Up Report.
10. For outputs to reset other manufacturer's devices (for example, VSDs) and for feedback from them, calibrate ranges to establish proper parameters. Coordinate with representative of the respective manufacturer and obtain their approval of the installation.
11. Verify proper sequences by using the approved checklists to record results and submit with BAS Start-Up Report. Verify proper sequence and operation of all specified functions.
12. Verify that all safety devices trip at appropriate conditions. Adjust setpoints accordingly.

Engineer shall provide the tolerances for the type and criticality of the area or zone being served by the equipment. Engineer may have to specify two or more sets of tolerances for a specific Project. Edit accordingly.

13. Tune all control loops to obtain the fastest stable response without hunting, offset or overshoot. Record tuning parameters and response test results for each control loop in the BAS Start-up Report. Except from a startup, maximum allowable variance from set point for controlled variables under normal load fluctuations shall be as follows. Within 3 minutes of any upset (for which the system has the capability to respond) in the control loop, tolerances shall be maintained (exceptions noted):
 - a. Duct air temperature: $[\pm 1 \text{ degrees F}]$.
 - b. Space Temperature: $[\pm 1 \text{ degrees F within 30 minutes}]$.
 - c. Chilled Water: $[\pm 1 \text{ degrees F}]$.

- d. Hot water temperature: [± 3 degrees F].
- e. Duct pressure: [± 0.25 inches wg].
- f. Water pressure: [± 1 psid].
- g. Duct or space Humidity: [± 5 percent within 30 minutes].
- h. Air flow control: [± 5] percent of setpoint velocity.
- i. Space Pressurization (on active control systems): [± 0.05 inches wg] with no door or window movements.

14. For interface and DDC control panels:

- a. Ensure devices are properly installed with adequate clearance for maintenance and with clear labels in accordance with the as-built record Drawings.
- b. Ensure that terminations are safe, secure and labeled in accordance with the as-built record Drawings.
- c. Check power supplies for proper voltage ranges and loading.
- d. Ensure that wiring and tubing are run in a neat and workman-like manner, either bound or enclosed in trough.
- e. Check for adequate signal strength on communication networks.
- f. Check for standalone performance of controllers by disconnecting the controller from the LAN. Verify the event is annunciated at Operator Interfaces. Verify that the controlling LAN reconfigures as specified in the event of a LAN disconnection.
- g. Ensure that all outputs and devices fail to their proper positions/states.
- h. Ensure that buffered and/or volatile information is held through power outage.
- i. With all system and communications operating normally, sample and record update/annunciation times for critical alarms fed from the panel to the Operator Interface.
- j. Check for proper grounding of all DDC panels and devices.

15. For Operator Interfaces:

- a. Verify that all elements on the graphics are functional and are properly bound to physical devices and/or virtual points, and that hot links or page jumps are functional and logical.
- b. Output all specified BAS reports for review and approval.
- c. Verify that the alarm printing and logging is functional and per requirements.
- d. Verify that trends are archiving to disk and provide a sample to The University for review.
- e. Verify that paging/dial-out alarm annunciation is functional.
- f. Start-up and check out control air compressors, air drying, and filtering systems in accordance with the appropriate section and with manufacturer's instructions.
- g. Verify proper interface with fire alarm system.

- B. Submit Start-Up Test Report: Report shall be completed, submitted, and approved prior to Substantial Completion.

3.03 SENSOR CHECKOUT AND CALIBRATION

- A. General Checkout: Verify that all sensor locations are appropriate and are away from causes of erratic operation. Verify that sensors with shielded cable are grounded only at one end. For sensor pairs that are used to determine a temperature or pressure difference, make sure they are reading within 0.2 degrees F of each other for temperature and within a tolerance equal to 2 percent of the reading of each other for pressure. Tolerances for critical applications may be tighter.
- B. Calibration: Calibrate all sensors using one of the following procedures:
 - 1. Sensors Without Transmitters - Standard Application: Make a reading with a calibrated test instrument within 6 inches of the site sensor at various points across the range. Verify that the sensor reading (via the permanent thermostat, gauge or BAS) is within the tolerances specified for the sensor. If not, adjust offset and range, or replace sensor. Where sensors are subject to wide variations in the sensed variable, calibrate sensor within the highest and lowest 20 percentage of the expected range.
 - 2. Sensors With Transmitters - Standard Application: Disconnect sensor. Connect a signal generator in place of sensor. Connect ammeter in series between transmitter and BAS control panel. Using manufacturer's resistance-temperature data, simulate minimum desired temperature. Adjust transmitter potentiometer zero until the ammeter reads 4 mA. Repeat for the maximum temperature matching 20 mA to the potentiometer span or maximum and verify at the OI. Record all values and recalibrate controller as necessary to conform to tolerances. Reconnect sensor. Make a reading with a calibrated test instrument within 6 inches of the site sensor. Verify that the sensor reading (via the permanent thermostat, gauge or BAS) is within the tolerances specified. If not, replace sensor and repeat. For pressure sensors, perform a similar process with a suitable signal generator.
- C. Sensor Tolerance: Sensors shall be within the tolerances specified for the device. Refer to Section 25 11 10.

3.04 COIL VALVE LEAK CHECK

- A. Verify proper close-off of the valves. Ensure the valve seats properly seat by simulating the maximum anticipated pressure difference across the circuit. Demonstrate to The University the verification of zero flow by measuring the coil differential pressure. If there is pressure differential, close the isolation valves to the coil to ensure the conditions change. If they do, this validates the valve is not closing. Remedy the condition by adjusting the stroke and range, increasing the actuator size/torque, replacing the seat, or replacing the valve as applicable.

3.05 VALVE STROKE SETUP AND CHECK

- A. For all valve and actuator positions checked, verify the actual position against the Operator Interface readout.
- B. Set pumps to normal operating mode. Command valve closed, verify that valve is closed, and adjust output zero signal as required. Command valve open, verify position is full open and adjust output signal as required. Command the valve to various few intermediate positions. If actual valve position doesn't reasonably correspond, replace actuator or add pilot positioner (for pneumatics).

3.06 BAS DEMONSTRATION

- A. All BAS Demonstration shall take place on the main Control Systems Server and MDACC WAN. Schedule to add system to main Control Systems Server and MDACC WAN with Owner at least two (2) weeks in advance to the demonstration. At the time of request, provide all documentation that the following criteria are met:
1. Updated BAS submittals in electronic and hard copy to Owner including the updated riser diagram for the system.
 2. Reports on verification of Network Layout Verification including but not limited to Building Controller locations, cable routes with length of cable between controllers and any trunk extenders or trunk isolators.
 3. Reports on verification of electrical characteristics of BAS network, communications and electrical integrity of Building Controllers.
 4. Reports on verification of traffic on BAS Network including but not limited to COVs between Building Controllers, point commands by the operator, point commands by program across the network, alarm reporting on the network, any unresolved points in the system, integrity of the ports on any Building Controller isolator/extender and results of Building Controller tests running at selected baud rate.
 5. Demonstrate to Owner the updates of databases without errors or faults between the temporary Control Systems Server and Building Controllers. If there is no temporary server, demonstrate to Owner after system is added to main Control Systems Server.
 6. Reports on verification of system log files, interruption of log files of system traffic and overall acceptable operation of the system where a temporary Control Systems Server is utilized.
- B. Demonstrate the operation of the BAS hardware, software, and all related components and systems to the satisfaction of The University. Schedule the demonstration with The University seven (7) calendar days in advance. Demonstration shall not be scheduled until all hardware and software submittals, and the Start-Up Test Report are approved. If the Work fails to conform to the Contract Documents, so as to require scheduling of additional Site visits by The University for re-demonstration, Contractor shall reimburse Owner for costs of subsequent Site visits.
- C. The Contractor shall supply all personnel and equipment for the demonstration, including, but not limited to, instruments, ladders, etc. Contractor-supplied personnel must be competent with and knowledgeable of all project-specific hardware, software, and the HVAC systems. All training documentation and submittals shall be at the Project Site.
- D. Demonstration shall typically involve small representative samples of systems/equipment randomly selected by The University.
- E. The system shall be demonstrated following the same procedures used in the Start-Up Test by using the approved Commissioning Checklists. Demonstration shall include, but not necessarily be limited to, the following:
1. Demonstrate that required software is installed on BAS workstations. Demonstrate that graphic screens, alarms, trends, and reports are installed as submitted and approved.
 2. Demonstrate that points specified and shown can be interrogated and/or commanded (as applicable) from all workstations, as specified.
 3. Demonstrate that remote dial-up communication abilities are in accordance with these Specifications.

4. Demonstrate correct calibration of input/output devices using the same methods specified for the Start-Up Tests. A maximum of 10 percent of I/O points shall be selected at random by The University for demonstration. Upon failure of any device to meet the specified end-to-end accuracy, an additional 10 percent of I/O points shall be selected at random by Owner for demonstration. This process shall be repeated until 100 percent of randomly selected I/O points have been demonstrated to meet specified end-to-end accuracy.
 5. Demonstrate that all DDC and other software programs exist at respective field panels. The Direct Digital Control (DDC) programming and point database shall be as submitted and approved.
 6. Demonstrate that all DDC programs accomplish the specified sequence of operation.
 7. Demonstrate that the panels and DDC network of panels automatically recover from power failures within five (5) minutes after power is restored.
 8. Demonstrate that the stand-alone operation of panels meets the requirements of these Specifications. Demonstrate that the panels' response to LAN communication failures meets the requirements of these Specifications.
 9. Identify access to equipment selected by The University. Demonstrate that access is sufficient to perform required maintenance.
 10. Demonstrate that required trend graphs and trend logs are set up per the requirements. Provide a sample of the data archive. Indicate the file names and locations.
- F. BAS Demonstration shall be completed and approved prior to Substantial Completion.
- G. Any tests successfully completed during the demonstration will be recorded as passed for the functional performance testing and will not have to be retested.

3.07 BAS ACCEPTANCE PERIOD

- A. After approval of the BAS Demonstration and prior to Contract Close Out Acceptance Phase shall commence. Acceptance Period shall not be scheduled until all HVAC systems are in operation and have been accepted, all required cleaning and lubrication has been performed.
- B. Operational Test: At the beginning of the Acceptance Phase, the system shall operate properly for two (2) weeks without malfunction, without alarm caused by control action or device failure, and with smooth and stable control of systems and equipment in conformance with these Specifications. At the end of the two weeks, Contractor shall forward the trend logs to The University for review. Owner shall determine if the system is ready for functional performance testing and document any problems requiring Contractor's attention.
1. If the systems are not ready for functional performance testing, Contractor shall correct problems and provide notification to The University that all problems have been corrected. The Acceptance Period shall be restarted at a mutually scheduled time for an additional one-week period.
 2. This process shall be repeated until Owner issues notice that the BAS is ready for functional performance testing.
- C. During the Acceptance Period, the Contractor shall maintain a hard copy log of all alarms generated by the BAS. For each alarm received, Contractor shall diagnose the cause of the alarm, and shall list on the log for each alarm, the diagnosed cause of the alarm, and the corrective action taken. If in the Contractor's opinion, the cause of the alarm is not the responsibility of the Contractor, Contractor shall immediately notify The University.

3.08 BAS OPERATOR TRAINING AND O&M MANUALS

- A. Provide up to four (4) complete sets of the approved Operations and Maintenance (O&M) Manuals (hard copy and one electronic copy) to be used for training.
- B. Contractor shall submit a Training Plan for the scope of training for which BAS Provider is responsible. Training Plan shall be forwarded to the Contractor who will compile, organize, format, and forward to the Engineer for review.
 - 1. Coordinate requirements of Training with the MDACC Monitoring Services Department.
- C. On-Site Training: Provide services of BAS Provider's qualified technical personnel for 8-hour days to instruct Owner's personnel in operation and maintenance of BAS. Instruction shall be in classroom setting at the Project Site for appropriate portions of the training. Training may be in non-contiguous days at the request of The University. The University shall notify Contractor seven (7) calendar days in advance of each day of requested training. The Contractor's designated training personnel shall meet with the Engineer and Owner for the purpose of discussing and fine-tuning the training agenda prior to the first training session. Training agenda shall generally be as follows:
 - 1. Basic Operator Workstation (OWS) Training – For all potential users of the OWS:
 - a. Brief walk-through of building, including identification of all controlled equipment and condensed demonstration of controller portable and built-in operator interface device display capabilities.
 - b. Brief overview of the various parts of the O&M Manuals, including hardware and software programming and operating publications, catalog data, controls installation Drawings, and DDC programming documentation.
 - c. Demonstration of workstation login/logout procedures, password setup, and exception reporting.
 - d. Demonstration of workstation menu penetration and broad overview of the various workstation features.
 - e. Overview of systems installed.
 - f. Present all Site-specific point naming conventions and points lists, open protocol information, configuration databases, back-up sequences, upload/download procedures, and other information as necessary to maintain the integrity of the BAS.
 - g. Overview of alarm features.
 - h. Overview of trend features.
 - i. Overview of workstation reports.
 - 2. BAS Hardware Training – For Maintenance and Control Technicians:
 - a. Review of installed components and how to install/replace, maintain, commission, and diagnose them.
 - 3. BAS Technician Training:
 - a. Introduction to controller programming and overview of the programming application interface.
 - b. General review of sequence of operation and control logic for the Project Site, including standalone and fail-safe modes of operation.

- c. Uploading/downloading and backing up programs.
- d. Network administration.
- e. Review of setpoint optimization and fine-tuning concepts.

3.09 WARRANTY PHASE BAS OPPOSITE SEASON TRENDING AND TESTING

- A. Trending: Throughout the Warranty Phase, trend logs shall be maintained. Contractor shall forward archive trend logs to The University for review upon Owner request. Owner will review these and notify Contractor of any warranty work required.
- B. Opposite Season Testing: Within twelve (12) months of Substantial Completion, Contractor shall schedule and conduct with Owner, Opposite Season functional performance testing. BAS Provider shall participate in this testing and remedy any deficiencies identified.

END OF SECTION 25 55 00 00A08 10

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 25 55 00 00B - BAS BASIC MATERIALS, INTERFACE DEVICES, AND SENSORS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them. Building automation system requirements may be specified, but not limited to, the following Sections when applicable:
 - 1. Packaged engine generator system.
 - 2. Fuel oil piping system.
 - 3. Hot water boilers.
 - 4. Computer room air conditioning units.
 - 5. Automatic transfer switch.

1.02 SUMMARY

- A. Pneumatic Tubing.
- B. Wiring.
- C. Control Valves and Actuators.
- D. Control Dampers and Actuators.
- E. Control Panels.
- F. Sensors.
- G. Pneumatic Control Components (Gauges, Switches, Relays, etc.).
- H. Electric Control Components (Switches, EP Valves, Thermostats, Relays, etc.).
- I. Transducers.
- J. Current Switches.
- K. Nameplates.
- L. Testing Equipment.
- M. Refer to Section 25 00 00 for general requirements.
- N. Refer to other Division 20 and Division 23 Sections for installation of instrument wells, valve bodies, and dampers in mechanical systems; not Work of this Section.
- O. Provide the following electrical work as work of this Section, complying with requirements of Division 26 Sections.
 - 1. Control wiring between field-installed controls, indicating devices, and unit control panels.

2. Interlock wiring between electrically interlocked devices, sensors, and between a hand or auto position of motor starters as indicated for all mechanical and controls.
3. Wiring associated with annunciator and alarm panels (remote alarm panels) and connections to their associated field devices.
4. All other necessary wiring for fully complete and functional control system as specified.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within all references.

1.04 WORK BY OTHERS

- A. Control Valves furnished under this Section shall be installed under the applicable piping Section under the direction of the BAS Provider who will be fully responsible for the proper operation of the valve.
- B. Control Dampers furnished under this Section shall be installed under the applicable air distribution or air handling equipment Section under the direction of the BAS Provider who will be fully responsible for the proper operation of the damper.
- C. Water Pressure Taps, Thermal Wells, Flow Switches, Flow Meters, etc. that will have wet surfaces, shall be installed under the applicable piping Section under the direction of the BAS Provider who will be fully responsible for the proper installation and application.
- D. Controlled Equipment Power Wiring shall be furnished and installed under Division 26. Where control involves 120 volt (V) control devices controlling 120V equipment, Division 26 Contractor shall extend power wiring to the equipment. BAS Provider shall extend it from the equipment to the control device.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Provide electronic, pneumatic, and electric control products in sizes and capacities indicated, consisting of valves, dampers, controllers, sensors, and other components as required for complete installation. Except as otherwise indicated, provide manufacturer's standard materials and components as published in their product information; designed and constructed as recommended by manufacturer, and as required for application indicated.

2.02 MATERIALS AND EQUIPMENT

[Edit the following to suit the Project. Engineer shall assess the cost effectiveness of pneumatically driven actuators. Engineer shall also assess the condition, reliability, and capacity of existing control air supplies where applicable to the Project.]

- A. Control Air Supply: Contractor may reuse existing control air in buildings where pneumatic controls will be replaced. Contractor shall install air dryers and air filters so that all controllers and new pneumatic devices receive a clean and dry air supply.
1. The control air filters shall remove oil and solid particles from the compressed air. Provide a prefilter and a final filter.
 2. The prefilter shall be rated for 100 percent removal of all solids 1 micron and larger, 100 percent removal of liquid water, and 70 percent removal of oil aerosols with 2000 ppm maximum inlet liquid loading.
 3. The final filter shall be rated for 100 percent removal of liquid water and solids larger than 0.03 micron; 99.999 percent removal of oil aerosols with 100 ppm maximum inlet liquid loading.
 4. Filters shall include replaceable filter element, differential pressure gauge, and automatic liquid drain trap. Filters shall be selected for a maximum pressure drop of 2 psig at compressor capacity. Filter bodies shall be rated for 225 psig or greater operating pressure. Transparent acrylic tube housings shall be protected by a perforated steel safety shield.
 5. Filters shall be Hankison, DelTech, Wilkerson, or Arrow Pneumatics. Substitutions shall be allowed per Division 01. Furnish one (1) spare filter element per filter.

[The following is a costly requirement that will significantly increase the installation cost. Engineer shall use caution in specifying this requirement and shall consult with Owner prior to specifying this requirement.]

6. Provide a PRV, oil filter and air filter combination assembly at each end use pneumatic device so that all pneumatic devices receive a clean and dry air supply.
 - a. The control air filters shall remove oil and solid particles from the compressed air.
 - b. Particulate filters shall be rated for 100 percent removal of all solids 5 micron and larger, 100 percent removal of liquid water, and removal of oil aerosols 0.01 microns and larger. Filters shall include replaceable filter element and automatic piston drain.
 - c. Filters shall be selected for a maximum pressure drop of 5 psig at device capacity. Filter bodies shall be rated for 150 psig or greater operating pressure. Provide ¼-inch ports. Provide relief valve set at 30 psig.
 - d. Filter/PRV's selection based on Wilkerson, Model Combination C08. Substitutions shall be allowed per Division 01.

[Edit the following to suit the Project. Engineer shall consult with Owner prior to specifying the dryers.]

7. For systems where no pneumatic tubing is subject to temperatures below 40 degrees F and without refrigerated dryers, provide an air-cooled refrigerated dryer with flow capacity at 100 degrees F, 100 psig saturated entering air, and 40 degrees F leaving dewpoint equal to or exceeding air compressor capacity.
 - a. Refrigerated dryer shall be a single package unit with all necessary piping, refrigerant, controls, wiring and accessories.
 - b. Dryer shall include refrigeration system, on/off switch, inlet air pressure gauge, and water separator with automatic drain. Refrigerant shall be R-134a. System shall be labeled by CSA or UL.
 - c. Manufacturer shall be Hankison, Wilkerson, DelTech, Ingersol-Rand or Arrow Pneumatics.

8. For systems with outdoor pneumatic components or components otherwise exposed to ambient conditions, provide a desiccant-type heatless self-regenerative air dryer for piping providing air supply to these components.
 - a. Dryer capacity shall exceed connected load, plus a 30 percent allowance for expansion with inlet conditions of 100 degrees F, saturated air at 100 psig, and outlet conditions of minus 40 degrees F dewpoint.
 - b. Dryer maximum air pressure drop at rated flow shall not exceed 5 psig. Required air flow for regeneration shall not exceed 20 percent of dryer output capacity.
 - c. Dryer shall include two desiccant towers, piping, changeover valves, exhaust silencers, controls and wiring.
 - d. Desiccant towers shall be designed in accordance with the ASME Boiler and Pressure Vessel Code, Section VIII, and shall be ASME stamped for 125 psig working pressure, and fitted with suitable relief valves if tower physical size places tower within the scope of the Code where stamp is required.
 - e. Desiccant dryers shall be as manufactured by Hankison, Deltech, Arrow Pneumatics, Ingersol-Rand or Zurn.
 9. Main Air Piping (between the compressors and the field control panels): Hard drawn copper tubing, ASTM B 88, Type L.
 10. Branch Air Piping (to include main air between field control panels and field devices: Seamless copper tubing, Type K or L, ASTM B 88; with cast-bronze solder joint fittings, ANSI B1.18; or wrought-copper solder-joint fittings, ANSI B16.22; except brass compression-type fittings at connections to equipment. Solder shall be 95/5 tin antimony, or other suitable lead free composition solder.
 11. Branch Air Piping Termination And Tubing Within Control Panels: Virgin polyethylene non-metallic tubing type FR, ASTM D 2737. Use compression or push-on brass fittings.
- B. Instrument Pipe and Tube:
1. Hydronic and Instruments:
 - a. Connection To Main Piping: Provide ½ inch minimum size threadolet, ½ inch x 2 inch brass nipple, and ½ inch ball valve for connection to welded steel piping. Provide tee fitting for other types of piping.
 - b. Remote Instruments: Adapt from ball valve to specified tubing and extend to remote instruments. Provide a union or otherwise removable fitting at ball valve so that connection to main can be cleaned with straight rod. Where manifolds with test ports are not provided for instrument, provide tees with ¼ inch FPT branch with plug for use as test port. Adapt from tubing size to instrument connection.
 - c. Line Mounted Instruments: Extend rigid piping from ball valve to instrument. Do not use close or running thread nipples. Adapt from ball valve outlet to instrument connection size. Provide a plugged tee if pipe makes 90 degree bend at outlet of valve to allow cleaning of connection to main with straight rod without removing instrument.

- d. Instrument Tubing: Seamless copper tubing, Type K or L, ASTM B 88; with cast-bronze solder joint fittings, ANSI B1.18; or wrought-copper solder-joint fittings, ANSI B16.22; or brass compression-type fittings. Solder shall be 95/5 tin antimony, or other suitable lead free composition solder. Tubing outside diameter size shall be not less than the larger of ¼ inch or the instrument connection size.
 - e. Rigid Piping for Line Mounted Instruments: Schedule 40 threaded brass, with threaded brass fittings.
2. Low Pressure Air Instrument Sensing Lines
- a. Connections: Use suitable bulkhead type fitting and static sensing tip for static pressure connections. Adapt tubing to instrument connection.
 - b. Tubing: Virgin polyethylene non-metallic tubing type FR, ASTM D 2737, with flame-retardant harness for multiple tubing. Use compression or push-on brass fittings.
- C. Secondary LAN Communication Wiring: All wiring shall be in accordance with the latest edition of the National Electrical Code and Division 26. Communication wiring shall be provided in a customized color jacketing material. Material color shall be as submitted and approved by MDACC Monitoring Services and Network Services. In addition all wiring jackets shall be labeled "BAS" in three (3) foot or fewer intervals along the length of the jacket material. An example is provided below:

Purpose	Function	Color	Label
Building Level	Communication	Orange	BAS Building Level Communication
Floor level	Communication	Blue	BAS Floor Level Communication
Inputs/Outputs	Panel to device	White	BAS Input Output Device Cable
24VAC	control power	White/Black tracer	BAS 24 VAC Control Power

- 1. Contractor shall supply all communication wiring between Building Controllers, Routers, Gateways, AAC's, ASC's and local and remote peripherals outside the MDACC IT infrastructure. (e.g., operator workstations, printers, and modems).
 - 2. Local Supervisory LAN: For any portions of this network required under this Section of the Specification, Contractor shall comply with Design Guidelines Element Z IS Network Services & Telecommunication Premises Distribution System Standards. Network shall be run with no splices and separate from any wiring over thirty (30) volts.
 - 3. Secondary Controller LANs: Communication wiring shall be individually 100 percent shielded pairs per manufacturer's recommendations for distances installed, with overall PVC cover, Class 2, plenum-rated run with no splices and separate from any wiring over thirty (30) volts. Shield shall be terminated and wiring shall be grounded as recommended by building controller manufacturer.
- D. Signal Wiring: Contractor shall run all signal wiring in accordance with the latest edition of the National Electrical Code and Division 26.
- 1. Signal wiring to all field devices, including, but not limited to, all sensors, transducers, transmitters, switches, etc. shall be twisted, 100 percent shielded pair, minimum 18-gage wire, with PVC cover. Signal wiring shall be run with no splices and separate from any wiring above thirty (30) volts.
 - 2. Signal wiring shield shall be grounded at controller end only unless otherwise recommended by the controller manufacturer.
- E. Low Voltage Analog Output Wiring: Contractor shall run all low voltage control wiring in accordance with the latest edition of the National Electrical Code and Division 26.

1. Low voltage control wiring shall be minimum 18-gage, twisted pair, 100 percent shielded, with PVC cover, Class 2 plenum-rated. Low voltage control wiring shall be run with no splices separate from any wiring above thirty (30) volts.
- F. Control Panels: Provide control panels with suitable brackets for wall mounting, unless noted otherwise, for each control system. Locate panel adjacent to systems served. Mount center of control panels [60 inches – confirm with Owner] above finished floor or roof.
 1. Interior: Fabricate panels of 16-gage furniture-grade steel, totally enclosed on four sides, with removable perforated backplane, hinged door and keyed lock, with manufacturer's standard shop-painted finish and color.
 2. Exterior: 16-gage 304 or 316 stainless steel NEMA 4X enclosure. Panel shall have hinged door, keyed lock, and integral, thermostatically controlled heater. Provide hinged deadfront inside panel when flush-mounted control and/or indicating devices are included in panel. Fiberglass or aluminum, as applicable, to be used when gases that are being used in the panel area are corrosive to stainless steel.
 3. Provide UL-listed cabinets for use with line voltage devices.
 4. Control panel shall be completely factory wired and piped, and all electrical connections made to a terminal strip.
 5. All gauges and control components shall be identified by means of nameplates.
 6. All control tubing and wiring shall be run neatly and orderly in open slot wiring duct with cover.
 7. Provide a 6 inch x 6 inch minimum wireway (metal wiring/tubing) trough across the entire width of the panel mounted to the top of the panel with close nipples of sufficient size for additional 50 percent wiring and tubing capacity. Wireways shall not be less than 24 inches in length. Control panel wiring shall be installed and distributed in the wireway to minimize routing of wiring and tubing within the control panel. Wireway construction to be the same as the associated control panel.
 8. Complete wiring and tubing termination drawings shall be mounted in, and a second set mounted adjacent to, each panel in a frame with lexan cover of sufficient size to be easily readable.

2.03 STANDARD SERVICE CONTROL VALVES

- A. Control valve sizing and selection is the initial responsibility of the Engineer and not left to the BAS Provider. Engineer shall provide a valve schedule that lists the requirements of the valves for Cv, close off, temperature etc. This should be a result of analyzing the valves performance across the range of control. Engineer shall consult with Owner prior to specifying control valves.
- B. General:
 1. Provide factory fabricated control valves of type, body material and pressure class indicated.
 2. Where type or body material is not indicated, provide selection as determined by manufacturer for installation requirements and pressure class, based on maximum pressure and temperature in piping system.
 3. Provide valve size in accordance with scheduled or specified maximum pressure drop across control valve.
 4. Control valves shall be equipped with heavy-duty actuators, and with proper close-off rating for each individual application.

5. Minimum close-off rating shall be as scheduled and adequate for each application, and shall generally be considered at dead head rating of the pump.

[The following valves are for use in a standard installation.]

C. Plug-Type Globe Pattern for Water Service:

1. Valve Sizing: Where not specifically indicated in the Contract Documents, modulating valves shall be sized for maximum full flow pressure drop between 50 percent and 100 percent of the branch circuit it is controlling unless scheduled otherwise. Two-position valves shall be same size as connecting piping.

[Edit/Delete the following to suit the systems applicable to the Project.]

2. Single Seated (Two-way) Valves: Valves shall have equal-percentage characteristic for typical heat exchanger service and linear characteristic for building loop connections to campus systems unless otherwise scheduled on the drawings. Valves shall have cage-type trim, providing seating and guiding surfaces for plug on 'top-and-bottom' guided plugs.
3. Double Seated (Three-way) Valves: Valves shall have linear characteristic. Valves shall be balanced-plug type, with cage-type trim providing seating and guiding surfaces on 'top-and-bottom' guided plugs.
4. Temperature Rating: 25 degrees F minimum, 250 degrees F maximum.
5. Body: Bronze, screwed, 250 psi maximum working pressure for ½ inch to 2 inch; Cast iron, flanged, 125 psi maximum working pressure for 2-1/2 inches and larger.
6. Valve Trim: Bronze; Stem: Polished stainless steel.
7. Packing: Spring Loaded Teflon or Synthetic Elastomer U-cups, self-adjusting.
8. Plug: Brass, bronze or stainless steel, Seat: Brass.
9. Disc: Replaceable composition or stainless steel filled PTFE.
10. Ambient Operating Temperature Limits: -10 to 150 degrees F (-12.2 to 66 degrees C).
11. Acceptable Manufacturers: Subject to compliance with requirements, approved manufacturers are as follows:
 - a. Johnson Controls.
 - b. Invensys.
 - c. Warren.
 - d. Delta.

D. Plug-Type Globe Pattern for Steam Service:

1. Valve Sizing: Where valve size is not specifically indicated in the Contract Documents, size modulating valves for applications of 15 psig or less for 80 percent of inlet gauge pressure unless scheduled otherwise. Modulating valves for applications of greater than 15 psig shall be sized for 42 percent of inlet absolute pressure unless scheduled otherwise. Two-position valves shall be same size as connecting piping.
2. Characteristics: Modified equal-percentage characteristics. Cage-type trim, providing seating and guiding surfaces for plug on "top and bottom" guided plugs.

- a. Working Temperature: 250 degrees F minimum for saturated steam applications of 15 psig or less; 366 degrees F minimum for saturated steam applications of greater than 15 psig up to 150 psig.
3. Body: Bronze, screwed, 250 psig steam working pressure for ½ inch to 2 inch; Cast iron, flanged, 100 psig steam working pressure for 2-1/2 inches and larger for applications of 50 psig or less.
4. Valve Trim, Plug, Seat and Stem: Polished stainless steel.
5. Packing: Spring Loaded Teflon.
6. Disc: Replaceable composition or stainless steel filled PTFE.
7. Acceptable Manufacturers: Subject to compliance with requirements, approved manufacturers are as follows:
 - a. Johnson Controls.
 - b. Invensys.
 - c. Warren.
 - d. Delta.
- E. Butterfly Type: To be used for two-position control only, unless prior approval is obtained from Owner.
 1. Body: Extended neck epoxy coated cast or ductile iron with full lug pattern, ANSI Class 125 or 250 bolt pattern to match specified flanges.
 2. Seat: EPDM, except in loop bypass applications where seat shall be metal to metal.
 3. Disc: Bronze or stainless steel, pinned or mechanically locked to shaft.
 4. Bearings: Bronze or stainless steel.
 5. Shaft: 416 stainless steel.
 6. Cold Service Pressure: 175 psi.
 7. Close Off: Bubble-tight shutoff to 150 psi.
 8. Operation: Valve and actuator operation shall be smooth both seating and unseating. Should more that 2 psi deadband be required to seat/unseat the valve, valve shall be replaced at no cost to The University.
 9. Acceptable Manufacturers: Subject to compliance with requirements, approved manufacturers are as follows:
 - a. Keystone.
 - b. Jamesbury WS815.
 - c. Bray Series 31.
 - d. Dezurik BGS.
- F. Ball Type:
 1. Body: Brass or bronze; one-, two-, or three-piece design; threaded ends.

2. Seat: Reinforced teflon.
 3. Ball: Stainless steel.
 4. Port: Standard or 'V' style.
 5. Stem: Stainless steel, blow-out proof design, extended to match thickness of insulation.
 6. Cold Service Pressure: 600 psi WOG.
 7. Steam working Pressure: 150 psi.
 8. Acceptable Manufacturers: Subject to compliance with requirements, approved manufacturers are as follows:
 - a. Conbraco.
 - b. Worcester.
 - c. Nibco.
 - d. Jamesbury.
 - e. PBM.
 - f. Delta.
- G. Segmented or Characterized Ball Type:
1. Body: Carbon steel (ASTM 216), one-piece design with wafer style ends.
 2. Seat: Reinforced teflon (PTFE).
 3. Ball: Stainless steel ASTM A351.
 4. Port: Segmented design with equal-percentage characteristic.
 5. Stem: Stainless steel.
 6. Cold Service Pressure: 200 psi WOG.
 7. Cavitation Trim: Provide cavitation trim where indicated and/or required, designed to eliminate cavitation and noise while maintaining an equal percentage characteristic. Trim shall be a series of plates with orifices to break the pressure drop into multi-stages.
 8. Acceptable Manufacturers: Subject to compliance with requirements, approved manufacturers are as follows:
 - a. Jamesbury R-Series.
 - b. Fisher.
 - c. Belimo.

2.04 CRITICAL SERVICE CONTROL VALVES

- A. Control valve sizing and selection is the initial responsibility of the Engineer and not left to the BAS Provider. Engineer shall provide a valve schedule that lists the requirements of the valves for Cv, close off, temperature etc. This should be a result of analyzing the valves performance across the range of control. Engineer shall consult with Owner prior to specifying control valves. Refer to the 'Control Valve Specification Sheet' located at the end of this Section. Owner shall complete the required fields designated on the Valve Sheet as noted and required.
- B. General:
 - 1. Provide factory fabricated control valves of type, body material and pressure class indicated on the 'Control Valve Specification Sheet' located at the end of this Section. Contractor shall utilize the sheet to submit the control valves for the Project.
 - 2. Valves shall be as manufactured by Fisher Controls International, Valtek Control Products, DeZurik/Copes-Vulcan, Keystone, Leslie Controls Inc., or equal.
 - 3. Where type or body material is not indicated, provide selection as determined by manufacturer for installation requirements and pressure class, based on maximum pressure and temperature in piping system.
 - 4. Provide valve size in accordance with scheduled or specified maximum pressure drop across control valve.
 - 5. Control valves shall be equipped with heavy-duty actuators and pilot positioners with proper close-off rating and capability for each individual application.
 - 6. Minimum close-off rating shall be as scheduled and adequate for each application, and shall generally be considered at dead head rating of the pump.

2.05 CONTROL DAMPERS

- A. General: Provide factory fabricated automatic control dampers of sizes, velocity and pressure classes as required for smooth, stable, and controllable airflow. Provide parallel or opposed blade dampers as recommended by manufacturer's sizing techniques. For dampers located near fan outlets, provide dampers rated for fan outlet velocity and close-off pressure, and recommended by damper manufacturer for fan discharge damper service. Control dampers used for smoke dampers shall comply with UL 555S. Control Dampers used for fire dampers shall comply with UL 555.
- B. For general isolation and modulating control service in rectangular ducts at velocities not greater than 1500 fpm (7.62 m/s), differential pressure not greater than 2.5 inches w.c. (622 Pa):
 - 1. Performance: Test in accordance with AMCA 500.
 - 2. Frames: Galvanized steel, 16-gage minimum thickness, welded or riveted with corner reinforcement.
 - 3. Blades: Stainless steel in lab exhausts and galvanized steel elsewhere, maximum blade size 8 inches (200 mm) wide by 48 inches (1219 mm) long, attached to minimum 1/2 inch (12.7 mm) shafts with set screws, 16 gage minimum thickness.
 - 4. Blade Seals: Synthetic elastomer, mechanically attached, field replaceable.
 - 5. Jamb Seals: Stainless steel.
 - 6. Shaft Bearings: Oil impregnated sintered bronze, graphite impregnated nylon sleeve or other molded synthetic sleeve, with thrust washers at bearings.

7. Linkage: Concealed in frame.
 8. Linkage Bearings: Oil impregnated sintered bronze or graphite impregnated nylon.
 9. Leakage: Less than one percent based on approach velocity of 1500 fpm (7.62 m/s) and 1 inches wg. (249Pa).
 10. Maximum Pressure Differential: 2.5 inches wg. (622 Pa).
 11. Temperature Limits: -40 to 200 degrees F (-40 to 93 degrees C).
 12. Where opening size is larger than 48 inches (1219 mm) wide or 72 inches (1829 mm) high, provide dampers in multiple sections, with intermediate frames and jackshafts appropriate for installation.
- C. For general isolation and modulating control service in rectangular ducts at velocities not greater than 4000 fpm (20.3 m/s), differential pressure not greater than 6 inches w.c. (1493 Pa):
1. Performance: Test in accordance with AMCA 500.
 2. Frames: Galvanized steel, 16-gage minimum thickness, welded or riveted with corner reinforcement.
 3. Blades: Extruded aluminum hollow airfoil shape, maximum blade size 8 inches (200 mm) wide by 48 inches (1219 mm) long, attached to minimum 1/2 inch (12.7 mm) shafts, 14 gage minimum extrusion thickness.
 4. Blade Seals: Synthetic elastomeric, mechanically attached, field replaceable.
 5. Jamb Seals: Stainless steel.
 6. Shaft Bearings: Oil impregnated sintered bronze sleeve, graphite impregnated nylon sleeve, molded synthetic sleeve, or stainless steel sleeve, with thrust washers at bearings.
 7. Linkage: Concealed in frame.
 8. Linkage Bearings: Oil impregnated sintered bronze or graphite impregnated nylon.
 9. Leakage: Less than 0.1 percent based on approach velocity of 4000 fpm. (20.3 m/s) and 1 inches wg. (249Pa).
 10. Maximum Pressure Differential: 6 inches wg. (622 Pa).
 11. Temperature Limits: -40 to 200 degrees F (-40 to 93 degrees C).
 12. Where opening size is larger than 48 inches (1219 mm) wide or 72 inches (1829 mm) high, provide dampers in multiple sections, with intermediate frames and jackshafts appropriate for the installation.
- D. For general isolation and modulating control service in rectangular ducts at velocities not greater than 4000 fpm, differential pressure not greater than 12 inches w.c.:
1. Performance: Test in accordance with AMCA 500.
 2. Frames: Galvanized steel, 12-gage minimum thickness, welded or riveted with corner reinforcement.
 3. Blades: Extruded aluminum hollow airfoil shape, maximum blade size 8 inches (200 mm) wide by 48 inches (1219 mm) long, attached to minimum 3/4 inch (19 mm) shafts with set screws.

4. Shaft Bearings: Oil impregnated sintered bronze or stainless steel, pressed into frame, with thrust washers at bearings.
 5. Linkage: 10-gage minimum thickness galvanized steel clevis type crank arms, 3/16 inch x ¾ inch (4.76 mm x 19 mm) minimum thickness tie rods.
 6. Linkage Bearings: Oil impregnated sintered bronze or graphite impregnated nylon.
 7. Leakage: Less than 0.2 percent based on approach velocity of 4000 fpm (20.3 m/s) and 1 inches wg. (249Pa) differential pressure.
 8. Maximum Pressure Differential: 12 inches wg. (2984 Pa).
 9. Temperature Limits: -40 to 300 degrees F (-40 to 149 degrees C).
 10. Where opening size is larger than 48 inches (1219 mm) wide or 72 inches (1829 mm) high, provide dampers in multiple sections, with intermediate frames and jackshafts appropriate for the installation.
- E. For general isolation and modulating control service in round ducts up to 40 inches in size at velocities not greater than 2500 fpm (12.7 m/s), differential pressure not greater than 4 inches w.c. (994 Pa):
1. Performance: Test in accordance with AMCA 500.
 2. Frames: Rolled 12 gage steel strip for sizes 6 inch and smaller, rolled 14 gage steel channel for larger sizes, galvanized or aluminum finish.
 3. Blades: Steel construction, 12 gage minimum thickness for dampers less than 18 inches (457 mm) in size, 10 gage minimum thickness for larger dampers.
 4. Blade Seals: Full circumference neoprene.
 5. Shaft: ½ inch (12.7 mm) diameter zinc or cadmium plated steel.
 6. Shaft Bearings: Oil impregnated sintered bronze or stainless steel, pressed into frame, with thrust washers at bearings.
 7. Leakage: Less than 0.2 percent based on approach velocity of 4000 fpm (20.3 m/s) and 1 inches wg. (249Pa) differential pressure.
 8. Maximum Pressure Differential: 4 inches wg. (994 Pa).
 9. Temperature Limits: -40 to 300 degrees F (-40 to 149 degrees C).
- F. For general isolation and modulating control service in round ducts up to 60 inches in size at velocities not greater than 4000 fpm (20.3 m/s), differential pressure not greater than 6 inches w.c. (1492 Pa):
1. Performance: Test in accordance with AMCA 500.
 2. Frames: Rolled 10-gage steel channel for sizes 48 inch and smaller, rolled 3/16 inch (4.76 mm) thick steel channel for larger sizes, galvanized or aluminum finish.
 3. Blades: Steel construction, 10-gage minimum thickness for dampers not greater than 48 inches in size, ¼ inch (6.35 mm) minimum thickness for larger dampers.
 4. Blade stops: ½ inch x ¼ inch (12.7 mm x 6.35 mm) full circumference steel bar.
 5. Blade Seals: Full circumference neoprene.

6. Shaft: Zinc or cadmium plated steel, angle reinforcing as necessary.
7. Shaft Bearings: Oil impregnated sintered bronze or stainless steel, pressed into frame, with thrust washers at bearings.
8. Leakage: Less than 0.4 percent based on approach velocity of 4000 fpm (20.3 m/s) and 1 inches wg. (249Pa) differential pressure.
9. Maximum Pressure Differential: 6 inches wg. (1492 Pa).
10. Temperature Limits: -40 to 250 degrees F (-40 to 121 degrees C).

2.06 ACTUATORS

- A. General: Size actuators and linkages to operate their appropriate dampers or valves with sufficient reserve torque or force to provide smooth modulating action or 2-position action as specified. Select spring-return actuators with manual override to provide positive shut-off of devices as they are applied.
- B. Actuators:
 1. Ambient Operating Temperature Limits: -10 to 150 degrees F (-12.2 to 66 degrees C).
 2. Two Position Electric Actuators: Line voltage (120 volt, 24 volt) with spring return. Provide end switches as required.
 3. Pneumatic Actuators: Provide heavy-duty actuators with stroke indication and spring return. Actuator shall consist of steel or aluminum cylinder and pistons. Housing shall be protected both internally and externally with corrosion resistant coating. Provide position feedback positive positioners with adjustable start point and operating range. Positive positioners shall be provided on all pneumatic valves larger than 1 inch.
 4. Electronic Actuators: Provide actuators with spring return for two-position (24v), 0-5 Vdc, 0-10 Vdc, 2-10Vdc, 4-20 mA, as required. Actuators shall travel full stroke in less than 90 seconds. Actuators shall be designed for a minimum of 60,000 full cycles at full torque and be UL 873 listed. Provide stroke indicator. Actuators shall have positive positioning circuit. [Parallel actuators on a single valve are not allowed.] or [Where two actuators are required in parallel or in sequence provide an auxiliary actuator driver.] Actuators shall have current limiting motor protection. Actuators shall have manual override where indicated. Modulating actuators for valves shall have minimum rangeability of 40 to 1.
 - a. Close-Off Pressure: Provide the minimum torque required, and spring return for fail positioning (unless otherwise specifically indicated) sized for required close-off pressure. Required close-off pressure for two-way water valve applications shall be the shutoff head of associated pump. Required close-off rating of steam valve applications shall be design inlet steam pressure plus 50 percent for low pressure steam, and 10 percent for high pressure steam. Required close-off rating of air damper applications shall be shutoff pressure of associated fan, plus 10 percent.
 - b. Subject to compliance with requirements, approved manufacturers are as follows:
 - 1) Siemens.
 - 2) Automated Logic.
 - 3) Belimo.
 - 4) Johnson Controls.

5) Delta.

C. Quarter-Turn Actuators (for Ball Valves):

1. Electric:

- a. Motor: Suitable for 120 or 240 volt single-phase power supply. Insulation shall be NEMA Class F or better. Motor shall be rated for 100 percent duty cycle. Motors shall have inherent overload protection.
- b. Gear Train: Motor output shall be directed to a self-locking gear drive mechanism. Gears shall be rated for torque input exceeding motor locked rotor torque.
- c. Wiring: Power and control wiring shall be wired to a terminal strip in the actuator enclosure
- d. Failsafe Positioning: Actuators shall be spring return type for failsafe positioning.
- e. Enclosure: Actuator enclosure shall be a NEMA 4 epoxy coated metal enclosure, and shall have a minimum of two threaded conduit entries.
- f. Limit Switches: Travel limit switches shall be UL approved. Switches shall limit actuator in both open and closed positions.
- g. Mechanical Travel Stops: The actuator shall include mechanical travel stops of stainless steel construction to limit actuator to specific degrees of rotation.
- h. Manual Override: Actuators shall have manual actuator override to allow operation of the valve when power is off. For valves 4 inches and smaller the override may be a removable wrench or lever or geared handwheel type. For larger valves, the override shall be a fixed geared handwheel type. An automatic power cut-off switch shall be provided to disconnect power from the motor when the handwheel is engaged for manual operation.
- i. Valve Position Indicator: A valve position indicator with arrow and open and closed position marks shall be provided to indicate valve position.
- j. Torque Limit Switches: Provide torque limit switches to interrupt motor power when torque limit is exceeded in either direction of rotation.
- k. Position Controller: For valves used for modulating control, provide an electronic positioner capable of accepting 4-20 mA, 0-10 Vdc, 2-10 Vdc, and 135 Ohm potentiometer.
- l. Ambient Conditions: Actuator shall be designed for operation from -140 to 150 degrees F ambient with 0 to 100 percent relative humidity.

2. Pneumatic Single- and Double-Acting Cylinder Type:

- a. Air Cylinder: Shall consist of steel or aluminum cylinder, dual pistons, double rack and pinion gearing mechanism. Housing shall be protected both internally and externally with corrosion resistant coating. Actuator shall be equipped with piston guide rods or similar mechanism so that seals are not loaded as linear bearings. Single acting units shall have multiple symmetrically arranged springs to apply equal force to piston. Cylinder shall be configurable for direction of fail-safe mode in the field. Actuators shall be spring return type for failsafe positioning.
- b. Position Indication: Provide extended shaft position indicator that is removable for manual override of valve.

- c. Two-Position Actuators: Provide appropriate three-way or four-way solenoid valve mounted on the actuator. Solenoid valve electrical enclosure shall meet NEMA 4 requirements. Provide actuator with position switches where required.
- d. Modulating Actuators: Provide a rotary electronic positioner designed to accept 4-20 mA, 0-10 Vdc, 2-10 Vdc, or 135 Ohm potentiometer and operate integral 3-way or 4-way solenoid valve to position valve rotation angle as sensed by integral position feedback device to match signal input. Enclosure shall meet NEMA-4 requirements. Actuator linearity and resolution shall be 0.5 percent of span. Hysteresis and deadband shall be adjustable. Provide accessory mechanical or proximity type position switches and position transmitters where required. Actuators shall be spring return type for failsafe positioning. Provide an enclosure heater for positioners located outside of buildings. [Engineer to coordinate power and electrical wiring for heater.]

2.07 GENERAL FIELD DEVICES

- A. Provide field devices for input and output of digital (binary) and analog signals into controllers (BCs, AACs, ASCs). Provide signal conditioning for all field devices as recommended by field device manufacturers and as required for proper operation in the system.
- B. It shall be the Contractor's responsibility to assure that all field devices are compatible with controller hardware and software.
- C. Field devices specified herein are generally 'two-wire' type transmitters, with power for the device to be supplied from the respective controller. If the controller provided is not equipped to provide this power, is not designed to work with 'two-wire' type transmitters, if field device is to serve as input to more than one controller, or where the length of wire to the controller will unacceptably affect the accuracy, the Contractor shall provide 'four-wire' type equal transmitter and necessary regulated DC power supply or 120 VAC power supply, as required.
- D. For field devices specified hereinafter that require signal conditioners, signal boosters, signal repeaters, or other devices for proper interface to controllers, Contractor shall furnish and install proper device, including 120V power as required. Such devices shall have accuracy and repeatability equal to, or better than, the accuracy and repeatability listed for respective field devices.
- E. Accuracy: As stated in this Section, accuracy shall include combined effects of nonlinearity, non-repeatability and hysteresis.

2.08 TEMPERATURE SENSORS (TS)

- A. Sensor range: When matched with A/D converter of BC, AAC/ASC, or SD, sensor range shall provide a resolution of no worse than 0.3 degrees F (0.16 degrees C) (unless noted otherwise). Where thermistors are used, the stability shall be better than 0.25 degrees F over five (5) years.

[Engineer shall carefully specify other applications where matched sensors are required for the specific Project.]

- B. Matched Sensors: The following applications shall require matched sensors:

- 1. Hydronic Temperature Difference Calculations: Provide matched supply and return temperature sensors where the pair is used for calculating temperature difference for use in load calculations or sequencing such as across chillers and plants. Sensing element shall be platinum RTD guaranteeing an accuracy of +/- 0.5 percent of span plus 0.1 degrees C.
- 2. Air Handling Unit Sequencing: Provide matched pair for the cooling and heating coil leaving sensors where the sequence includes calculating an offset from the supply air setpoint to maintain a leaving heating coil temperature. Sensing element shall be platinum RTD guaranteeing an accuracy of +/- 0.5 percent of span plus 0.1 degrees C.

[Engineer must designate where various amenities to room sensors are required. The following assumes that this will be indicated on the Contract Documents. Otherwise Engineer must add the clarification below. Edit/Delete the following to suit the systems as applicable.]

These are sensors for standard control and monitoring. Consult Owner for direction in the application of sensing element types.]

C. Room Temperature Sensor: Shall be an element contained within a ventilated cover, suitable for wall mounting, unless noted otherwise. Provide insulated base. Following sensing elements are acceptable:

1. Sensing element shall be platinum RTD, thermistor, or integrated circuit, +/- 0.6°F accuracy at calibration point.
2. Provide setpoint adjustment where indicated. The setpoint adjustment shall be a warmer/cooler indication that shall be scalable via the BAS.
3. Provide an occupancy override button on the room sensor enclosure where indicated. This shall be a momentary contact closure.
4. Provide current temperature indication via an LCD or LED readout, where noted.

[These are sensors for critical control and monitoring. Consult Owner for direction in the application of sensing element types.]

D. Critical Room Temperature Sensor: Shall be an element contained within a ventilated cover, suitable for wall mounting. Provide insulated base. Following sensing elements are acceptable:

1. Sensing element shall be platinum RTD, +/- 0.1 degrees C measured at 0 degrees C.
2. Provide setpoint adjustment where indicated. The setpoint adjustment shall be a warmer/cooler indication that shall be scalable via the BAS.
3. Provide an occupancy override button on the room sensor enclosure where indicated. This shall be a momentary contact closure
4. Provide current temperature indication via an LCD or LED readout, where noted.

[These are sensors for standard control and monitoring. Consult Owner for direction in the application of sensing element types.]

E. Single-Point Duct Temperature Sensor: Shall consist of sensing element, junction box for wiring connections and gasket to prevent air leakage or vibration noise. Temperature range as required for resolution indicated. Sensor probe shall be 316 stainless steel.

1. Sensing element shall be platinum RTD, thermistor, or integrated circuit, +/- 0.3 degrees F accuracy at calibration point

[These are sensors for critical control and monitoring. Consult Owner for direction in the application of sensing element types.]

F. Single-Point Duct Temperature Sensor: Shall consist of sensing element, junction box for wiring connections and gasket to prevent air leakage or vibration noise. Temperature range as required for resolution indicated. Sensor probe shall be 316 stainless steel.

1. Sensing element shall be platinum RTD, +/- 0.1 degrees C measured at 0 degrees C.

[Edit the following averaging length per square foot based on how homogeneous the air temperature will be at the installed location. For instance, a preheat sensor of a mixed air plenum

will require more length than the discharge off a preheat coil in a 100 percent outside air handling unit.

These are sensors for standard control and monitoring. Consult Owner for direction in the application of sensing element types.]

G. Averaging Duct Temperature Sensor: Shall consist of an averaging element, junction box for wiring connections and gasket to prevent air leakage. Provide sensor lengths and quantities to result in one lineal foot of sensing element for each three square feet of cooling coil/duct face area. Temperature range as required for resolution indicated.

1. Sensing element shall be platinum RTD, or thermistor, +/- 0.3 degrees F accuracy at calibration point.

[These are sensors for critical control and monitoring. Consult Owner for direction in the application of sensing element types.]

H. Averaging Duct Temperature Sensor: Shall consist of an averaging element, junction box for wiring connections and gasket to prevent air leakage. Provide sensor lengths and quantities to result in one lineal foot of sensing element for each three square feet of cooling coil/duct face area. Temperature range as required for resolution indicated.

1. Sensing element shall be platinum RTD, +/- 0.2 degrees C measured at 0 degrees C.

I. Liquid immersion temperature sensor shall include brass thermowell, sensor and connection head for wiring connections. Temperature range shall be as required for resolution of 0.15 degrees F.

1. Sensing element (chilled water/glycol systems) shall be platinum RTD +/- 0.2 degrees C measured at 0 degrees C.

J. Pipe Surface-Mount Temperature Sensor: Shall include metal junction box and clamps and shall be suitable for sensing pipe surface temperature and installation under insulation. Provide thermally conductive paste at pipe contact point. Temperature range shall be as required for resolution indicated in this Section.

1. Sensing element shall be platinum RTD, thermistor, or integrated circuit, +/- 0.4 degrees F accuracy at calibration point.

K. Outside air sensors shall consist of a sensor, sun shield, utility box, and watertight gasket to prevent water seepage. Temperature range shall be as required for resolution indicated in this Section.

1. +/- 0.2 degrees C measured at 0 degrees C.

2.09 HUMIDITY TRANSMITTERS

A. Units shall be suitable for duct, wall (room) or outdoor mounting. Unit shall be two-wire transmitter utilizing bulk polymer resistance change or thin film capacitance change humidity sensor. Unit shall produce linear continuous output of 4-20 mA for percent relative humidity (% RH). A combination temperature and humidity sensor may be used for zone level monitoring. Sensors shall have the following minimum performance and application criteria:

1. Input Range: 0 to 100% RH.
2. Accuracy (% RH): +/- 2 percent between 20-90% RH at 77 degrees F, including hysteresis, linearity, and repeatability.
3. Sensor Operating Range: As required by application.
4. Long Term Stability: Less than 1 percent drift per year.

- B. Acceptable Manufacturers: Units shall be Vaisala HM Series, General Eastern, Microline, or Hy-Cal HT Series.

2.10 DIFFERENTIAL PRESSURE TRANSMITTERS (DP)

A. Liquid, Steam and Gas:

1. General: Two-wire smart DP cell type transmitter, 4-20 mA or 1-5 Vdc linear output, adjustable span and zero, stainless steel wetted parts.
2. Ambient Limits: -40 to 175 degrees F (-40 to 121 degrees C), 0 to 100% RH.
3. Process Limits: -40 to 400 degrees F (-40 to 205 degrees C).
4. Accuracy: Less than 0.1 percent.
5. Output Damping: Time constant user selectable from 0 to 36 seconds.
6. Vibration Effect: Less than +/- 0.1 percent of upper range limit from 15 to 2000 Hz in any axis relative to pipe mounted process conditions.
7. Electrical Enclosure: NEMA 4, 4X, 7, 9.
8. Approvals: FM, CSA.
9. Acceptable Manufacturers: Rosemount Inc. 3051 Series, Foxboro, Johnson-Yokagawa.

- B. General Purpose Low Pressure Air: Generally for each measurement of duct pressure, filter differential pressure or constant volume air velocity pressure measurement where the range is applicable.

1. General: Loop powered two-wire differential capacitance cell-type transmitter.
2. Output: Two wire 4-20 mA output with zero adjustment.
3. Overall Accuracy: Plus or minus 1 percent.
4. Minimum Range: 0.1 inches w.c.
5. Maximum Range: 10 inches w.c.
6. Housing: Polymer housing suitable for surface mounting.
7. Acceptable Manufacturers: Units shall be Setra, Modus T30, Veris PX Series, or Dwyer Series 616.
8. Static Sensing Element: Pitot-type static pressure sensing tips similar to Dwyer model A-301 and connecting tubing.
9. Range: Select for specified setpoint to be between 25 percent and 75 percent full-scale.
10. Magnehelic Gauges: Provide Dwyer Series 200 Magnehelic Differential Pressure Gauge (or equal) for each DP transmitter. Provide gauge, mounting bracket, ¼ inch aluminum tubing, static pressure tips, and molded plastic vent valves for each gauge connection. Select range for specified recommended filter loading pressure drop to be 75 percent full-scale. For other DP transmitters select range for specified setpoint to be between 25 percent and 75 percent full-scale.

- C. General Purpose Low Pressure/Low Differential Air: Generally for use in static measurement of space pressure or constant volume air velocity pressure measurement where the range is applicable.
 - 1. General: Loop powered, two-wire differential capacitance cell type transmitter.
 - 2. Output: Two-wire 4-20 mA output with zero adjustment.
 - 3. Overall Accuracy: Plus or minus 1 percent.
 - 4. Minimum Repeatability: +/- .25 percent of reading.
 - 5. Maximum Range: 0.1, 0.25, or 0.5 inches w.c.
 - 6. Housing: Polymer housing suitable for surface mounting.
 - 7. Acceptable Manufacturers: Setra, Modus T30.
 - 8. Static Sensing Element: Pitot-type static pressure sensing tips similar to Dwyer model A-301 and connecting tubing.
 - 9. Range: Select for specified setpoint to be between 25 percent and 75 percent full-scale.
- D. VAV Velocity Pressure: Generally for use in variable volume air velocity pressure measurement where the range is applicable.
 - 1. General: Loop powered two-wire differential capacitance cell type transmitter.
 - 2. Output: Two-wire, 4-20 mA output with zero adjustment.
 - 3. Overall Accuracy: Plus or minus 0.25 percent.
 - 4. Minimum Range: 0 inches w.c.
 - 5. Maximum Range: 1 inch w.c.
 - 6. Housing: Polymer housing suitable for surface mounting.
 - 7. Acceptable Manufacturers: Setra.
 - 8. Range: Select for minimum range that will accept the maximum velocity pressure expected.
 - 9. Magnehelic Gauges: Provide Dwyer Series 200 Magnehelic Differential Pressure Gauge (or equal) for each DP transmitter. Provide gauge, mounting bracket, ¼ inch aluminum tubing, static pressure tips, and molded plastic vent valves for each gauge connection. Select range for specified setpoint to be between 25 percent and 75 percent full-scale.

2.11 AIRFLOW MEASURING STATIONS (AFMS)

- A. Fan Inlet Probe: Shall consist of vortex shedding multi-sensor probes which are installed in the inlet of the fan. Individual sensors on the probe provide direct proportional and linear signals to airflow velocity.
 - 1. Sensor Accuracy: +/- 2.0 percent.
 - 2. Interchangeability: +/- 0.5 percent.
 - 3. Velocity Range: 750 to 9000 fpm.
 - 4. Electronics Accuracy: +/- 0.05 percent.

5. Temperature Limits: -20 degrees F to 140 degrees F.
 6. Enclosure for Electronics: NEMA 1.
 7. Material: Aluminum.
 8. Operating Range: Select minimum range to accommodate the expected flow range of the equipment.
 9. Acceptable Manufacturers: Tek-Air Systems Inc. 'Vortek' Model 7000, or approved equal.
- B. Air Flow Traverse Probes:
1. Furnish where indicated on the Drawings, vortex shedding multi-sensor insertion type, air flow traverse probes. The probes, and placement of the probes, shall provide measurement accuracy within +/- 2 percent of actual velocity. Probes shall be of cylindrical cross Section and shall indicate no more than a +/- 3 percent deviation from the centerline velocity at a yaw angle of 30 degrees.
 2. Probes shall be provided with integral mounting plate, 1/4 compression fitting connections, end mounting rod and be suitable to operate in ambient conditions off 300 degrees F. The probe assemblies shall not have a pressure drop greater than 10 percent of the velocity pressure at the maximum design flow. The probes shall not amplify sound levels in the duct.
 3. Submit data indicating the developed differential pressure and pressure loss at the minimum and maximum design flows for each duct location. Provide differential pressure transmitter for measuring velocity, with a range selected to match the velocity of the maximum design flow for the duct served.
 - a. Sensor Accuracy: +/- 2.0 percent.
 - b. Interchangeability: +/- 0.5 percent.
 - c. Velocity Range: 400 to 9000 fpm.
 - d. Electronics Accuracy: +/- 0.05 percent.
 - e. Temperature Limits: -20 degrees F to 200 degrees F.
 - f. Enclosure for Electronics: NEMA 1.
 - g. Humidity Limits: 0 to 100% RH (non-condensing).
 - h. Material: 304 stainless steel.
 - i. Operating Range: Select minimum range to accommodate the expected flow range of the equipment.
 - j. The following schedule is the minimum probe quantities across either the width or height of the duct sections where the probes are being inserted:

Insertion Side (inches)	Quantity
6-11	1
12-30	2
31-48	3
48-60	4
61-84	6
85-120	6

- k. Manufacturer: Tek-Air Model T-FP5000 or approved equal.

2.12 VALVE BYPASS FOR DIFFERENTIAL PRESSURE SENSORS

- A. Provide a five valve bypass kit for protection of DP sensors where the static on the pipe can cause an over pressure when connected to one port with the other at atmospheric pressure. Kit shall include high and low pressure isolation valves, high and low pressure vent valves, calibration taps, and a bypass valve contained in a NEMA 1 enclosure.

2.13 DIFFERENTIAL PRESSURE SWITCHES (DPS)

- A. General Service Auto Reset - Air: Diaphragm with adjustable setpoint and differential and snap acting form C contacts rated for the application. Provide manufacturer's recommended static pressure sensing tips and connecting tubing. Acceptable Manufacturer - Dwyer Series 1900 or approved equal.
- B. General Service Manual Reset - Air: Diaphragm with adjustable setpoint and differential and snap acting form C contacts rated for the application. Provide manufacturer's recommended static pressure sensing tips and connecting tubing. Acceptable Manufacturer - Dwyer Series 1900 or approved equal.
- C. General Service - Water: Diaphragm with adjustable setpoint, 2 psig or adjustable differential and snap-acting Form C contacts rated for the application. 60 psid minimum pressure differential range and 0 degrees F to 160 degrees F operating temperature range.

2.14 PRESSURE SWITCHES (PS)

- A. Diaphragm or bourdon tube with adjustable setpoint and differential and snap-acting Form C contacts rated for the application. Pressure switches shall be capable of withstanding 150 percent of rated pressure.
- B. Acceptable Manufacturers: Square D, ITT Neo-Dyn, ASCO, Penn, Honeywell, and Johnson Controls.

2.15 TRANSDUCERS

- A. Consult Owner for direction in the application of Transducers.
- B. Standard Capacity Electronic-to-Pneumatic (E-P) Transducers: E-P transducers shall be Voltage-to-Pneumatic (V-P) type, Current-to-Pneumatic (I-P) type:
 - 1. Electrical Power Supply: 24 Vac or 24 Vdc.
 - 2. Pneumatic Air Supply: 30 psig (2.07 bar) maximum.
 - 3. Air Capacity: 1100 scim @ 20 psig (300 cm³/sec @ 1.4 bar).
 - 4. Air Consumption: Zero at steady state.
 - 5. Output Span: 0-20 psig (0-1.4 bar).
 - 6. Input: 4-20 mA, 0-5 Vdc, 1-5 Vdc, 0-10 Vdc, 2-10 Vdc, 0-15 Vdc, or 3-15 Vdc input.
 - 7. Gauges: Provide with main and branch air gauges
 - 8. Enclosure: Polymer designed for surface or panel mount. Provide with main air and branch air gauges.
 - 9. Air Connections: ¼ inch (6.35 mm) barbed.

10. Failure Mode on Power Loss: Non-failsafe transducers shall have no output air loss. Failsafe transducers shall exhaust output upon power loss.
11. Acceptable Manufacturers: RE Technologies Model UCP-522.
- C. Consult Owner for direction in the application of Transducers.
- D. Electronic-to-Pneumatic (E-P) Transducers: E-P transducers shall be Voltage-to-Pneumatic (V-P) type, Current-to-Pneumatic (I-P) type, Phase cut Type:
 1. Electrical Power Supply: 24 Vac or 24 Vdc, 100 mA.
 2. Accuracy: +/- 1 percent.
 3. Feedback: Branch pressure feedback from an on board pressure sensor - VDC Feedback.
 4. Override: Manual Potentiometer.
 5. Pneumatic Air Supply: 25-30 psig (2.07 bar) maximum.
 6. Air Capacity: .5 scim @ 20 psig (300 cm³/sec @ 1.4 bar).
 7. Air Consumption: None.
 8. Output Span: 3-15 psig factory set field adjustable.
 9. Input: 4-20 mA, 0-5 Vdc, 0-10 Vdc, 2-10 Vdc, 0-18 Vdc, 0-20V Phase Cut input.
 10. Gauges: Provide with main and branch air gauges.
 11. Enclosure: NEMA 1. Provide with main air and branch air gauges.
 12. Air Connections: ¼ inch (6.35 mm) barbed brass.
 13. Failure Mode on Power Loss: Non-failsafe transducers shall have no output air loss. Failsafe transducers shall exhaust output upon power loss.
 14. Acceptable Manufacturers: TRIATEK CP-3000.

2.16 CURRENT SWITCHES (CS)

- A. Clamp-On Design Current Operated Switch (for Constant Speed Motor Status Indication):
 1. Range: 2.5 to 135 amps.
 2. Trip Point: Adjustable.
 3. Switch: Solid state, normally open, 1.0A @ 30VAC/DC.
 4. Lower Frequency Limit: 6 Hz.
 5. Trip Indication: LED.
 6. Approvals: UL, CSA.
 7. Max. Cable Size: 350 MCM.
 8. Acceptable Manufacturers: Veris Industries H-908.

- B. Clamp-on Wire Through Current Switch (CS/CR) (for Constant Speed Motors): Same as CS with 24v command relay rated at 5A @ 240 Vac resistive, 3A @ 240 Vac inductive, load control contact power shall be induced from monitored conductor (minimum conductor current required to energize relay 5A, max. rating of 135A). Acceptable Manufacturers shall be Veris Industries, Inc., Model # H938 or RE Technologies RCS 1150.
 - 1. Where used for single-phase devices, provide the CS/CR in a self-contained unit in a housing similar with override switch to Kele RIBX.
- C. Clamp-On Design Current Operated Switch for Variable Speed Motor Status Indication:
 - 1. Range: 3.5 to 135 Amps.
 - 2. Trip Point: Self-calibrating based on VA memory associated with frequency to detect loss of belt with subsequent increase of control output to 60 Hz.
 - 3. Switch: Solid state, normally open, 0.1A @ 30VAC/DC.
 - 4. Frequency Range: 35 to 75 Hz.
 - 5. Trip Indication: LED.
 - 6. Approvals: UL, CSA
 - 7. Max. Cable Size: 350 MCM.
 - 8. Acceptable Manufacturers: Veris Industries, Inc. H-904.
- D. Clamp-On Wire Through Current Switch (CS/CR) (for Variable Speed Motors): Same as CS with 24v command relay rated at 5A @ 240 Vac resistive, 3A @ 240 Vac inductive, load control contact power shall be induced from monitored conductor (minimum conductor current required to energize relay 5A, max. rating of 135A). Acceptable manufacturer shall be Veris Industries, Inc., Model # H934.
- E. Variable Speed Status: Where current switches are used to sense the status for variable speed devices, the CT shall include on-board VA/Hz memory to allow distinction between a belt break and subsequent ramp up to 60 Hz, versus operation at low speed. The belt break scenario shall be indicated as a loss of status and the operation at low speed shall indicate normal status.

2.17 CURRENT TRANSFORMERS (CT)

- A. Clamp-On Design Current Transformer (for Motor Current Sensing):
 - 1. Range: 1-10 amps minimum, 20-200 amps maximum.
 - 2. Trip Point: Adjustable.
 - 3. Output: 0-5 VDC.
 - 4. Accuracy: +/- 0.2 percent from 20 to 100 Hz.
 - 5. Acceptable Manufacturers: KELE SA100.

2.18 OUTDOOR AIR STATIC PRESSURE SENSING TIP

- A. Pressure Sensor: Pressure sensing tip shall be designed to minimize the effects of wind and resulting velocity pressure up to 80 mph. Acceptable manufacturers shall be Dwyer A-306.
- B. Low Air Pressure Surge Dampener: 30-second time constant. Acceptable manufacturer shall be Modus SD030.

2.19 CONTINUOUS LEVEL TRANSMITTERS

A. Capacitance Type:

1. General: Provide a loop powered, continuous capacitance type level transmitter with adjustable span and zero.
2. Output: 4-20 mA.
3. Probe: Fluoropolymer coated stainless steel rod or cable. Provide cable probe with end attachment hardware or weight.
4. Electrical Enclosure: NEMA 4, 7.
5. Approvals: UL or CSA.
6. Accuracy: ± 1 percent of calibrated span.
7. Process Connection: MPT or ANSI Flange as required.
8. Acceptable Manufacturers: Drexelbrook, Endress & Hauser.

B. Hydrostatic Pressure:

1. General: Two wire smart d/p cell type transmitter.
2. Output: 4-20 mA or 1 to 5 volt user selectable linear or square root output.
3. Range: Adjustable span and zero.
4. Probe: Stainless steel wetted parts.
5. Environmental Limits: -40 to 250 degrees F (-40 to 121 degrees C), 0 to 100% RH.
6. Accuracy: Less than 0.1 percent of span.
7. Output Damping: Time constant user selectable from 0 to 36 seconds.
8. Vibration Effect: Less than ± 0.1 percent of upper range limit from 15 to 2000 Hz in any axis relative to pipe mounted process conditions.
9. Electrical Enclosure: NEMA 4, 4X, 7, 9.
10. Approvals: FM, CSA.
11. Acceptable Manufacturers: Rosemount Inc. 3051 Series, Foxboro, and Johnson-Yokagawa.

[Engineer must clearly indicate which flow meters are acceptable for various duties. Edit to suit the Project.]

2.20 ULTRASONIC FLOW METER FOR WATER SERVICE:

- A. General: Single-channel non-wetted ultrasonic meter to measure volumetric fluid using transit-time flow measurement.
- B. Measurement: Single channel (Two Channel) measurement.
- C. Enclosure: Epoxy-coated aluminum NEMA 4X, IP66 weatherproof.
- D. Accuracy: ± 2 percent of velocity reading at 1 to 40 feet per second.

- E. Rangeability: 400 to 1.
- F. Repeatability: +/- 0.2 to 0.5 percent at full scale.
- G. Input Power: 120 VAC or 24VDC.
- H. Operating Temperature: 14 degrees F to 140 degrees F.
- I. Control Panel: Stainless Steel case. Digital display: 2-line x 16-character LCD display, LED backlight, configurable to display up to 4 measurement parameters in sequence.
- J. Keypad: 6-button internal keypad.
- K. Output: Single Channel – one 4-20 mA (Two Channel – two 4-20 mA).
- L. Output Units: Velocity in feet per second or meters per second.
- M. Volumetric Flow: Cubic feet (ft3), cubic meters (m3), gallons (gal), and liters (L).
- N. Totalizer (forward and reverse): Cubic feet (ft3), cubic meters (m3), gallons (gal), and liters (L).
- O. Transducer Temperature Range: -40 degrees F to 140 degrees F.
- P. Provide all slide track brackets, stainless steel chain or strap, for a complete installation. Provide connector cables and connectors as required for a complete system.
- Q. Acceptable Manufacturers: EMCO.

2.21 ULTRASONIC FLOW METER FOR STEAM SERVICE:

- A. General: Single-channel ultrasonic meter to measure the mass flow rate of saturated or superheated steam and the volumetric flow of wet steam.
- B. Measurement: Single Channel measurement.
- C. Enclosure: Stainless steel NEMA 7/4X.
- D. Accuracy: +/- 1 percent of velocity reading at 3 to 150 feet per second.
- E. Rangeability: 1500 to 1.
- F. Repeatability: +/- 0.2 to 0.5 percent at 1 to 150 feet per second.
- G. Input Power: 120 VAC or 24 VAC/VDC.
- H. Operating Temperature: -40 degrees F to 140 degrees F.
- I. Display: 2-line x 16-character LCD display, LED backlight, configurable to display up to 4 measurement parameters in sequence.
- J. Output: 4-20 mA.
- K. Transducer:
 - 1. Type: T9.
 - 2. Temperature Range: -40 degrees F to 400 degrees F.
 - 3. Pressure Ratings: 0 to 250 psig operating pressure, 750 psig test pressure
 - 4. Material: Titanium.

5. Connection: Threaded or flanged connection.

L. Acceptable Manufacturers: EMCO Steam Flow Transmitter.

2.22 INSERTION TYPE TURBINE METER FOR WATER SERVICE

A. General:

1. Turbine Insertion Flow Meter sensing method shall be impedance sensing (iron magnetic and non-photoelectric), with volumetric accuracy of +/- 2 percent of reading over middle 80 percent of operating range, and +/- 4 percent of reading over the entire operating range.
2. Turbine Insertion Flow Meter shall have maximum operating pressure of 400 psi and maximum operating temperature of 200 degrees F continuous (220 degrees F peak).
3. All wetted metal parts shall be constructed of 316 stainless steel. Flow meter shall meet or exceed all of the accuracy, head loss, flow limits, pressure and material requirements of the AWWA standard C704-70 for the respective pipe or tube size.
4. Analog outputs shall consist of non-interactive zero and span adjustments, a DC linearity of 0.1 percent of span, voltage output of 0-10 V, and current output of 4-20 mA.

B. Installation: Install in water systems with a minimum of 10 pipe diameters unobstructed flow. Double turbine insertion required at between 10 and 4 diameters unobstructed flow.

C. Acceptable Manufacturers: Onicon Corp. and Hersey.

2.23 VORTEX SHEDDING FLOW METER FOR LIQUID, STEAM AND GAS SERVICE:

A. Output: 4-20 mA, 0-10 Vdc, 0-5 Vdc.

B. Maximum Fluid Temperature: 800 degrees F (427 degrees C).

C. Wetted Parts: Stainless Steel.

D. Housing: NEMA 4X.

E. Turndown: 10:1 minimum.

F. Accuracy: 0.5 percent of calibrated span for liquids, 1 percent of calibrated span for steam and gases.

G. Body: Wafer style or ANSI flanged to match piping Specification.

H. Acceptable Manufacturers: Foxboro 83 series, Johnson-Yokagawa, and Rosemount.

2.24 MAGNETIC FLOW METER FOR WATER SERVICE

A. General Requirements:

1. Sensor shall be a magnetic flow meter, which utilizes Faraday's Law to measure volumetric fluid flow through a pipe.
2. The flow meter shall consist of two (2) elements, the sensor and the electronics. The sensor shall generate a measuring signal proportional to the flow velocity in the pipe. The electronics shall convert this EMF into a standard current output.
3. Electronic replacement shall not affect meter accuracy (electronic units are not matched with specific sensors).

- a. Provide a four-wire, externally powered, magnetic type flow transmitter with adjustable span and zero, integrally mounted to flow tube.
- b. Output: 4-20 mA.
- c. Flow Tube: Stainless steel.
- d. Electrical Enclosure: NEMA 4, 7.
- e. Approvals: UL or CSA.
- f. Stability: 0.1 percent of rate over six (6) months.
- g. Process Connection: Carbon steel, ANSI 150 LB, size as required.

B. Meter Accuracy:

1. Under the reference conditions of a 68 degrees F media temperature, a 68 degrees F ambient temperature, a +/- 1 percent nominal power supply voltage, 10 diameters up stream and 5 down of straight piping and a fully developed flow profile; the meter must meet the following requirements:
2. Plus or minus 0.8 percent of reading accuracy in the flow range of 1.65 - 33 ft/sec +/- (0.66/Velocity actual feet per second +0.4) percent of reading accuracy in the flow range of 0 - 1.65 feet per second.
3. Meter repeatability shall be +/- 0.1 percent of rate at velocities > 1.65 feet per second.

C. Calibration: The sensor must be calibrated on an internationally accredited (i.e. NAMAS) flow rig with accuracy better than 0.1 percent. Calibration shall be traceable to National Institute of Standard and Technology.

D. Construction:

1. The meter piping material shall be AISI 304 stainless steel.
2. The meter flange and enclosure material shall be carbon steel.
3. The external surface of the sensor is to be treated with at least .006 inches (150 μ m) of Corrosion resistant two-component paint.
4. The inner meter piping shall be protected with a neoprene liner or similar liner.
5. The electrode material shall be AISI 316 Ti or better.
6. The sensor be ANSI class 150 pounds.

E. Electronics:

1. The sensor shall contain a SENSOR-PROM, storing calibration and factory default settings, i.e. the identification of the sensor and size.
2. An ISO 9001 approved company shall manufacture the sensor and electronics.
3. As standard, the electronics must be installable directly on the sensor or installable (remote) up to 1500 feet from the sensor as a maximum.
4. With local electronics installation, the electronics shall be able to withstand three (3) feet water submersion for up to 30 minutes.

5. The electronics shall be compatible with the following power specifications:
 - a. 15/230 Vac +10 percent to 15 percent 50-60 Hz.
 - b. The power consumption must be 10 Watts or less independent of meter size.
6. The meter electronics shall be able to produce simultaneous scaleable current and frequency/pulse output. The frequency output shall be linearly proportional to flow rate and scaleable from 0-10 kHz. The pulse output shall be scaleable from 50 to 5000 milliseconds duration, suitable for an electromechanical totalizer in engineering units.
7. The electronics must have an internal totalizer for summation of flow.
8. The output of the electronics must be individually, galvanically isolated with an isolation voltage of more than 500 V.

F. Output:

1. The current signal must be either 0-20 mA or 4-20 mA proportional to the flow velocity.
2. The output current signal must accommodate 20 percent over range without loss in linearity.
3. The electronics shall have an alphanumeric LCD display showing actual flow and totalized flow in engineering units.
4. The display and keyboard must be rotatable so that the display can be viewed regardless of sensor orientation.

G. Error Detection:

1. The electronics must be able to detect the flowing error conditions:
 - a. Signal connection between electronics and sensor interrupted.
 - b. Loss of current to the coil circuit.
 - c. Load on the current output.
 - d. Defective electronics.
 - e. Defective sensor.
 - f. Empty pipe.
2. The electronics must have an Error Log where all error conditions occurring within a period of 180 days are stored.

H. Electronic Replacement Programming:

1. The electronics must be immediately replaceable without the need of cable disconnection or renewed configuration programming.
2. When the supply voltage is applied, the electronics must self configure and display flow without keyboard contact (no programming required).
3. The electronics must be provided with an automatic zero flow setting.
4. The electronics shall be programmable with respect to:

- a. User display options and menu
 - b. Setting data
 - c. Configuration of outputs
 - d. Zero 'cut-off' from 0 percent to 9.9 percent of maximum flow.
5. For ease of programming, the electronics shall be programmable away from the meter using the meter Sensor-Prom and a 9 V battery.
 6. The electronics shall be suitable for operation in an ambient temperature range of -4 degrees F to 120 degrees F.
- I. Acceptable Manufacturers:
1. Engineering Measurements Co. (EMCO MAG 3100 with a model MAG 2500 electronic transmitter and display).
 2. Rosemont.
 3. Toshiba.
 4. Hersey Measurement.
 5. Yokogawa Industrial Automation.
 6. Endress & Hauser.

2.25 VENTURI FLOW METER FOR WATER SERVICE

- A. Flow Sensing Element: Differential-pressure Venturi-type designed for installation in piping.
- B. Construction: Bronze or cadmium plated steel with brass quick connect fittings and attached tag with flow conversion data and rated flow. Ends shall be threaded for 2 inches and smaller and flanged or welded for larger than 2 inches.
- C. Differential transmitter shall be dual range industrial grade as specified above.
- D. Connect differential pressure to venturi and repipe quick connect fittings for measurement. Provide ball valves to isolate quick connects and differential pressure transmitter.
- E. Apply Venturi-type flow meters where minimum flow range is no less than 40 percent of maximum flow.

2.26 CO2 SENSORS/TRANSMITTERS (CO2)

- A. General: CO2 sensors shall use silicon based, diffusion aspirated, infrared single beam, dual-wavelength sensor.
- B. Accuracy: +/- 36ppm at 800 ppm and 68 degrees F.
- C. Stability: 5 percent over 5 years.
- D. Output: 4-20 mA, 0-10 Vdc or relay.
- E. Mounting: Duct or Wall as indicated.
- F. Acceptable Manufacturer: Vaisala, Inc. GMD20 (duct) or GMW20 (wall).

2.27 PNEUMATIC CONTROL COMPONENTS

- A. Analog Pressure Gauges: Gauges shall be pneumatic type, minimum 1-1/2 inches (38 mm) in diameter, with white face and black numerals. Surface-mounted gauges shall have chrome plated trim and be a minimum of 2-1/2 inches (64 mm) in diameter.
- B. Pneumatic Actuated Pressure Switches (PE) (for 30 psig max pressure control systems): Pressure ranges and sensitivity of PEs shall match control system sequence of operation. Switch operation shall be externally adjustable over the operating pressure range (nominal 0-20 psig, 0 to 138 KPa). PE switches shall be SPDT type, rated for the particular application, and shall be UL listed. PE shall be as manufactured by Penn.
- C. Pilot Positioners: Operating span adjustment range is from 3 to 15 psi (21 to 104 kPa), or as required for the actuator being served. Positioner shall be furnished with zero and span adjustments and a mounting bracket for attachment directly to the actuator.

2.28 ELECTRIC CONTROL COMPONENTS

- A. Limit Switches (LS): Limit switches shall be UL listed, SPDT or DPDT type, with adjustable trim arm. Limit switches shall be as manufactured by Square D, Allen Bradley.
- B. Electric Solenoid-Operated Pneumatic Valves (EP): EP valves shall be rated for a minimum of 1.5 times their maximum operating static and differential pressure. Valves shall be ported 2-way, 3-way, or 4-way and shall be normally closed or open as required by the application. EPs shall be sized for minimum pressure drop, and shall be UL and CSA listed. Furnish and install gauges on all inputs of EPs. Furnish an adjustable air pressure regulator on input side of solenoid valves serving actuators operating at greater than 30 psig.
 - 1. Coil Enclosure: Indoors shall be NEMA 1, Outdoors shall be NEMA 3, 4, 7, 9.
 - 2. Fluid Temperature Rating: Valves for compressed air and cold water service shall have 150 degrees F (66 degrees C) minimum rating. Valves for hot water or steam service shall have fluid temperature rating higher than the maximum expected fluid temperature.
 - 3. Acceptable Manufacturers: EP valves shall be as manufactured by ASCO or Parker.
 - 4. Coil Rating: EP valves shall have appropriate voltage coil rated for the application (i.e., 24 VAC, 120 VAC, 24 VDC, etc.).
- C. Low Temperature Detector ('Freezestat') (FZ): Low temperature detector shall consist of a 'cold spot' element which responds only to the lowest temperature along any one foot of entire element, minimum bulb size of 1/8 inches x 20 feet (3.2mm x 6.1m), junction box for wiring connections and gasket to prevent air leakage or vibration noise, DPDT (4 wire, 2 circuit) with manual reset. Temperature range 15 to 55 degrees F (-9.4 to 12.8 degrees C), factory set at 38 degrees F.
- D. High Temperature Detectors ('Firestat') (FS): High temperature detector shall consist of 3-pole contacts, a single point sensor, junction box for wiring connections and gasket to prevent air leakage or vibration noise, triple-pole, with manual reset. Temperature range 25 to 215 degrees F (-4 to 102 degrees C).
- E. Surface-Mounted Thermostat: Surface-mounted thermostat shall consist of SPDT contacts, operating temperature range of 50 to 150 degrees F (10 to 65 degrees C), and a minimum 10 degrees F fixed setpoint differential.
- F. Low Voltage Wall Thermostat: Wall-mounted thermostat shall consist of SPDT sealed contacts, operating temperature range of 50 to 90 degrees F (10 to 32 degrees C), switch rating of 24 Vac (30 Vac maximum), and both manual and automatic fan operation in both the heat and cool modes.

- G. Control Relays: All control relays shall be UL listed, with contacts rated for the application, and mounted in minimum NEMA 1 enclosure for indoor locations, NEMA 4 for outdoor locations.
1. Control relays for use on electrical systems of 120 volts or less shall have, as a minimum, the following:
 - a. AC coil pull-in voltage range of +10 percent, -15 percent or nominal voltage.
 - b. Coil sealed volt-amperes (VA) not greater than four (4) VA.
 - c. Silver cadmium Form C (SPDT) contacts in a dustproof enclosure, with 8 or 11 pin type plug.
 - d. Pilot light indication of power-to-coil and coil retainer clips.
 - e. Coil rated for 50 and 60 Hz service.
 - f. Acceptable Manufacturers: Relays shall be Potter Brumfield, Model KRPA or approved equal.
 2. Relays used for across-the-line control (start/stop) of 120V motors, 1/4 horsepower, and 1/3 horsepower, shall be rated to break minimum 10 Amps inductive load. Relays shall be IDEC or approved equal.
 3. Relays used for stop/start control shall have low voltage coils (30 VAC or less), and shall be provided with transient and surge suppression devices at the controller interface.
 4. All safety circuits shall be installed to operate individual interposing relays located in the associated equipment control panel. Each safety device (i.e. Freezestat, DP safety, smoke detector, firestat, etc.) wiring circuit shall be installed with individual homeruns back to the associated control panel. See control drawings for details.
- H. General Purpose Power Contactors: NEMA ICS 2, AC general-purpose magnetic contactor. ANSI/NEMA ICS 6, NEMA 1 enclosure. Manufacturer shall be Square 'D', Cutler-Hammer or Westinghouse.
- I. Control Transformers: Furnish and install control transformers as required. Control transformers shall be machine tool type, and shall be US and CSA listed. Primary and secondary sides shall have replaceable fuses in accordance with the NEC. Transformer shall be properly sized for application, and mounted in minimum NEMA 1 enclosure.
1. Transformers shall be manufactured by Westinghouse, Square 'D', or Jefferson.
- J. Time Delay Relays (TDR): TDRs shall be capable of on or off delayed functions, with adjustable timing periods, and cycle timing light. Contacts shall be rated for the application with a minimum of two (2) sets of Form C contacts, enclosed in a NEMA 1 enclosure.
1. TDRs shall have silver cadmium contacts with a minimum life span rating of one million operations. TDRs shall have solid state, plug-in type coils with transient suppression devices.
 2. TDRs shall be UL and CSA listed, Crouzet type.
- K. Electric Push Button Switch: Switch shall be momentary contact, oil tight, push button, with number of N.O. and/or N.C. contacts as required. Contacts shall be snap-action type, and rated for minimum 120 Vac operation. Switch shall be 800T type, as manufactured by Allen Bradley or approved equal.
- L. Pilot Light: Panel-mounted pilot light shall be NEMA ICS 2 oil tight, transformer type, with screw terminals, push-to-test unit, LED type, rated for 120 VAC. Unit shall be 800T type, as manufactured by Allen-Bradley or approved equal.

- M. Alarm Horn: Panel-mounted audible alarm horn shall be continuous tone, 120 Vac Sonalert solid-state electronic signal, as manufactured by Mallory or approved equal.
- N. Electric Selector Switch (SS): Switch shall be maintained contact, NEMA ICS 2, oil-tight selector switch with contact arrangement, as required. Contacts shall be rated for minimum 120 Vac operation. Switch shall be 800T type, as manufactured by Allen-Bradley or approved equal.

[Engineer must clearly indicate which refrigerant monitors are acceptable for the application. Only specify the refrigerant monitor in this Section if not provided by the chiller manufacturer in the chiller Specification. Edit to suit the Project.]

2.29 REFRIGERANT MONITOR

- A. General: Contractor shall provide a refrigerant sensitive infrared-based stationary refrigerant gas leak monitor system designed to continuously measure refrigerants. Refrigerant monitor shall be coordinated to detect [insert refrigerant types here if known or delete] refrigerants used in chiller equipment installed under Division 23. The alarm system shall comply with the latest edition of ANSI/ASHRAE 15 and local code requirements.
- B. The refrigerant monitor shall be capable of monitoring multiple refrigerant gas compounds at multiple locations in concentrations of 0 PPM to a minimum of 1000 PPM. The Monitor shall have a low range resolution of 1 PPM in the range of 1 PPM through 100 PPM. Readings above 100 PPM must be accurate to within +/- 5 percent of reading. Accuracy shall be maintained within ambient environmental ranges of 0 degrees C through 50 degrees C, (32 degrees F through 122 degrees F) and 5 percent through 90 percent relative humidity, non-condensing.
- C. The refrigerant monitor shall automatically and continuously monitor the areas through a sample draw type tubular pick up system with an internal pump and filter. The installation of the monitoring control and the tubing shall be in strict accordance with the manufacturer's instructions. The location, routing, and final position of the sample tubes shall be submitted to the engineer with all necessary shop drawings and monitor specifications and installation instructions. Tubing size, tubing material, and tube length limitations shall be within the specifications of the monitor manufacturer. The location and method of tube support and hangers must be identified on the shop drawings. Each of the sampling tubes shall have end of line filters.
- D. The analyzer will be based on infrared detection technology, and will be factory tested and calibrated for the specified refrigerant or refrigerants. Factory certification of the calibrations shall be provided with the O&M manuals. The analyzer shall provide a menu driven or automatic method of checking both zero, span calibration for each sensor, and allow for adjustment.
- E. The monitor shall be equipped with four (4) outputs. Three relays shall energize at an adjustable user defined set point based on refrigerant concentration levels. The relay threshold adjustment shall be protected by keyed or password access controls. Adjustments and observations shall be made at the front panel operator interface. The relay threshold values can be viewed without a password. The digital display will continuously display the refrigerant concentration level and alarm status. The fourth output shall indicate a monitor malfunction alarm. The monitor shall also have an analog output that will provide a linear scaled reference to the refrigerant concentration in parts per million. The analog output signal shall be an industry standard DC voltage, or mA current signal.
- F. The monitor shall have a NEMA 4 enclosure with a gasketed, hinged front cover. Conduits and tube connections shall be located on the bottom of the enclosure. The enclosure shall have a rust and corrosion resistant finish.
- G. The following alarm modes will be provided by the refrigerant monitor:

1. Alarm Level One: Low level of refrigerant concentration at one of the sampling points has detected the presence of a possible refrigerant leak. The initial alarm threshold shall be set to 5 PPM (adjustable) and increased if there are nuisance alarms. This alarm level shall be displayed on the refrigerant monitor interface panel, indicating which sensor has triggered the alarm, and the associated concentration of refrigerant in PPM. This event will also send an Alarm Level One signal to the BAS through a digital output from the monitor relay. This alarm will remain active until the refrigerant concentration is reduced below set point.
2. Alarm Level Two: This alarm shall indicate that one of the sensors has detected a refrigerant concentration that is approaching dangerous levels in the area being monitored. This alarm shall be set to 25 percent below the maximum calculated refrigerant level specified in the latest editions of ANSI/ASHRAE 15 and ASHRAE 34. This alarm will be displayed on the monitor interface, and will indicate which of the sensors has caused the alarm, and the highest concentration in PPM. This event will also activate the beacon and audible alarm mounted on the refrigerant monitoring enclosure. This alarm will also be sent to the BAS through the digital output of the relay. In this mode the audible alarm can be silenced, but the beacon shall remain active until the fault is cleared
3. Alarm Level Three: This alarm shall be set at the maximum calculated refrigerant level specified in the latest editions of ANSI/ASHRAE 15 and ASHRAE 34 whichever is the lowest concentration. The refrigerant monitor interface will display which sensor has caused the alarm, and the associated concentration in PPM. This event will also activate the beacon and audible alarm mounted on the refrigerant monitoring enclosure. If the audible alarm had been silenced by an earlier alarm, the activation of this level three alarm will cause the audible alarm to be activated again. The relay in the refrigerant monitoring panel shall activate the space ventilation system, and will disable all combustion or flame-producing equipment via hardwired control interlocks. In addition, this event will de-energize the energy source for any hot surface (850 degrees F or 454 degrees C) located in the space. Interlocks must also be provided to close any normally open doors or openings to the space for proper ventilation and isolation during this alarm condition. This alarm level will also signal the BAS through the digital output through the same relay. In this mode, the audible alarm can be silenced, but the beacon shall remain active until the fault is cleared.

H. All alarm conditions shall be report to the BAS system as follows:

1. Alarm Level One: The lowest refrigerant alarm level shall detect the presence of refrigerant in low concentrations and energize a relay to signal a low level alarm to the BAS operator terminal(s). The alarm shall display an alarm message stating that there is a potential refrigerant leak in the designated area.
2. Alarm Level Two: The second refrigerant level alarm shall be a high refrigerant alarm alert. This alarm shall energize a relay to signal the BAS system indicating a high level alarm on the BAS operator terminal(s). This BAS alarm shall state that high levels of refrigerant have been detected in the designated area.
3. Fault Alarm: Reports a high level alarm to the BAS operator terminal(s) that there is a fault in the refrigerant monitoring alarm system.

2.30 NAMEPLATES

- A. Provide engraved phenolic or micarta nameplates for all equipment, components, and field devices furnished. Nameplates shall be 1/8 inch thick, black, with white center core, and shall be minimum 1 inch x 3 inch, with minimum 1/4 inch high block lettering. Nameplates for devices smaller than 1 inch x 3 inch shall be attached to adjacent surface.
- B. Each nameplate shall identify the function for each device.

2.31 TESTING EQUIPMENT

- A. Contractor shall test and calibrate all signaling circuits of all field devices to ascertain that required digital and accurate analog signals are transmitted, received, and displayed at system operator terminals, and make all repairs and recalibrations required to complete test. Contractor shall be responsible for test equipment required to perform these tests and calibrations. Test equipment used for testing and calibration of field devices shall be at least twice as accurate as respective field device (e.g., if field device is +/- 0.5 percent accurate, test equipment shall be +/- 0.25 percent accurate over same range).

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine areas and conditions under which control systems are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Owner.

3.02 INSTALLATION OF CONTROL SYSTEMS

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. General: Install systems and materials in accordance with manufacturer's instructions, roughing-in drawings and details shown on drawings. Install electrical components and use electrical products complying with requirements of the latest edition of the National Electrical Code and all local codes.
- D. Main Control Air Piping: All main air piping between the compressors and the control panels shall be copper, run per ASTM B88
- E. Branch Control Air Piping: Accessible tubing is defined as that tubing run in mechanical equipment rooms; inside mechanical equipment enclosures, such as heating and cooling units, instrument panels; across roofs, in pipe chases, etc. Inaccessible tubing is defined as that tubing run in concrete slabs; furred walls; or ceilings with no access.
 - 1. Provide copper tubing with maximum unsupported length of three (3) feet for accessible tubing run exposed to view. Terminal single-line connections less than 18 inches length may be copper tubing, or polyethylene tubing run. Tubing exposed to ambient conditions must be properly protected from sunlight and protected from damage.
 - 2. Provide copper tubing for inaccessible tubing, other than in concrete pour. In a concrete pour polyethylene tubing may be used, install in rigid conduit or vinyl-jacketed polyethylene tubing. Install in galvanized rigid steel conduit at all exterior locations. Install in PVC Schedule 40 conduit if encased in concrete.
 - 3. Polyethylene tubing may be used in control panels provided it is run in a neat and orderly fashion, bundled where applicable, properly supported and installed in a neat and workman like manner. Fasten flexible connections bridging cabinets and doors, neatly along hinge side, and protect against abrasion.
 - 4. Pressure test control air piping at 30 psi (207 kPa) for 24 hours. Test fails if more than 2 psi loss occurs.
 - 5. Number-code or color-code tubing, except local individual room control tubing, for future identification and servicing of control system. Code shall be as indicated on approved installation drawings.

- F. Control Wiring: The term "control wiring" is defined to include providing of wire, conduit and miscellaneous materials as required for mounting and connection of electric control devices.
1. Wiring System: Install complete wiring system for electric control systems. Conceal wiring except in mechanical rooms and areas where other conduit and piping are exposed. Installation of wiring shall generally follow building lines. Install in accordance with the latest edition of the National Electrical Code and Division 26. Fasten flexible conductors bridging cabinets and doors, neatly along hinge side, and protect against abrasion. Tie and support conductors neatly.
 2. Control Wiring Conductors: Install control wiring conductors, without splices between terminal points, color-coded. Install in neat workmanlike manner, securely fastened. Install in accordance with the latest edition of the National Electrical Code and Division 26.
 3. Communication wiring, signal wiring and low voltage control wiring shall be installed separate from any wiring over thirty (30) volts. Signal wiring shield shall be grounded at controller end only, unless otherwise recommended by the controller manufacturer.
 4. All WAN and LAN patch cords shall be approved and installed as approved by owner.

[Engineer shall consult with Owner prior to allowing exposed cable and including the applicable paragraphs.]

5. [Install all control wiring external to panels in electric metallic tubing or raceway. Installation of wiring shall generally follow building lines. Provide compression type connectors. Install wiring in galvanized rigid steel conduit at all exterior locations and where subjected to moisture. Install in PVC Schedule 40 conduit if encased in concrete. All conduits penetrating partitions, walls or floors shall be sealed with a submitted and approved fire/smoke sealant material to prevent migration of air through the conduit system.
6. [Communication wiring, signal wiring and low voltage control wiring may be run without conduit in concealed, accessible locations if noise immunity is ensured.
 - a. Contractor shall be fully responsible for noise immunity and rewire in conduit if electrical or RF noise affects performance.
 - b. Accessible locations are defined as areas inside mechanical equipment enclosures, such as heating and cooling units, instrument panels etc.; in accessible pipe chases with easy access, or suspended ceilings with easy access. Installation of wiring shall generally follow building lines.
 - c. Run in a neat and orderly fashion, bundled where applicable, and completely suspended (strapped to rigid elements or routed through wiring rings) away from areas of normal access. Tie and support conductors neatly with suitable nylon ties and not to exceed five (5) foot intervals.
 - d. Conductors shall not be supported by the ceiling system or ceiling support system. Conductors shall be pulled tight and be installed as high as practically possible in ceiling cavities. Wiring shall not be laid on the ceiling or duct.
 - e. Conductors shall not be installed between the top cord of a joist or beam and the bottom of roof decking.]
7. Secondary LAN Communication cabling shall be provided in an Owner approved color dedicated to the BAS.
8. Number-code or color-code conductors appropriately for future identification and servicing of control system. Code shall be as indicated on approved installation drawings.

- G. Control Valves: Install so that actuators, wiring, and tubing connections are accessible for maintenance. Where possible, install with valve stem axis vertical, with operator side up. Where vertical stem position is not possible or would result in poor access, valves may be installed with stem horizontal. Do not install valves with stem below horizontal, or down.
- H. Averaging Temperature Sensors: Cover no more than two square feet per linear foot of sensor length except where indicated. Generally, where flow is sufficiently homogeneous/adequately mixed at sensing location, consult Engineer for requirements.

[Engineer must specifically show locations of all flow measuring stations and flow meters and design the straight length of duct of pipe required for accurate sensors. This length must be specifically shown on the drawing and be adequate for the installation.]

- I. Airflow Measuring Stations: Install per manufacturer's recommendations in an unobstructed straight length of duct (except those installations specifically designed for installation in fan inlet). For installations in fan inlets, provide on both inlets of double inlet fans and provide inlet cone adapter as recommended by AFM station manufacturer.

[Engineer must specifically show locations of all flow measuring stations and flow meters and design the straight length of duct of pipe required for accurate sensors. This length must be specifically shown on the drawing and be adequate for the installation.]

- J. Fluid Flow Sensors: Install per manufacturer's recommendations in an unobstructed straight length of pipe.
- K. Relative Humidity Sensors: Provide element guard as recommended by manufacturer for high velocity installations. For high limit sensors, position remote enough to allow full moisture absorption into the air stream before reaching the sensor.
- L. Water Differential Pressure Transmitters: Provide valve bypass arrangement to protect against over pressure damaging the transmitter.
- M. Steam Differential Pressure Transmitters: Install as shown on the Drawings per manufacturer's instructions.
- N. Pipe Surface Mount Temperature Sensors: Install with thermally conductive paste at pipe contact point. Where sensor is to be installed on an insulated pipe Contractor shall neatly cut insulation install sensor, repair or replace insulation and vapor barrier and adequately seal vapor barrier.
- O. Flow Switches: Where possible, install in a straight run of pipe at least 15 diameters in length to minimize false indications.
- P. Current Switches for Motor Status Monitoring: Adjust so that setpoint is below minimum operating current and above motor no load current.
- Q. Supply Duct Pressure Transmitters:
 - 1. General: Install pressure tips with at least four (4) 'round equivalent' duct diameters of straight duct with no takeoffs upstream. Install static pressure tips securely fastened with tip facing upstream in accordance with manufacturer's installation instructions. Locate the transmitter at an accessible location to facilitate calibration.
 - 2. VAV System 'Down-Duct' Transmitters: Locate pressure tips approximately 2/3 of the hydraulic distance to the most remote terminal in the air system.
- R. Cutting and Patching Insulation: Repair insulation to maintain integrity of insulation and vapor barrier jacket. Use hydraulic insulating cement to fill voids and finish with material matching or compatible with adjacent jacket material.

3.03 REFRIGERANT MONITOR INSTALLATION

- A. Install in accordance with the manufacturer's instructions. Place sensing tips in locations to maximize effectiveness.
- B. Hard wire interlocks to the emergency ventilation and shutdown of combustion devices.

[For Critical Service Control Valve applications, Engineer shall complete the applicable following forms for each individual application and/or valve. Control valve sizing and selection is the initial responsibility of the Engineer and NOT left to the BAS Provider. The items noted with a * and *,** shall be completed by the Engineer to list the requirements of the valves for Cv, close off, temperature ratings, cage material, seat material, trim material etc. for each individual application. This should be a result of analyzing the valves performance and application across the range of control. Engineer shall consult with Owner prior to specifying these valves.]

END OF SECTION 25 55 00 00B11 00

SECTION 25 55 00 00C - BAS BASIC MATERIALS, INTERFACE DEVICES, AND SENSORS (RETROFIT)**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them. Building automation system requirements may be specified, but not limited to, the following Sections when applicable:
 - 1. Packaged engine generator system.
 - 2. Fuel oil piping system.
 - 3. Hot water boilers.
 - 4. Computer room air conditioning units.
 - 5. Automatic transfer switch.

1.02 SUMMARY

- A. Section Includes:
 - 1. Wiring.
 - 2. Control Valves and Actuators.
 - 3. Control Dampers and Actuators.
 - 4. Control Panels.
 - 5. Sensors.
 - 6. Electric Control Components (Switches, EP Valves, Thermostats, Relays, etc.).
 - 7. Transducers.
 - 8. Current Switches.
 - 9. Nameplates.
 - 10. Testing Equipment.
- B. Refer to Section 25 00 10 for general requirements.
- C. Refer to other Division 20 and Division 23 Sections for installation of instrument wells, valve bodies, and dampers in mechanical systems; not Work of this Section.
- D. Provide the following electrical Work as Work of this Section, complying with requirements of Division 26 sections:
 - 1. Control wiring between field-installed controls, indicating devices, and unit control panels.

2. Interlock wiring between electrically interlocked devices, sensors, and between a hand or auto position of motor starters as indicated for all mechanical and controls.
3. Wiring associated with annunciator and alarm panels (remote alarm panels) and connections to their associated field devices.
4. All other necessary wiring for fully complete and functional control system as specified.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within all references.

1.04 WORK BY OTHERS

- A. Control Valves furnished under this Section shall be installed under the applicable piping Section under the direction of the BAS Provider who will be fully responsible for the proper operation of the valve.
- B. Control Dampers furnished under this Section shall be installed under the applicable air distribution or air handling equipment Section under the direction of the BAS Provider who will be fully responsible for the proper operation of the damper.
- C. Water Pressure Taps, Thermal Wells, Flow Switches, Flow Meters, etc. that will have wet surfaces, shall be installed under the applicable piping Section under the direction of the BAS Provider who will be fully responsible for the proper installation and application.
- D. Variable Frequency Drives furnished under section 23 05 13 shall be provided with serial communication protocol information specific to the selected BAS Provider. BAS Provider shall be fully responsible to interface and make available VFD information in the building automation system as monitor only information. Control of the VFD shall meet controller standalone requirements of Section 25.
- E. Controlled Equipment Power Wiring shall be furnished and installed under Division 26. Where control involves 120 volt (V) control devices controlling 120V equipment, Division 26 Contractor shall extend power wiring to the equipment. BAS Provider shall extend it from the equipment to the control device.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MATERIALS AND EQUIPMENT

- A. General: Provide electronic and electric control products in sizes and capacities indicated, consisting of valves, dampers, controllers, sensors, and other components as required for complete installation. Except as otherwise indicated, provide manufacturer's standard materials and components as published in their product information; designed and constructed as recommended by manufacturer, and as required for application indicated.
- B. Communication Wiring: All wiring shall be in accordance with the latest edition of the National Electrical Code and Division 26. Communication wiring shall be provided in a customized color jacketing material. Material color shall be as submitted and approved by MDACC Monitoring Services and MDACC Communications and Computer Services. In addition all wiring jackets shall be labeled "BAS" in three (3) foot or fewer intervals along the length of the jacket material.
 - 1. Contractor shall supply all communication wiring between Building Controllers, Routers, Gateways, AAC's, ASC's and local and remote peripherals outside the MDACC IT infrastructure. (e.g., operator workstations, printers, and modems).
 - 2. Local Supervisory LAN: For any portions of this network required under this Section of the Specification, Contractor shall comply with Design Guidelines Element Z IS Network Services & Telecommunication Premises Distribution System Standards. Network shall be run with no splices and separate from any wiring over thirty (30) volts.
 - 3. Secondary Controller LANs: Communication wiring shall be individually 100 percent shielded pairs per manufacturer's recommendations for distances installed, with overall PVC cover, Class 2, plenum-rated run with no splices and separate from any wiring over thirty (30) volts. Shield shall be terminated and wiring shall be grounded as recommended by building controller manufacturer.
- C. Signal Wiring: Contractor shall run all signal wiring in accordance with the latest edition of the National Electrical Code and Division 26.
 - 1. Signal wiring to all field devices, including, but not limited to, all sensors, transducers, transmitters, switches, etc. shall be twisted, 100 percent shielded pair, minimum 18-gage wire, with PVC cover. Signal wiring shall be run with no splices and separate from any wiring above thirty (30) volts.
 - 2. Signal wiring shield shall be grounded at controller end only unless otherwise recommended by the controller manufacturer.
- D. Low Voltage Analog Output Wiring: Contractor shall run all low voltage control wiring in accordance with the latest edition of the National Electrical Code and Division 26.
 - 1. Low voltage control wiring shall be minimum 18-gage, twisted pair, 100 percent shielded, with PVC cover, Class 2 plenum-rated. Low voltage control wiring shall be run with no splices separate from any wiring above thirty (30) volts.
- E. Control Panels: Provide control panels with suitable brackets for wall mounting, unless noted otherwise, for each control system. Locate panel adjacent to systems served. Mount center of control panels [60 inches – confirm with Owner] above finished floor or roof.
 - 1. Interior: Fabricate panels of 16-gage furniture-grade steel, totally enclosed on four sides, with removable perforated backplane, hinged door and keyed lock, with manufacturer's standard shop-painted finish and color.

2. Exterior: 16-gage 304 or 316 stainless steel NEMA 4X enclosure. Panel shall have hinged door, keyed lock, and integral, thermostatically controlled heater. Provide hinged deadfront inside panel when flush-mounted control and/or indicating devices are included in panel. Fiberglass or aluminum, as applicable, to be used when gases that are being used in the panel area are corrosive to stainless steel.
3. Provide UL-listed cabinets for use with line voltage devices.
4. Control panel shall be completely factory wired and piped, and all electrical connections made to a terminal strip.
5. All gauges and control components shall be identified by means of nameplates.
6. Provide a 6 inch x 6 inch minimum wireway (metal wiring/tubing) trough across the entire width of the panel mounted to the top of the panel with close nipples of sufficient size for additional 50 percent wiring and tubing capacity. Wireways shall not be less than 24 inches in length. Control panel wiring shall be installed and distributed in the wireway to minimize routing of wiring and tubing within the control panel. Wireway construction to be the same as the associated control panel.
7. Complete wiring and tubing termination Drawings shall be mounted in, and a second set mounted adjacent to, each panel in a frame with lexan cover of sufficient size to be easily readable.

2.03 CONTROL VALVES

A. General:

1. Provide factory fabricated control valves of type, body material and pressure class indicated on the 'Control Valve Specification Sheet' located at the end of this Section. Contractor shall utilize the sheet to submit the control valves for the Project.
2. Valves shall be as manufactured by Siemens, Fisher Controls International, Valtek Control Products, DeZurik/Copes-Vulcan, Keystone, Leslie Controls Inc., or equal.
3. Where type or body material is not indicated, provide selection as determined by manufacturer for installation requirements and pressure class, based on maximum pressure and temperature in piping system.
4. Provide valve size in accordance with scheduled or specified maximum pressure drop across control valve.
5. Control valves shall be equipped with heavy-duty actuators and pilot positioners with proper close-off rating and capability for each individual application.
6. Minimum close-off rating shall be as scheduled and adequate for each application, and shall generally be considered at dead head rating of the pump.

2.04 CONTROL DAMPERS

- A. General: Provide factory fabricated automatic control dampers of sizes, velocity and pressure classes as required for smooth, stable, and controllable airflow. Provide parallel or opposed blade dampers as recommended by manufacturer's sizing techniques. For dampers located near fan outlets, provide dampers rated for fan outlet velocity and close-off pressure, and recommended by damper manufacturer for fan discharge damper service. Control dampers used for smoke dampers shall comply with UL 555S. Control Dampers used for fire dampers shall comply with UL 555.

- B. For general isolation and modulating control service in rectangular ducts at velocities not greater than 1500 feet per minute (fpm) (7.62 m/s), differential pressure not greater than 2.5 inches w.c. (622 Pa):
1. Performance: Test in accordance with AMCA 500.
 2. Frames: Galvanized steel, 16-gage minimum thickness, welded or riveted with corner reinforcement.
 3. Blades: Stainless steel in lab exhausts and galvanized steel elsewhere, maximum blade size 8 inches (200 mm) wide by 48 inches (1219 mm) long, attached to minimum 1/2 inch (12.7 mm) shafts with set screws, 16 gage minimum thickness.
 4. Blade Seals: Synthetic elastomer, mechanically attached, field replaceable.
 5. Jamb Seals: Stainless steel.
 6. Shaft Bearings: Oil impregnated sintered bronze, graphite impregnated nylon sleeve or other molded synthetic sleeve, with thrust washers at bearings.
 7. Linkage: Concealed in frame.
 8. Linkage Bearings: Oil impregnated sintered bronze or graphite impregnated nylon.
 9. Leakage: Less than one percent based on approach velocity of 1500 fpm. (7.62 m/s) and 1 inches wg. (249Pa).
 10. Maximum Pressure Differential: 2.5 inches wg. (622 Pa).
 11. Temperature Limits: -40 to 200 degrees F (-40 to 93 degrees C).
 12. Where opening size is larger than 48 inches (1219 mm) wide or 72 inches (1829 mm) high, provide dampers in multiple sections, with intermediate frames and jackshafts appropriate for installation.
- C. For general isolation and modulating control service in rectangular ducts at velocities not greater than 4000 fpm (20.3 m/s), differential pressure not greater than 6 inches w.c. (1493 Pa):
1. Performance: Test in accordance with AMCA 500.
 2. Frames: Galvanized steel, 16-gage minimum thickness, welded or riveted with corner reinforcement.
 3. Blades: Extruded aluminum hollow airfoil shape, maximum blade size 8 inches (200 mm) wide by 48 inches (1219 mm) long, attached to minimum 1/2 inch (12.7 mm) shafts, 14 gage minimum extrusion thickness.
 4. Blade Seals: Synthetic elastomeric, mechanically attached, field replaceable.
 5. Jamb Seals: Stainless steel.
 6. Shaft Bearings: Oil impregnated sintered bronze sleeve, graphite impregnated nylon sleeve, molded synthetic sleeve, or stainless steel sleeve, with thrust washers at bearings.
 7. Linkage: Concealed in frame.
 8. Linkage Bearings: Oil impregnated sintered bronze or graphite impregnated nylon.
 9. Leakage: Less than 0.1 percent based on approach velocity of 4000 fpm. (20.3 m/s) and 1 inches wg. (249Pa).

10. Maximum Pressure Differential: 6 inches wg. (622 Pa).
 11. Temperature Limits: -40 to 200 degrees F (-40 to 93 degrees C).
 12. Where opening size is larger than 48 inches (1219 mm) wide or 72 inches (1829 mm) high, provide dampers in multiple sections, with intermediate frames and jackshafts appropriate for the installation.
- D. For general isolation and modulating control service in rectangular ducts at velocities not greater than 4000 fpm, differential pressure not greater than 12 inches w.c.:
1. Performance: Test in accordance with AMCA 500.
 2. Frames: Galvanized steel, 12-gage minimum thickness, welded or riveted with corner reinforcement.
 3. Blades: Extruded aluminum hollow airfoil shape, maximum blade size 8 inches (200 mm) wide by 48 inches (1219 mm) long, attached to minimum 3/4 inch (19 mm) shafts with set screws.
 4. Shaft Bearings: Oil impregnated sintered bronze or stainless steel, pressed into frame, with thrust washers at bearings.
 5. Linkage: 10-gage minimum thickness galvanized steel clevis type crank arms, 3/16 inch x 3/4 inch (4.76 mm x 19 mm) minimum thickness tie rods.
 6. Linkage Bearings: Oil impregnated sintered bronze or graphite impregnated nylon.
 7. Leakage: Less than 0.2 percent based on approach velocity of 4000 fpm (20.3 m/s) and 1 inches wg. (249Pa) differential pressure.
 8. Maximum Pressure Differential: 12 inches wg. (2984 Pa).
 9. Temperature Limits: -40 to 300 degrees F (-40 to 149 degrees C).
 10. Where opening size is larger than 48 inches (1219 mm) wide or 72 inches (1829 mm) high, provide dampers in multiple sections, with intermediate frames and jackshafts appropriate for the installation.
- E. For general isolation and modulating control service in round ducts up to 40 inches in size at velocities not greater than 2500 fpm (12.7 m/s), differential pressure not greater than 4 inches w.c. (994 Pa):
1. Performance: Test in accordance with AMCA 500.
 2. Frames: Rolled 12 gage steel strip for sizes 6 inch and smaller, rolled 14 gage steel channel for larger sizes, galvanized or aluminum finish.
 3. Blades: Steel construction, 12 gage minimum thickness for dampers less than 18 inches (457 mm) in size, 10 gage minimum thickness for larger dampers.
 4. Blade Seals: Full circumference neoprene.
 5. Shaft: 1/2 inch (12.7 mm) diameter zinc or cadmium plated steel.
 6. Shaft Bearings: Oil impregnated sintered bronze or stainless steel, pressed into frame, with thrust washers at bearings.
 7. Leakage: Less than 0.2 percent based on approach velocity of 4000 fpm. (20.3 m/s) and 1 inches wg. (249Pa) differential pressure.

8. Maximum Pressure Differential: 4 inches wg. (994 Pa).
9. Temperature Limits: -40 to 300 degrees F (-40 to 149 degrees C).
- F. For general isolation and modulating control service in round ducts up to 60 inches in size at velocities not greater than 4000 fpm (20.3 m/s), differential pressure not greater than 6 inches w.c. (1492 Pa):
 1. Performance: Test in accordance with AMCA 500.
 2. Frames: Rolled 10-gage steel channel for sizes 48 inch and smaller, rolled 3/16 inch (4.76 mm) thick steel channel for larger sizes, galvanized or aluminum finish.
 3. Blades: Steel construction, 10-gage minimum thickness for dampers not greater than 48 inches in size, 1/4 inch (6.35 mm) minimum thickness for larger dampers.
 4. Blade stops: 1/2 inch x 1/4 inch (12.7 mm x 6.35 mm) full circumference steel bar.
 5. Blade Seals: Full circumference neoprene.
 6. Shaft: Zinc or cadmium plated steel, angle reinforcing as necessary.
 7. Shaft Bearings: Oil impregnated sintered bronze or stainless steel, pressed into frame, with thrust washers at bearings.
 8. Leakage: Less than 0.4 percent based on approach velocity of 4000 fpm (20.3 m/s) and 1 inches wg. (249Pa) differential pressure.
 9. Maximum Pressure Differential: 6 inches wg. (1492 Pa).
 10. Temperature Limits: -40 to 250 degrees F (-40 to 121 degrees C).

2.05 ACTUATORS

- A. General: Size actuators and linkages to operate their appropriate dampers or valves with sufficient reserve torque or force to provide smooth modulating action or 2-position action as specified. Select spring-return actuators with manual override to provide positive shut-off of devices as they are applied.
- B. Actuators:
 1. Ambient Operating Temperature Limits: -10 to 150 degrees F (-12.2 to 66 degrees C).
 2. Two Position Electric Actuators: Line voltage (120 volt, 24 volt) with spring return. Provide end switches as required.
 3. Modulating Electronic Actuators: Provide actuators with spring return for 0-5 Vdc, 0-10 Vdc, 2-10Vdc, and 4-20 mA on valves greater than 1 inch. 3-point floating actuators for terminal units are to fail in place unless specified otherwise. Actuators shall travel full stroke in less than 150 seconds. Actuators shall be designed for a minimum of 60,000 full cycles at full torque and be UL 873 listed. Provide stroke indicator. Actuators shall have positive positioning circuit where indicated. [Parallel actuators on a single valve are allowed only if written approval is given by Owner]. Actuators shall have current limiting motor protection. Actuators shall have manual override on valves 1 inch and larger. Modulating actuators for valves shall have minimum rangeability of 40 to 1.

- a. Close-Off Pressure: Provide the minimum torque required, and spring return for fail positioning (unless otherwise specifically indicated) sized for required close-off pressure. Required close-off pressure for two-way water valve applications shall be the shutoff head of associated pump. Required close-off rating of steam valve applications shall be design inlet steam pressure plus 50 percent for low pressure steam, and 10 percent for high pressure steam. Required close-off rating of air damper applications shall be shutoff pressure of associated fan, plus 10 percent.
- b. Subject to compliance with requirements, approved manufacturers are as follows:
 - 1) Siemens.
 - 2) Automated Logic.
 - 3) Belimo.
 - 4) Johnson Controls.
 - 5) Delta.
 - 6) Substitutions: By written approval from Owner.

2.06 GENERAL FIELD DEVICES

- A. Provide field devices for input and output of digital (binary) and analog signals into controllers (BCs, AACs, ASCs). Provide signal conditioning for all field devices as recommended by field device manufacturers and as required for proper operation in the system.
- B. It shall be the Contractor's responsibility to assure that all field devices are compatible with controller hardware and software.
- C. Field devices specified herein are generally 'two-wire' type transmitters, with power for the device to be supplied from the respective controller. If the controller provided is not equipped to provide this power, is not designed to work with 'two-wire' type transmitters, if field device is to serve as input to more than one controller, or where the length of wire to the controller will unacceptably affect the accuracy, the Contractor shall provide 'four-wire' type equal transmitter and necessary regulated DC power supply or 120 VAC power supply, as required.
- D. For field devices specified hereinafter that require signal conditioners, signal boosters, signal repeaters, or other devices for proper interface to controllers, Contractor shall furnish and install proper device, including 120V power as required. Such devices shall have accuracy and repeatability equal to, or better than, the accuracy and repeatability listed for respective field devices.
- E. Accuracy: As stated in this Section, accuracy shall include combined effects of nonlinearity, nonrepeatability and hysteresis.

2.07 VFD SERIAL COMMUNICATION

- A. VFD Serial communications shall include, but not be limited to monitor the following feedback signals:
 1. Process variable.
 2. Output speed/frequency.
 3. Current
 4. Torque

5. Power (kW)
6. Operating hours
7. Kilowatt hours (kWh)
8. Relay outputs
9. Diagnostic warning and fault information

2.08 TEMPERATURE SENSORS (TS)

- A. Sensor range: When matched with A/D converter of BC, AAC/ASC, or SD, sensor range shall provide a resolution of no worse than 0.8 degrees F (unless noted otherwise). Where thermistors are used, the stability shall be better than 0.25 degrees F over five (5) years.
- B. Room Temperature Sensor: Shall be an element contained within a ventilated cover, suitable for wall mounting, unless noted otherwise. Provide insulated base. Sensor color and type shall match surrounding existing sensor when applicable. Following sensing elements are acceptable:
 1. Sensing element shall be platinum RTD, thermistor, or integrated circuit, ± 0.6 degrees F accuracy at calibration point.
 2. Provide setpoint adjustment where indicated. The setpoint adjustment shall be a warmer/cooler indication that shall be scalable via the BAS.
 3. Provide an occupancy override button on the room sensor enclosure where indicated. This shall be a momentary contact closure.
 4. Provide current temperature indication via an LCD or LED readout, where indicated.
- C. Single-Point Duct Temperature Sensor: Application allowed on supply air volumes of 2000 CFM or less and non-critical return air readings. Shall consist of sensing element, junction box for wiring connections and gasket to prevent air leakage or vibration noise. Temperature range as required for resolution indicated.
 1. Sensing element shall be 100 Ohm platinum RTD which transmits a 4 to 20 mA output signal. The accuracy of this sensor shall be ± 0.7 degrees F. This type of sensor does not require field calibration and shall be replaced if tolerance of ± 1.4 degrees F is exceeded.
- D. Averaging Duct Temperature Sensor: Shall consist of an averaging element, junction box for wiring connections and gasket to prevent air leakage. Provide sensor lengths and quantities to result in one lineal foot of sensing element for each three square feet of cooling coil/duct face area. Temperature range as required for resolution indicated.
 1. Sensing element shall be 100 Ohm platinum RTD which transmits a 4 to 20 mA output signal. The accuracy of this sensor shall be ± 0.7 degrees F. This type of sensor does not require field calibration and shall be replaced if tolerance of ± 1.4 degrees F is exceeded.
- E. Liquid immersion temperature sensor shall include brass thermowell, sensor and connection head for wiring connections. Temperature range shall be as required to fit the application
 1. (Scale 20 – 70 degrees F) Sensing element shall be 100 Ohm platinum RTD which transmits a 4 to 20 mA output signal. The accuracy of this sensor shall be ± 0.6 degrees F. This type of sensor does not require field calibration and shall be replaced if tolerance of ± 1.2 degrees F is exceeded.

2. (Scale 30 – 250 degrees F) Sensing element shall be 100 Ohm platinum RTD which transmits a 4 to 20 mA output signal. The accuracy of this sensor shall be ± 0.7 degrees F. This type of sensor does not require field calibration and shall be replaced if tolerance of ± 1.4 degrees F is exceeded.
- F. Pipe Surface-Mount Temperature Sensor: Shall be used only where indicated or by written approval by Owner. Sensor shall include metal junction box and clamps and shall be suitable for sensing pipe surface temperature and installation under insulation. Provide thermally conductive paste at pipe contact point.
1. Sensing element shall be 100 Ohm platinum RTD which transmits a 4 to 20 mA output signal. The accuracy of this sensor shall be ± 1.1 degrees F on a range of 30 - 250 degrees F scale. This type of sensor does not require field calibration and shall be replaced if tolerance of ± 1.5 degrees F is exceeded.
- G. Outside air sensors shall consist of a sensor, sun shield, utility box, and watertight gasket to prevent water seepage.
1. Sensing element shall be 100 Ohm platinum RTD which transmits a 4 to 20 mA output signal. The accuracy of this sensor shall be ± 0.6 degrees F. This type of sensor does not require field calibration and shall be replaced if tolerance of ± 1.2 degrees F is exceeded.

2.09 HUMIDITY TRANSMITTERS

- A. Units shall be suitable for their application. Unit shall be two-wire transmitter utilizing bulk polymer resistance change or thin film capacitance change humidity sensor. Unit shall produce linear continuous output of 4-20 mA for percent relative humidity (% RH). A combination temperature and humidity sensor may be used for zone level monitoring. Sensors shall have the following minimum performance and application criteria:
1. Input Range: 0 to 100% RH.
 2. Accuracy (% RH): ± 2 percent between 20-90% RH at 77 degrees F, including hysteresis, linearity, and repeatability.
 3. Sensor Operating Range: As required by application.
 4. Long Term Stability: Less than 1 percent drift per year.
- B. Acceptable Manufacturers: Units shall be Siemens, Vaisala HM Series, General Eastern, Microline, or Hy-Cal HT Series.

2.10 DIFFERENTIAL PRESSURE TRANSMITTERS (DP)

- A. Liquid, Steam and Gas:
1. General: Two-wire smart DP cell type transmitter, 4-20 mA linear output, adjustable span and zero, stainless steel wetted parts.
 2. Ambient Limits: 0 to 175 degrees F.
 3. Process Limits: 0 to 175 degrees F.
 4. Accuracy: Less than 0.3 percent.
 5. Output Damping: Time constant user selectable from 0 to 36 seconds.

6. Vibration Effect: Less than ± 0.1 percent of upper range limit from 15 to 2000 Hz in any axis relative to pipe mounted process conditions.
 7. Electrical Enclosure: NEMA 4, 4X, 7, 9.
 8. Approvals: FM, CSA.
 9. Acceptable Manufacturers: Setra, Rosemount Inc. 3051 Series, Foxboro, Johnson-Yokagawa.
- B. General Purpose Low Pressure Air: Generally for each measurement of duct pressure, filter differential pressure or constant volume air velocity pressure measurement where the range is applicable. Sensor shall be in range at all times.
1. General: Loop powered two-wire differential capacitance cell-type transmitter.
 2. Output: Two wire 4-20 mA output with zero adjustment.
 3. Overall Accuracy: Plus or minus 1 percent.
 4. Minimum Range: 0.1 inches w.c.
 5. Maximum Range: 10 inches w.c.
 6. Housing: Polymer housing suitable for surface mounting.
 7. Acceptable Manufacturers: Units shall be Setra,
 8. Static Sensing Element: Pitot-type static pressure sensing tips similar to Dwyer model A-301 and connecting tubing.
 9. Magnehelic Gauges: Provide Dwyer Series 200 Magnehelic Differential Pressure Gauge (or equal) for each DP transmitter for filter differential pressure. Provide gauge, mounting bracket, $\frac{1}{4}$ inch aluminum tubing, static pressure tips, and molded plastic vent valves for each gauge connection. Select range for specified recommended filter loading pressure drop to be 75 percent full-scale. For other DP transmitters select range for specified setpoint to be between 25 percent and 75 percent full-scale.

2.11 VALVE BYPASS FOR DIFFERENTIAL PRESSURE SENSORS

- A. Provide a five valve bypass kit for protection of DP sensors where the static on the pipe can cause on over pressure when connected to one port with the other at atmospheric pressure. Kit shall include high and low pressure isolation valves, high and low pressure vent valves, calibration taps, and a bypass valve contained in a NEMA 1 enclosure.

2.12 DIFFERENTIAL PRESSURE SWITCHES (DPS)

- A. General Service Auto Reset - Air: Diaphragm with adjustable setpoint and differential and snap acting form C contacts rated for the application. Provide manufacturer's recommended static pressure sensing tips and connecting tubing. Acceptable Manufacturer - Dwyer Series 1900 or approved equal.
- B. General Service Manual Reset - Air: Diaphragm with adjustable setpoint and differential and snap acting form C contacts rated for the application. Provide manufacturer's recommended static pressure sensing tips and connecting tubing. Acceptable Manufacturer - Dwyer Series 1900 or approved equal.
- C. General Service - Water: Diaphragm with adjustable setpoint, 2 psig or adjustable differential and snap-acting Form C contacts rated for the application. 60 psid minimum pressure differential range and 0 degrees F to 160 degrees F operating temperature range.

2.13 PRESSURE SWITCHES (PS)

- A. Diaphragm or bourdon tube with adjustable setpoint and differential and snap-acting Form C contacts rated for the application. Pressure switches shall be capable of withstanding 150 percent of rated pressure.
- B. Acceptable Manufacturers: Siemens, Square D, ITT Neo-Dyn, ASCO, Penn, Honeywell, and Johnson Controls.

2.14 CURRENT SWITCHES (CS)

- A. Clamp-On Design Current Operated Switch (for Motor Status Indication):
 - 1. Range: 3.5 to 135 amps.
 - 2. Trip Point: Adjustable.
 - 3. Switch: Solid state, normally open, 0.1A @ 30VAC/DC.
 - 4. Trip Indication: LED.
 - 5. Approvals: UL, CSA.
 - 6. Maximum Cable Size: 350 MCM.
 - 7. Manufacturers: Veris Industries H-608, H-904, H-908.
 - a. Veris Model Number H-608 restricted to constant speed motors rated 40 horsepower or less.
 - b. Veris Model Number H-904 required on VFD motors.
- B. Variable Speed Status: Contractor shall utilize programmable status contacts from the VSD where applicable.

2.15 CURRENT TRANSFORMERS (CT)

- A. Clamp-On Design Current Transformer (for Motor Current Sensing)
 - 1. Range: 1-10 amps minimum, 20-200 amps maximum.
 - 2. Trip Point: Adjustable.
 - 3. Output: 0-5 VDC.
 - 4. Accuracy: ± 0.2 percent from 20 to 100 Hz.
 - 5. Acceptable Manufacturers: KELE SA100.

[Engineer must refer to the BAS Master Specification Section 25 11 10 for the following applications if needed:

Airflow Measuring Stations (AFMS)

Ultrasonic Flow Meter for Water Service

Ultrasonic Flow Meter for Steam Service

Insertion Type Turbine Meter for Water Service

Vortex Shedding Flow Meter for Liquid, Steam and Gas Service

Magnetic Flow Meter for Water Service***Venturi Flow Meter for Water Service******Refrigerant Monitor]*****2.16 CO₂ SENSORS/TRANSMITTERS (CO₂)**

- A. General: CO₂ sensors shall use silicon based, diffusion aspirated, infrared single beam, dual-wavelength sensor.
- B. Accuracy: ± 100 ppm.
- C. Stability: 5 percent over 5 years.
- D. Output: 4-20 mA, 0-10 Vdc or relay.
- E. Mounting: Duct or Wall as indicated.
- F. Acceptable Manufacturer: Vaisala, Inc. GMD20 (duct) or GMW20 (wall).

2.17 ELECTRIC CONTROL COMPONENTS

- A. Limit Switches (LS): Limit switches shall be UL listed, SPDT or DPDT type, with adjustable trim arm. Limit switches shall be as manufactured by Square D, Allen Bradley.
- B. Low Temperature Detector ('Freezestat') (FZ): Low temperature detector shall consist of a 'cold spot' element which responds only to the lowest temperature along any one foot of entire element, minimum bulb size of 1/8 inch x 20 feet (3.2mm x 6.1m), junction box for wiring connections and gasket to prevent air leakage or vibration noise, DPDT (4 wire, 2 circuit) with manual reset. Temperature range 15 to 55 degrees F (-9.4 to 12.8 degrees C), factory set at 38 degrees F.
- C. High Temperature Detectors ('Firestat') (FS): High temperature detector shall consist of 3-pole contacts, a single point sensor, junction box for wiring connections and gasket to prevent air leakage of vibration noise, triple-pole, with manual reset. Temperature range 25 to 215 degrees F (-4 to 102 degrees C).
- D. Surface-Mounted Thermostat: Surface-mounted thermostat shall consist of SPDT contacts, operating temperature range of 50 to 150 degrees F (10 to 65 degrees C), and a minimum 10 degrees F fixed setpoint differential.
- E. Low Voltage Wall Thermostat: Wall-mounted thermostat shall consist of SPDT sealed contacts, operating temperature range of 50 to 90 degrees F (10 to 32 degrees C), switch rating of 24 Vac (30 Vac maximum), and both manual and automatic fan operation in both the heat and cool modes.
- F. Control Relays: All control relays shall be UL listed, with contacts rated for the application.
 - 1. Control relays for use on electrical systems of 120 volts or less shall have, as a minimum, the following:
 - a. Pilot light indication of power-to-coil.
 - b. Coil rated for 50 and 60 Hz service.
 - c. Acceptable Manufacturers: Relays shall be Functional Devices (RIB), Potter Brumfield, Model KRPA or approved equal.

2. Relays used for across-the-line control (start/stop) of 120V motors, 1/4 horsepower, and 1/3 horsepower, shall be rated to break minimum 10 Amps inductive load. Relays shall be IDEC or approved equal.
 3. Relays used for stop/start control shall have low voltage coils (30 VAC or less), and shall be provided with transient and surge suppression devices at the controller interface.
 4. All safety circuits shall be installed to operate individual interposing relays located in the associated equipment control panel. Each safety device (i.e. freezestat, DP safety, smoke detector, firestat, etc.) wiring circuit shall be installed with individual homeruns back to the associated control panel. See control Drawings for details.
- G. General Purpose Power Contactors: NEMA ICS 2, AC general-purpose magnetic contactor. ANSI/NEMA ICS 6, NEMA 1 enclosure. Manufacturer shall be Square 'D', Cutler-Hammer or Westinghouse.
- H. Control Transformers: Furnish and install control transformers as required. Control transformers shall be machine tool type, and shall be US and CSA listed. 120/24 VAC transformers shall be fused in accordance with the NEC. Transformer shall be properly sized for application, and mounted in minimum NEMA 1 enclosure.
1. Transformers shall be manufactured by Westinghouse, Square 'D', Jefferson or approved equal.
- I. Time Delay Relays (TDR): TDRs shall be capable of on or off delayed functions, with adjustable timing periods, and cycle timing light. Contacts shall be rated for the application with a minimum of two (2) sets of Form C contacts, enclosed in a NEMA 1 enclosure.
1. TDRs shall have silver cadmium contacts with a minimum life span rating of one million operations. TDRs shall have solid state, plug-in type coils with transient suppression devices.
 2. TDRs shall be UL and CSA listed, Crouzet type.
- J. Electric Push Button Switch: Switch shall be momentary contact, oil tight, push button, with number of N.O. and/or N.C. contacts as required. Contacts shall be snap-action type, and rated for minimum 120 Vac operation. Switch shall be 800T type, as manufactured by Allen Bradley or approved equal.
- K. Pilot Light: Panel-mounted pilot light shall be NEMA ICS 2 oil tight, transformer type, with screw terminals, push-to-test unit, LED type, rated for 120 VAC. Unit shall be 800T type, as manufactured by Allen-Bradley or approved equal.
- L. Alarm Horn: Panel-mounted audible alarm horn shall be continuous tone, 120 Vac Sonalert solid-state electronic signal, as manufactured by Mallory or approved equal.
- M. Electric Selector Switch (SS): Switch shall be maintained contact, NEMA ICS 2, oil-tight selector switch with contact arrangement, as required. Contacts shall be rated for minimum 120 Vac operation. Switch shall be 800T type, as manufactured by Allen-Bradley or approved equal.

2.18 NAMEPLATES

- A. Provide engraved phenolic or micarta nameplates for all equipment, components, and field devices furnished. Nameplates shall be 1/8 inch thick, black, with white center core, and shall be minimum 1 inch x 3 inch, with minimum 1/4 inch high block lettering. Nameplates for devices smaller than 1 inch x 3 inch shall be attached to adjacent surface.
- B. Each nameplate shall identify the function for each device.

2.19 TESTING EQUIPMENT

- A. Contractor shall test and calibrate all signaling circuits of all field devices to ascertain that required digital and accurate analog signals are transmitted, received, and displayed at system operator terminals, and make all repairs and recalibrations required to complete test. Contractor shall be responsible for test equipment required to perform these tests and calibrations. Test equipment used for testing and calibration of field devices shall be at least twice as accurate as respective field device (e.g., if field device is ± 0.5 percent accurate, test equipment shall be ± 0.25 percent accurate over same range).

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. General: Install systems and materials in accordance with manufacturer's instructions, roughing-in Drawings and details shown on Drawings. Install electrical components and use electrical products complying with requirements of the latest edition of the National Electrical Code and all local codes.
- D. Control Wiring: The term "control wiring" is defined to include providing of wire, conduit and miscellaneous materials as required for mounting and connection of electric control devices.
 - 1. Wiring System: Install complete wiring system for electric control systems. Conceal wiring except in mechanical rooms and areas where other conduit and piping are exposed. Installation of wiring shall generally follow building lines. Install in accordance with the latest edition of the National Electrical Code and Division 26. Fasten flexible conductors bridging cabinets and doors, neatly along hinge side, and protect against abrasion. Tie and support conductors neatly.
 - 2. Control Wiring Conductors: Install control wiring conductors, without splices between terminal points, color-coded. Install in neat workmanlike manner, securely fastened. Install in accordance with the latest edition of the National Electrical Code and Division 26.
 - 3. Communication wiring, signal wiring and low voltage control wiring shall be installed separate from any wiring over thirty (30) volts. Signal wiring shield shall be grounded at controller end only, unless otherwise recommended by the controller manufacturer.
 - 4. All WAN and LAN patch cords shall be approved and installed as approved by owner.
 - 5. Install all control wiring external to panels in electric metallic tubing or raceway. Installation of wiring shall generally follow building lines. Provide steel type connectors. Install wiring in galvanized rigid steel conduit at all exterior locations and where subjected to moisture. Install in PVC Schedule 40 conduit if encased in concrete. All conduits penetrating partitions, walls or floors shall be sealed with a submitted and approved fire/smoke sealant to prevent migration of air through the conduit system.
 - 6. Communication wiring, signal wiring and low voltage control wiring may be run without conduit in concealed, accessible locations if noise immunity is ensured.
 - a. Contractor shall be fully responsible for noise immunity and rewire in conduit if electrical or RF noise affects performance.

- b. Accessible locations are defined as areas inside mechanical equipment enclosures, such as heating and cooling units, instrument panels etc.; in accessible pipe chases with easy access, or suspended ceilings with easy access. Installation of wiring shall generally follow building lines.
 - c. Run in a neat and orderly fashion, bundled where applicable, and completely suspended (strapped to rigid elements or routed through wiring rings) away from areas of normal access. Tie and support conductors neatly with suitable nylon ties and not to exceed five (5) foot intervals.
 - d. Conductors shall not be supported by the ceiling system or ceiling support system. Conductors shall be pulled tight and be installed as high as practically possible in ceiling cavities. Wiring shall not be laid on the ceiling or duct.
 - e. Conductors shall not be installed between the top cord of a joist or beam and the bottom of roof decking.
7. Secondary LAN Communication cabling shall be provided in an Owner approved color dedicated to the BAS.
8. Number-code or color-code conductors appropriately for future identification and servicing of control system. Code shall be as indicated on approved installation Drawings..
- E. Control Valves: Install so that actuators, wiring, and tubing connections are accessible for maintenance. Where possible, install with valve stem axis vertical, with operator side up. Where vertical stem position is not possible or would result in poor access, valves may be installed with stem horizontal. Do not install valves with stem below horizontal, or down.
- F. Averaging Temperature Sensors: Cover no more than two square feet per linear foot of sensor length except where indicated. Manufacturer recommended mounting clips shall be used to support and prevent any movement of the sensing probe in the air flow. Generally, where flow is sufficiently homogeneous/adequately mixed at sensing location, consult Engineer for requirements.
- G. Fluid Flow Sensors: Install per manufacturer's recommendations in an unobstructed straight length of pipe.
- H. Relative Humidity Sensors: Provide element guard as recommended by manufacturer for high velocity installations. For high limit sensors, position remote enough to allow full moisture absorption into the air stream before reaching the sensor.
- I. Water Differential Pressure Transmitters: Provide 5 valve bypass arrangement to protect against over pressure damaging the transmitter.
- J. Steam Differential Pressure Transmitters: Install as shown on the Drawings per manufacturer's instructions.
- K. Pipe Surface Mount Temperature Sensors: Install with thermally conductive paste at pipe contact point. Where sensor is to be installed on an insulated pipe Contractor shall neatly cut insulation install sensor, repair or replace insulation and vapor barrier and adequately seal vapor barrier.
- L. Flow Switches: Where possible, install in a straight run of pipe at least 15 diameters in length to minimize false indications.
- M. Current Switches for Motor Status Monitoring: Adjust so that set point is below minimum operating current and above motor no load current.
- N. Supply Duct Pressure Transmitters:

1. General: Install pressure tips with at least four (4) 'round equivalent' duct diameters of straight duct with no takeoffs upstream. Install static pressure tips securely fastened with tip facing upstream in accordance with manufacturer's installation instructions. Locate the transmitter at an accessible location to facilitate calibration.
 2. VAV System 'Down-Duct' Transmitters: Locate pressure tips as indicated on Drawings or as approved by Owner's TAB Firm.
- O. Cutting and Patching Insulation: Repair insulation to maintain integrity of insulation and vapor barrier jacket. Use hydraulic insulating cement to fill voids and finish with material matching or compatible with adjacent jacket material.

[For Critical Service Control Valve applications, Engineer shall complete the applicable following forms for each individual application and/or valve. Control valve sizing and selection is the initial responsibility of the Engineer and NOT left to the BAS Provider. The items noted with a * and **, shall be completed by the Engineer to list the requirements of the valves for Cv, close off, temperature ratings, cage material, seat material, trim material etc. for each individual application. This should be a result of analyzing the valves performance and application across the range of control. Engineer shall consult with Owner prior to specifying these valves.]

END OF SECTION 25 55 00 00C11 10

SECTION 25 55 00 00D - BAS FIELD PANELS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Section includes:
 - 1. Building Controller (BC).
 - 2. Advance Application Specific Controller (AAC).
 - 3. Application Specific Controller (ASC).
- B. Furnish and install DDC Control units and/or Smart Devices required to support specified building automation system functions.
- C. Refer to Section 25 00 00 - Building Automation System (BAS) General for general requirements.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within all references.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MANUFACTURERS

- A. The BAS and digital control and communications components installed, as Work of this Contract shall be an integrated distributed processing.
 - 1. All access, programming, alarming, system configuration shall be utilized from the existing system software and database without any third party programs or gateways.

2.03 STAND-ALONE FUNCTIONALITY

- A. General: These requirements clarify the requirement for stand-alone functionality relative to packaging I/O devices with a controller. Stand-alone functionality is specified with the controller and for each Application Category specified in this Section. This item refers to acceptable paradigms for associating the points with the processor.
- B. Functional Boundary:
 - 1. Provide controllers so that all points associated with and common to one unit or other complete system/equipment shall reside within a single control unit. The boundaries of a standalone system shall be as dictated in the Contract Documents.
 - 2. Systems specified for the Application Category will dictate the boundary of the standalone control functionality. See related restrictions below.
 - 3. When referring to the controller as it pertains to the standalone functionality, reference is specifically made to the processor.
 - 4. One processor shall execute all the related I/O control logic via one operating system that uses a common programming and configuration tool.
- C. The following configurations are considered acceptable with reference to a controller's standalone functionality:
 - 1. Points packaged as integral to the controller such that the point configuration is listed as an essential piece of information for ordering the controller (having a unique ordering number).
 - 2. Controllers with processors and modular back planes that allow plug in point modules as an integral part of the controller.
 - 3. I/O point expander boards, plugged directly into the main controller board to expand the point capacity of the controller.
- D. The following configurations are considered unacceptable with reference to a controller's standalone functionality:
 - 1. I/O point expansion devices connected to the main controller board via wiring and as such may be remote from the controller and that communicate via a sub LAN protocol.
 - 2. Multiple controllers enclosed in the same control panel to accomplish the point requirement.

2.04 BUILDING CONTROLLER (BC)

- A. General Requirements:
 - 1. The BC(s) shall provide fully distributed control independent of the operational status of the OWSs and CSS. All necessary calculations required to achieve control shall be executed within the BC independent of any other device. All control strategies performed by the BC(s) shall be both operator definable and modifiable through the Operator Interfaces.
 - 2. BCs shall perform overall system coordination, accept control programs, perform automated HVAC functions, control peripheral devices and perform all necessary mathematical and logical functions.
 - 3. BCs shall share information with the entire network of BCs for full global control directly without requiring other BCs, LAN devices, Local Supervisory LAN gateways, routers etc. to assist, perform, or act as an intermediate device for communicating.

4. Each controller shall permit multi-user operation from multiple workstations and portable operator terminals connected either locally or over the Primary Controller LAN. Each unit shall have its own internal RAM, non-volatile memory, microprocessor, battery backup, regulated power supply, power conditioning equipment, ports for connection of operating interface devices, and control enclosure.
5. BCs shall be programmable from an operator workstation, portable operator terminal, or hand held operating device. BC shall contain sufficient memory for all specified global control strategies, user defined reports and trending, communication programs, and central alarming.
6. BCs shall be connected to a controller network that qualifies as a Primary Controlling LAN.
7. All BCs shall be protected from any memory loss due to a loss of power by one or a combination of the following:

Volatile RAM shall have a battery backup using a lithium battery with a rated service life of fifty (50) hours, and a rated shelf life of at least five (5) years. Self-diagnostic routine shall report an alarm for a low battery condition.

EEPROM, EPROM, or NOVRAM non-volatile memory.

8. In addition, BCs shall provide intelligent, standalone control of HVAC functions. Each BC shall be capable of standalone direct digital operation utilizing its own processor, non-volatile memory, input/output, wiring terminal strips, A/D converters, real-time clock/calendar and voltage transient and lightning protection devices. Refer to standalone functionality specified above.
9. The BC shall provide for point mix flexibility and expandability. This requirement may be met via either a family of expander boards, modular input/output configuration, or a combination thereof. Refer to stand alone functionality specified above.
10. All BC point data, algorithms and application software shall be modifiable from the Operator Workstation.
11. Each BC shall execute application programs, calculations, and commands via a microprocessor resident in the BC. The database and all application programs for each BC shall be stored in non-volatile or battery backed volatile memory within the BC and will be able to upload/download to/from the OWS and/or CSS.
12. BC shall provide buffer for holding alarms and messages. Alarms and messages shall reside in a buffer within the controller and be delivered up to the CSS via the LAN when the buffer is full or when scheduled.
13. BC shall provide buffer for holding trends. Trends shall reside in a buffer within the controller and be delivered up to the CSS via the LAN when the buffer is full or when scheduled.
14. Each BC shall include self-test diagnostics, which allow the BC to automatically alarm any malfunctions, or alarm conditions that exceed desired parameters as determined by programming input.
15. Each BC shall contain software to perform full DDC/PID control loops.
16. For systems requiring end-of-line resistors those resistors shall be located in the BC.
17. Input-Output Processing:

Digital Outputs (DO):

- 1) Outputs shall be rated for a minimum 24 Vac or Vdc, 1 amp maximum current. Each shall be configurable as normally open or normally closed.

- 2) Each output shall have an LED to indicate the operating mode of the output and a manual hand off or auto switch to allow for override. Provide feedback to remotely indicate the HOA is not in the Auto position. If these HOA switches are not provided on the main board they shall be provided via isolation relays within the control enclosure.
- 3) Each DO shall be discrete outputs from the BC's board (multiplexing to a separate manufacturer's board is unacceptable). Provide suppression to limit transients to acceptable levels.

Analog Inputs (AI):

- 4) AI shall be 0-5 Vdc, 0-10 Vdc, 0-20 Vdc, and 0-20 mA. Provide signal conditioning, and zero and span calibration for each input.
- 5) Each input shall be a discrete input to the BC's board (multiplexing to a separate manufacturers board is unacceptable unless specifically indicated otherwise).
- 6) A/D converters shall have a minimum resolution of twelve (12) bits.

Digital Inputs (DI):

- 7) Monitor dry contact closures.
- 8) Accept pulsed inputs of at least one per second. Source voltage for sensing shall be supplied by the BC and shall be isolated from the main board.

Universal Inputs (UI-AI or DI): To serve as either AI or DI as specified above.

Electronic Analog Outputs (AO):

- 9) Voltage mode: 0-5 Vdc and 0-10 Vdc; Current mode: 4-20 mA. Provide zero and span calibration and circuit protection.
- 10) Pulse Width Modulated (PWM) analog via a DO and transducer is acceptable only with Owner approval (Generally these will not be allowed on loops with a short time constant such as discharge temperature loops, economizer loops, pressure control loops and the like. They are generally acceptable for standard room temperature control loops).
- 11) Where these are allowed, transducer/actuator shall be programmable for normally open, normally closed, or hold last position and shall allow adjustable timing. Each DO shall be discrete outputs from the BC's board (multiplexing to a separate manufacturers board is unacceptable). D/A converters shall have a minimum resolution of ten (10) bits.

Analog Output Pneumatic (AOP), 0-20 psi:

- 12) Pneumatic outputs via an I/P transducer, or digital to pneumatic transducer are acceptable.
- 13) Multiplexed digital to pneumatic transducers are acceptable provided they are supplied as a standard product and part of the BC and provide individual feedback.
- 14) Multiplexed pneumatic outputs of a separate manufacturer are unacceptable.

Pulsed Inputs:

- 15) Capable of counting up to eight (8) pulses per second with buffer to accumulate pulse count.

- 16) Pulses shall be counted at all times.
18. A communication port for operator interface through a terminal shall be provided in each BC. It shall be possible to perform all program and database back-up, system monitoring, control functions, and BC diagnostics through this port. Standalone BC panels shall allow temporary use of portable devices without interrupting the normal operation of permanently connected modems, printers, or workstations.
19. Each BC shall be equipped with loop tuning algorithm for precise proportional, integral, derivative (PID) control. Loop tuning tools provided with the Operator Workstation software is acceptable. In any case, tools to support loop tuning must be provided such that P, I, and D gains are automatically calculated.
20. All analog output points shall have a selectable failure setpoint. The BC shall be capable of maintaining this failure setpoint in the event of a system malfunction, which causes loss of BC control, or loss of output signal, as long as power is available at the BC. The failure setpoint shall be selectable on a per point basis.
21. Slope intercepts and gain adjustments shall be available on a per-point basis.
22. BC Power Loss:

Upon a loss of power to any BC, the other units on the primary controlling network shall not in any way be affected.

Upon a loss of power to any BC, the battery backup shall ensure that the energy management control software, the Direct Digital Control software, the database parameters, and all other programs and data stored in the RAM are retained for a minimum of fifty (50) hours. An alarm diagnostic message shall indicate that the BC is under battery power.

Upon restoration of power within the specified battery backup period, the BC shall resume full operation without operator intervention. The BC shall automatically reset its clock such that proper operation of any time dependent function is possible without manual reset of the clock. All monitored functions shall be updated.

Should the duration of a loss of power exceed the specified battery back-up period or BC panel memory be lost for any reason, the panel shall automatically report the condition (upon resumption of power) and be capable of receiving a download via the network, and connected computer. In addition, The University shall be able to upload the most current versions of all energy management control programs, Direct Digital Control programs, database parameters, and all other data and programs in the memory of each BC to the operator workstation via the local area network, or via the telephone line dial-up modem where applicable, or to the laptop PC via the local RS-232C port.

23. BC Failure:

Building Controller LAN Data Transmission Failure: BC shall continue to operate in stand-alone mode. BC shall store loss of communication alarm along with the time of the event. All control functions shall continue with the global values programmable to either last value or a specified value. Peer BCs shall recognize the loss, report alarm and reconfigure the LAN.

BC Hardware Failure: BC shall cease operation and terminate communication with other devices. All outputs shall go to their specified fail position.

24. Each BC shall be equipped with firmware resident self-diagnostics for sensors and be capable of assessing an open or shorted sensor circuit and taking an appropriate control action (close valve, damper, etc.).

25. BCs may include LAN communications interface functions for controlling secondary controlling LANs Refer to Section 25 30 00 - BAS System Communications Devices for requirements if this function is packaged with the BC.
26. A minimum of four (4) levels of password protection shall be provided at each BC.
27. BCs shall be mounted in packaged equipment enclosures, or locking wall mounted in an enclosure, as specified elsewhere.
28. In the last month of the Warranty Period, all controller firmware, software, drivers, etc. will be upgraded to the latest release (version) in effect at the end of the Warranty Period.
29. All BC naming conventions shall adhere to the format as established by The University's Standard Acronyms document.

B. BACnet Building Controller Requirements:

1. The BC(s) shall support all BIBBs defined in the BACnet Building Controller (B-BC) device profile as defined in the BACnet standard.
2. BCs shall communicate over the BACnet Building Controller LAN.
3. Each BC shall be connected to the BACnet Building Controller LAN communicating to/from other BCs.

2.05 ADVANCED APPLICATION SPECIFIC CONTROLLER (AAC) AND APPLICATION SPECIFIC CONTROLLER (ASC)

A. General Requirements:

1. AACs and ASCs shall provide intelligent, standalone control of HVAC equipment. Each unit shall have its own internal RAM, non-volatile memory and will continue to operate all local control functions in the event of a loss of communications on the ASC LAN or sub-LAN. Refer to standalone requirements by application specified in this Section. In addition, it shall be able to share information with every other BC and AAC /ASC on the entire network.
2. Each AAC and ASC shall include self-test diagnostics that allow the AAC /ASC to automatically relay to the BC, LAN Interface Device or workstation, any malfunctions or abnormal conditions within the AAC /ASC or alarm conditions of inputs that exceed desired parameters as determined by programming input.
3. AACs and ASCs shall include sufficient memory to perform the specific control functions required for its application and to communicate with other devices.
4. Each AAC and ASC must be capable of stand-alone direct digital operation utilizing its own processor, non-volatile memory, input/output, minimum eight (8) bit A to D conversion, voltage transient and lightning protection devices. All volatile memory shall have a battery backup of at least fifty (50) hours with a battery life of five (5) years.
5. All point data; algorithms and application software within an AAC /ASC shall be modifiable from the Operator Workstation.
6. In the last month of the Warranty Period, all controller firmware, software, drivers, etc. will be upgraded to the latest release (version) in effect at the end of the Warranty Period.
7. AAC and ASC Input-Output Processing

Digital Outputs (DO): Outputs shall be rated for a minimum 24 VAC or VDC, 1 amp maximum current. Each shall be configurable as normally open or normally closed. Each DO shall be discrete outputs from the AAC/ASC's board (multiplexing to a separate manufacturer's board is unacceptable). Provide suppression to limit transients to acceptable levels.

Analog Inputs (AI): AI shall be 0-5 Vdc, 0-10Vdc, 0-20Vdc, and 0-20 mA. Provide signal conditioning, and zero and span calibration for each input. Each input shall be a discrete input to the BC's board (multiplexing to a separate manufacturers board is unacceptable unless specifically indicated otherwise). A/D converters shall have a minimum resolution of eight to ten bits depending on application.

Digital Inputs (DI): Monitor dry contact closures. Accept pulsed inputs of at least one per second. Source voltage for sensing shall be supplied by the BC and shall be isolated from the main board.

Universal Inputs (UI-AI or DI): To serve as either AI or DI as specified above.

Electronic Analog Outputs (AO) as required by application:

- 1) Voltage mode, 0-5VDC and 0-10VDC; current mode (4-20 mA). Provide zero and span calibration and circuit protection. Pulse Width Modulated (PWM) analog via a DO and transducer is acceptable only with Owner approval (Generally, PWM will not be allowed on loops with a short time constant such as discharge temperature loops, economizer loops, pressure control loops and the like. They are generally acceptable for standard room temperature control loops.).
- 2) Where PWM is allowed, transducer/actuator shall be programmable for normally open, normally closed, or hold last position and shall allow adjustable timing. Each DO shall be discrete outputs from the BC's board (multiplexing to a separate manufacturers board is unacceptable).
- 3) D/A converters shall have a minimum resolution of eight (8) bits.

Analog Output Pneumatic (AOP), 0-20 psi: Pneumatic outputs via an I/P transducer, PWM/P transducer, or digital to pneumatic transducer are acceptable. Multiplexed digital to pneumatic transducers are acceptable provided they are supplied as a standard product and part of the AAC /ASC and provide individual feedback. Multiplexed pneumatic outputs of a separate manufacturer are unacceptable.

B. BACnet AAC(s) and ASC(s) Requirements:

1. The AAC(s) and ASC(s) shall support all BIBBs defined in the BACnet Building Controller (B-AAC and B-ASC) device profile as defined in the BACnet standard.
2. AAC(s) and ASC(s) shall communicate over the BACnet Building Controller LAN or the ASC LAN or sub-LAN.
3. Each BC shall be connected to the BACnet Building Controller LAN communicating to/from other BCs.

C. Terminal Unit Controllers:

1. Terminal unit controllers controlling damper positions to maintain a quantity of supply or exhaust air serving a space shall have an automatically initiated function that resets the volume regulator damper to the fully closed position on a scheduled basis.
2. The controllers shall initially be set up to perform this function once every 24 hours. The purpose of this required function is to reset and synchronize the actual damper position with the calculated damper position and to assure the damper will completely close when commanded.

3. The software shall select scheduled terminal units randomly and shall not allow more than 5 percent of the total quantity of controllers in a building to perform this function at the same time. When possible the controllers shall perform this function when the supply or exhaust air system is not operating or is unoccupied.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine areas and conditions under which control systems are to be installed. Do not proceed with Work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

3.03 SYSTEM ACCESS

- A. Provide an Ethernet connection and a 5 port hub at each panel housing a controller or controllers that provides access to the Local Supervisory LAN and to the Control System Server for all Controllers, other than an Application Category 1 Controllers. The user shall be able to access each controller on the system using this connection via the Control System Server database for graphics, schedules, programming, controller configuration etc.

3.04 HARDWARE APPLICATION REQUIREMENTS

A. General:

1. The functional intent of this specification is to allow cost effective application of manufacturers standard products while maintain the integrity and reliability of the control functions.
2. A Building Controller as specified above is generally fully featured and customizable whereas the AAC/ASC refers to a more cost-effective unit designed for lower-end applications. Specific requirements indicated below are required for the respective application. Manufacturer may apply the most cost-effective unit that meets the requirement of that application.

B. Standalone Capability:

1. Each Control Unit shall be capable of performing the required sequence of operation for the associated equipment.
2. All physical point data and calculated values required to accomplish the sequence of operation shall originate within the associated CU with only the exceptions enumerated below. Listed below are functional point data and calculated values that shall be allowed to be obtained from or stored by other CUs or SDs via LAN.

- C. Where associated control functions involve functions from different categories identified below, the requirements for the most restrictive category shall be met.

D. Application Category 0 (Distributed Monitoring):

1. Applications in this category include the following:

Monitoring of variables that are not used in a control loop, sequence logic, or safety.

2. Points on BCs, AACs, and ASCs may be used in these applications as well as SDs and/or general-purpose I/O modules.
3. Where these points are trended, Contractor shall verify and document that the network bandwidth is acceptable for such trends and is still capable of acceptable and timely control function.

Delete equipment that is not applicable – do not move equipment types from one category to another.

E. Application Category 1 (Application Specific Controller):

1. Applications in this category include the following:

Fan Coil Units.

Airflow Control Boxes (VAV and Constant Volume Terminal Units).

Miscellaneous Heaters.

Unitary equipment <15 tons (Package Terminal AC Units, Package Terminal Heat Pumps, Split-System AC Units, Split-System Heat Pumps, Water-Source Heat Pumps).

Induction Units.

Dual Duct Zone Dampers.

2. ASCs may be used in these applications.

3. Standalone Capability:

Provide capability to execute control functions for the application for a given setpoint or mode, which shall generally be occupied mode control.

Only the following data (as applicable) may be acquired from other controllers via LANs. In the event of a loss of communications with any other controller, or any fault in any system hardware that interrupts the acquisition of any of these values, the ASC shall use the last value obtained before the fault occurred.

If such fault has not been corrected after the specified default delay time, specified default value(s) shall then be substituted until such fault has been corrected.

<u>Physical/Virtual Point</u>	<u>Default Value</u>
Scheduling Period	Normal
Morning Warm-Up	Off (cold discharge air)
Load Shed	Off (no shedding)
Summer/Winter	Winter
Trend Data	N/A
[Smoke Pressurization Mode]	[Normal Mode]

4. Mounting:

ASCs that control equipment located above accessible ceilings shall be mounted on the equipment in an accessible enclosure and shall be rated for plenum use.

ASCs that control equipment mounted in a mechanical room may either be mounted in, on the equipment, or on the wall of the mechanical room at an adjacent, accessible location.

ASCs that control equipment mounted outside or in occupied spaces shall either be located in the unit or in a proximate mechanical/utility space.

BAS Provider may furnish ASCs to the terminal unit manufacturer for factory mounting.

5. **Programmability:** Operator shall be able to modify all setpoints (temperature and airflow), scheduling parameters associated with the unit, tuning and set up parameters, interstage timing parameters, and mode settings. Application-specific block control algorithms may be used to meet the sequence of operations. The ability to customize the control algorithm is not required unless specifically indicated otherwise.
6. **LAN Restrictions:** For networks operating at 38.4 kbps or less, limit the number of nodes on the network to meet all system performance criteria and to no more than 80 percent of the maximum recommended by the manufacturer. For networks operating at greater than 38.4 kbps limit the number of nodes on the network to meet all system performance criteria up to the maximum recommended by the manufacturer.

Delete equipment that is not applicable – do not move equipment types from one category to another.

F. Application Category 2 (General Purpose Terminal Controller):

Applications in this category include the following:

Unitary Equipment \geq 15 tons (Air Conditioners, Heat Pumps, Packaged Heating/Cooling Units, and similar).

Small, Constant Volume Single Zone Air Handling Units.

Constant Volume Pump Start/Stop.

Miscellaneous Equipment (Exhaust Fan) Start/Stop.

Miscellaneous Monitoring (not directly associated with a control sequence and where trending is not critical).

1. BCs may be used in these applications.
2. ASC's may be used in these applications provided the ASC meets all requirements specified below. This category requires a general-purpose ASC to which application-specific control algorithms can be attached.
3. Standalone Capability:

Only the following data (as applicable) may be acquired from other ASCs via LANs.

In the event of a loss of communications with any other ASCs, or any fault in any system hardware that interrupts the acquisition of any of these values, the AAC/ASC shall use the last value obtained before the fault occurred.

If such fault has not been corrected after the specified default delay time, specified default value(s) shall then be substituted until such fault has been corrected.

Physical/Virtual Point	Default Delay Time	Default Value
Outside Air Temperature	3 minutes	80°F
Outside Air Humidity	3 minutes	60% RH
Outside Air Enthalpy	3 minutes	30 Btu/lb
Trend Data	3 minutes	N/A
Cooling/Heating Requests	3 minutes	None
[Smoke Pressurization Mode]	[3 minutes]	[Normal Mode]
[Smoke Exhaust Command]	[3 minutes]	[Normal Mode]

4. Mounting:

ASCs that control equipment located above accessible ceilings shall be mounted on the equipment and shall be rated for plenum use.

ASCs that control equipment located in occupied spaces or outside shall either be mounted within the equipment enclosure (responsibility for physical fit remains with the Contractor) or in a near by mechanical/utility room in which case it shall be enclosed in a NEMA 1, locking enclosure.

5. Programmability:

Operator shall be able to modify all setpoints (temperature and airflow), scheduling parameters associated with the unit, tuning and set up parameters, interstage timing parameters, and mode settings.

Operator shall be able to address and configure spare inputs for monitoring.

Operator shall be able to address and configure spare outputs for simple single loop control actions or event initiated actions.

Application-specific block control algorithms shall used to meet the sequence of operations. The ability to customize the control algorithm is not required unless specifically indicated otherwise.

6. LAN Restrictions: Limit the number of nodes servicing any one of these applications on the AAC/ASC LAN to 32.

Delete equipment that is not applicable – do not move equipment types from one category to another.

G. Application Category 3 (Advanced Application Controller):

1. Applications in this category include the following:

Steam Pressure Reducing Station Control.

Steam Converter Control.

Large Constant Volume Air Handlers.

VAV Air Handlers.

Dual Duct Air Handlers.

Multizone Air Handlers.

Self Contained VAV Units.

Air Handlers serving critical areas.

Central Cooling Plant.

Central Heating Plant.

Cooling Towers.

Sequenced or Variable Speed Pump Control.

Local Chiller Control (unit specific).

Campus Loop Chilled Water Control.

2. BCs shall be used in these applications.

3. LAN Restrictions: Comply with Part Two requirements, Stand-Alone Functionality.

3.05 CONTROL UNIT REQUIREMENTS

A. Refer to Section 25 00 00 for requirements pertaining to control unit quantity and location.

END OF SECTION 25 55 00 00D14 00

SECTION 25 55 00 00E - BAS SOFTWARE AND PROGRAMMING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Section Includes:
 - 1. System Software.
 - 2. Programming Description.
 - 3. Control Algorithms.
 - 4. Energy Management Applications.
 - 5. Password Protection.
 - 6. Alarm Reporting.
 - 7. Trending.
 - 8. Data Acquisition and Storage.
 - 9. Point Structuring.
 - 10. Dynamic Color Graphics.
- B. Fully configure systems and furnish and install all software, programming and dynamic color graphics for a complete and fully functioning system as specified.
- C. Refer to Section 25 00 00 - Building Automation System (BAS) General for general requirements as well as requirements for interface with Owner's WAN.

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within all references.

1.04 LICENSING

- A. Provide or upgrade all licensing for all software packages at all required workstations. BAS licensing shall allow unlimited simultaneous users for access to all aspects of the system including system access, workstations, points, programming, database management, graphics etc. No restrictions shall be placed on the licensing. All operator interface, programming environment, networking, database management and any other software used by the Contractor to install the system or needed to operate the system to its full capabilities shall be licensed and provided to The University.
- B. All software should be available on all Operator Workstations or CSSs provided, and on all Portable Operator Terminals. Hardware and software keys to provide all rights shall be installed on all workstations. At least two (2) sets of CDs shall be provided with backup software for all software provided, so that The University may reinstall any software as necessary. Include all licensing for workstation operating systems, and all required third-party software licenses.
- C. Provide licensing and original software copies for each OWS or CSS.
- D. Provide licensing and original software copies for each remote graphic workstation. Licenses for remote graphic workstations shall allow for access to any Site and shall not be restricted to accessing only the LANs included in this Project.
- E. In the last month of the Warranty Period, upgrade all software and firmware packages to the latest release (version) in effect at the end of the Warranty Period.
- F. Refer to Section 25 00 00 - Building Automation System (BAS) General for further requirements.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 SYSTEM SOFTWARE-GENERAL

- A. Functionality and Completeness: Contractor shall furnish and install all software and programming necessary to provide a complete and functioning system as specified. Contractor shall include all software and programming not specifically itemized in these Specifications, which is necessary to implement, maintain, operate, and diagnose the system in compliance with these Specifications.
- B. Configuration: The software shall support the system as a distributed processing network configuration.

2.03 CONTROLLER SOFTWARE

- A. BC Software Residency: Each BC as defined below shall be capable of control and monitoring of all points physically connected to it. All software including the following shall reside and execute at the BC:
 - 1. Real-Time Operating System software.
 - 2. Real-Time Clock/Calendar and network time synchronization.
 - 3. BC diagnostic software.
 - 4. LAN Communication software/firmware.

5. Direct Digital Control software.
 6. Alarm Processing and Buffering software.
 7. Energy Management software.
 8. Data Trending, Reporting, and Buffering software.
 9. I/O (physical and virtual) database.
 10. Remote Communication software.
- B. AAC/ASC Software Residency: Each AAC/ASC as defined below shall be capable of control and monitoring of all points physically connected to it. As a minimum, software including the following shall reside and execute at the AAC/ASC. Other software to support other required functions of the AAC/ASC may reside at the BC or LAN interface device (specified in Section 25 30 00) with the restrictions/exceptions per application provided in Section 25 14 00:
1. Real-Time Operating System software.
 2. AAC/ASC diagnostic software.
 3. LAN Communication software.
 4. Control software applicable to the unit it serves that will support a single mode of operation.
 5. I/O (physical and virtual) database to support one mode of operation.
- C. Stand Alone Capability: BC shall continue to perform all functions independent of a failure in other BC/AAC/ASC or other communication links to other BCs/AACs/ASCs. Trends and runtime totalization shall be retained in memory. Runtime totalization shall be available on all digital input points that monitor electric motor status. Refer also to Section 25 14 00 for other aspects of stand alone functionality.
- D. Operating System: Controllers shall include a real-time operating system resident in ROM. This software shall execute independently from any other devices in the system. It shall support all specified functions. It shall provide a command prioritization scheme to allow functional override of control functions. Refer also to Section 25 14 00 for other aspects of the controller's operating system.
- E. Network Communications: Each controller shall include software/firmware that supports the networking of CUs on a common communications trunk that forms the respective LAN. Network support shall include the following:
1. Building Controller/Primary LAN shall be a high-speed network designed and optimized for control system communication. If a Primary LAN communications trunk is severed, BCs shall reconfigure into two separate LANs and continue operations without interruption or Operator intervention.
 2. Controller communication software shall include error detection, correction, and re-transmission to ensure data integrity.
 3. Operator/System communication software shall facilitate communications between other BCs, all subordinate AACs/ASCs, Gateways and LAN Interface Devices or Operator Workstations. Software shall allow point interrogation, adjustment, addition/deletion, and programming while the controller is on line and functioning without disruption to unaffected points. The software architecture shall allow networked controllers to share selected physical and virtual point information throughout the entire system.
- F. Point Database/Summary Table:

1. All points included in the typical equipment point list must be represented to Owner's WAN in a common, open protocol format. All points should be provided as BACnet standard analog, binary, schedule, or trend objects. Naming conventions for these points and network addressing are discussed in Part Three of this Section.
 2. Point/system database creation and modification shall be via a user-friendly, menu-driven program. System software shall support virtual or logic point (points not representing a physical I/O) creation. Software shall support virtual points with all services specified herein. Database software shall support definition of all parameters specified in Part Three of this Section for a given point type. If database does not support all these parameters, software module shall be created and attached to the points which accomplish the respective function.
- G. Diagnostic Software: Controller software shall include diagnostic software that checks memory and communications and reports any malfunctions
- H. Alarm/Messaging Software: Controller software shall support alarm/message processing and buffering software as more fully specified below.
- I. Application Programs: CUs shall support and execute application programs as more fully specified below:
1. All Direct Digital Control software, Energy Management Control software, and functional block application programming software templates shall be provided in a 'ready-to-use' state, and shall not require (but shall allow) Owner programming.
 2. Line programs shall supply preprogrammed functions to support these energy management and functional block application algorithms. All functions shall be provided with printed narratives and/or flow diagrams to document algorithms and how to modify and use them.
- J. Security: Controller software shall support multiple level password access restriction as more fully specified below.
- K. Direct Digital Control: Controller shall support application of Direct Digital Control Logic. All logic modules shall be provided pre-programmed with written documentation to support their application. Provide the following logic modules as a minimum:
1. Proportional-Integral-Derivative (PID) control with analog, PWM and floating output.
 2. Two Position control (Hi or Low crossing with deadband).
 3. Single-Pole Double-Throw relay.
 4. Delay Timer (delay-on-make, delay-on-break, and interval).
 5. Hi/Low Selection.
 6. Reset or Scaling Module.
 7. Logical Operators (And, Or, Not, Xor).
- L. Psychrometric Parameters: Controller software shall provide preprogrammed functions to calculate and present psychrometric parameters (given temperature and relative humidity) including the following as a minimum: Enthalpy, Wet Bulb Temperature.

- M. Updating/Storing Application Data: Site-specific programming residing in volatile memory shall be uploadable/downloadable from an OWS or CSS connected locally, to the Primary LAN, to the Local Supervisory LAN and remotely via the internet and modem and telephone lines as applicable but all must be available. Initiation of an upload or download shall include all of the following methods; Manually, Scheduled, and Automatically upon detection of a loss or change.
- N. Restart: System software shall provide for orderly shutdown upon loss of power and automatic restart upon power restoration. Volatile memory shall be retained; outputs shall go to programmed fail (open, closed, or last) position. Equipment restart shall include a user definable time delay on each piece of equipment to stagger the restart. Loss of power shall be alarmed at operator interface indicating date and time.
- O. Time Synchronization: Operators shall be able to set the time and date in any device on the network that supports time-of-day functionality. The operator shall be able to select to set the time and date for an individual device, devices on a single network, or all devices simultaneously. Automatic time synchronization shall be provided.
- P. Miscellaneous Calculations: System software shall automate calculation of psychometric functions, calendar functions, kWh/kW, and flow determination and totalization from pulsed or analog inputs, curve-fitting, look-up table, input/output scaling, time averaging of inputs and A/D conversion coefficients.

2.04 APPLICATION PROGRAMMING DESCRIPTION

- A. The application software shall be user programmable.
- B. This Specification generally requires a programming convention that is logical, easy to learn, use, and diagnose. General approaches to application programming shall be provided by one, or a combination, of the following conventions:
 - 1. Point Definition: provide templates customized for point type, to support input of individual point information. Use standard BACnet Objects as applicable.
 - 2. Graphical Block Programming: Manipulation of graphic icon 'blocks', each of which represents a subroutine, in a functional/logical manner forming a control logic diagram. Blocks shall allow entry of adjustable settings and parameters via pop-up windows. Provide a utility that shall allow the graphic logic diagrams to be directly compiled into application programs. Logic diagrams shall be viewable either off-line, or on-line with real-time block output values.
 - 3. Functional Application Programming: Pre-programmed application specific programs that allow/require limited customization via 'fill-in-the-blanks' edit fields. Typical values would be setpoints gains, associated point names, alarm limits, etc.
 - 4. Line Programming: Textual syntax-based programming in a language similar to BASIC designed specifically for HVAC control. Subroutines or functions for energy management applications, setpoints, and adjustable parameters shall be customizable, but shall be provided preprogrammed and documented.
- C. Provide a means for testing and/or debugging the control programs both off-line and on-line.

2.05 ENERGY MANAGEMENT APPLICATIONS

- A. System shall have the ability to perform all of the following energy management routines via preprogrammed function blocks or template programs. As a minimum provide the following whether or not required in the software:
 - 1. Time-of-Day Scheduling.
 - 2. Calendar-Based Scheduling.

3. Holiday Scheduling.
 4. Temporary Schedule Overrides.
 5. Optimal Start/Optimal Stop-based on space temperature offset, outdoor air temperature, and building heating and cooling capacitance factors as a minimum.
 6. Night Setback and Morning Recovery Control, with ventilation only during occupancy.
 7. Economizer Control (enthalpy or dry-bulb).
 8. Peak Demand Limiting / Load Shedding.
 9. Dead Band Control.
- B. All programs shall be executed automatically without the need for operator intervention, and shall be flexible enough to allow operator customization.

2.06 PASSWORD PROTECTION

- A. Multiple-level password access protection shall be provided to allow The University's authorized BAS Administrator to limit workstation control, display and database manipulation capabilities as BAS Administrator deems appropriate for each user, based upon an assigned user name with a unique password.
- B. All passwords for the system shall be provided to The University including administrator, dealer, or factory level passwords for the systems provided under this Project.
- C. Passwords shall restrict access to all Control Units.
- D. Each user name shall be assigned to a discrete access level. A minimum of four (4) levels of access shall be supported. Alternately, a comprehensive list of accessibility/functionality items shall be provided, to be enabled or disabled for each user.
- E. A minimum of 250 user names shall be supported per Owner's direction.
- F. Operators shall be able to perform only those commands available for the access level assigned to their user name.
- G. User-definable, automatic log-off timers of from 1 to 60 minutes shall be provided to prevent operators from inadvertently leaving interface device software on-line.

2.07 ALARM AND EVENT MANAGEMENT REPORTING

- A. Alarm management shall be provided to monitor, buffer, and direct alarms and messages to operator devices and memory files. Each BC shall perform distributed, independent alarm analysis and filtering to minimize operator interruptions due to non-critical alarms, minimize network traffic, and prevent alarms from being lost. At no time shall a BC's ability to report alarms be affected by either operator activity at an Operator Workstation or local handheld device, or by communications with other panels on the network.
1. Alarm Descriptor: Each alarm or point change shall include that point's English language description, and the time and date of occurrence. In addition to the alarm's descriptor and the time and date, the user shall be able to print, display and store an alarm message to more fully describe the alarm condition or direct operator response.
 2. Alarm Prioritization:

- a. The software shall allow users to define the handling and routing of each alarm by their assignment to discrete priority levels.
 - b. A minimum of five (5) priority levels shall be provided. For each priority level, users shall have the ability to enable or disable an audible tone whenever an alarm is reported and whenever an alarm returns to normal condition.
 - c. All alarms shall display at the appropriate workstation alarm screen and each shall be assigned with the correct color and numeric value of priority.
 - d. Attention needs to be considered where instantaneous on / off alarms may occur and defined as being nuisance alarms. These types of alarms that activate and deactivate in a short time period shall be delayed or enhanced in such a way to prevent them from becoming nuisance alarms.
 - e. Users shall have the ability to manually inhibit alarm reporting for each individual alarm and for each priority level. Contractor shall coordinate with The University on establishing alarm priority definitions.
3. Alarm Report Routing: Each alarm shall be associated with a priority level and unique user-defined list of operator devices including any combination of local or remote workstations, printers, workstation disk files, e-mail addresses, and pagers. All alarms associated with a given priority level shall be routed to all operator devices on the user-defined list associated with that priority level. For each priority level, alarms shall be automatically routed to a default operator device in the event that alarms are unable to be routed to any operator device assigned to the priority level.
 4. Auto-Dial Alarm Routing: For alarm priority levels that include a remote workstation (accessed by modem) as one of the listed reporting destinations, the BC shall initiate a call to report the alarm, and shall terminate the call after alarm reporting is complete. System shall be capable of multiple retries and buffer alarms until a connection is made. If no connection is made, system shall attempt connection to an alternate dial-up workstation. System shall also be able to dial multiple pagers upon alarm activation.
 5. Alarm Acknowledgment: For alarm priority levels that are directed to a workstation screen, an indication of alarm receipt shall be displayed immediately regardless of the application in use at the workstation, and shall remain on the screen until acknowledged by a user having a password that allows alarm acknowledgment. Upon acknowledgment, the complete alarm message string (including date, time, and user name of acknowledging operator) shall be stored in a selected file on the workstation hard disk.
- B. It shall be possible for any operator to receive a summary of all alarms regardless of acknowledgement status; for which a particular recipient is enrolled for notification; based on current event state; based on the particular event algorithm (e.g., change of value, change of state, out of range, and so on); alarm priority; and notification class.
- C. Alarming Services:
1. All alarms and events shall be implemented using standard BACnet event detection and notification mechanisms. The workstation shall receive BACnet alarm and event notifications from any gateway or BACnet controller in the system and display them to an operator.
 2. The alarm shall be linked to the system graphic it corresponds to. Either intrinsic reporting or algorithmic change reporting may be used but the intrinsic reporting method is preferred.

3. The workstation shall also log alarms and events, provide a way for an operator with sufficient privilege to acknowledge alarms, and log acknowledgements of alarms. It shall be possible for an operator to receive, at any time, a summary of all alarms that are currently in effect at any Site whether or not they have been acknowledged. Operators shall also be able to view and change alarm limits for any alarm at the appropriate password level
- D. Alarm Historical Database: The database shall store all alarms and events object occurrences in an ODBC or an OLE database-compliant relational database. Provide a commercially available ODBC driver or OLE database data provider, which would allow applications to access the data using standard Microsoft Windows Data Services.
- E. Submit all alarms per Section 25 00 00.

2.08 TRENDING

- A. The software shall display historical data in both a tabular and graphical format. The requirements of this trending shall include the following:
 1. Provide trends for all physical points, virtual points and calculated variables.
 2. BACnet Trend Objects are required and all trend data shall be stored in relational database format as specified in herein under Data Acquisition and Storage.
 3. In the graphical format, the trend shall plot at least four (4) different values for a given time period superimposed on the same graph. The four (4) values shall be distinguishable by using unique colors. In printed form the four (4) lines shall be distinguishable by different line symbology. Displayed trend graphs shall indicate the engineering units for each trended value.
 4. The sample rate and data selection shall be selectable by the operator.
 5. The trended value range shall be selectable by the operator.
 6. Where trended values on one table/graph are COV, software shall automatically fill the trend samples between COV entries.
- B. Control Loop Performance Trends: Controllers incorporating PID control loops shall also provide high resolution sampling in less than six second increments for verification of control loop performance.
- C. Data Buffering and Archiving: Trend data shall be buffered at the BC, and uploaded to hard disk storage when archival is desired. All archived trends shall be transmitted to the on-Site OWS or CSS as applicable. Uploads shall occur based upon a user-defined interval, manual command, or automatically when the trend buffers become full.
- D. Time Synchronization: Provide a time master that is installed and configured to synchronize the clocks of all BACnet devices supporting time synchronization. Synchronization shall be done using Coordinated Universal Time (UTC). All trend sample times, both BACnet and LonTalk, shall be able to be synchronized. The frequency of time synchronization message transmission shall be selectable by the operator.
- E. Submit all Trends per Section 25 00 00.

2.09 DYNAMIC PLOTTING

- A. Provide a utility to dynamically plot in real-time at least four (4) values on a given 2-dimensional dynamic plot/graph with at least two Y-axes. At least five (5) dynamic plots shall be allowed simultaneously.

2.10 DATA ACQUISITION AND STORAGE

- A. All points included in the typical equipment point list must be represented in a common, open or accessible format. All points should be provided as BACnet standard analog, binary, schedule, or trend objects. Naming conventions for these points and network addressing are discussed in the 'Point Naming Conventions' paragraph below.
- B. Data from the BAS shall be stored in relational database format. The format and the naming convention used for storing the database files shall remain consistent across the database and across time. The relational structure shall allow for storage of any additional data points, which are added to the BAS in future. The metadata/schema or formal descriptions of the tables, columns, domains, and constraints shall be provided for each database.
- C. The database shall allow applications to access the data while the database is running. The database shall not require shutting down in order to provide read-write access to the data. Data shall be able to be read from the database without interrupting the continuous storage of trend data being carried by the BAS.
- D. The database shall be ODBC or OLE database compliant. Provide a commercially-available ODBC driver or OLE database data provider, which would allow applications to access the data via Microsoft Windows standard data access services.

2.11 TOTALIZATION

- A. The software shall support totalizing analog, digital, and pulsed inputs and be capable of accumulating, storing, and converting these totals to engineering units used in the documents. These values shall generally be accessible to the Operator Interfaces to support management-reporting functions.
- B. Totalization of electricity use/demand shall allow application of totals to different rate periods, which shall be user definable.
- C. When specified to provide electrical or utility Use/Demand, the Contractor shall obtain from the local utility all information required to obtain meter data, including k factors, conversion constants, and the like.

2.12 EQUIPMENT SCHEDULING

- A. Provide a graphic utility for user-friendly operator interface to adjust equipment-operating schedules.
- B. All operators shall be able to view the entries for a schedule. Operators with sufficient privilege shall be able to modify schedule entries from any workstation.
- C. Scheduling feature shall include multiple seven-day master schedules, plus holiday schedule, each with start time and stop time. Master schedules shall be individually editable for each day and holiday.
- D. Scheduling feature shall allow for each individual equipment unit to be assigned to one of the master schedules.
- E. Timed override feature shall allow an operator to temporarily change the state of scheduled equipment. An override command shall be selectable to apply to an individual unit, all units assigned to a given master schedule, or to all units in a building. Timed override shall terminate at the end of an operator selectable time, or at the end of the scheduled occupied/unoccupied period, whichever comes first. A password level that does not allow assignment of master schedules shall allow a timed override feature.
- F. A yearly calendar feature shall allow assignment of holidays, and automatic reset of system real time clocks for transitions between daylight savings time and standard time.

2.13 POINT STRUCTURING AND NAMING

A. General:

1. The intent of this Section is to require a consistent means of naming points across The University's WAN. Contractor shall configure the systems from the perspective of The University's WAN, not solely the local Project.
2. The following requirement establishes a standard for naming points and addressing Buildings, Networks, Devices, Instances, and the like.
3. The convention is tailored towards The University's WAN and as such, the interface shall always use this naming convention.
4. Native BACnet systems shall also use this naming convention. For non-BACnet systems, the naming convention shall be implemented as much as practical, and any deviations from this naming convention shall be approved by The University.
5. Each controller shall have English language descriptors for all system points, variables, parameters etc. located and accessible from the controller memory. All point naming shall match between all system files and record documents.

B. Point Summary Table:

1. The term 'Point' is a generic description for the class of object represented by analog and binary inputs, outputs, and values.
2. With each schematic, Contractor shall provide a Point Summary Table listing:
 - a. Building code.
 - b. Floor code.
 - c. Room number.
 - d. Sub room letter.
 - e. Equipment type.
 - f. Equipment number.
 - g. Equipment code.
 - h. Full point name (see Point Naming Convention paragraph).
 - i. Point description.
 - j. Ethernet backbone network number.
 - k. Network number.
 - l. Device ID.
 - m. Device MAC address.
 - n. Object ID (object type, instance number).
 - o. Engineering units.

3. Additional fields for non-BACnet systems shall be appended to each row. Point Summary Table shall be provided in both hard copy and in electronic format (ODBC-compliant).
4. Point Summary Table shall also illustrate Network Variables/BACnet Data Links.
5. The BAS Provider shall coordinate with The University's representative to compile and submit a proposed Point Summary Table for review prior to any object programming or Project startup. The Contractor shall support and not impede direct negotiations between the BAS Provider and The University to allow the customizing necessary for structuring the BAS point names to meet The University's needs. The University shall grant approval of final point names to be verified through Commissioning by issuing the approved alarms to the Contractor.
6. The Point Summary Table shall be kept current throughout the duration of the Project by the Contractor as the Master List of all points for the Project. Project closeout documents shall include an up-to-date accurate Point Summary Table. The Contractor shall deliver to The University the final Point Summary Table prior to final acceptance of the system. The Point Summary Table shall be used as a reference and guide during the Commissioning process.
7. The Point Summary Table shall contain all data fields on a single row per point. The Point Summary Table is to have a single master source for all point information in the building that is easily sorted and kept up-to-date. Although a relational database of Device ID-to-point information would be more efficient, the single line format is required as a single master table that will reflect all point information for the building. The point description shall be an easily understandable English-language description of the point.

Point Summary Table - Example	
(Transpose for a single point per row format)	
Building Code	AC (Anderson Central)
Floor Code	04
Room Number	1000
Sub room letter	a
Equipment Type	Air Handler (AH)
Equipment Number	31
Equipment Code	SAT
*POINT NAME (OBJECT NAME)	AC04.1000a.AH31.SAT
*Point Description (Object Description)	AH31 Supply Air Temperature
Ethernet Network Number	600
Network Number	610
Device ID	1024006
Device MAC address	24
Object Type	AI
Instance Number	4
Engineering Units	kW
Network Variable?	True
Server Device	1024006
Client Devices	1028006
Included with Functional	
*Represents information that shall reside in the relevant property for the object	

C. Point Naming Convention:

1. The University shall designate the 'Building' descriptor. The 'Equipment Type' descriptor shall define the equipment category; e.g., Chiller, Air Handling Unit, or other equipment. The 'Equipment Code' descriptor shall define the hardware or software type or function associated with the equipment; e.g., supply temperature, water pressure, alarm, mixed air temperature setpoint, etc. and shall contain any numbering conventions for multiples of equipment; e.g., CHLR1KW, CHLR2KW, BLR2AL (Boiler 2 Alarm), HWP1ST (Hot Water Pump 1 Status).
2. A consistent object (point) naming convention shall be utilized to facilitate familiarity and operational ease across Owner's WAN. Inter-facility consistency shall be maintained to ensure transparent operability to the greatest degree possible.

D. Device Addressing Convention:

1. BACnet network numbers and Device Object IDs shall be unique throughout the network.
2. All assignment of network numbers and Device Object IDs shall be coordinated with The University.
3. The Contractor shall coordinate with The University or a designated representative to ensure that no duplicate Device Object IDs occur.
4. Alternative Device ID schemes or cross Project Device ID duplication if allowed shall be approved before Project commencement by The University.

2.14 OPERATOR INTERFACE GRAPHIC SOFTWARE

- A. Graphic software shall facilitate user-friendly interface to all aspects of the System Software specified above. The intent of this Specification is to require a graphic package that provides for intuitive operation of the systems without extensive training and experience. It shall facilitate logical and simple system interrogation, modification, configuration, and diagnosis.
- B. Graphic software shall support multiple simultaneous screens to be displayed and resizable in a 'Windows'-like environment. All functions excepting text entry functions shall be executable with a mouse.
- C. Graphic software shall provide for multitasking such that third-party programs can be used while the OWS software is on line. Software shall provide the ability to alarm graphically even when operator is in another software package.
- D. Operating system software shall be [Microsoft Windows 2000 Professional or Windows XP Professional].
- E. The software shall allow for Owner creation of user-defined, color graphic displays of geographic maps, building plans, floor plans, and mechanical and electrical system schematics. These graphics shall be capable of displaying all point information from the database including any attributes associated with each point (i.e., engineering units, etc.). In addition, operators shall be able to command equipment or change setpoints from a graphic through the use of the mouse
- F. Screen Penetration: The operator interface shall allow users to access the various system graphic screens via a graphical penetration scheme by using the mouse to select from menus or 'button' icons. Each graphic screen shall be capable of having a unique list of other graphic screens that are directly linked through the selection of a menu item or button icon.
- G. Dynamic Data Displays: Dynamic physical point values shall automatically updated at a minimum frequency of six (6) updates per minute without operator intervention. Point value fields shall be displayed with a color code depicting normal, abnormal, override and alarm conditions.

- H. Point Override Feature: Each displayed point shall be individually enabled/disabled to allow mouse-driven override of digital points or changing of analog points. Such overrides or changes shall occur in the control unit, not just in the workstation software. The graphic point override feature shall be subject to password level protection. Points that are overridden shall be reported as an alarm, and shall be displayed in a coded color. The alarm message shall include the operator's user name. A list of points that are currently in an override state shall be available through menu selection.
- I. Submit all Graphics per Section 25 00 00.
- J. Dynamic Symbols: Provide a selection of standard symbols that change in appearance based on the value of an associated point.
 - 1. Analog symbol: Provide a symbol that represents the value of an analog point as the length of a line or linear bar.
 - 2. Digital symbol: Provide symbols such as switches, pilot lights, rotating fan wheels, etc. to represent the value of digital input and output points.
 - 3. Point Status Color: Graphic presentations shall indicate different colors for different point statuses. (For instance, green = normal, red = alarm, gray (or '???') for non-response.)
- K. Graphics Development Package: Graphic development and generation software shall be provided to allow the user to add, modify, or delete system graphic displays.
 - 1. The Contractor shall provide libraries of pre-engineered screens and symbols depicting standard air handling unit components (e.g. fans, cooling coils, filters, dampers, etc.), mechanical system components (e.g., pumps, chillers, cooling towers, boilers, etc.), complete mechanical systems (e.g. constant volume-terminal reheat, VAV, etc.) and electrical symbols.
 - 2. The Graphic Development Package shall use a mouse or similar pointing device to allow the user to perform the following:
 - a. Define symbols.
 - b. Position items on graphic screens.
 - c. Attach physical or virtual points to a graphic.
 - d. Define background screens.
 - e. Define connecting lines and curves.
 - f. Locate, orient and size descriptive text.
 - g. Define and display colors for all elements.
 - h. Establish correlation between symbols or text and associated system points or other displays.
 - i. Create hot spots or link triggers to other graphic displays or other functions in the software.

2.15 REMOTE PERSONAL COMPUTER WORKSTATION GRAPHIC SOFTWARE

- A. Remote graphic operator software shall provide all the functionality specified for the local graphic software. It shall also provide for dial-up communications using the specified modems via commercial telephone lines to connect to the Local Supervisory or Primary LAN, and using the Internet.

- B. Software shall not require graphic images to be sent across the phone lines or 56Kbps or slower Internet connection. Graphic images shall reside on the remote operator workstation hard drive and all licenses must be provided for the graphic software on the remote machine. Exceptions to this requirement include:
 - 1. System configuration uses an Internet server and presents web pages that can be pulled up using a standard browser.
 - 2. System configuration uses an Internet server and presents the standalone application running locally but controlled via a remote browser. Operator Interface Graphical Software application must therefore support multi-instancing to allow multiple simultaneous remote connections and use of the graphic software.
- C. Software shall be capable of initiating communication to the any LAN, upon user command, to perform all specified functions. Software shall be capable of initiating communication to the LANs in accordance with user-programmed time schedules to upload trend and report data. Software shall be capable of communicating from the LAN in accordance with user-programmed time schedules to report alarms, upload trend, and report data. Software shall automatically terminate the communication whenever all applications requiring modem connection are closed.

PART 3 - EXECUTION

3.01 SYSTEM CONFIGURATION

- A. Contractor shall thoroughly and completely configure BAS system software, supplemental software, network communications, CSS, OWS, remote operator workstation, portable operators terminal, printer, and remote communications.

3.02 SITE-SPECIFIC APPLICATION PROGRAMMING

- A. Provide all database creation and Site-specific application control programming as required by these Specifications, national and local standards and for a fully functioning system. Provide all initial Site-specific application programming and thoroughly document programming. Generally meet the intent of the written sequence of operation. It is the Contractor's responsibility to request clarification on sequence issues that require such clarification.
- B. All Site-specific programming shall be fully documented and submitted for review and approval, both prior to downloading into the panel, at the completion of functional performance testing, and at the end of the Warranty Period.
- C. All programming, graphics and data files must be maintained in a logical system of directories. All file names shall adhere to the naming convention format as established in The University's Standard Acronyms documentation. All files developed for the Project will be the property of The University and shall remain on the workstation(s)/server(s) at the completion of the Project.

3.03 PASSWORD SETUP

- A. Set up the following password levels to include the specified capabilities:
 - 1. Level 1: (Owner's BAS Administrator):
 - a. Level 2 capabilities.
 - b. View, add, change and delete user names, passwords, password levels.
 - c. All unrestricted system capabilities including all network management functions.

2. Level 2: (Programmer):
 - a. Level 3 capabilities.
 - b. Configure system software.
 - c. Modify control unit programs.
 - d. Modify graphic software.
 - e. Essentially unrestricted except for viewing or modifying user names, passwords, password levels.
 3. Level 3: (Senior HVAC Technician):
 - a. Level 4 capabilities.
 - b. Override output points.
 - c. Change setpoints.
 - d. Change equipment schedules.
 - e. Exit BAS software to use third party programs.
- B. Contractor shall assist Owner's operators with assigning user names, passwords and password levels.
- 3.04 POINT PARAMETERS
- A. Provide the following minimum programming for each analog input:
1. Name.
 2. Address.
 3. Scanning frequency or COV threshold.
 4. Engineering units.
 5. Offset calibration and scaling factor for engineering units.
 6. High and low alarm values and alarm differentials for return to normal condition.
 7. High and low value reporting limits (reasonableness values), which shall prevent control logic from using shorted or open circuit values.
 8. Default value to be used when the actual measured value is not reporting. This is required only for points that are transferred across the primary and/or secondary controlling networks and used in control programs residing in control units other than the one in which the point resides. Events causing the default value to be used shall include failure of the control unit in which the point resides, or failure of any network over which the point value is transferred.
 9. Selectable averaging function that shall average the measured value over a user selected number of scans for reporting.
- B. Provide the following minimum programming for each analog output:
1. Name.

2. Address.
 3. Output updating frequency.
 4. Engineering units.
 5. Offset calibration and scaling factor for engineering units.
 6. Output Range.
 7. Default value to be used when the normal controlling value is not reporting.
- C. Provide the following minimum programming for each digital input:
1. Name.
 2. Address.
 3. Engineering units (on/off, open/closed, freeze/normal, etc.).
 4. Debounce time delay.
 5. Message and alarm reporting as specified.
 6. Reporting of each change of state, and memory storage of the time of the last change of state.
 7. Totalization of on-time (for all motorized equipment status points), and accumulated number of off-to-on transitions.
- D. Provide the following minimum programming for each digital output:
1. Name.
 2. Address.
 3. Output updating frequency.
 4. Engineering units (on/off, open/closed, freeze/normal, etc.).
 5. Direct or Reverse action selection.
 6. Minimum on-time.
 7. Minimum off-time.
 8. Status association with a DI and failure alarming (as applicable).
 9. Reporting of each change of state, and memory storage of the time of the last change of state.
 10. Totalization of on-time (for all motorized equipment status points), and accumulated number of off-to-on transitions.
 11. Default value to be used when the normal controlling value is not reporting.

3.05 TRENDS

- A. Contractor shall establish and store trend logs. Trend logs shall be prepared for each physical input and output point, and all dynamic virtual points such as setpoints subject to a reset schedule, intermediate setpoint values for cascaded control loops, and the like as approved by The University.

- B. The University will analyze trend logs of the system operating parameters to evaluate normal system functionality. Contractor shall establish these trends and ensure they are being stored properly.
 - 1. Data shall include a single row of field headings and the data thereafter shall be contiguous. Each record shall include a date and time field or single date stamp. Recorded parameters for a given piece of equipment or component shall be trended at the same intervals and be presented in a maximum of two separate 2-dimensional formats with time being the row heading and field name being the column heading.
- C. Sample times indicated as COV (\pm) or change-of-value mean that the changed parameter only needs to be recorded after the value changes by the amount listed. When output to the trending file, the latest recorded value shall be listed with any given time increment record. The samples shall be filled with the latest values also if the points include different time intervals. If the BAS does not have the capability to record based on COV, the parameter shall be recorded based on the interval common to the unit.
- D. Trending intervals or COV thresholds shall be dictated by The University upon system start-up.
- E. The Contractor shall demonstrate functional trends as specified for a period of 30 days after successful system demonstration before final acceptance of the system.

3.06 TREND GRAPHS

- A. Prepare controller and workstation software to display graphical format trends. Trended values and intervals shall be the same as those specified
- B. Lines shall be labeled and shall be distinguishable from each other by using either different line types, or different line colors.
- C. Indicate engineering units of the y-axis values; e.g. degrees F., inches w.g., Btu/lb, percent open, etc.
- D. The y-axis scale shall be chosen so that all trended values are in a readable range. Do not mix trended values on one graph if their unit ranges are incompatible.
- E. Trend outside air temperature, humidity, and enthalpy during each period in which any other points are trended.
- F. All points trended for one HVAC subsystem (e.g. air handling unit, chilled water system, etc.) shall be trended during the same trend period.
- G. Each graph shall be clearly labeled with HVAC subsystem title, date, and times.

[Engineer must edit the following to be Project specific.]

3.07 ALARMS

- A. This Section supersedes and over rules all references to building automation alarms in the Contract Documents, including all sequences of operations and other sections of the BAS Specification in regards to alarms. The Contractor shall support and not impede direct negotiations between the BAS Provider and The University to allow the customizing necessary for customizing alarms and alarm parameters to meet The University's needs.
- B. The BAS Provider is required to submit a point summary to confirm building automation point names as specified herein The BAS Provider shall submit this point summary with the addition of identifying all alarms which includes detail information on the alarm parameters to the UTHSCSA for approval prior to the beginning of any Commissioning process of the building automation system.

- C. The UTHSCSA will provide the format form to the BAS Provider upon request. The University shall grant approval of alarms to be verified through Commissioning by issuing the approved alarms to the Contractor. The approved alarms issued to the Contractor shall be used for the Functional Test Procedures alarms tested. The Contractor shall initiate the start of this process immediately after building automation submittal have been approved and monitor the progress to ensure the construction schedule is not delayed.
- D. Analog Input Alarms:
1. Duct Static Pressure:
 - a. Alarm @ \pm 0.3 inches from set point for 5 minutes.
 - b. Normal @ \pm 0.2 inches from set point for 5 minutes.
 - c. Alarm is active after fan is proven ON for the minimum time necessary to allow the sensor to be within the alarm parameter.
 - d. Alarm is deactivated after fan is proven OFF.
 2. Duct Air Temperatures:
 - a. Alarm @ \pm 2.0 degrees F from set point for 5 minutes.
 - b. Normal @ \pm 1.0 degrees F from set point for 5 minutes.
 - c. Alarm is active after fan is proven ON for the minimum time necessary to allow the sensor to be within the alarm parameter.
 - d. Alarm is deactivated after fan is proven OFF.
 3. Space or Room Temperature:
 - a. Typically will be alarmable with adjustable limits and time delay.
 4. Duct or Space Humidity:
 - a. Alarm @ (+) 15 percent from set point (60 percent) for 5 minutes.
 - b. Alarm @ (-) 20 percent from set point (60 percent) for 5 minutes.
 - c. Normal @ 5 percent from offset alarm parameters for 5 minutes.
 - d. Point is always ready to alarm.
 5. Water temperature sensors which are inputs to control loops:
 - a. Submit reasonable alarm parameter to prevent nuisance alarming.
 - b. Owner will confirm alarm.
 6. All other Analog Inputs:
 - a. BAS Provider shall utilize their expertise and recommend not less than three (3) analog input alarms which protect The University's best interests.
 - b. Identify recommended alarms in submittal.
 - c. Owner will confirm alarm.

E. Digital Inputs Alarms:

1. Proofs (current sensor, air flow switches, water differential pressure switches etc).
 - a. Digital inputs paired with BAS digital output will have the ability to alarm at all times.
 - b. Alarm will delay for the reason time needed when the state of the digital output changes to prevent nuisance alarms.
 - c. Point is in alarmed condition when the value of the digital input does not equal the value of the digital output after the time delay.
 - d. Point is in the Normal condition when the value of the digital input equals the value of the digital output after the time delay.
 - e. Digital input proofs without a paired digital output shall not alarm and be for monitoring purposes only.
2. Safeties (high static cutout, freeze condition, excessive vibration, high humidity cutout, VFD fault, etc.).
 - a. The digital input shall be always ready to alarm without delay.
 - b. The digital input shall display "ALARM" at the Alarm screen when activated.
 - c. The digital input shall display "NORMAL" at the Alarm screen when deactivated.
3. Monitoring Digital Inputs (auxiliary drain pan alarm, Liebert Unit general alarm, water detector, etc) the exception is air filter differential pressure switch.
 - a. All digital inputs which "deactivated" is the normal state of planed operations shall alarm when the normal state of planed operation changes.
 - b. The digital input shall display "ALARM" at the Alarm screen when activated.
 - c. The digital input shall display "NORMAL" at the Alarm screen when deactivated.
4. Air Filters:
 - a. Typically will not be alarmable.
 - b. Submit as not alarmable and Owner will confirm.
 - c. The digital input shall display "DIRTY" when activated.
 - d. The digital input shall display "CLEAN" when deactivated

F. Analog Outputs Alarms:

1. All Analog Outputs:
 - a. BAS Provider shall utilize their expertise and recommend any analog output alarms which protect The University's best interests.
 - b. Identify recommended alarms in submittal.
 - c. Owner will confirm any alarms.

G. Digital Outputs Alarms:

1. Refer to digital inputs paired with digital outputs as specified herein.
2. All Digital Outputs:
 - a. BAS Provider shall utilize their expertise and recommend any digital output alarms which protect The University's best interests.
 - b. Identify recommended alarms in submittal.
 - c. Owner will confirm any alarms.
- H. Nuisance Alarms: All alarms which have been identified by The University as a nuisance alarm due to numerous times in and out of alarm, shall be addressed and corrected by the Contractor in a manner that The University has approved.
- I. See requirements for additional equipment-specific alarms specified in the Contract Documents.

3.08 GRAPHIC SCREENS

[Engineer must provide electronic control design floor plans.]

- A. Floor Plan Screens: The Contract Document Drawings will be made available to the Contractor in AutoCAD LT 2002 format upon request. These Drawings may be used only for developing backgrounds for specified graphic screens; however The University does not guarantee the suitability of these Drawings for the Contractor's purpose. Graphic Screens shall be submitted for approval.
 1. Provide graphic floor plan screens for each floor [wing] [tower] [other] of each building.
 - a. Indicate the location of all equipment that is not located on the equipment room screens.
 - b. Indicate the location of temperature sensors associated with each temperature-controlled zone (i.e., VAV terminals, fan-coils, single-zone AHUs, etc.) on the floor plan screens.
 - c. Display the space temperature point adjacent to each temperature sensor symbol. Use a distinct line symbol to demarcate each terminal unit zone boundary. Use distinct colors to demarcate each air handling unit zone.
 - d. Mechanical floor plan Drawings will be made available to the Contractor upon request for the purpose of determining zone boundaries. Indicate room numbers as provided by The University.
 - e. Provide a drawing link from each space temperature sensor symbol and equipment symbol shown on the graphic floor plan screens to each corresponding equipment schematic graphic screen.
 2. Provide graphic floor plan screens for each mechanical equipment room and a plan screen of the roof. Indicate the location of each item of mechanical equipment. Provide a drawing link from each equipment symbol shown on the graphic plan view screen to each corresponding mechanical system schematic graphic screen.
 3. If multiple floor plans are necessary to show all areas, provide a graphic building key plan. Use elevation views and/or plan views as necessary to graphically indicate the location of all of the larger scale floor plans. Link graphic building key plan to larger scale partial floor plans. Provide links from each larger scale graphic floor plan screen to the building key plan and to each of the other graphic floor plan screens.
 4. Provide a graphic Site plan with links to and from each building plan.

- B. System Schematic Screens: Provide graphic system schematic screen for each HVAC subsystem controlled with each I/O point in the Project appearing on at least one graphic screen. System graphics shall include flow diagrams with status, setpoints, current analog input and output values, operator commands, etc. as applicable. General layout of the system shall be schematically correct. Input/output devices shall be shown in their schematically correct locations. Include appropriate engineering units for each displayed point value. Verbose names (English language descriptors) shall be included for each point on all graphics; this may be accomplished by the use of a pop-up window accessed by selecting the displayed point with the mouse. Indicate all adjustable setpoints on the applicable system schematic graphic screen or, if space does not allow, on a supplemental linked-setpoint screen.
1. Provide graphic screens for each air handling system. Indicate outside air temperature and enthalpy, and mode of operation as applicable (i.e., occupied, unoccupied, warm-up, cool-down). Link screens for air handlers to the heating system and cooling system graphics. Link screens for supply and exhaust systems if they are not combined onto one screen.
 2. Provide a graphic screen for each zone. Provide links to graphic system schematic screens of air handling units that serve the corresponding zone.
 3. Provide a cooling system graphic screen showing all points associated with the chillers, cooling towers and pumps. Indicate outside air dry-bulb temperature and calculated wet-bulb temperature. Link screens for chilled water and condenser water systems if they cannot fit onto one cooling plant graphic screen.
 4. Link screens for heating and cooling system graphics to utility history reports showing current and monthly electric uses, demands, peak values, and other pertinent values.
- C. Bar Chart Screens: On each graphic Bar Chart Screen, provide drawing links to the graphic air handling unit schematic screens.
1. Provide a graphic chilled water valve screen showing the analog output signal of all chilled water valves in a bar chart format, with signals expressed as percentage of fully open valve (percentage of full cooling). Indicate the discharge air temperature and setpoint of each air handling unit, cooling system chilled water supply and return temperatures and the outside air temperature and humidity on this graphic. Provide drawing links between the graphic cooling plant screen and this graphic screen.
 2. Provide a graphic heating water valve screen showing the analog output signal of all air handling unit heating water valves in a bar chart format, with signals expressed as percentage of fully open valve (percentage of full heating). Indicate the temperature of the controlled medium (such as AHU discharge air temperature or zone hot water supply temperature) and the associated setpoint and the outside air temperature and humidity.
- D. Alarms: Each programmed alarm shall appear on at least one graphic screen. In general, alarms shall be displayed on the graphic system schematic screen for the system that the alarm is associated with (for example, chiller alarm shall be shown on graphic cooling system schematic screen). For all graphic screens, display analog values that are in a 'high alarm' condition in a red color, 'low alarm' condition in a blue color. Indicate digital values that are in alarm condition in a red color.

END OF SECTION 25 55 00 00E15 00

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 25 55 00 00F - BAS COMMUNICATION DEVICES (RETROFIT)

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 SUMMARY

- A. Section includes:
 - 1. Local Supervisory LAN Gateways/Routers.
 - 2. Chiller Controls Interface Device (CID).
 - 3. Variable Frequency Drives (VFD's).
- B. Provide all interface devices and software to provide an integrated system connecting BCs, AACs, ASCs and Gateways to The University's Wide Area Network (MDACC WAN).

1.03 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with the applicable requirements and standards addressed within all references.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 LOCAL SUPERVISORY LAN GATEWAYS/ROUTERS

- A. The Supervisory Gateway shall be a microprocessor-based communications device that acts as a gateway/router between the Supervisory LAN CSSs or OWS and the Primary LAN.
- B. The Gateway shall perform information translation between the Primary LAN and the Local Supervisory LAN, which is 100 Mbps Ethernet TCP/IP and shall use BACnet over IP.
- C. The gateway shall contain its own microprocessor, RAM, battery, real-time clock, communication ports, and power supply as specified for a BC in Section 25 14 10. Each gateway/router shall be mounted in a lockable enclosure unless it is a PC that also serves as an OWS.

- D. The gateway/router shall allow centralized overall system supervision, operator interface, management report generation, alarm annunciation, acquisition of trend data, and communication with control units. It shall allow system operators to perform the following functions from the CSS, OWSs, and POTs:
 - 1. Configure systems.
 - 2. Monitor and supervise control of all points.
 - 3. Change control setpoints.
 - 4. Override input values.
 - 5. Override output values.
 - 6. Enter programmed start/stop time schedules.
 - 7. View and acknowledge alarms and messages.
 - 8. Receive, store and display trend logs and management reports.
 - 9. Upload/Download programs, databases, etc. as specified.
- E. Upon loss of power to the Gateway, the battery shall provide for minimum 100 hour backup of all programs and data in RAM.
- F. The Gateway shall be transparent to control functions and shall not be required to control information routing on the Primary LAN

2.03 CHILLER CONTROLS INTERFACE DEVICE (CID)

- A. The CID shall be a microprocessor-based communications device that acts as a gateway between the control protocol and the applicable chiller controller.
- B. The CID shall contain its own microprocessor, RAM, battery, communication ports and, power supply.
- C. Each CID shall support full bi-directional communications translation as more fully specified in Section 25 15 10.
- D. The following points shall be mapped as a minimum:
 - 1. CHW Supply and Return Temperatures.
 - 2. CW Supply and Return Temperatures.
 - 3. Power Consumption (kW).
 - 4. Percent of Power Consumption (compared to maximum).
 - 5. Bearing Temperature.
 - 6. Suction and Head Pressures.
 - 7. Suction and Head Temperatures.
 - 8. All available alarms; common alarm as minimum.
 - 9. Chiller Status.

10. Enable/Disable.
11. Current Limit Percent.
12. CHW Setpoint and Setpoint Reset.
13. Current Amperage.

2.04 VARIABLE FREQUENCY DRIVE INTERFACE

1. Enable / Disable.
2. Drive Speed in HZ.
3. Drive current.
4. Drive Alarms.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine areas and conditions under which control systems are to be installed. Do not proceed with Work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.02 INSTALLATION

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.
- C. Provide all interface devices and software to provide an integrated system.
- D. Closely coordinate with The University, or designated representative, to establish IP addresses and communications to assure proper operation of the building automation system with Owner's WAN.

END OF SECTION 25 55 00 00F30 10

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 00 00 00 - ELECTRICAL DEMOLITION

PART 1 -- GENERAL

1.1 WORK INCLUDED

- A. Electrical demolition for remodeling.
- B. Electrical/control portion of HVAC work covered by Division 23 pertaining electrical demolition shall follow the requirement set forth by this and related electrical specifications.

1.2 RELATED WORK

- A. This Section shall be used in conjunction with the following other specifications and related Contract Documents to establish the total requirements for minor electrical demolition for remodeling.
 - 1. Section 26 00 00.UT - Basic Electrical Requirements. Hereafter all UT Spec Sections refer to UT Specs found at <https://apps.utsystem.edu/engineeringspecs/Download2.aspx>
- B. In the event of conflict regarding minor electrical demolition requirements between this Section and any other Section, the provisions of this Section shall govern.

PART 2 -- PRODUCTS

2.1 MATERIALS AND EQUIPMENT

- A. Materials and equipment for patching and extending work: as specified in individual Sections.
- B. Provide all materials necessary for work.

PART 3 -- EXECUTION

3.1 EXAMINATION

- A. All demolitions or modifications to existing systems shall be coordinated through UTHSCSA's Representative. Demolition drawings are based on casual field observation and existing record documentations. Therefore the accuracy or exactness of the drawings is not guaranteed. The Contractor shall verify that field measurements and circuiting arrangements are as shown on Drawings and abandoned wiring and equipment serve only abandoned facilities. The Contractor shall be responsible for reporting discrepancies to Engineer before disturbing existing installation.
- B. Beginning of demolition means Contractor accepts existing conditions.

3.2 PREPARATION

- A. Disconnect electrical systems in walls, floors, and ceilings scheduled for removal. Provide temporary wiring and connections to maintain remaining systems in service during demolition and/or modification. UTHSCSA reserves the right up to 24 hours prior to any scheduled event to delay or suspend shutdowns or outages to more convenient times at no additional cost.
- B. Existing Electrical Service: Maintain existing system in service until new system is complete and ready for service. No work shall begin without proper permits and authorizations. Disable system only to make switchovers and connections. Obtain permission from UTHSCSA at least three (3) weeks before partially or completely disabling system. Minimize outage duration. Make temporary connections to maintain service in areas adjacent to work area.
- C. Existing Fire Alarm System: Maintain existing system in service until new system is accepted. Disable system only to make switchovers and connections. Notify UTHSCSA at least three (3) weeks before partially or completely disabling system. Minimize outage duration. Provisions for manual fire watch shall be provided in areas where services are interrupted. Make temporary connections to maintain service in areas adjacent to work area.
- D. Existing Telephone System: Maintain existing system in service until new system is complete and ready for service. Disable system only to make switchovers and connections. Notify UTHSCSA at least three (3) weeks before partially or completely disabling system. Minimize outage duration. Make temporary connections to maintain service in areas adjacent to work area.

3.3 DEMOLITION AND EXTENSION OF EXISTING ELECTRICAL WORK

- A. Remove, relocate, and extend existing installations to accommodate new plan drawings.
- B. Remove exposed abandoned conduit, including abandoned conduit above accessible ceiling finishes full length from source to device. Cut embedded or concealed conduit flush with walls and floors, and patch surfaces to match.
- C. Disconnect abandoned outlets and remove devices. Remove abandoned outlets if conduit servicing them is abandoned and removed. Provide blank cover for abandoned outlet boxes that are not removed.
- D. Disconnect and remove abandoned panelboards and distribution equipment.
- E. Disconnect and remove electrical devices and equipment serving utilization equipment that has been removed.
- F. Disconnect and remove abandoned luminaires. Remove brackets, stems, hangers, and other accessories.
- G. Repair adjacent construction and finishes damaged during demolition and extension work.
- H. Maintain access to existing electrical installations that remain active. Modify installation or provide access panel as appropriate.
- I. Extend existing installations using materials and methods compatible with existing electrical installation or as specified.
- J. The level of completion shall be demonstrated to UTHSCSA's Representative.
- K. Where equipment is indicated to be demolished and returned to UTHSCSA, the Contractor shall include the delivery of this equipment to UTHSCSA's site storage area. Remove with care all equipment to be relocated. Repair or replacement of newly damaged equipment is the responsibility of the Contractor.

3.4 CLEANING AND REPAIR

- A. The Contractor shall follow UTHSCSA's clean work policy and shall include the removal of trash and demolished material from the building or work area at the end of the each day and removal from the site once a week.
- B. The Contractor shall be responsible for repairing adjacent construction and finishes damaged during demolition and/or modification. The Contractor shall be responsible for the removal of ceiling tiles required in the demolition work. The Contractor shall be responsible for the replacement of damaged tiles and reinstallation of the ceiling prior to final acceptance.
- C. Panelboards: Clean exposed surfaces and check tightness of electrical connections. Replace damaged circuit breakers and provide closure plates for vacant positions. Provide typed circuit directory showing revised circuiting arrangement to UTHSCSA.
- D. Luminaires: Remove existing luminaires for cleaning. Use mild detergent to clean all exterior and interior surfaces; rinse with clean water and wipe dry. Replace lamps, ballasts, and broken electrical parts.

3.5 DISPOSITION OF MATERIAL AND EQUIPMENT

- A. Review with UTHSCSA materials that have been removed and are no longer required, to determine any which UTHSCSA may desire to keep. Deliver those materials that UTHSCSA desires to UTHSCSA's specified location.
- B. For those materials not required by UTHSCSA, dispose of them in accordance with applicable regulations.

END OF SECTION 26 00 00 0000 00

Task	Specification	Specification Description
26 01 00 00	26 00 00 00	Electrical Demolition

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 05 00 00 - BASIC ELECTRICAL MATERIALS AND METHODS**PART 1 GENERAL****1.1 WORK INCLUDED**

- A. Hinged cover enclosures and cabinets
- B. Contactors
- C. Control relays
- D. Push buttons, and selector switches
- E. Terminal blocks and accessories
- F. Penetration sealing systems (fire stops)
- G. Electrical/control portion of HVAC work covered by Division 23 pertaining basic electrical materials and methods shall follow the requirement set forth by this and related electrical specifications.

1.2 APPLICABLE CODES AND STANDARDS

- A. NFPA 70, National Electrical Code (latest edition)
- B. IEEE C2, National Electrical Safety Code, (latest edition)
- C. Applicable publications of NEMA, ANSI, IEEE, and ICEA
- D. Underwriters Laboratories, Inc. Standards (UL)
- E. Federal, city, state, and local codes and regulations having jurisdiction
- F. OSHA requirements
- G. NEMA 250 - Enclosures for Electrical Equipment (1000 Volts Maximum)
- H. NEMA WD 1 – General-Purpose Wiring Devices
- I. UL 98 - Enclosed Switches

1.3 INTENT

- A. This Section is not, and shall not be interpreted to be, a complete listing of all materials or equipment that is Contractor furnished and erected. It is intended to clarify and further define the Contractor scope of work, procurement, and responsibilities for those incidental materials that are not specified by other specifications, but important to a complete and operational system.
- B. The Contractor shall furnish all equipment and materials, whether or not specified in other Sections of specification and on drawings, for installation and connection required to place equipment into satisfactory operating service. The Contractor shall review the Drawings and specifications for clarification of his responsibility in the handling and installation of equipment and material. Where applicable, and not in contradiction with the Drawings and specifications, the Contractor shall install and connect the equipment in accordance with the manufacturer's recommendations and instructions.
- C. All materials and equipment shall be of types and manufacturer specified. Should materials or equipment so specified be unattainable, the Contractor shall submit the description and manufacturer's literature, reason for substitution request and shall secure the approval of the Engineer before substitution of other material or equipment is purchased. This Section establishes performance requirements and the quality of equipment acceptable for use.

1.4 SUBMITTALS

- A. Provide submittals in addition and in accordance with Section 26 00 00.UT, Basic Electrical Requirements, and Division 01 UT.

- B. Submit manufacturer's literature and specification data sheets for each type of basic material, which is applicable to the project.

1.5 DELIVERY, STORAGE AND HANDLING

- A. Provide factory-wrapped waterproof flexible barrier material for covering materials, where applicable, to protect against physical damage in transit. Damaged materials shall be removed from project site.
- B. In their factory-furnished coverings, store materials in a clean, dry indoor space, which provides protection against the weather.

PART 2 PRODUCTS

2.1 ENCLOSURES AND CABINETS

- A. Enclosures and cabinets for all Contractor furnished electrical equipment and devices shall be suitable for the location and environmental conditions and shall be of the NEMA type as shown in Table 26 05 00 00-1. Exceptions shall be specifically designated on the Drawings.

Table 26 05 00 00-1 Enclosures		
Location	Environment	Enclosure Type
Indoor Utility	Dry, subject to dust, falling dirt and dripping non-corrosive liquids	NEMA 12
Indoor	Clean, Dry	NEMA 1
Outdoor	Subject to windblown dust and rain, splashing water, and hose-directed water	NEMA 4
Indoor	Wet, subject to hose-directed water	NEMA 4
Outdoor	Subject to falling rain, sleet, and external ice formation	NEMA 3R
Indoor or Outdoor	Subject to corrosion, windblown dust and rain, splashing water and hose-directed water	NEMA 4X

- B. Enclosures shall have the following properties:
1. Hinged Cover Enclosures: NEMA 250.
 - a. Type 1: Steel.
 - b. Type 4: Steel with gasket door, rain tight.
 - c. Type 4X: Stainless steel, (polycarbonate or fiberglass reinforced polyester (FRP) in corrosive areas).
 - d. Type 12: Steel with gasketed door, dust-tight.
- C. Finish: Exterior, manufacturer's standard gray enamel finish; interior, white enamel finish.
- D. Covers: Continuous hinge, held closed by flush latch operable by hasp and staple for padlock. Where required for NEMA ratings, gaskets shall be neoprene rubber.
- E. Interior Panel for Mounting Terminal Blocks or Electrical Components: 14-gauge steel, white enamel finish.
- F. Provide protective pocket inside front cover with schematic diagram, connection diagram, and layout drawing of control wiring and components within enclosure.

- G. Forced Ventilation: Where indicated, provide 115V single-phase fan motor, filtered with air plenum, finger guard, and stainless steel grille. Washable aluminum filter, accessible for cleaning from outside the enclosure; 20,000-hour continuous operation without lubrication or service. Provide matching exhaust grille assembly. Mount fan in lower side corner, exhaust grille in opposite upper side corner.

2.2 CONTACTORS

- A. Acceptable Manufacturers
 - 1. General Electric Company
 - 2. Square D Company
 - 3. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.
- B. Contactors: NEMA ICS 2; electrically held or mechanically held as indicated on Drawings. Two-wire control for electrically held contactors and three-wire control for mechanically held contactors.
- C. Enclosure: NEMA 1 unless indicated otherwise on Drawings.
- D. Control Transformer: Provide when indicated on Drawings. Minimum capacity shall be 100 VA. Provide two primary and one secondary fuse protection.
- E. Coil operating voltage; 110 volts, 60 Hz or as per drawings.
- F. Size: NEMA ICS 2; size as indicated on Drawings.
- G. Contacts: As indicated on Drawings; 600 Volts, 60 Hz.
- H. Provide solderless pressure wire terminals on bus terminals suitable for mounting in panelboard as indicated on Drawings.

2.3 CONTROL RELAYS

- A. Acceptable Manufacturers
 - 1. General Electric
 - 2. Cutler-Hammer
 - 3. Square D Company
 - 4. Allen-Bradley
 - 5. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.
- B. Provide magnetic control relays, NEMA Class A: A300 (300 volts, 10 amps continuous, 7,200 VA make, 720 VA break), industrial control type with field-convertible contacts, and meeting the requirements of NEMA ICS 2.
- C. Where time delay relays are specified or required, unless otherwise noted, provide magnetic control relays with a solid-state timer attachment adjustable from 0.2 to 60 seconds (minimum) or with range as indicated. Provide with field convertible from ON delay to OFF delay and vice versa.
- D. Where latching (mechanically held) relays or motor thermal detector relays are specified, provide magnetic control relays with mechanical latch attachment with unlatching coil and coil clearing contacts.

2.4 PUSH BUTTONS, AND SELECTOR SWITCHES

- A. Acceptable Manufacturers
 - 1. Allen-Bradley
 - 2. Square D
 - 3. Cutler Hammer
 - 4. Seimens

5. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.
- B. For non-hazardous, indoor, dry locations, including control panels, and individual stations, provide heavy duty, NEMA 13, oil tight type pushbuttons, indicating lights, selector switches, and stations for these devices.
- C. For non hazardous, outdoor, or normally wet locations, or where otherwise indicated, provide heavy duty corrosion resistant, NEMA 4, watertight type pushbuttons, indicating lights, or selector switches mounted in NEMA 4 watertight enclosures. Provide special gasketing required to make complete station watertight.
- D. For hazardous locations, provide control station listed by UL for Class I, Divisions 01 and 02, Groups C and D; Class II, Division 01 and 02, Groups E, F, and G. Specific type shall be in accordance with area classification as indicated on the Drawings.
- E. For corrosive locations, provide nonmetallic components and enclosures meeting NEMA Type 4X.
- F. Provide devices meeting the requirements of NEMA ICS 2, and having individual, extra large nameplates indicating their specific function. Provide push-button stations with laminated plastic nameplates indicating the drive they control. Provide contacts with NEMA designation rating A600. Install provisions for locking pushbuttons and selector switches in the OFF position wherever lockout provisions are indicated. Nameplates shall be as specified in Section 16195.
- G. Utilize selector switches having standard operating levers. All indicating lights shall be LED type, push-to-test type. Provide ON or RUN lights colored red. Provide OFF or STOP lights colored green.

2.5 TERMINAL BLOCKS AND ACCESSORIES

A. Signal And Control Terminals

1. Acceptable Manufacturers

- a. Phoenix Contact
- b. TE Connectivity
- c. Weidmüller
- d. Entrelec
- e. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements substitution requirement.

2. Signal and Control Terminals: Modular construction type, DIN 46 277/3 channel mounted; screw clamp compression connectors, rated 300 volts. Minimum terminal width of 0.24-inch, capable of holding two No. 12 or two No. 14 AWG conductors in each connector. Terminal identification numbers shall be thermoset characters (black) on a white background. Provide 25 percent spare terminals.

B. Power Terminals

1. Acceptable Manufacturers

- a. TE Connectivity
- b. IlSCO
- c. Square D Company
- d. Burndy
- e. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in 26 00 00 and Division 01 for substitution requirement.

2. Power Terminals: Unit construction type, closed-back type, with tubular pressure screw connectors, rated 600 volts, size as required. Provide 25 percent spare terminals. **All terminals shall be copper, AL/CU are not acceptable.**

2.6 PENETRATION SEALING SYSTEMS (FIRE STOPS)

- A. Provide penetration sealing where conduit, cable tray, etc. pass through rated walls, ceilings, and floors. See Section 07 84 00, Fire Stopping, for sealing requirements and systems.

2.7 UL LISTING

- A. All equipment and materials shall be new and conform to the requirements of this Section. All equipment and materials shall be UL listed, and shall bear their label whenever standards have been established and level service is regularly furnished. All equipment and materials shall be of the best grade of their respective kind for the purpose. Determination of the grade shall be by the engineer.

PART 3 EXECUTION

3.1 FABRICATION - CONTROL ENCLOSURES AND CABINETS

- A. Shop assemble enclosures and cabinets housing terminal blocks or electrical components in accordance with NEMA ICS 6.

3.2 INSTALLATION - ENCLOSURES AND CABINETS

- A. Install cabinets and enclosures plumb; anchor securely to wall and structural supports at each corner, minimum. Direct attachment to dry wall is not permitted.
- B. Provide accessory feet for freestanding equipment enclosures.
- C. Install trim plumb.

3.3 ERECTION OF EQUIPMENT

- A. Manufacturer's Installation Instructions: Where furnished or called for by the manufacturer equipment manufacturer's installation instructions shall be considered a part of this specification and fully complied with. Where the Contractor damages the finishing coat of paint in existing or completed areas, he shall refinish with matching paint.
- B. Mounting Heights: Individual safety switches and buttons and devices shall normally be installed at the following mounting heights, when not specified on the Drawings.
 1. Safety Switches: 6 feet 0 inches (to top).
 2. Pushbuttons: 4 feet 0 inches (to center).
 3. Control Panels: 6 feet 0 inches (to top).
- C. Mounting: Equipment and control devices shall be supported independent of conduit connections. Panels or cabinets shall be mounted on metal frame supports independently of equipment. Control devices and metal enclosures shall be bolted or welded to steel channel or steel plate. All electrical equipment and devices not covered by the above, such as miscellaneous switches, thermostats, duct switches, temperature switches, floats, photoelectrical devices, and similar electrical devices shall be located and set as suitable for the application. Where control panels are provided as part of the equipment racks mounted on the floor, they shall be provided to support conduits and flexible connections to control panels.

3.4 COORDINATION

- A. Exact location of all electrical equipment, devices and fixtures shall be determined in field by contractor and verified by Engineer's field representative prior to installation.

END OF SECTION 26 05 00 00

THIS PAGE INTENTIONALLY LEFT BLANK

Task	Specification	Specification Description
26 05 00 00	26 00 00 00	Electrical Demolition

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 05 19 00 - CABLE, WIRE, AND CONNECTORS, 600 VOLT**PART 1 GENERAL****1.1 WORK INCLUDED**

- A. Building wire.
 - 1. Power distribution circuitry.
 - 2. Control system circuitry. (including HVAC, Div. 23)
 - 3. Lighting circuitry.
 - 4. Appliance and equipment circuitry.
 - 5. Motor-branch circuitry.
 - 6. Outdoors lighting and power.
 - 7. Other systems using electrical power.
- B. Cable.
- C. Wiring connections and terminations.
- D. Electrical/control portion of HVAC work covered by Division 23 pertaining 600 volt cable, wire and connectors shall follow the requirement set forth by this specification.

1.2 REFERENCES

- A. NEMA WC 3 - Rubber-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy.
- B. NEMA WC 5 - Thermoplastic-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy.
- C. ANSI/UL 83 – Thermoplastic-Insulated Wire and Cables
- D. NFPA 70 – National Electrical Code, latest edition
- E. NETA – Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.
- F. Where application of National Electrical Code, trade association standards or publications appears to be in conflict with the requirements of this Section, the Architect/Engineer shall be asked for an interpretation.

1.3 SUBMITTALS

- A. Provide submittals in accordance with and in addition to General Conditions for submittal requirement.
- B. Submit manufacturer's literature and specification data sheets for each item of cable, wire connectors, or product marked by line item.
- C. Qualification of cable and wire manufacturer: Company specializing in manufacturing products specified in this Section with minimum ten years experience.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Provide factory-wrapped waterproof flexible barrier material for covering wire and cable wood reels, where applicable; and weather resistant fiberboard containers for factory packaging of cable, wire and connectors, to protect against physical damage in transit. Damaged cable, wire or connectors shall be removed from project site.
- B. Store cable, wire and connectors in a clean, dry indoor space in their factory-furnished coverings, which provides protection against the weather.

PART 2 PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. Generally, cable, wire and connectors shall be of manufacturer's standard materials, as indicated by published product information.
- B. Provide factory-fabricated wire of the size, rating, material and type as indicated for each service. Where not indicated, provide proper selection as required to comply with installation requirements and with NEC standards. The minimum size wire to be used for power or lighting circuits shall be #12 copper with insulation as noted below. Minimum size for control shall be #14 copper.
- C. The conductors of wires and cables shall be of copper (tinned where specified), and have conductivity in accordance with the standardization rules of the IEEE. The conductor and each strand shall be round and free of kinks and defects.
- D. Grounding conductors, where insulated, shall be colored solid green or identified with green color as required by the NEC. Conductors intended as a neutral shall be colored solid white, or identified as required by the NEC. All motor or equipment power wiring shall be colored according to Section 26 05 53.UT, Electrical Identification.
- E. All cable specified for use in tray shall be multiconductor and shall have an outer jacket of flame-retardant, moisture and sunlight resistant polyvinyl chloride (PVC) and shall be UL and NEC approved type for tray installation. Cable installed in cable tray outdoors shall have a jacket that is UV resistant chlorinated polyethylene (CPE) or polyvinyl chloride (PVC), rated 90°C per UL Standard 1277.
- F. All low voltage power and control cable installed in open cable tray above ceilings used for return air shall be plenum rated. Where tray cable is not available in size and type required, conductors shall be installed in conduit.
- G. Use copper lugs.

2.2 BUILDING WIRE

- A. Thermoplastic-insulated Building Wire: NEMA WC 5.
- B. Rubber-insulated Building Wire: NEMA WC 3.
- C. Feeders and Branch Circuits Larger Than 10 AWG: 98% conductivity copper, soft-drawn, stranded conductor, 600 volt insulation, THHN Use XHHW conductors where installed in conduit underground.
- D. Feeders and Branch Circuits 10 AWG and Smaller: 98% conductivity copper, soft-drawn, solid conductor, 600-volt insulation, THW/THHN.

2.3 REMOTE CONTROL AND SIGNAL CABLE

- A. 600 Volt Insulation Control Cable for Class 1 Remote Control and Signal Circuits, Type TC:
 - 1. Individual Conductors: 14 AWG, stranded copper, XHHW insulation. Rated 90 degrees C dry, 75 degrees C wet, color-coded per ICEA Method 1 plus one green equipment grounding conductor.
 - 2. Assembly: Bundle wrapped with cable tape and covered with an overall PVC jacket. Cable shall pass IEEE-1202 vertical tray ribbon-burner flame test (210,000 BTU) VW-1.
- B. Instrumentation Cable
 - 1. 300 Volt Instrumentation Cable, Multiple Pairs, Overall Shield, Type PLTC:
 - a. Individual Conductors: 18 AWG, stranded, tinned copper, flame retardant polyethylene or PVC insulated, rated 105 degrees C, black and white numerically printed and coded pairs.
 - b. Assembly: Individual twisted pairs having a 100 percent coverage aluminum-polyester shield and 20 AWG stranded tinned copper drain wire. Conductor bundle shall be shielded with 100 percent coverage overall aluminum-polyester shield complete with 20 AWG drain wire. All group shields completely isolated from each other. Bundle wrapped with cable tape and covered with an overall flame retardant PVC jacket. Cable shall pass IEEE-383 vertical tray flame test (70,000 BTU) UL1581.

C. Life Safety Systems Cable

1. All life safety system wiring shall be installed in dedicated conduit or raceway with adequate separation/shielding from all other systems.
2. Life safety systems wiring shall be as specified in the Section 28 31 20 UT– Zoned Fire Alarm and Smoke Detection Systems.

D. Security/Access Control/CCTV Cable

1. All security/access control wiring shall be installed in dedicated conduits.
2. Security/access control wiring shall be rated and as specified on drawings:

2.4 WIRING CONNECTIONS AND TERMINATIONS

- A. Provide factory-fabricated, metal connectors of the size, rating, material, type and class as indicated for each service. Where not indicated, provide proper selection as required to comply with installation requirements with NEC standards, and proper craftsmanship. Select from only following types, classes, kinds and styles.

1. Type:
 - a. Solderless pressure connectors
 - b. Crimp.
 - c. Threaded.
 - d. Insulated spring wire connectors with plastic caps for 10 AWG and smaller.
2. Class: Insulated.
3. Material: Copper (for CU to CU connection). No CU/AL connectors/terminals shall be allowed.
4. Style:
 - a. Insulated terminals. Use ring-terminal for control wiring. Use flange (fork) spade compression terminal for termination of stranded conductors at wiring devices, including ground connection.
 - b. Split bolt-parallel connector.
 - c. Pigtail connector.
 - d. Pre-insulated multi-tap connector.

PART 3 EXECUTION**3.1 INSPECTION**

- A. Installer must examine the areas and conditions under which cable, wire and connectors are to be installed and notify the Contractor in writing of conditions detrimental to the proper and timely completion of the work. Inspect wire and cable for physical damage. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 GENERAL WIRING METHODS

- A. Install electrical cable, wire and connectors as indicated, in accordance with the manufacturer's written instructions, the applicable requirements of NEC and the National Electrical Contractors Association's "Standard of Installation", and as required to ensure that products serve the intended functions.
- B. Coordinate cable and wire installation work with electrical raceway and equipment installation work, as necessary for proper interface. Do not install the conductors until raceway system is complete and properly cleaned.

- C. Cables shall be selected on the basis of their purpose and UL listing. Generally, use Type THHN in building interiors and other dry locations. Outdoors and underground in raceways, use Type RHW. Conductors subject to abrasion, such as in lighting poles, shall be Type or THHN.
- D. No conductor smaller than No. 12 wire shall be used for lighting purposes. In the case of "home runs" over 75' in length (150' for 277 volt) no conductor smaller than a No. 10 wire shall be used. The sizing of all wire except remote control wire shall be accomplished in the case of both feeder and branch circuits by conforming to the following provisions. Separate neutral conductors shall be provided for each phase of the same size for 120V/277V single-phase application for heavy electrical loads, computer loads, loads fed from isolated transformers, lab equipment, clinic equipment, dedicated circuits, unless noted otherwise on drawings. Voltage drop on feeders and branch circuits shall not exceed 2 percent.
- E. Remote control wires shall be no smaller than No. 14 conductors. Control wires shall be run in separate conduits. Departures from the sizes so determined shall be made only in those cases in which the National Electrical Code requires the use of larger conductors. The sizes as determined from these tables shall be regarded as the acceptable minimum under all other circumstances. In no case, however, shall there be a voltage drop greater than that specified in any feeder or branch circuit. The Contractor may, if he deems it necessary or advisable, use larger sized conductors than those shown. Under no circumstances, however, shall the Contractor use any conductors sized in a manner which does not conform to the above mentioned tables without having first secured the written approval of The University's duly authorized representative.
- F. Install exposed wire and cable, parallel and perpendicular to surface or exposed structural members and follow the surface contours, where possible.
- G. Splice branch circuits only in accessible junction or outlet boxes. Control cable shall never be spliced except the final connection to field devices. Where terminations of cables that are installed under this Section are to be made by others, provide pigtail of adequate length for neat, trained and bundles connections, minimum 5 feet at each location, unless noted otherwise on drawings.
- H. Wiring Within An Enclosure: Contractor shall bundle ac and dc wiring separately within an enclosure. The Contractor shall utilize panel wire-ways when they are provided. Where wireways are not provided the Contractor shall neatly tag, bundle wires and secure to sub-panel at a minimum of every three inches with T&B Type TC5355 heavy duty mounting bases.
- I. Do not band any conductor either permanently or temporarily during installation to radii less than four times the outer diameter of 600-volt insulated conductors.

3.3 WIRING INSTALLATION IN RACEWAYS

- A. Wire and cable shall be pulled into clean dry conduit. Do not exceed manufacturer's recommended values for maximum pulling tension.
- B. Pull conductors together where more than one is being installed in a raceway.
- C. Use UL listed pulling compound or lubricant, when necessary; compound must not deteriorate conductor and insulation.
- D. Do not use a pulling means, including fish tape, cable or rope, which can damage the raceway.
- E. Install wire in raceway after interior of building has been physically protected from the weather and all mechanical work likely to injure conductors has been completed.
- F. Place no more than 3 phases, ground, and neutral of a circuit in same raceway. Larger conductor counts shall be approved by engineer.
- G. Provide separate conduit or raceway for line and load conductors of motor starters, safety disconnect switches, and similar devices. Those devices shall not share the same raceway.
- H. All conduits shall contain a green grounding conductor. Conduit, wireways, or boxes shall not be used as the equipment grounding conductor.
- I. Any damage to conductor's outer PVC jacket shall be reason to replace conductor.

3.4 CABLE INSTALLATION

1. Cables shall be supported every 5 feet by J-hooks or other method specified on the drawings. Support shall be from overhead building structures above all other systems and equipment no surface mounted to structure. Cables shall not be supported by other system supports, lay on to of ducts, boxes, conduits or ceiling tiles. Cable may drop to equipment served in area of equipment.

- A. Provide protection for exposed cables where subject to damage during construction. Do not install cable before the completion of raceway system.
- B. Cable above ceilings shall be in conduit or raceways. Cables, conduits and raceways shall not be laid on ceiling tiles or strapped to ceiling wire.
- C. Use suitable cable fittings and connectors.
- D. It shall be the Contractor's responsibility to accurately measure all cable runs before the cable is cut. The Contractor shall furnish all tools and equipment, have sufficient properly trained personnel and shall exercise necessary care to ensure that the cable is not damaged during installation. Cable found to be damaged before installation shall not be installed. Cable damage during installation shall be removed and replaced. Repairs to cables can only be done with written permission from The University's Representative and only under special circumstances.
- E. Care shall be exercised with cables entering or leaving cable trays that all cable bend radii shall not be less than the recommended minimum and that cables are not left to rest unprotected on any sharp edge or corner.
- F. PVC jacketed cable shall not be installed or worked in any way at temperatures below 32 degrees F, unless cable has been previously stored in a heated area 48 hours prior to being pulled and transported to a heated pulling area.
- G. Each cable entering an enclosure shall have its conductors bundled together and identified with the cable number. All groups of conductors within an enclosure shall be shaped and formed to provide a neat appearance to facilitate future additions or rework. All control conductors shall be numbered and shall be labeled at each termination with this number, using markers designed for the application.
- H. Multi-Conductor Cable Installation: Power and 120V control cable shall be installed in the same tray. When cables leave trays, they shall be protected between the trays and the cable terminal points by drawing them through conduits. Do not route 600V cables (power cable and 120V control cable) in the same conduit or cable tray as low voltage cables (less than 50V, communications, security systems, or control conductors). Do not route security systems, or control cables through communications rooms. Fire alarm cable shall be routed in a separate conduit only.
- I. Instrument Cable: Instrument cable shall, when conduit installation is required be installed in rigid steel conduit. They shall not be spliced at any point. The shields and drain wires of shielded signal cables shall be grounded only at one point as indicated on the Drawings.

3.5 WIRING CONNECTIONS AND TERMINATIONS

- A. Install splices, taps and terminations, which have equivalent-or-better mechanical strength and insulation as the conductor. Make splices, taps and terminations to carry full ampacity of conductors without perceptible temperature rise.
- B. Keep conductor splices and taps accessible and to a minimum, and in junction boxes only. Control circuit conductors shall terminate at terminal blocks only. Splices below grade shall only be in handholes or manholes and shall be made watertight with epoxy resin type splicing kits similar to Scotchcast.
- C. Use splice, tap and termination connectors, which are compatible with the conductor material.
- D. Thoroughly clean wires before installing lugs and connectors.
- E. Terminate spare conductors with electrical tape and label as spare.
- F. Power and Lighting Circuits: Use solderless pressure connectors with insulating covers for copper wire splices and taps, 8 AWG and larger. For 10 AWG and smaller, use insulated spring wire connectors with plastic caps on lighting and receptacle circuits.

- G. Use split bolt connectors for copper wire splices and taps, 6 AWG and larger. Tape un-insulated conductors and connectors with electrical tape to 150 percent of the insulation value of conductor.
- H. Connections for all wire sizes in motor terminal boxes where the motor leads are furnished with crimped-on lugs shall be made by installing ring type compression terminals on the motor branch circuit ends and then bolting the proper pairs of lugs together. First one layer of No. 33 scotch tape reversed (sticky side out), then a layer of rubber tape, then four layers of No. 33 half-lapped.
- I. Identify conductors per Section 26 05 53 –Electrical Identification.

3.6 FIELD QUALITY CONTROL

- A. Torque test conductor connections and terminations to manufacturer's recommended values.
- B. Perform continuity test on all power and equipment branch circuit conductors. Verify proper phasing connections.
- C. Conductors in vertical conduits or raceways shall be supported in the manner set forth in the appropriate section of the latest revision of the National Electrical Code. Lighting fixtures shall not be used for raceways for circuits other than parallel wiring of fixtures.
- D. Conductors may be run in parallel on sizes 1/0 to 500 MCM inclusive provided all paralleled conductors are the same size, length, and type of insulation. Except as otherwise shown on drawings, no more than three conductors may be run in parallel, and they shall be so arranged and terminated as to insure equal division of the total current between all conductors involved. Where parallel connection is contemplated, approval of The University's representative must be obtained before installation is made.

3.7 TESTING AND ACCEPTANCE

- A. Before final acceptance, the Contractor shall make voltage, insulation, load tests, and meggar tests, necessary to demonstrate to The University's representative the satisfactory installation and proper performance of all circuits.
- B. Test feeder conductors clear of faults. Insulation-resistance test shall be conducted per NETA – Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems. Test results below 50 megohms shall be cause for rejection of the wiring installation. Replace and retest all such rejected conductor.
- C. At the completion of a project, the Contractor shall provide for The University three (3) complete and finally corrected sets of working drawings, and (1) set of correct CAD and/or Revit files. These sets of working drawings shall be new, unused and in good condition, and shall include the nature, destination, path, size and type of wire and all other characteristics for complete identification of each and every conduit and circuit.

SECTION 26 05 26 00 - GROUNDING

PART 1 -- GENERAL

1.1 WORK INCLUDED

- A. Power system grounding.
- B. Communication system grounding.
- C. Electrical equipment and raceway grounding and bonding.

1.2 RELATED WORK

- A. Lightning protection.
- B. Transformers
- C. Switchgear
- D. Ground Buses in Electrical & AV Closets
- E. Water Service
- F. Building Steel
- G. Gas Service
- H. Antennas

1.3 REFERENCES

- A. NFPA 70 – National Electrical Code, latest edition
- B. ANSI/UL 467 – Electrical Grounding and Bonding Equipment
- C. ANSI/IEEE STD 142 – Recommended Practice for Grounding of Industrial and Commercial Power Systems
- D. IEEE 81 – Guide for Measuring Earth Receptivity, Ground Impedance and earth Surface Potential of a ground System
- E. IEEE 1100 – Recommended Practice for Powering and Grounding Sensitive Electronic Equipment
- F. ANSI/TIA/EIA 607 – Commercial Building Grounding and Bonding Requirements for Telecommunications

1.4 SYSTEM DESCRIPTION

- A. Ground the electrical service system neutral at service entrance equipment to grounding electrodes. Electrical systems that are grounded shall be connected to earth in a manner that will limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operations. Concrete encased electrodes shall be connected as the most effective grounding electrodes. Provide a completely grounded system in accordance with Article 250 of the NEC.
- B. Ground each separately-derived system neutral to separate ground buses that are installed in nearest electrical rooms. Transformer, UPS systems, power conditioners, inverters, or other power supplies are separately derived systems. Standby or emergency generators are separately derived systems if the neutral is bonded to the generator frame and if there is no direct connection of the generator neutral conductor to the service neutral conductor.
- C. Provide communications system grounding conductor connected to separate electrode (ground bus) that is installed in each IT room.
- D. Bond together system neutrals, service equipment enclosures, exposed non-current carrying metal parts of electrical equipment, metal raceway systems, cable trays, auxiliary gutters, meter fittings, boxes, cable armor, cable sheath, ground bus in electrical rooms and IT rooms, metal frame of the building or structure, ground ring, lightning down lead conductor, grounding conductor in raceways and cables, receptacle ground connectors, and metal underground water pipe.
- E. Bonding jumpers shall be installed around non-metal fittings or insulating joints to ensure electrical

continuity. Bonding shall be provided where necessary to ensure electrical continuity and the capacity to conduct safely any fault current likely to be imposed.

- F. Supplementary Grounding Electrode: Use driven ground rod on exterior of building or in main service equipment area.
- G. Use minimum 6 AWG copper conductors for communications service grounding conductor. Leave 10 feet slack conductor at termination.

1.5 SUBMITTALS

- A. Provide submittals in accordance with and in addition to General Conditions for submittal requirement.

PART 2 -- PRODUCTS

2.1 MATERIALS AND EQUIPMENT

- A. Grounding system components shall be as required to comply with the design and construction of the system indicated.
- B. Ground conductors shall be stranded tinned, annealed copper cable of the sizes indicated on drawings. Bond grounding conductors at both ends of metallic conduit.
- C. Grounding clips shall be Steel City Type G, or equal.
- D. Ground Rods shall be copper-encased steel, 1" diameter, minimum length 10 feet.

PART 3 -- EXECUTION

3.1 INSTALLATION

- A. Install ground system as indicated, in accordance with the applicable requirements of the National Electrical Code, the National Electrical Contractors Association's "Standard of Installation", and quality craftsmanship.
- B. Install grounding conductors continuous, without splice or connection, between equipment and grounding electrodes. Install test wells as required per drawings.
- C. In feeder and branch circuits, provide a separate, insulated green equipment grounding conductor. Terminate each end on a grounding lug, bus, or bushing.
- D. Connect grounding electrode conductors to metal water pipe where metal pipe is available and accessible using suitable ground clamp. Make connections to flanged piping at street side of flange. Provide bonding jumper around water meter.
- E. Install exothermic welded ground connectors where they are concealed or inaccessible.
- F. Ground each outlet by the use of an approved grounding clip attached to the junction box in such a position to be readily inspected on removal of the cover plate; or by the use of an approved grounding yoke type receptacle.
- G. No strap grounding clamps shall be used; connections requiring bolting shall be made up with monel metal bolts, washers and nuts. Connections shall be made only after surfaces have been cleaned, or ground to expose virgin metal.
- H. Install internal ground wire on liquid tight flexible metal conduit with grounding bushings.
- I. Conductor connections shall be made by means of solderless connectors such as serrated bolted clamps or split bolt and nut type connectors.
- J. The neutral of each transformer shall be bonded to system ground at one point only. This point shall be ahead of the first secondary protective device. See transformer specifications.
- K. Connect grounding conductors to ground rods at the upper end of the rod with the end of the rod and the connection points below finished grade. Below grade connection shall be exothermic-welded type connectors as manufactured by Cadweld, Thermoweld. In manhole or thru slabs, install ground rods with 4 to 6 inches above the floor with connections of grounding conductors fully visible and accessible.

- L. Isolated Grounding Systems: Use insulated equipment grounding conductor and connect only to separate grounding bus, at first panel.
- M. Provide grounding and bonding at CPS's metering equipment and pad-mounted transformer in accordance with CPS's requirements if utility is involved.

3.2 FIELD QUALITY CONTROL

- A. Inspect grounding and bonding system conductors and connections for tightness and proper installation.
- B. Measure ground resistance from system neutral connection at service entrance to convenient ground reference point using suitable ground testing equipment. Resistance shall not exceed 10 ohms. Provide additional ground rod as required until resistance reading is 10 ohms or less. Record conditions and measurements and submit to Owner for approval.

SECTION 26 05 33 00 - RACEWAYS, CONDUITS, AND BOXES**PART 1 GENERAL****1.1 WORK INCLUDED****A. Raceways:**

1. Surface metal raceways.
2. Multi-outlet assemblies.
3. Wireways.
4. Indoor service poles.

B. Conduit:

1. Rigid metal conduit and fittings. (RGS)
2. Intermediate metal conduit and fittings. (IMC)
3. Electrical metallic tubing and fittings. (EMT)
4. Flexible metal conduit and fittings.
5. Liquid-tight flexible metal conduit and fittings.
6. Non-metallic conduit and fittings. (underground use only)
7. PVC coated rigid steel conduit.

C. Boxes:

1. Wall and ceiling outlet boxes.
2. Pull and junction boxes.

D. Electrical/control portion of HVAC work covered by Division 23 pertaining raceway, conduit and boxes shall follow the requirement set forth by this specification.**1.2 REFERENCES**

- A. NFPA 70 – National Electrical Code, latest edition
- B. ANSI C80.1 - Rigid Steel Conduit, Zinc-Coated
- C. ANSI C80.3 - Electrical Metallic Tubing, Zinc-Coated
- B. ANSI/NEMA FB 1 - Fittings and Supports for Conduit and Cable Assemblies
- E. EMA TC 3 - PVC Fittings for Use with Rigid PVC Conduit and Tubing

- P. NEMA RN 1 – Polyvinyl Chloride (PVC) Externally Coated galvanized Rigid Steel Conduit and Intermediate Metal Conduit
- Q. NEMA VE 1 – Metallic Cable Tray Systems
- R. UL 6 – Rigid Metal Conduit
- S. ANSI/UL 5C – Surface Raceways and Fittings for Use with Data, Signal, and Control Circuits
- T. ANSI/UL 498 – Attachment Plugs and Receptacles
- U. ANSI/UL 943 – Ground Fault Circuit Interrupters

1.3 SUBMITTALS

- A. Provide submittals in accordance with and in additional to Section 26 00 00.UT, Basic Electrical Requirements, and Submittal Procedures.
- B. Shop drawings consisting of a complete list of equipment and materials, which will be used for the project, including manufacturer's descriptive and technical literature, catalog cuts and installation instructions.
- C. Sealing/fire stopping materials and details.

1.4 STORAGE AND HANDLING

- A. Handle materials carefully to avoid damage, breaking, denting and scoring. Damaged equipment or materials shall not be installed.
- B. Store materials in a clean dry space and protected from the weather.

PART 2 PRODUCTS

2.1 SURFACE METAL RACEWAY

- A. Surface metal raceway shall be factory pre-assembled galvanized or aluminum steel as shown on drawings, complete including bases, removable covers, receptacles, end plates, elbows, connectors and fittings, to exact length to match the length of the cabinets, casework, utility chases, and shelving as indicated on laboratory and furniture shop drawings, and work bench details, to provide a complete system. Internal and external surfaces shall be free of nicks, cuts, sharp edges and other imperfections..
- B. Size and manufacturer shall be as shown on the Drawings. The length shown on electrical drawings is diagrammatic only and is not accurate for fabrication of raceway sections. Refer to shop drawings, architectural plans, elevations, and details.
- C. Finish shall be as shown on drawings .
- D. Covers shall be field removable by use of a standard screwdriver, without marring the extrusion or cover finish. Raceway with two covers must allow each cover to be removed separately without access into the compartment(s) enclosed by the other cover.
- E. Provide a permanent, integral, grounded metallic dividing barrier to isolate the wiring compartments in the multi-outlet raceway system per drawing as applicable. Provide divider with fittings that maintain the separation of the raceway wiring compartments.
- F. Provide device brackets for mounting standard single-gang or two-gang devices within the raceway system. Devices shall have the capacity of mounting flush or in conjunction with device faceplates.
- G. Provide receptacles for the respective power systems as indicated on the drawings. Refer to Section 26 27 26.UT Wiring Devices for device specifications.

2.2 MULTI-OUTLET ASSEMBLY

- A. Multi-outlet assembly shall be two-piece sheet metal channel with fitted, removable cover suitable for use as a multi-outlet assembly, and comply with surface metal raceway specifications.
- B. Size shall be as indicated on the Drawings.

- C. Provide receptacles mounted as shown on Drawings. Label receptacles with panel and circuit numbers and color code wiring to match building.
- D. Finish shall be ANSI-61 gray enamel.
- E. Provide couplings, elbows, outlet and device boxes, and connectors designed for use with multi-outlet system.

2.3 WIREWAYS

- A. Wireways shall be of steel construction general purpose for indoor spaces and rain tight for outdoor applications with knockouts.
- B. Size shall be as indicated on Drawings, 4X4 minimum or as required by NEC
- C. Cover shall be hinged or screwed as indicated on Drawings. Rain tight wireways shall be provided with full gasketing.
- D. Fittings shall be so constructed to continue the "lay-in" feature through the entire installation.
- E. Provide all sheet metal parts with a rust inhibiting phosphatizing primer coating and finished in gray enamel. All hardware shall be cadmium plated to prevent corrosion.

2.4 CONDUIT AND FITTINGS

- A. Conduit and fittings for all electrical systems on this project shall include the following:
 - 1. Service entrance
 - 2. Electrical power and lighting feeders
 - 3. Electrical power and lighting circuits
 - 4. Telephone systems (minimum 6-inch bending radius)
 - 5. Control systems (to include HVAC)
 - 6. Fire alarm and signaling systems
 - 7. CCTV rough-in system
 - 8. Clock and bell system
 - 9. Computer system rough-in
 - 10. Sound system rough-in
 - 11. Other electrical systems
- B. For each electrical wireway system indicated, provide a complete assembly of conduit, tubing or duct with fittings including, but not necessarily limited to, connectors, nipples, couplings, locknuts, bushings, expansion fittings, other components and accessories as needed to form a complete system of the same type indicated.
- C. Conduit fittings shall be designed and approved for the specific use intended. Conduit fittings, including flexible, shall have insulated throats or bushings. Rigid conduits shall have insulated bushings, unless grounding bushings are required by N.E.C. Article 250. Grounding bushings shall have insulated throats.
- D. Rigid and intermediate metal conduit shall be hot-dipped galvanized. Fittings shall be threaded type. Expansion fittings shall be OZ Type DX.
- E. Electrical metallic tubing shall be galvanized. Fittings shall be all steel compression type. Expansion fittings shall be OZ Type TX.
- F. Flexible metal conduit and fittings shall be zinc-coated steel.
- G. Liquid-tight flexible conduit and fittings shall consist of single strip, continuous, flexible interlocked, double-wrapped steel, galvanized inside and outside, forming smooth internal wiring channel with liquid-tight covering of flexible polyvinyl chloride (PVC). It shall be furnished with a sealing O-ring where entering an enclosure subject to moisture. Where O-Rings are used, ground type bushings shall be used

in the box or enclosure.

- H. Nonmetallic conduit, flex, and fittings shall be suitable for temperature rating of conductor but not less than 90°C. Nonmetallic conduit and fittings shall be molded of high impact PVC compound having noncombustible, nonmagnetic, non-corrosive and chemical resistant properties and shall be of the same manufacturer. Where located outdoors and above ground, the conduit and fittings shall be UV resistant. Solvent cement shall be of the same manufacturer as the conduit and shall be of the brush-on type. Spray solvents are prohibited. PVC coated metallic fittings shall not be permitted for PVC conduit connections. **These products are not acceptable unless specifically indicated on drawings.**
- I. Crimp or set-screw type fittings are not acceptable.
- J. Minimum conduit size shall be 3/4 inch, except 1/2 inch flexible metallic conduit may be used as fixture whips.
- K. PVC coated rigid steel conduit shall be externally coated with a 40 mil PVC coating and internal phenolic coating over a galvanized surface.

2.5 WALL AND CEILING OUTLET BOXES

- A. Galvanized steel interior outlet wiring boxes of the type, shape and size, including depth of box, to suit each respective location and installation; constructed with stamped knockouts in back and sides, and with threaded holes with screws for securing box covers or wiring devices.
 - 1. Minimum switchbox depth shall be 2 inches, outlet boxes minimum for electrical and voice data shall be 2 1/8 inches deep, unless approved by engineer for structural purposes.
 - 2. Provide outlet box accessories as required for each installation, including mounting brackets, wallboard hangers, extension rings, fixture studs, cable clamps and metal straps for supporting outlet boxes.
 - 3. Provide multi-gang outlets of single box design. Sectional boxes are not acceptable. Provide outlet boxes of sufficient volume to accommodate the number of conductors entering the box in accordance with the requirements of NEC.
- B. Provide deep type cast metal weatherproof exterior outlet wiring boxes of the type, shape and size, including depth of box, with threaded conduit ends, cast metal face plate with spring-hinged waterproof cap suitably configured for each application, including face plate gasket and fasteners. Provide PVC type outlet boxes only in corrosive areas rated as NEMA 13X.
- C. Outlet boxes in poured concrete shall be plenum type without any holes and with reset knockouts. Where extension rings are used to offset conduit between wall reinforcing steel, joint between extension ring and box shall be sealed to prevent concrete from entering box during pour.

2.6 PULL AND JUNCTION BOXES

- A. Boxes shall be galvanized sheet metal conforming to ANSI/NEMA OS 1 with screw-on cover and welded seams, stainless steel nuts, bolts, screws and washers.
- B. Boxes larger than 12 inches in any dimension shall be panelboard code gauge galvanized steel with hinged cover.
- C. Boxes shall be sized in accordance with NEC.
- D. Provide cast-in-place, pre-cast concrete or die-molded fiberglass handholes/pull boxes as per design for underground installations. Cast-in-place and pre-cast boxes shall be provided with reinforcing bars with material compressive strength no less than 11,000 psi, and shall be approved by Owner/Structural Engineer.

2.7 CABLE TRAY AND FITTINGS

- A. Ladder type cable trays
 - 1. Tray: NEMA VE 1, Class 12C or as indicated on the drawings.

2. Material and Finish of Tray, Fittings, and Accessories: 6063-T6 aluminum extrusion or hot-dip galvanized after fabrication steel (ASTM A123) as indicated on Drawings.
 3. Inside width: 12 inches minimum or as indicated on Drawings.
 4. Inside depth: 4 inches minimum or as indicated on Drawings
 5. Straight Section rung spacing: 12 inches on center or as indicated on drawings.
 6. Inside radii of fittings: as indicated on Drawings
 7. Accessories and Fittings: Manufacturer's standard clamps, hangers, brackets, splice plates, reducer plates, blind ends, barrier strips, connectors, and grounding straps.
 8. Provide covers on tray where exiting the top of control cabinets, communication/data cabinets, distribution panelboards and switchboards which cover vertical Sections of tray and 90 degree bend.
- B. Perforated bottom cable trays
1. Tray: NEMA VE 1, Class 12C.
 2. Material and Finish of Tray, Fittings, and Accessories: 6063-T6 aluminum extrusion or hot-dip galvanized steel (ASTM A123).
 3. Inside Width: 12 inches minimum or as indicated on Drawings.
 4. Inside depth: 4 inches minimum or as indicated on Drawings.
 5. Inside radii of fittings: 12 inches, or as indicated on drawings.
 6. Accessories and Fittings: Manufacturer's standard clamps, hangers, brackets, splice plates, reducer plates, blind ends, barrier strips, connectors, and grounding straps.
 7. Utilization: Data cables, control cables, telephone cables, fiber optics. Do not use for vertical sections. Vertical cables shall be installed vertical floor mounted racks.
 8. Covers: Ventilated covers where indicated on the drawings.
- C. Fiberglass cable trays
1. Tray: NEMA FG1
 2. Material and finish of tray, fittings, and accessories: Glass fiber reinforced polyester.
 3. Inside width: 12 inches minimum or as indicated on Drawings.
 4. Inside depth: 4 inches minimum or as indicated on Drawings
 5. Inside Radii of Fittings: 12 inches or as indicated on Drawings.
 6. Accessories and Fittings: Manufacturer's standard clamps hangers, brackets, splice plates, reducer plates, blind ends, barrier strips, and connectors.
 7. Covers: Solid covers where indicated on the drawings.
- D. Warning signs for cable trays
1. 1/2-inch high black letters on yellow plastic with the following wording: WARNING! DO NOT USE CABLE TRAY AS WALKWAY, LADDER, OR SUPPORT. USE ONLY AS MECHANICAL SUPPORT FOR CABLES AND TUBING!
- E. Provide cable tray grounding system, per manufacturer, NEC, and drawings

PART 3 EXECUTION

3.1 INSTALLATION - CONDUIT

- A. Install a complete conduit system as indicated, in accordance with the applicable requirements of NEC, NEMA and the National Electrical Contractors Association's "Standard of Installation", manufacturers published recommendations, and good workmanship.

- B. Cut conduit square using a saw or pipe cutter. De-burr cut ends. Joints in steel conduit must be painted with T&B Kopr shield and drawn up tight. Threads for rigid metal conduit and IMC shall be deep and clean. Running threads shall not be used. Wipe plastic conduit clean and dry before joining. Apply full, even coat of cement with brush to entire area that will be inserted into fitting. Let joint cure for 20 minutes minimum. Spray type of cement is not acceptable. Install raceway and conduit system from point of origin in outlets shown, complete with support assemblies including all necessary hangers, beam clamps, hanger rods, turnbuckles, bracing, rolls, clips angles, through bolts, brackets, saddles, nuts, bolts, washers, offsets, pull boxes, junction boxes and fittings to ensure a complete functional raceway system. Where vertical drops of conduit are made to equipment in open space, the vertical conduit shall be rigidly supported from racks supported on the floor.
- C. Install rigid wall hot-dipped galvanized steel conduit or hot-dipped galvanized intermediate metal conduit for service entrance; feeders; wall or floor penetrations; mechanical rooms electrical rooms and exposed locations where there is a high potential subject to physical damage; exposed outdoor locations; damp locations or any location as per design drawing. Minimum size shall be $\frac{3}{4}$ inch. The following exceptions permitted:
1. EMT, $\frac{3}{4}$ inch minimum
 - a. In sizes, $\frac{3}{4}$ inch minimum, up to and including 4 inch, may be used inside dry locations where not subject to mechanical damage. EMT may be used in air-conditioned spaces, such as accessible ceilings and dry wall partitions. EMT may not be used outside, in concrete, underground, in under floor spaces, in masonry walls, in locations likely to be damp, in electrical rooms subject to mechanical damage due to future installation. EMT shall not be used for medium voltage circuits.
 - b. All conduits shall be concealed in walls or ceilings unless otherwise noted.
 2. PVC (underground use only)
 - a. Install PVC schedule 40 conduit where direct buried in earth.
 - b. Type EB, Utility Duct, encased in concrete.
 3. Liquid-tight
 - a. Install liquid-tight flexible metal conduit for connections to rotating, vibrating, moving or movable equipment, including dry-type transformers. Install internal ground wire on flexible conduit with grounding bushings. Maximum length shall be 6 feet minimum of 2 feet, minimum size $\frac{1}{2}$ inch.
 4. Flexible Metal Conduit
 - a. Install standard flexible metal conduit (not liquid-tight), which shall be only used for lighting fixture whips or motor vibrations, with internal ground wire. Install flexible conduit connection such that vibrations are not transmitted to adjoining conduit or building structure. Maximum length shall be 6 feet minimum of 3 feet; minimum size shall be $\frac{3}{4}$; and minimum size shall be $\frac{1}{2}$ inch for lay-in light fixture whips. No MC Cable shall be allowed.
- D. Install conduits parallel and supported on Unistrut, or equal, trapezes and anchored with split ring hangers, conduit straps or other devices specifically designed for the purpose. No raceways or boxes shall be supported using wire. Arrange conduit to maintain headroom and present a neat appearance. Conduit routes shall follow the contour of the surface it is routed on. Route exposed conduit and tray above accessible ceilings parallel and perpendicular to walls and adjacent piping. Maintain 12-inch clearance between conduit and heat sources, such as flues, steam pipes, and heating appliances. Wire ties or "wrap lock" are not permitted to support or secure conduit system. Fasten conduit with the following material:
1. Wood screws on wood
 2. Toggle bolts on hollow masonry
 3. Bolts and expansion anchors in concrete or brick
 4. Machine screws, threaded rods and clamps on steel

5. Conduit clips on steel joists.
6. Roofing membrane pad installed with roof manufacture's conduit support on roof, spaced at intervals not to exceed 5 feet.
- E. Install conduits outside of building lines at a minimum depth of 30 inches below finished grade. Maintain twelve inches earth or two inches concrete separation between electrical conduits and other services or utilities underground. Encase all plastic 277/480 volt conduits with red concrete.
- F. Ducts in concrete encased ductbanks shall be independently supported by interlocking module spacers by Formex or equal. Spacers shall provide 3 inches separation between adjacent ducts. Spacers shall be installed at 6 feet maximum intervals.
- G. Ducts in concrete encased ductbanks shall be terminated in manholes, pull boxes, and vaults with belled fittings. A watertight tapered plug shall be furnished and installed in unused duct openings. Where terminators are installed in new work, they shall be poured-in-place.
- H. Install underground conduits with sealing glands equal to OZ Type FSK exterior to the conduit and OZ type CSB, or equal internally at the point where conduits enter the building to prevent water seepage into the building.
- I. Fittings shall be approved for grounding purposes or shall be jumpered with a copper grounding conductors of appropriate ampacity. Leave termination of such jumpers exposed.
- J. Install expansion fittings in metal and PVC conduit as follows:
 1. Conduit Crossing Building Expansion Joints:
 - a. EMT all sizes
 - b. IMC all sizes
 - c. RMC all sizes
 - d. PVC all sizes
 2. Conduits entering environmental rooms and other locations subject to thermal expansion and as required by NEC.
 3. Expansion joint fitting shall be crouse-hind type XC.
- K. Avoid moisture traps where possible; where unavoidable, provide junction box with drain fitting at conduit low point.
- L. Use suitable conduit caps to protect installed conduit against entrance of dirt and moisture if cable or wire are not installed immediate after conduit run. Tape covering conduit ends is not acceptable.
- M. Provide 200 lb. nylon cord full length in empty conduit, with tags.
- N. Where conduit penetrates fire-rated walls and floors, provide pipe sleeve two sizes larger than conduit; pack void around conduit with oakum and fill ends of sleeve with fire-resistive compound or provide mechanical fire-stop fittings with UL listed fire-rating or seal opening around conduit with UL listed foamed silicone elastomer compound equal to fire-rating of floor or wall.
- O. Install no more than the equivalent of three 90-degree bends between boxes. Where four 90 degree bends are required, prior approval by the Engineer is required. Use conduit bodies to make sharp changes in direction, as around beams. Conduit bodies shall be readily accessible and sized for the cables installed. Running or rolling offsets are not approved. Use factory long radius elbows for bends in conduit larger than 2-inch size. All parallel bends shall be concentric.
- P. Conduit entering / exiting cable tray shall be attached to the tray rail by means of strut bolted to the rail and standard manufacturer's accessories or by use of a UL listed conduit to tray connector. Conduit shall only enter / exit tray horizontally supported within 3 feet of the tray and extend into the tray 2 inches. Conduit shall be terminated with a grounding bushing and bonded to the ground conductor routed in the tray. (The attachment to the tray shall not be considered a ground.)

3.2 INSTALLATION - SURFACE METAL RACEWAY AND MULTI-OUTLET

- A. Use flathead screws to fasten channel to surfaces. Mount plumb and level.
- B. Use suitable insulating bushings and inserts at connections to outlets and corner fittings on multi-outlet assembly.
- C. Maintain grounding continuity between raceway components to provide a continuous grounding path in accordance with the requirement of NEC.

3.3 INSTALLATION - WIREWAYS

- A. Bolt wireways to steel channels fastened to the wall or in self-supporting structure. Install level.
- B. Gasket each joint in oil-tight wireway.
- C. Mount rain tight wireway for exterior installation in horizontal position only.

3.4 INSTALLATION - BOXES

- A. Provide electrical boxes as shown on Drawings, and as required for splices, taps, wire pulling, equipment connections, and code compliance.
- B. Provide outlet box accessories as required for each installation, including mounting brackets, wallboard hangers, extension rings, fixture studs, cable clamps and metal straps for supporting outlet boxes, compatible with outlet boxes being used and meeting requirements of individual situations.
- C. Electrical box locations shown on Drawings are approximate unless dimensioned. Verify location of outlets prior to rough-in.
- D. Locate and install boxes to allow access
- E. Do not install boxes back-to-back in walls. Provide minimum 6-inch separation. Provide minimum 24-inch separation in acoustic-rated walls. If boxes are connected together, install flexible connection between the two and pack openings with fiberglass.
- F. Secure boxes rigidly to the substrate upon which they are being mounted, or solidly imbed boxes in concrete or masonry. Do not support junction boxes from the raceway systems. Boxes shall not be permitted to move laterally. Boxes shall be secured between two studs. Boxes connected to one stud are not permitted.
- G. Provide knockout plugs for unused openings.
- H. Use multiple-gang boxes where more than one device is mounted together. Do not use sectional boxes. Provide barriers to separate wiring of different voltage systems.
- I. Install boxes in walls without damaging wall insulation.
- J. Outlet boxes in plaster partitions shall be "shallow-type" set flush in wall so there is at least 5/8 inch plaster covering back of box.
- K. Outlet boxes for switch shall not be used as junction boxes.
- L. Coordinate mounting heights and locations of outlets mounted above counters, benches and backsplashes.
- M. In inaccessible ceiling areas, position outlets and junction boxes within 6 inches of recessed luminaire, to be accessible through luminaire ceiling opening.
- N. Outlet boxes supporting fixtures shall be securely anchored in place in an approved manner. Support outlet boxes, fixtures, and conduit in acoustic ceiling areas from building structures, not from acoustic ceilings. Lighting fixture outlets shall be coordinated with mechanical and architectural equipment and elements to eliminate conflicts and provide a workable neat installation.
- O. Set floor boxes level and flush with finish flooring material.

3.5 INSTALLATION – CABLE TRAY

- A. Installation: In conformance with NEC and NEMA requirements and in accordance with manufacturer's

instructions. Arrange cable tray to maintain headroom and present neat appearance. Cables shall be arranged in cable trays in a neat, workmanlike manner.

- B. Support cable tray at each connection point, at the end of each run, and at other points to maintain spacing between supports of 10 feet maximum. Trays shall be level with respect to grade plus or minus 1/8-inch per 10 feet or 1/2-inch cumulative. Unless otherwise noted cable trays shall be supported by rigid steel brackets or trapeze type hangers. Hanger materials, including threaded hanger rods, all brackets, and other structural support items shall be per Section 26 05 33, Supporting Methods and shall have sufficient strength to support the load with a safety factor of at least 3 when all trays are filled to design capacity. Where multiple tiers of cable tray are installed, a minimum of 100-lbs./foot fill for each cable tray shall be used to establish support requirements if limiting factor is the supporting material. In fabricating or installing cable tray supports, holes shall be drilled and cuts made with a saw. Hanger rods shall be of 1/2-inch or larger diameter, shall be double-nutted at the lowest cable tray support and the hanger rod shall be cut off one (1) inch below the bottom nut. Cable tray support spacing shall not exceed 10 feet for ladder type trays. Hanger rods shall be unspliced. Cable trays installed on trapeze type hangers shall be braced laterally at intervals not exceeding 50 feet. Refer to Section 26 05 33 for cable tray support methods.
- C. Where it is necessary to make field changes in the tray system, cuts shall be made with hacksaw or power saw. All sharp edges and burrs shall be removed.
- D. Install warning signs at 50 foot centers along route of cable tray, in locations visible from the floor.
- E. Where new cable trays are installed above, below or in-line with existing cable trays, the new cable tray shall be supported independently from the existing cable tray with new supports and framing unless approved by The University and the Structural Engineer. Maintain twelve-inch clearance between cable tray and surfaces with temperatures exceeding 104 degrees F, such as flues, steam pipes, and heating appliances. Maintain at least 6-inch clearance between cable tray and piping, ductwork or other interference. Any deviation from this must be approved by The University. It shall be the Contractor's responsibility to protect existing cable tray in the area of construction against damage throughout the construction period. Any damaged cable tray shall be replaced by the Contractor at no additional cost prior to final acceptance by The University.
- F. All power cable trays shall have a continuous; No. 4/0 insulated copper, (for aluminum tray) and bare copper (for galvanized steel tray) grounding conductor run inside the tray. Bond No. 4/0 to each section of tray and fitting with an OZ Gedney type CTGC ground clamp. All communication cable trays shall have a continuous, No. 6, green insulated copper grounding conductor run inside the tray. Connect to tray at each fitting or tray section per the Drawings.
- G. Maintain electrical continuity between sections of cable tray and bond cable trays at the both ends to building ground plates to provide a continuous grounding path. Install copper braided bonding jumpers around expansion joints and hinged adjustable splice plates where electrical discontinuity occurs.
- H. Cable tray in designated "Corrosive" areas shall be fiberglass.

3.6 INSTALLATION - INDOOR SERVICE POLES

- A. Verify that installation of ceiling suspension system and other work above finished ceiling is complete.
- B. Neatly cut openings in ceiling panels.
- C. Attach foot and top clamp in accordance with manufacturer's instructions.
- D. Install trim plate to enclose ceiling panel opening.
- E. Install poles plumb. Install grounding.

3.7 WALL AND FLOOR PENETRATIONS:

- A. Core drilling shall be approved in writing by the Structural Engineer prior to execution. Avoid anchor bolt on structural column by installing "column hugging" type of unistrut support for electrical installation. PVC shall not be used for wall and floor penetration.
- B. Wall penetrations for cable tray or under floor raceway shall be sealed in accordance with Specification

Section 07 84 00, Fire-stopping, and Section 07 91 26, Joint Sealers.

- C. Provide a 3 1/2 inch curb around block outs through concrete floors. Fire-stop per specification.
- D. Route conduit through roof openings for piping and ductwork where possible; otherwise, route through roof per roof manufacturer's subcontract. Coordinate roof penetrations with the roofing contractor.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 05 33 16 - RACEWAYS AND BOXES**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of raceways and boxes. Products shall be as follows or as approved by UTHSCSA. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes raceways, fittings, boxes, enclosures, and cabinets for electrical wiring.

C. Definitions

1. EMT: Electrical metallic tubing.
2. EPDM: Ethylene-propylene-diene terpolymer rubber.
3. FMC: Flexible metal conduit.
4. IMC: Intermediate metal conduit.
5. LFMC: Liquid tight flexible metal conduit.
6. NBR: Acrylonitrile-butadiene rubber.
7. RNC: Rigid nonmetallic conduit.

D. Submittals

1. Product Data: For surface raceways, wireways and fittings, floor boxes, hinged-cover enclosures, and cabinets.
2. Shop Drawings: For the following raceway components. Include plans, elevations, sections, details, and attachments to other work.
 - a. Custom enclosures and cabinets.
 - b. For handholes and boxes for underground wiring, including the following:
 - 1) Duct entry provisions, including locations and duct sizes.
 - 2) Frame and cover design.
 - 3) Grounding details.
 - 4) Dimensioned locations of cable rack inserts, and pulling-in and lifting irons.
 - 5) Joint details.
3. Samples: For each type of exposed finish required for wireways, nonmetallic wireways and surface raceways, prepared on Samples of size indicated below.
4. Coordination Drawings: Conduit routing plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
 - a. Structural members in the paths of conduit groups with common supports.
 - b. HVAC and plumbing items and architectural features in the paths of conduit groups with common supports.
5. Manufacturer Seismic Qualification Certification: Submit certification that enclosures and cabinets and their mounting provisions, including those for internal components, will withstand seismic forces defined in UT Specs Division 26 Section(s) "Hangers And Supports For Electrical Systems" AND "Vibration And Seismic Controls For Electrical Systems". Include the following:
 - a. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 1) The term "withstand" means "the cabinet or enclosure will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will retain its enclosure characteristics, including its interior accessibility, after the seismic event."
 - b. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

- c. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- 6. Qualification Data: For professional engineer and testing agency.
- 7. Source quality-control test reports.

E. Quality Assurance

- 1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to UTHSCSA AHJ, and marked for intended use.
- 2. Comply with NFPA 70.

1.2 PRODUCTS

A. Metal Conduit And Tubing

- 1. Rigid Steel Conduit: ANSI C80.1.
- 2. Aluminum Rigid Conduit: ANSI C80.5.
- 3. IMC: ANSI C80.6.
- 4. PVC-Coated Steel Conduit: PVC-coated rigid steel conduit **OR** IMC, **as directed**.
 - a. Comply with NEMA RN 1.
 - b. Coating Thickness: **0.040 inch (1 mm)**, minimum.
- 5. EMT: ANSI C80.3.
- 6. FMC: Zinc-coated steel **OR** Aluminum **OR** Zinc-coated steel or aluminum, **as directed**.
- 7. LFMC: Flexible steel conduit with PVC jacket.
- 8. Fittings for Conduit (Including all Types and Flexible and Liquidtight), EMT, and Cable: NEMA FB 1; listed for type and size raceway with which used, and for application and environment in which installed.
 - a. Conduit Fittings for Hazardous (Classified) Locations: Comply with UL 886.
 - b. Fittings for EMT: Steel **and** compression type.
 - c. Coating for Fittings for PVC-Coated Conduit: Minimum thickness, **0.040 inch (1 mm)**, with overlapping sleeves protecting threaded joints.
- 9. Joint Compound for Rigid Steel Conduit or IMC: Listed for use in cable connector assemblies, and compounded for use to lubricate and protect threaded raceway joints from corrosion and enhance their conductivity.

B. Nonmetallic Conduit And Tubing

- 1. RNC: NEMA TC 2, Type EPC-40-PVC, unless otherwise indicated.
- 2. LFNC: UL 1660.
- 3. Fittings for RNC: NEMA TC 3; match to conduit type and material.
- 4. Fittings for LFNC: UL 514B.

C. Optical Fiber/Communications Cable Raceway And Fittings

- 1. Description: Comply with UL 2024; flexible type, approved for plenum **OR** riser **OR** general-use, **as directed**, installation.

D. Metal Wireways

- 1. Description: Sheet metal sized and shaped as indicated, NEMA 250, Type 1 **OR** 12 **OR** 3R, **as directed**, unless otherwise indicated.
- 2. Fittings and Accessories: Include couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.
- 3. Wireway Covers: Hinged type **OR** Screw-cover type **OR** Flanged-and-gasketed type **OR** As indicated, **as directed**.
- 4. Finish: Manufacturer's standard enamel finish.

E. Nonmetallic Wireways

1. Description: Fiberglass polyester, extruded and fabricated to size and shape indicated, with no holes or knockouts. Cover is gasketed with oil-resistant gasket material and fastened with captive screws treated for corrosion resistance. Connections are flanged, with stainless-steel screws and oil-resistant gaskets.
OR
Description: PVC plastic, extruded and fabricated to size and shape indicated, with snap-on cover and mechanically coupled connections with plastic fasteners.
 2. Fittings and Accessories: Include couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.
- F. Surface Raceways
1. Surface Metal Raceways: Galvanized steel with snap-on covers. Manufacturer's standard enamel finish in color selected **OR** Prime coating, ready for field painting, **as directed**.
 2. Surface Nonmetallic Raceways: Two-piece construction, manufactured of rigid PVC with texture and color selected from manufacturer's standard **OR** custom, **as directed**, colors.
- G. Boxes, Enclosures, And Cabinets
1. Sheet Metal Outlet and Device Boxes: NEMA OS 1.
 2. Cast-Metal Outlet and Device Boxes: NEMA FB 1, ferrous alloy **OR** aluminum, **as directed**, Type FD, with gasketed cover.
 3. Nonmetallic Outlet and Device Boxes: NEMA OS 2.
 4. Metal Floor Boxes: Cast metal **OR** Sheet metal, **as directed**, fully adjustable **OR** semi-adjustable, **as directed**, rectangular.
 5. Nonmetallic Floor Boxes: Nonadjustable, round.
 6. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.
 7. Cast-Metal Access, Pull, and Junction Boxes: NEMA FB 1, cast aluminum **OR** galvanized, cast iron, **as directed**, with gasketed cover.
 8. Hinged-Cover Enclosures: NEMA 250, Type 1, with continuous-hinge cover with flush latch, unless otherwise indicated.
 - a. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.
 - b. Nonmetallic Enclosures: Plastic, finished inside with radio-frequency-resistant paint, **as directed**.
 9. Cabinets:
 - a. NEMA 250, Type 1, galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.
 - b. Hinged door in front cover with flush latch and concealed hinge.
 - c. Key latch to match panelboards.
 - d. Metal barriers to separate wiring of different systems and voltage.
 - e. Accessory feet where required for freestanding equipment.
- H. Handholes And Boxes For Exterior Underground Wiring
1. Description: Comply with SCTE 77.
 - a. Color of Frame and Cover: Gray **OR** Green **as directed**.
 - b. Configuration: Units shall be designed for flush burial and have open **OR** closed **OR** integral closed, **as directed**, bottom, unless otherwise indicated.
 - c. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.
 - d. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
 - e. Cover Legend: Molded lettering, "ELECTRIC" **OR** "TELEPHONE" **OR** as indicated for each service, **as directed**.
 - f. Conduit Entrance Provisions: Conduit-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.
 - g. Handholes **12 inches wide by 24 inches long (300 mm wide by 600 mm long)** and larger shall have inserts for cable racks and pulling-in irons installed before concrete is poured.

2. Polymer-Concrete Handholes and Boxes with Polymer-Concrete Cover: Molded of sand and aggregate, bound together with polymer resin, and reinforced with steel or fiberglass or a combination of the two.
3. Fiberglass Handholes and Boxes with Polymer-Concrete Frame and Cover: Sheet-molded, fiberglass-reinforced, polyester-resin enclosure joined to polymer-concrete top ring or frame.
4. Fiberglass Handholes and Boxes: Molded of fiberglass-reinforced polyester resin, with covers of polymer concrete **OR** reinforced concrete **OR** cast iron **OR** hot-dip galvanized-steel diamond plate **OR** fiberglass, **as directed**.

I. Sleeves For Raceways

1. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends.
2. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.
3. Sleeves for Rectangular Openings: Galvanized sheet steel with minimum **0.052- or 0.138-inch (1.3- or 3.5-mm)** thickness as indicated and of length to suit application.
4. Coordinate sleeve selection and application with selection and application of firestopping specified in Division 07 Section "Firestopping".

J. Sleeve Seals

1. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and cable.
 - a. Sealing Elements: EPDM **OR** NBR, **as directed**, interlocking links shaped to fit surface of cable or conduit. Include type and number required for material and size of raceway or cable.
 - b. Pressure Plates: Plastic **OR** Carbon steel **OR** Stainless steel, **as directed**. Include two for each sealing element.
 - c. Connecting Bolts and Nuts: Carbon steel with corrosion-resistant coating **OR** Stainless steel, **as directed**, of length required to secure pressure plates to sealing elements. Include one for each sealing element.

K. Source Quality Control For Underground Enclosures

1. Handhole and Pull-Box Prototype Test: Test prototypes of handholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.
 - a. Tests of materials shall be performed by a independent testing agency.
 - b. Strength tests of complete boxes and covers shall be by either an independent testing agency or manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.
 - c. Testing machine pressure gages shall have current calibration certification complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

1.3 EXECUTION

A. Raceway Application

1. Outdoors: Apply raceway products as specified below, unless otherwise indicated:
 - a. Exposed Conduit: Rigid steel conduit **OR** IMC **OR** RNC, Type EPC-40-PVC **OR** RNC, Type EPC-80-PVC, **as directed**.
 - b. Concealed Conduit, Aboveground: Rigid steel conduit **OR** IMC **OR** EMT **OR** RNC, Type EPC-40-PVC, **as directed**.
 - c. Underground Conduit: RNC, Type EPC-40 **OR** 80, **as directed**, -PVC, direct buried.
 - d. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC **OR** LFNC, **as directed**.
 - e. Boxes and Enclosures, Aboveground: NEMA 250, Type 3R **OR** 4, **as directed**.
 - f. Application of Handholes and Boxes for Underground Wiring:

- 1) Handholes and Pull Boxes in Driveway, Parking Lot, and Off-Roadway Locations, Subject to Occasional, Nondeliberate Loading by Heavy Vehicles: Polymer concrete **OR** Fiberglass enclosures with polymer-concrete frame and cover **OR** Fiberglass-reinforced polyester resin, **as directed**, SCTE 77, Tier 15 structural load rating.
- 2) Handholes and Pull Boxes in Sidewalk and Similar Applications with a Safety Factor for Nondeliberate Loading by Vehicles: Polymer-concrete units **OR** Heavy-duty fiberglass units with polymer-concrete frame and cover, **as directed**, SCTE 77, Tier 8 structural load rating.
- 3) Handholes and Pull Boxes Subject to Light-Duty Pedestrian Traffic Only: Fiberglass-reinforced polyester resin, structurally tested according to SCTE 77 with **3000-lbf (13 345-N)** vertical loading.
2. Comply with the following indoor applications, unless otherwise indicated:
 - a. Exposed, Not Subject to Physical Damage: EMT **OR** ENT **OR** RNC, **as directed**.
 - b. Exposed, Not Subject to Severe Physical Damage: EMT **OR** RNC identified for such use, **as directed**.
 - c. Exposed and Subject to Severe Physical Damage: Rigid steel conduit **OR** IMC, **as directed**. Includes raceways in the following locations:
 - 1) Loading dock.
 - 2) Corridors used for traffic of mechanized carts, forklifts, and pallet-handling units.
 - 3) Mechanical rooms.
 - d. Concealed in Ceilings and Interior Walls and Partitions: EMT **OR** ENT **OR** RNC, Type EPC-40-PVC, **as directed**.
 - e. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): FMC, except use LFMC in damp or wet locations.
 - f. Damp or Wet Locations: Rigid steel conduit **OR** IMC, **as directed**.
 - g. Raceways for Optical Fiber or Communications Cable in Spaces Used for Environmental Air: Plenum-type, optical fiber/communications cable raceway **OR** EMT, **as directed**.
 - h. Raceways for Optical Fiber or Communications Cable Risers in Vertical Shafts: Riser-type, optical fiber/communications cable raceway **OR** EMT, **as directed**.
 - i. Raceways for Concealed General Purpose Distribution of Optical Fiber or Communications Cable: General-use, optical fiber/communications cable raceway **OR** Riser-type, optical fiber/communications cable raceway **OR** Plenum-type, optical fiber/communications cable raceway **OR** EMT, **as directed**.
 - j. Boxes and Enclosures: NEMA 250, Type 1, except use NEMA 250, Type 4, stainless steel **OR** nonmetallic, **as directed**, in damp or wet locations.
3. Minimum Raceway Size: **1/2-inch (16-mm) OR 3/4-inch (21-mm)**, **as directed**, trade size.
4. Raceway Fittings: Compatible with raceways and suitable for use and location.
 - a. Rigid and Intermediate Steel Conduit: Use threaded rigid steel conduit fittings, unless otherwise indicated.
 - b. PVC Externally Coated, Rigid Steel Conduits: Use only fittings listed for use with that material. Patch and seal all joints, nicks, and scrapes in PVC coating after installing conduits and fittings. Use sealant recommended by fitting manufacturer.
5. Install nonferrous conduit or tubing for circuits operating above 60 Hz. Where aluminum raceways are installed for such circuits and pass through concrete, install in nonmetallic sleeve.
6. Do not install aluminum conduits in contact with concrete.

B. Installation

1. Comply with NECA 1 for installation requirements applicable to products specified in Part 2 except where requirements on Drawings or in this Article are stricter.
2. Keep raceways at least **6 inches (150 mm)** away from parallel runs of flues and steam or hot-water pipes. Install horizontal raceway runs above water and steam piping.
3. Complete raceway installation before starting conductor installation.
4. Support raceways as specified in UT Specs Division 26 Section(s) "Hangers and Supports for Electrical Systems".
5. Arrange stub-ups so curved portions of bends are not visible above the finished slab.

6. Install no more than the equivalent of three 90-degree bends in any conduit run except for communications conduits, for which fewer bends are allowed.
7. Conceal conduit and EMT within finished walls, ceilings, and floors, unless otherwise indicated.
8. Raceways Embedded in Slabs:
 - a. Run conduit larger than **1-inch (27-mm)** trade size, parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place conduit close to slab support.
 - b. Arrange raceways to cross building expansion joints at right angles with expansion fittings.
 - c. Change from RNC Type EPC-40-PVC, to rigid steel conduit, or IMC before rising above the floor.
9. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound to threads of raceway and fittings before making up joints. Follow compound manufacturer's written instructions.
10. Raceway Terminations at Locations Subject to Moisture or Vibration: Use insulating bushings to protect conductors, including conductors smaller than No. 4 AWG.
11. Install pull wires in empty raceways. Use polypropylene or monofilament plastic line with not less than **200-lb (90-kg)** tensile strength. Leave at least **12 inches (300 mm)** of slack at each end of pull wire.
12. Raceways for Optical Fiber and Communications Cable: Install raceways, metallic and nonmetallic, rigid and flexible, as follows:
 - a. **3/4-Inch (19-mm)** Trade Size and Smaller: Install raceways in maximum lengths of **50 feet (15 m)**.
 - b. **1-Inch (25-mm)** Trade Size and Larger: Install raceways in maximum lengths of **75 feet (23 m)**.
 - c. Install with a maximum of two 90-degree bends or equivalent for each length of raceway unless Drawings show stricter requirements. Separate lengths with pull or junction boxes or terminations at distribution frames or cabinets where necessary to comply with these requirements.
13. Install raceway sealing fittings at suitable, approved, and accessible locations and fill them with listed sealing compound. For concealed raceways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces. Install raceway sealing fittings at the following points:
 - a. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.
 - b. Where otherwise required by NFPA 70.
14. Expansion-Joint Fittings for RNC: Install in each run of aboveground conduit that is located where environmental temperature change may exceed **30 deg F (17 deg C)**, and that has straight-run length that exceeds **25 feet (7.6 m)**.
 - a. Install expansion-joint fittings for each of the following locations, and provide type and quantity of fittings that accommodate temperature change listed for location:
 - 1) Outdoor Locations Not Exposed to Direct Sunlight: **125 deg F (70 deg C)** temperature change.
 - 2) Outdoor Locations Exposed to Direct Sunlight: **155 deg F (86 deg C)** temperature change.
 - 3) Indoor Spaces: Connected with the Outdoors without Physical Separation: **125 deg F (70 deg C)** temperature change.
 - 4) Attics: **135 deg F (75 deg C)** temperature change.
 - b. Install fitting(s) that provide expansion and contraction for at least **0.00041 inch per foot of length of straight run per deg F (0.06 mm per meter of length of straight run per deg C)** of temperature change.
 - c. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer's written instructions for conditions at specific location at the time of installation.
15. Flexible Conduit Connections: Use maximum of **72 inches (1830 mm)** of flexible conduit for recessed and semirecessed lighting fixtures, **as directed**, equipment subject to vibration, noise transmission, or movement; and for transformers and motors.
 - a. Use LFMC in damp or wet locations subject to severe physical damage.
 - b. Use LFMC in damp or wet locations not subject to severe physical damage.

16. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall.
17. Set metal floor boxes level and flush with finished floor surface.
18. Set nonmetallic floor boxes level. Trim after installation to fit flush with finished floor surface.

C. Installation Of Underground Conduit

1. Direct-Buried Conduit:
 - a. Excavate trench bottom to provide firm and uniform support for conduit. Prepare trench bottom as specified in UT Specs Division 31 Section "Earth Moving" for pipe less than **6 inches (150 mm)** in nominal diameter.
 - b. Install backfill as specified in Division 31 Section "Earth Moving"
 - c. After installing conduit, backfill and compact. Start at tie-in point, and work toward end of conduit run, leaving conduit at end of run free to move with expansion and contraction as temperature changes during this process. Firmly hand tamp backfill around conduit to provide maximum supporting strength. After placing controlled backfill to within **12 inches (300 mm)** of finished grade, make final conduit connection at end of run and complete backfilling with normal compaction as specified in UT Specs Division 31 Section "Earth Moving".
 - d. Install manufactured duct elbows for stub-ups at poles and equipment and at building entrances through the floor, unless otherwise indicated. Encase elbows for stub-up ducts throughout the length of the elbow.
OR
Install manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through the floor.
 - 1) Couple steel conduits to ducts with adapters designed for this purpose, and encase coupling with **3 inches (75 mm)** of concrete.
OR
For stub-ups at equipment mounted on outdoor concrete bases, extend steel conduit horizontally a minimum of **60 inches (1500 mm)** from edge of equipment pad or foundation. Install insulated grounding bushings on terminations at equipment.
 - e. Warning Planks: Bury warning planks approximately **12 inches (300 mm)** above direct-buried conduits, placing them **24 inches (600 mm)** o.c. Align planks along the width and along the centerline of conduit.

D. Installation Of Underground Handholes And Boxes

1. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting conduits to minimize bends and deflections required for proper entrances.
2. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from **1/2-inch (12.5-mm)** sieve to **No. 4 (4.75-mm)** sieve and compacted to same density as adjacent undisturbed earth.
3. Elevation: In paved areas, set so cover surface will be flush with finished grade. Set covers of other enclosures **1 inch (25 mm)** above finished grade.
4. Install handholes and boxes with bottom below the frost line, **<Not less than 12">** below grade.
5. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables, but short enough to preserve adequate working clearances in the enclosure.
6. Field-cut openings for conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

E. Sleeve Installation For Electrical Penetrations

1. Coordinate sleeve selection and application with selection and application of firestopping specified in Division 07 Section "Firestopping".
2. Concrete Slabs and Walls: Install sleeves for penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of slabs and walls.
3. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.

4. Rectangular Sleeve Minimum Metal Thickness:
 - a. For sleeve cross-section rectangle perimeter less than 50 inches (1270 mm) and no side greater than 16 inches (400 mm), thickness shall be 0.052 inch (1.3 mm).
 - b. For sleeve cross-section rectangle perimeter equal to, or greater than, 50 inches (1270 mm) and 1 or more sides equal to, or greater than, 16 inches (400 mm), thickness shall be 0.138 inch (3.5 mm).
5. Fire-Rated Assemblies: Install sleeves for penetrations of fire-rated floor and wall assemblies unless openings compatible with firestop system used are fabricated during construction of floor or wall.
6. Cut sleeves to length for mounting flush with both surfaces of walls.
7. Extend sleeves installed in floors 2 inches (50 mm) above finished floor level.
8. Size pipe sleeves to provide 1/4-inch (6.4-mm) annular clear space between sleeve and raceway unless sleeve seal is to be installed or unless seismic criteria require different clearance.
9. Seal space outside of sleeves with grout for penetrations of concrete and masonry and with approved joint compound for gypsum board assemblies, **as directed**.
10. Interior Penetrations of Non-Fire-Rated Walls and Floors: Seal annular space between sleeve and raceway, using joint sealant appropriate for size, depth, and location of joint. Refer to UT Specs Division 07 Section "Joint Sealants" for materials and installation.
11. Fire-Rated-Assembly Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at raceway penetrations. Install sleeves and seal with firestop materials. Comply with UT Specs Division 07 Section "Firestopping".
12. Roof-Penetration Sleeves: Seal penetration of individual raceways with flexible, boot-type flashing units applied in coordination with roofing work.
13. Aboveground, Exterior-Wall Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch (25-mm) annular clear space between pipe and sleeve for installing mechanical sleeve seals.
14. Underground, Exterior-Wall Penetrations: Install cast-iron "wall pipes" for sleeves. Size sleeves to allow for 1-inch (25-mm) annular clear space between raceway and sleeve for installing mechanical sleeve seals.

F. Sleeve-Seal Installation

1. Install to seal underground, exterior wall penetrations.
2. Use type and number of sealing elements recommended by manufacturer for raceway material and size. Position raceway in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

G. Firestopping

1. Apply firestopping to electrical penetrations of fire-rated floor and wall assemblies to restore original fire-resistance rating of assembly. Firestopping materials and installation requirements are specified in Division 07 Section "Firestopping".

H. Protection

1. Provide final protection and maintain conditions that ensure coatings, finishes, and cabinets are without damage or deterioration at time of Substantial Completion.
 - a. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
 - b. Repair damage to PVC or paint finishes with matching touchup coating recommended by manufacturer.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 05 53 00 - ELECTRICAL IDENTIFICATION

PART 1 GENERAL

1.1 WORK INCLUDED

- A. Nameplates and tape labels
- B. Wire and cable markers
- C. Conduit color coding and labeling

1.2 REFERENCES

- A. NFPA 70 – National Electrical Code (latest edition)

1.3 SUBMITTALS

- A. Provide submittals in accordance with and in additional to Section 26 00 00.UT, Basic Electrical Requirements, and Division 01 for submittal requirement.
 - 1. Furnish nameplate identification schedules listing equipment type and nameplate data with letter sizes and nameplate material.

PART 2 PRODUCTS

2.1 MATERIALS

- A. Equipment Nameplates:
 - 1. For normal power electrical equipment, provide engraved three-layer laminated plastic nameplates, engraved white letters on a black background.
 - 2. For emergency equipment provide engraved three-layer laminated plastic nameplates with engraved white letters on a red background.
 - 3. For UPS powered equipment provide engraved three-layer laminated plastic nameplates with engraved white letters on an orange background.
 - 4. For fire alarm system provide engraved three-layer laminated plastic nameplates with white letters on a yellow background.
 - 5. For security and CCTV system panels, provide engraved three-layer laminated plastic nameplates with white letters on a blue background.
- B. Underground Warning Tape
 - 1. Manufactured polyethylene material and unaffected by acids and alkalines.
 - 2. 3.5 mils thick and 6 inches wide.
 - 3. Tensile strength of 1,750 psi lengthwise.
 - 4. Printing on tape shall include an identification note BURIED ELECTRIC LINE, and a caution note CAUTION. Repeat identification and caution notes over full length of tape. Provide with black letters on a red background.
- C. Conductor Color Tape and Heat Shrink:
 - 1. Colored vinyl electrical tape shall be applied perpendicular to the long dimension of the cable or conductor.
 - 2. In applications utilizing tray cable, heat shrinkable tubing shall be used to obtain the proper color coding for the length of the conductor in the cabinet or enclosure. Variations to the cable color coding due to standard types of wire or cables are not acceptable.
- D. Conduit Labels (5 kV and 15 kV Conduits, 38KV conduits Only): 2-inch black letters on yellow background reading "DANGER - 4160 VOLTS" or "DANGER – 13,800 VOLTS" or "DANGER 34,500

VOLTS". Labels shall have adhesive backing, and shall be installed at intervals not exceeding 50 feet and on all pull boxes located to be visible from floor.

- E. Warning labels: Provide warning labels with black lettering on red background with a minimum of 1/2" lettering.
- F. Tape Labels: Thermal adhesive tape, with minimum 1/4-inch letters for labeling receptacles, switches, control device stations, junction and pull boxes, larger than 4"x4", and manual motor starter units, etc, showing panel and circuit.
 - 1. Black letters on white background for normal power.
 - 2. Black letters on white background for emergency/standby power.
 - 3. Black letters on white background for UPS power.
- G. 4"x4" J-Box Labels: Label with Black Sharpie with clear letters, to include panel, circuit and voltage.

PART 3 EXECUTION

3.1 INSTALLATION

- A. Degrease and clean surfaces to receive nameplates or tape labels.
- B. Install nameplates parallel to equipment lines.
- C. Secure plastic nameplates to equipment fronts using screws or rivets. Use of adhesives shall be per Owner's approval. Secure nameplate to outside face of flush mounted panelboard doors in finished locations.

3.2 WIRE IDENTIFICATION

- A. Provide wire markers on each conductor in panelboard gutters, pull boxes, outlet and junction boxes, and at load connection. Identify with branch circuit or feeder number for power and lighting circuits. Label control wire with number as indicated on schematic and interconnection diagrams or equipment manufacturer's shop drawings for control wiring.
- B. Conductors for power circuits to be identified per the following schedule, for new construction and to match existing for remodel and finish out.

Conductor	System Voltage			
	480/277V	208/120V	240/120V High Leg	Medium Voltage
Phase A	Brown	Black	Black	One White Band
Phase B	Purple	Red	Orange	Two White Bands
Phase C	Yellow	Blue	Blue	Three White Bands
Neutral	Gray	White	White	N/A
Grounding IG	Green N/A	Green Green w/Yellow	Green Green w/Yellow	Green N/A

3.3 NAMEPLATE ENGRAVING SCHEDULE

- A. Provide nameplates of minimum letter height as scheduled below. Nameplate schedules shall be submitted to owner for approval.
 - 1) All manufacturers shall follow this organization.
 - a. Line One- Name (Tag) shown on PM System
 - b. Line Two- Fed from (Panel, Circuits and Room)
- B. Individual Circuit Breakers in Distribution Panelboards, Disconnect Switches, Motor Starters, and Contactors: 1/4-inch; identify source to device and the load it serves, including location.

- C. Dry Type Transformers Not in Substations: 3/8-inch; identify equipment designation. 1/4-inch; identify secondary load.
- D. Automatic Transfer Switches: 3/8-inch; white letters and red background; identify equipment designation 1/4-inch; identify voltage rating, normal source, standby source and load served including location.
- E. Panelboards: 3/8-inch; identify equipment designation. 1/4 -inch; identify source, and bus rating.
- F. Individual circuit breakers in panelboards shall identify receptacle or load and location.

3.4 ENCLOSURE COLOR CODING

- A. The following systems shall have each junction and pull box cover completely painted per the following:

System	Color of Box Cover
Ethernet Backbone	Blue
Telecommunications	Brown
FCMS	Green
Emergency Power	Red
Security**	White
Fire Alarm	Red and marked F.A.
Clock	Fluorescent Violet
U.P.S.	Fluorescent Pink

**Security shall include, but not be limited to, the following systems:

- Card Access
- Duress Alarms
- Perimeter Door Alarms
- CCTV

SECTION 26 22 13 00 - DRY TYPE TRANSFORMERS**PART 1 – GENERAL****1.1 WORK INCLUDED**

This Section includes enclosed dry type distribution transformers rated 600 volts and less, sizes up to 500 kVA.

- A. Dry type Two-Winding transformers.
- B. Dry type Buck and Boost transformers.
- C. Dry type Shielded Isolation transformers.
- D. Dry type, K-rated transformers.

1.2 REFERENCES

- A. NEMA ST 1 - Specialty Transformers (Except General Purpose Type)
- B. NEMA ST 20 - Dry Type Transformers for General Applications
- C. IEEE C57.12.01 - General Requirements for Dry-Type Distribution and Power Transformers.
- D. IEEE C57.12.91 - Test Code for Dry-Type Distribution and Power Transformers
- E. IEEE C57.96 – Guide for Loading Dry-Type Distribution and Power Transformers
- F. IEEE Std. 519 - Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems
- G. UL 506 – Specialty Transformers
- H. UL 1561 - Dry Type General Purpose and Power Transformers
- I. NEMA TP 1 – Guide for Determining Energy Efficiency for Distribution Transformers
- J. NEMA TP 2 – Standard Test Method for Measuring the Energy Consumption for Distribution Transformers

1.3 SUBMITTALS

- A. Provide submittals in accordance with and in addition to General Requirement for submittal requirement.
- B. Submit manufacturer's data on dry type transformers, vibration isolators and accessories.
- C. Include outline and support point dimensions of enclosures and accessories; unit weight; voltage; kVA; impedance ratings and characteristics; loss data; efficiency at 25, 50, 75 and 100 percent rated load; sound level; tap configurations; insulation system type, and rated temperature rise.

1.4 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Store transformers in a clean and dry space and protected from weather in accordance with manufacturer's instructions. Cover ventilating openings to keep out dust.
- B. Transformer shall not be used as work tables, scaffolds or ladders.
- C. Handle transformers carefully to avoid damage to material components, enclosure and finish. Use only lifting eyes and brackets provided for that purpose. Damaged transformers shall be rejected and not be installed on project.

PART 2 - PRODUCTS**2.1 MATERIALS AND EQUIPMENT**

- A. Transformers shall be of dry type complying with the design function requirements of the project. Design characteristics shall be as noted in manufacturer's submittal data.
- B. Provide barrel type coils vacuum impregnated with high grade insulating varnish, non-hydroscopic thermo-setting type.

- C. Furnish copper windings, continuous without splice.
- D. Use non-aging silicon steel cores held together with steel channels or angles, with low flux density, quiet operating, and vibration isolated from enclosure and support channels.
- E. All transformers shall be designed, manufactured, and tested in accordance with all the latest applicable ANSI, NEMA, IEEE and UL standards, and shall be UL listed and bear the UL label.

2.2 DRY TYPE TWO-WINDING TRANSFORMERS

- A. Acceptable manufacturers
 - 1. Square D
 - 2. Cutler-Hammer
 - 3. General Electric Company
 - 4. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.
- B. Dry type transformers shall be NEMA ST 20; factory-assembled, air cooled dry type transformers; ratings as shown on the Drawings.
- C. Insulation system and average winding temperature rise (in a 40 degree C maximum ambient) for rated kVA as follows:

kVA Rating	Insulation Class (degree C)	Temperature Rise (degree C)
1-15 kVA	185	80
25-500 kVA	220	80

- D. The maximum temperature of the top of the enclosure shall not exceed 50 degrees C rise above a 40 degree ambient.
- E. Winding Taps, Transformers 15 kVA and Less: Two 5 percent below rated voltage, full capacity taps on primary winding.
- F. Winding Taps, Transformers 25 kVA and Larger: Two 2.5 percent above rated voltage and four 2.5 percent below rated voltage, full capacity taps on primary.
- G. Sound Levels: Maximum sound levels are as follows:

kVA Rating	Sound Level
0-9	40 db
10-50	45 db
51-150	50 db
151-300	55 db
301-500	60 db

- H. Basic impulse level shall be 10 KV.
- I. Ground core and coil assembly to enclosure by means of a visible flexible copper grounding strap.
- J. Transformers 15 kVA and less shall be suitable for wall, floor, or trapeze mounting; transformers larger than 15 kVA shall be floor mounted.
- K. Enclosure shall be NEMA Type 2 or as shown on the Drawings. Provide lifting eyes or brackets.
- L. Nameplate on transformer shall include transformer connection data, kVA ratings, impedance, and overload capacity based on rated allowable winding temperature rise. Identify primary and secondary voltages.
- M. Isolate core and coil from enclosure using vibration absorbing mounts.
- N. Provide identification nameplate in accordance with Section 26 05 53 Electrical Identification.

- O. Transformer, no load primary current shall be less than 5% of transformer primary load current. Record and report test results to UTHSCSA. nameplate full

2.3 DRY TYPE BUCK AND BOOST TRANSFORMERS

- A. Acceptable manufacturers
1. Square D
 2. Cutler-Hammer
 3. General Electric Company
 4. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure General Requirements for substitution requirement.
- B. Dry Type Buck and Boost Transformers shall be NEMA ST 1; factory-assembled, dry type two winding buck and boost transformers; ratings as shown on the Drawings.
- C. Insulation system and average winding temperature rise for rated kVA as follows:

kVA Rating	Insulation Class (degree C)	Temperature Rise (degree C)
0.25-2 kVA	185	115
3-7.5 kVA	185	115

- D. Transformers shall be suitable for wall mount.
- E. Enclosure shall be NEMA 1 or as shown on the Drawings.
- F. Nameplate shall include transformer connection data.

2.4 DRY TYPE SHIELDED ISOLATION TRANSFORMERS

- A. Acceptable manufacturers
1. Square D
 2. Cutler-Hammer
 3. General Electric Company
 4. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.
- B. Dry Type Shielded Isolation Transformers shall be NEMA ST 20; factory-assembled, air cooled dry type shielded isolation transformers; ratings as shown on the Drawings.
- C. Insulation system and average winding temperature rise (in a 40 degree C maximum ambient) for rated kVA shall be as 2.2 C.
- D. The maximum temperature of the top of the enclosure shall not exceed 50 degrees C rise above a 40 degree ambient.
- E. Winding Taps, Transformers 15 kVA and Less: Two 5 percent below rated voltage, full capacity taps on primary winding.
- F. Winding Taps, Transformers 25 kVA and Larger: Two 2.5 percent above rated voltage and four 2.5 percent below rated voltage, full capacity taps on primary.
- G. Maximum sound levels are as 2.2 G.
- H. Basic Impulse Level shall be 10 KV.
- I. Ground core and coil assembly to enclosure by means of a visible flexible copper grounding strap.
- J. Transformers shall be supplied with quality, full width electrostatic shields in a maximum effective coupling capacitance between primary and secondary of 33 picofarads. With transformers connected under normal, loaded operating conditions, the attenuation of line noise and transients shall equal or exceed the following limits:

1. Common mode noise attenuation:

Frequency	Attenuation
0 - 1.5k Hz	120 db
1.5 -10k Hz	90 db
10 - 100k Hz	65 db
100k – 1M Hz	40 db

2. Transverse mode noise attenuation:

Frequency	Attenuation
1.5 -10k Hz	52 db
10 - 100k Hz	30 db
100k – 1M Hz	30 db

- K. Provide electrostatic shield between the primary and secondary winding and grounded to the transformer core.
- L. Transformers 15 kVA and less shall be suitable for wall, floor, or trapeze mounting; transformers larger than 15 kVA shall be floor mounted.
- M. Enclosure shall be NEMA Type 2 or as shown on the Drawings. Provide lifting eyes or brackets.
- N. Nameplate on transformer shall include transformer connection data, ratings, impedance, and overload capacity based on rated allowable winding temperature rise. Identify primary and secondary voltages.
- O. Isolate core and coil from enclosure using vibration absorbing mounts.
- P. Provide identification nameplate in accordance with Section 26 05 53 Electrical Identification
- Q. Transformer, no load primary current shall be less than 5% of transformer primary nameplate full load current. Record and report test results to UTHSCSA.

2.5 DRY TYPE, K-RATED TRANSFORMERS

- A. K-rated transformers shall be NEMA ST 20; factory-assembled, air cooled dry type transformers meeting all the requirements as specified under paragraphs 2.2 and 2.4 of this Section; ratings as shown on the Drawings.
- B. Impedance range shall be 3 percent to 5 percent with a 2 percent minimum reactance in order to reduce neutral current when supplying loads with large amount of third harmonic current.
- C. Transformers shall be UL listed and labeled for K-4 or K-13; ratings as shown on the Drawings.
- D. Three-phase transformer secondary neutral terminal shall be sized for 200 percent of the rated secondary phase current.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Installer shall examine the areas and conditions under which dry type transformers are to be installed and notify the contractor in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install dry type transformers as indicated, in accordance with the applicable requirements of the NEC, the National Electrical Contractors Association's "Standard of Installation" and quality construction.
- B. Check for damage and tight connections prior to energizing transformer.
- C. Measure primary and secondary voltages and make appropriate tap adjustments.
- D. Set transformer plumb and level.

- E. Use flexible liquid-tight conduit, 2 ft. minimum length, 6 ft. maximum length for connections to transformer case. Make conduit connections to side panel of enclosure.
- F. Mount transformers on vibration isolating pads suitable for isolating the transformer noise from the building structure.
 - 1. For floor or roof transformer installations, use one pad type Korfund Elasto-Grip, waffle, or equal, at each corner of the transformer, sized for load of 50 lbs./sq. in.
 - 2. For wall hung transformer installations, use spring type Korfund Series P, or equal. Provide sound pads at each corner of the transformer, sized for 1/2 inch deflection.
- G. Avoid mounting transformers in areas where tend to amplify noises, such as stairways, hall areas, and corners near ceilings. Avoid where possible, nearby reflecting object or enclosure that might resonate or echo.
- H. Ground transformers in accordance with Section 26 05 26 Grounding, and NEC requirements. Bring all ground connectors and neutral to one point with lug mounted on frame's exposed bare metal surface. Call for inspection before closing and energizing.

SECTION 26 24 16 00 - PANELBOARDS

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Distribution panelboards.
- B. Branch circuit panelboards.

1.2 REFERENCES

- A. NEMA AB 1 - Molded Case Circuit Breakers and Molded Case Switches.
- B. NAME KS 1 - Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum).
- C. NEMA PB 1 - Panelboards.
- D. NEMA PB 1.1 - Instructions for Safe Installation, Operation and Maintenance of Panelboards Rated 600 Volts or Less.
- E. NEMA PB 1.2 - Application Guide for Ground-fault Protective Devices for Equipment.
- F. NEMA AB 3 – Molded Case Breakers and Their Application
- G. ANSI/UL 67 – Electric Panelboards
- H. ANSI/UL 50 – Cabinets and Boxes
- I. ANSI/UL 508 – Industrial Control Equipment

1.3 SUBMITTALS

- A. Provide submittals in accordance with and in addition to General Requirements for submittal requirement.
- B. Submit dimensioned drawings showing size, circuit breaker arrangement and equipment ratings including, but not limited to, voltage, main bus ampacity, integrated short circuit ampere rating, bus material and temperature rating of circuit breaker terminations.

1.4 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Deliver distribution panelboards in factory-fabricated water-resistant wrapping.
- B. Handle panelboards carefully to avoid damage to material component, enclosure and finish.
- C. Store in a clean, dry space and protected from the weather.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Eaton
- B. General Electric Company
- C. Square D Company
- D. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.

2.2 PANELBOARD CONSTRUCTION

- A. General: Provide flush or surface mounted, or surface mounted deadfront circuit breaker type distribution or branch circuit panelboards with electrical ratings and configurations, as indicated on the drawings and schedules. Load center type of panelboards are not acceptable.
- B. Enclosure:
 - 1. Enclosure shall be proper NEMA type as shown on the drawings.

2. NEMA 1

- a. Back box shall be galvanized steel for flush mounted branch circuit panelboards. Back box shall have gray enamel electro-deposited finish over cleaned phosphatized steel for all other type panelboards.
- b. Provide panelboard fronts with door in door with flush lock.
- c. Where power monitors, metering, or TVSS are specified on the Drawings, the manufacturer shall provide factory installed units and covers.

3. NEMA 3R, 3S and 12

- a. Enclosure and doors shall have gray enamel electro-deposited finish over cleaned phosphatized steel.
- b. Doors shall be gasketed and equipped with tumbler type vault lock and two trunk latches where required by UL standard. Interior trim shall consist of four pieces, each covering one gutter top, bottom and both sides.
4. Construct cabinet in accordance with UL 50. Use not less than 16-gauge galvanized sheet steel, with all cut edge galvanized. Provide a minimum 4-inch gutter wiring space on each side. Provide large gutter where required to accommodate the size and quantity of conductors to be terminated in the panel, and where required by code.
5. Exterior and interior steel surfaces shall be cleaned and finished with gray enamel over rust inhibiting phosphatized coating. Color shall be ANSI 61 gray for normal power and red for emergency power.
6. Doors shall be equipped with flush-type combination catch and key lock. All locks shall be keyed alike.
7. Branch circuit panelboards shall be 5 ¾ inches deep.
8. A plastic sleeve directory holder and panel schedule shall be mounted inside of each door.
9. Reinforce enclosure and securely support bus bars and overcurrent devices to prevent vibration and breakage in handling.
10. Rating: Minimum integrated short-circuit rating, voltage and current rating as shown on drawings.
11. Labeling: The Contractor shall furnish and install engraved, laminated plastic nameplates on the trim per Section 26 05 53, Electrical Identification

C Bus:

1. Provide panelboards with rounded edge phase, neutral and ground buses, rated full capacity as scheduled on drawings. Buses shall be full-length copper and braced for the maximum available fault current as shown on drawings. Neutral bus shall be 200% rated for electronic grade panelboards.
2. Where isolated ground buses are specified or indicated, provide copper grounding bus bars mounted in the panelboard on insulated standoffs to ensure isolation from equipment ground potential. Isolated ground buses shall be drilled and tapped as appropriate for connection of the individual isolated grounding conductors. **All ground bus bars shall be copper.**
3. All lugs for phase, neutral, and ground buses shall be tin-plated copper. **AL/CU connectors are not acceptable.**
4. Panelboard shall be rated SE where required for Service Entrance duty.

2.3 SWITCHING AND OVERCURRENT PROTECTIVE DEVICES

- A. Provide molded case circuit breakers with manufacturer's standard construction, bolt on type, with integral inverse time delay thermal and instantaneous magnetic trip in each pole. Circuit breakers shall be constructed using glass reinforced polyester insulating material providing superior dielectric strength. Provide circuit breakers UL listed as Type HACR for air-conditioning equipment branch circuits.

- B. Circuit breakers shall have an over center, trip-free, toggle operating mechanism that will provide a quick-make, quick-break contact action.
- C. Provide handle padlock attachments on circuit breakers where indicated on drawings. Device shall be capable of accepting a single padlock. All circuit breakers shall be capable of being individually padlocked in the off position.
- D. The circuit breakers shall be connected to the bus by means of solidly bolted connection. In multi-pole breakers, the phase connections on the bussing shall be made simultaneously without additional connectors or jumpers. Multi-pole breakers shall be two or three pole as specified. Handle ties are not permitted. The circuit breaker shall have common tripping for all poles.
- E. All circuit breakers shall be provided with visible ON and OFF indications.
- F. Provide GFI circuit breakers as indicated on drawing or per NEC requirement.
- G. Breaker voltage and trip rating shall be per drawings. Breaker faceplate shall indicate UL certificate standards with applicable voltage systems and corresponding short current rating as per drawings.
- H. Molded Case Circuit Breakers:
 - 1. Breakers 400 ampere frame and less shall be manufacturer's standard industrial construction, bolt-on type, integral inverse time delay thermal and instantaneous magnetic trip. Breakers 225 ampere through 400 ampere shall have continuously adjustable magnetic pick-ups of approximately five to ten times trip rating.
 - 2. Breakers 600 ampere frame and above shall be equipped with solid-state trip complete with built-in current transformers, solid-state trip unit and flux transfer shunt trip.
- I. Current Limiting Molded Case Circuit Breakers:
 - 1. Breakers 100 ampere frame shall be inverse time delay thermal and instantaneous magnetic trip.
 - 2. Breakers 250 ampere and 400 ampere frame shall be solid-state trip with built-in current transformers, solid-state trip unit and flux transfer shunt trip.
 - 3. Current limiting breakers shall protect downstream molded case breakers. Submit manufacturer's test data proving the protection, from both peak currents and I²T energy of downstream devices.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install panelboards in accordance with manufacturer's written instructions and the applicable requirements of the NEC, NEMA, ANSI, the National Electrical Contractors Association's "Standard of Installation", and quality workmanship.
- B. Anchor can firmly to walls and structural surfaces, ensuring that they are permanently and mechanically secured. Direct attachment to dry wall is not permitted. Freestanding panelboards shall be installed on a concrete housekeeping pad with anchors per manufacturer's recommendation.
- C. Mounting height:
 - 1. Distribution Panelboards: As per Drawings, but such that the center of the highest operating handle is no greater than 79 inches above finished floor.
 - 2. Branch Circuit Panelboards: As per Drawings, but such that the center of the highest operating handle is no greater than 79 inches above finished floor.
 - 3. Where panelboards occur in groups, the tops shall be aligned if it can be done without exceeding items 1 and 2 above.
- D. Install panelboards plumb. Adjust trim to cover all openings. Seal all conduit openings and cap all unused knockout holes.
- E. Provide blank plates for unused open spaces in panelboards. Keep the front door closed after work to protect from damage, dirt, and debris at all times.

- F. Install identification nameplates in accordance with Section 26 05 53, Electrical Identification.

3.2 FIELD QUALITY CONTROL

- A. Visual and Mechanical Inspection: Inspect for physical damage, proper alignment, anchorage, and grounding. Check proper installation and tightness of connections for circuit breakers and lugs.
- B. Provide testing as indicated in Section 26 05 00 – Basic Electrical Material and Methods.

3.3 PANELBOARD SCHEDULE

- A. The Contractor shall provide engraved, laminated plastic nameplates for circuit identification as indicated on the Drawings for distribution panelboards.
- B. The Contractor shall provide a typed index directory inside the front door of branch circuit panelboards identifying each circuit as shown on Panel Schedule drawings. Where changes are made, the schedule shall reflect the changes. At the end of the job, these schedules shall reflect as-built record conditions.
Provide hard and digital (excel) copies to UTHSCSA of As-Built schedules.

END OF SECTION 26 24 16 0024 16 0024 10 0024 16

Task	Specification	Specification Description

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 27 26 00 - WIRING DEVICES AND FLOOR BOXES**PART 1 - GENERAL****1.1 WORK INCLUDED**

- A. Wiring Devices:
 - 1. Wall switches.
 - 2. Receptacles.
 - 3. Device plates and box covers.
 - 4. Wall dimmers.
 - 5. Occupant sensors.
- B. Floor boxes.
- C. Wiring for HVAC in Division 23 shall meet the requirement of this specification.

1.2 REFERENCES

- A. Americans with Disabilities Act (ADA)
- B. ANSI/NEMA OS 1- Sheet-Steel Outlet Boxes, Device Boxes, Covers, and Box Supports.
- C. ANSI/UL 20 – General Use Snap Switches.
- D. ANSI/UL 498 – Attachment Plugs and Receptacles.
- E. ANSI/UL 943 – Ground Fault Circuit Interrupters.
- F. NEMA 250 – Enclosures for Electrical Equipment (1000 Volts maximum).
- G. NEMA WD 1 – General-Purpose Wiring Devices.
- H. NEMA WD 2 - Semiconductor Dimmers for Incandescent Lamps.
- I. NEMA WD 5 - Specific-Purpose Wiring Devices.
- J. Texas Accessibility Standards. (TAS)

1.3 SUBMITTALS

- A. Provide submittals in accordance with and in additional to General Requirements for submittal requirement.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Deliver wiring devices individually wrapped in factory-fabricated containers.
- B. Handle wiring devices carefully to avoid damage, breaking and scoring.
- C. Store in a clean dry space and protected from the weather.

PART 2 - PRODUCTS**2.1 GENERAL**

- A. Provide factory fabricated wiring devices in the type and electrical rating for the service indicated. Where type and grade are not indicated, provide proper selection to correspond with branch circuit wiring and overcurrent protection. Attachment of wires to devices shall be by screw pressure under the head of binding screws. Arrangements depending on spring pressure or tension are not acceptable. All binding screws shall be brass or bronze.
- B. Device color:
 - 1. Switches, receptacles, and dimmers on normal power shall be white.

2. Switches, receptacles, dimmers, and faceplates on emergency power shall be red.
3. Isolated ground receptacles shall be orange.
4. Key operated switches shall be gray.
5. Provide receptacles in surface mounted raceways in colors as shown on drawings. Coordinate color of devices and device plates in other areas with the architectural finish. Refer to drawings and specifications.
6. For renovation or expansion of existing facilities, provide normal power devices and plates to match existing.

2.2 WALL SWITCHES

A. Acceptable manufacturers

1. Cooper Wiring Devices
2. Hubbell
3. General Electric
4. Leviton
5. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.

B. Material

1. Wall switches for lighting circuits shall be AC general use snap switch with toggle handle, 20 amperes and 120/277 volt AC with number of poles as required.
2. Pilot light type shall be equipped with red toggle handle (glow when on), 20 amperes and 120/277 volt AC with number of poles as required.
3. Key operated switches shall be Gray, 20 amperes and 120/277 volt AC with number of poles as required key all locks alike. Furnish keys compatible with key switch, quantity as approved by Owner, minimum of ten copies.
4. Illuminated Emergency-Power-Off switch shall be provided with button guard equal to Allen-Bradley #800T-QA10R or approved substitutions.
5. A listed manual switch having a horsepower rating not less than the rating of the motor and marked "Suitable as Motor Disconnect" shall be permitted to serve as disconnect means for stationary motor of $\frac{3}{4}$ horsepower or less.
6. Switch terminal screws or connectors shall be designed to accommodate No. 10 solid conductor.

2.3 RECEPTACLES

A. Acceptable manufacturers

1. Cooper Wiring Devices
2. Hubbell
3. General Electric
4. Leviton
5. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.

B. Material

1. Hospital grade receptacles shall be installed in clinic, patient care and other areas required by NFPA. Tamper proof in areas serving children.
2. Circuit and convenience duplex receptacles shall be rated 20 amperes, 125 volt AC.

3. GFCI receptacles shall be rated 20 amperes, 125 volt with integral ground fault current interrupter
4. Isolated ground duplex receptacles shall be Orange, rated 20 amperes, 125 volt.
5. Heat trace receptacles shall be Arrow-Hart #5262CRGRY with Crouse Hinds #WLRD-1 cover. Install round plug on cord supplied with heat trace to match weatherproof bushing on receptacle cover for watertight installation.
6. Specific-use receptacles shall have volts, amps, poles and NEMA configuration as noted on drawings, as required for branch circuit wiring, over current protection, and equipment application.
7. Heavy-duty lock-blade receptacles shall be NEMA WD5 heavy-duty specification grade.
8. Emergency receptacles shall be red plastic face
9. Weatherproof receptacles as specified shall be mounted in a cast steel box with gasketed, weatherproof device plate as specified.

2.4 WALL PLATES

A. Acceptable manufacturers

1. Cooper Wiring Devices
2. Hubbell
3. General Electric
4. Leviton
5. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.

B. Material

1. Wall plates in IT, mechanical and electrical rooms, loading docks, lab areas, and other industrial areas shall be 316 or 302 stainless steel with cutouts as required for devices indicated on drawings, unless otherwise noted. Other wall plates shall be smooth nylon, of a matching color to existing or as specified on Drawings. Where switches or outlets are shown adjacent to each other, they shall be ganged with partitions between different type services and covered by a single custom wall plate.
2. Exposed boxes:
 - a. Dry interior spaces: Use cast metal plates with cast metal box. Use heavy cadmium-plated sheet steel plates with steel boxes and copper-free aluminum with aluminum boxes. All screws shall be stainless steel. Edges of plates must be flush with edges of boxes.
 - b. Other locations: Use weatherproof devices plates. Provide cast metal plates with gasketed spring door
3. Jumbo plates are not permitted.
4. Weatherproof cover plate shall be gasketed cast aluminum or feraloy (by Crouse-Hinds) with hinged gasketed device covers.
5. Wall plate for isolated ground receptacles shall be silk-screened "ISOLATED GROUND".

2.5 WALL DIMMERS

A. Acceptable manufacturers

1. Lutron
2. Leviton
3. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.

B. Material

1. Provide NEMA WD 2 solid-state wall-box dimmers, where indicated on drawings. Dimmers shall be complete, with linear slide-type solid-state dimming controls, and LED light level ON/OFF indicators. Dimmer shall produce IES square-law response from blackout to full brightness. Dimmer rise time shall be restricted to prevent interference with professional quality audio or video equipment. Dimmer shall be compatible with ballast per manufacturer's specification.
2. Device: White finish plastic with linear slide.
3. Voltage: As noted on drawings.
4. Power rating: Match load shown; 1000 watts minimum, larger size is required to accommodate connected loads greater than 1000watts. Load to 80% of the dimmer capacity, maximum.

2.6 FLOOR MOUNTED SERVICE FITTINGS AND BOXES

A. Acceptable manufacturers

1. Steel City
2. Walker
3. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.

B. Material

1. Floor mounted service boxes shall be flush mounted brushed aluminum housing with poke-through assembly. Provide brass cover plate with two hinged lift lids where carpeting is installed.
2. Quantity of outlets for A/V and power per drawings.

2.7 OCCUPANT SENSORS

A. Acceptable manufacturers

1. Wattstopper
2. As specified on drawings
3. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in General Requirements for substitution requirement.

B. Material

1. Self-mounting, ceiling bracket.
2. Quad element, infrared detector behind a fresnel lens.
3. Features
 - a. Provide power packs as required.
 - b. Power packs shall be by same manufacturer.
 - c. Adjustable time-out delay: not greater than 15 minutes.
 - d. Supplied with plenum rated low voltage wire leads for termination.
 - e. Manual shutoff per sensor is required for wall switches.
4. Control unit
 - a. Enclosure: Galvanized, heavy duty for mounting to a 4 inch or 4-11/16 inch square box.
 - b. Control up to (7) sensors.
 - c. Power rating
 - (1) 600 watts for incandescent at 120 volts.

(2) 2500 watts for fluorescent at 277 volts.

d. Supplied with plenum rated low voltage wire leads for termination.

2.8 TAPE LABELS

- A. Provide tape labels in accordance with Section 26 05 53, Electrical Identification, on all receptacles and switches indicating panelboard and circuit number. White tape with 3/16 inch black letters/numbers.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Installer must examine the areas and conditions under which wiring devices and floor boxes are to be installed and notify the Contractor in writing of conditions detrimental to the proper and timely completion of the work. Inspect devices for physical damage. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 DEVICE COORDINATION

- A. Where items of equipment are provided under other Sections of this specification or by The University, provide a compatible receptacle and/or device plate for the cap or plug, and cord of the equipment.

3.3 INSTALLATION

A. General:

1. Install wiring devices and floor boxes as indicated, in accordance with the applicable requirements of the latest release of NEC, NEMA, and ANSI.
2. The approximate location of switches, power outlets, floor boxes, etc., is indicated on the drawings. These drawings, however, may not give complete and accurate information in regard to locations of such items. Determine exact locations by reference to the general building drawings and by actual measurements during construction of the building before rough-in, subject to the approval of The University.
3. Where more than one device occurs in one outlet box, connected to different voltage systems, a barrier must be provided for isolation to meet NEC Article 800.

B. Wall Switches and Dimmers:

1. Location:

- a. Install wall switches and dimmers in suitable outlet box centered at the height of 48 inches above finished floor, OFF position down.
- b. Where wainscot occurs at the 48" level, install device in the wall below the wainscot and as near the 48" level as possible to provide the most pleasing appearance, but in no case partially in the wainscot and partially in the wall.
- c. Where shown near doors, install switches and dimmers not less than 2" and not more than 12" from door trim.
- d. Verify all door swings before rough-in and locate switches and dimmers on strike side of door as finally installed.

2. Position:

- a. Wall switches: Install wall switches in a uniform position so the same direction of operation will open and close the circuits throughout the project, generally up or to the left for the ON position.
- b. Wall dimmers: Install dimmers in a uniform position so the same direction of operation will brighten and dim the lights throughout the project, generally up for brightest position.

3. Wall Box Dimmers:

- a. De-rate ganged dimmers as instructed by manufacturer. Do not use common neutral.

- b. Compatibility: Where dimmers are connected to fluorescent lights, verify with ballast manufacturer and dimmer manufacturer the suitability of the ballast for dimming applications.
- c. Test: Test dimmers per manufacturer's instructions. Demonstrate that unit's function as specified. Where remote dimmers are provided, demonstrate that unit's function properly as master and remote.
- d. Burn-in: Where dimmers are connected to fluorescent fixtures, operate at full brightness for the full burn-in duration as specified or recommended by the lamp manufacturer, not less than 100 hours.

C. Receptacles:

1. Location:

- a. Install convenience outlets, telephone, data and TV outlets in suitable steel outlet boxes centered at the height of 18 inches above the finished floor, 6 inches above countertop or at the backsplash level, or as indicated on the drawings. Coordinate with equipment and architectural drawings.
- b. Install receptacles generally where indicated on drawings. The University's representative reserves the right to make any reasonable changes in receptacle locations without change in the contract sum.
- c. Install specific-use receptacles at heights shown on Drawings, or 18" AFF if not shown.

2. Position:

- a. Install receptacles vertically with ground pole on top. Install receptacles horizontally, where field condition does not allow vertical installation, with ground pole on left.
- 3. All receptacles with 6 feet of a water source such as sinks shall be GFCI type. Arrange circuit wiring for last receptacle on circuit to be GFCI. Feed through to non-GFCI receptacles is not permitted, unless specifically shown on Drawings.

D. Plates:

- 1. Where cover plates do not completely conceal the rough openings for the devices, it shall be the responsibility of the General Contractor to patch, paint, etc. around the opening to the satisfaction of The University.
- 2. All devices and cover plates shall be plumb and parallel to adjacent surfaces or trim. Devices must be flush with the finished trim cover plates and plates must be tight to surfaces over which they are installed.
- 3. Where switches controlling devices that are out of sight, or where three or more switches are gang mounted, plates shall be labeled to identify items being controlled, or areas being lighted. Labeling shall be engraved 3/16-inch Condensed Gothic and shall be filled with black enamel.

E. Floor Boxes:

- 1. Verify locations of all floor boxes with The University before installation. Increase slab thickness at boxes if required to obtain a minimum of 1 inch of concrete below bottom of box.
- 2. Install floor boxes level and flush with finish flooring material. Completely envelope floor boxes in concrete except at the top.
- 3. Adjust covers flush with finished floor.

F. Occupant Sensors:

- 1. Flush mount occupant sensors through round hole cut in ceiling tile, positioning and placement per sensor manufacturer's recommendation.
- 2. It is the installer's responsibility to replace damaged ceiling tiles during his installation of sensor.

3. The low voltage control wiring installed above ceiling tiles shall be plenum rated or general building wiring installed in raceway system and installed tight to above structure, above other equipment and systems, and supported every 5 feet.

SECTION 26 28 13 00 - FUSES, 600 VOLT

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Dual-element, current limiting Class R fuses for loads up to 600 volts, 0-600 Amps.
- B. Time delay, current limiting Class L fuses for loads up to 600 volts, 601-6000 Amps.

1.2 REFERENCES

- A. UL 248-12 - Standard For Safety For Low-Voltage Fuses-Part 12: Class R Fuses
- B. UL 248-10 - Standard For Safety For Low-Voltage Fuses-Part 10: Class L Fuses
- C. Where application of local codes, trade association standard or publications appears to be in conflict with the requirements of this Section, the Engineer shall be asked for an interpretation.

1.3 SUBMITTALS

- A. Provide submittals in accordance with and in additional to General Requirements for submittal requirement.

1.4 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Store fuses in a clean and dry space and protected from weather. DO NOT STORE OUTDOORS.

PART 2 - PRODUCTS

2.1 MATERIAL AND EQUIPMENT

- A. Furnish fuses manufactured by Buss, or equal, in accordance with the following:
 - 1. Motors and Transformers, 0 to 600 Amp:
 - a. 250 volt - Buss LPN-RK, UL Class RK1.
 - b. 600 volt - Buss LPS-RK, UL Class RK1.
 - 2. Lighting Loads, 0 to 600 Amp:
 - a. 250 volt - Buss KTN-R, UL Class RK1.
 - b. 600 volt - Buss KTS-R, UL Class RK1.
 - 3. All Applications, 601 to 6000 Amp:
 - a. 600 volt - Buss KRP-C, UL Class L.
- B. Size fuses serving motor loads as specifically recommended by motor or equipment manufacturer or in the range of 150% to 175% of motor nameplate rating per NEC in accordance to the type of motor. **Fuse installation shall only be allowed by approval of Engineer.**
- C. Interrupting Rating: 300,000 RMS Amps.
- D. Maintenance Stock, Fuses:
 - 1. Furnish the following:
 - a. Minimum three spare fuses or 10%, whichever is greater, of each size and type for a spare set.
 - b. Furnish spare fuse cabinet sized to contain required spare fuse stock.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install fuses where indicated, in accordance with the manufacturer's written instructions, the applicable requirements of NEC, national and local codes, regulations, and requirements.
- B. Provide quantity of spare fuses and fuse cabinet per the requirement of this Section at the location per drawing or the direction of Owner's Representative, in addition to replace blown or defective fuses during installation, startup, system commissioning and acceptance.
- C. Furnish equipment list with fuses required for all equipment using fuses.
- D. Provide spare control fuses for all equipment and gear furnished.

END OF SECTION 26 28 13 0028 10 0028 13

Task	Specification	Specification Description

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 28 16 00 - DISCONNECT SWITCHES

PART 1 GENERAL

1.1 WORK INCLUDED

- A. Disconnect switches, fusible and non-fusible.
- B. Enclosures.

1.2 REFERENCES

- A. Federal Spec. W-S-865 - Switch, Box (Enclosed), Surface-Mounted.
- B. NEMA KS 1 - Enclosed Switches.
- C. NFPA 70 - National Electrical Code
- D. NFPA 70E - Electrical Safety Requirement for Employee Workplaces
- E. UL 98 - Enclosed Switches.

1.3 SUBMITTALS

- A. Provide submittals in accordance with and in addition to General Requirements for submittal requirement.
- B. Submit manufacturer's product data. Submit dimensioned drawings and equipment ratings for voltage, capacity, horsepower, and short circuit.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Deliver switches individually wrapped in factory-fabricated water-resistant type containers.
- B. Handle switches carefully to avoid damage to material components, enclosure and finish. Damaged switches shall not be installed on project.
- C. Store switches in a clean and dry space and protected from weather.

PART 2 PRODUCTS

2.1 FABRICATED SWITCHES

- A. NEMA KS 1; Type HD quick-make, quick-break, load interrupter enclosed knife switch with externally operable handle interlocked to prevent opening front cover with switch in ON position. Handle lockable in OFF position. Handle lockable in ON position for service entrance disconnect. Provide defeater so that qualified personnel can open door while switch is in the closed position.
- B. Use switches that have number of poles required as per drawings.
- C. Switches shall be Underwriters' approved for duty shown and enclosure type per drawings. NEMA 3R switches shall be provided where exposed to weather. NEMA 3R switches shall have weatherproof threaded hubs for all conduit entries into switch.
- D. Use fuse clips that are rejecting type to accept Class RK or L fuses only.
- E. Identify switches, as to equipment served, with engraved laminated plastic plates. Refer to 26 05 53 Electrical Identification Section of this specification.
- F. Voltage rating: 240VAC or 600VAC as per drawings.

PART 3 EXECUTION

3.1 INSPECTION

- A. Contractor shall examine the areas and conditions under which safety and disconnect switches are to be installed and notify The University in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF SAFETY AND DISCONNECT SWITCHES

- A. Install safety or disconnect switches, where required by NEC, where indicated on drawings, and where required by equipment manufacturer, in a location convenient for maintenance on switch and adjacent equipment.
- B. For equipment with motors larger than 1/8 hp, install thermally protected disconnect switches at motor.
- C. Provide fused disconnect switches, whether or not indicated on drawings, when required to maintain equipment manufacturer's warranty. Coordinate with Division 23 for warranty requirements of equipment approved by submittal.
- D. Install fuses in fusible disconnect switches. Provide permanent marking inside switch enclosure for fuse type.
- E. Wall mount switches, where possible, or mount on unistrut supports.

SECTION 26 29 13 13 - VARIABLE SPEED DRIVES**PART 1 GENERAL**

1.1 This specification shall apply to variable speed drives installed in UTHSCSA campuses.

1.2 SECTION INCLUDES

A. Variable Speed Drives

1.3 RELATED SECTIONS

A. UT Spec Section 23 05 13 – Motors

1.4 REFERENCES

- A. AFBMA 9 – Load Ratings and Fatigue Life for Ball Bearings (latest edition)
- B. AFBMA 11 – Load Rating and Fatigue Life for Roller Bearings (latest edition)
- C. AMCA 99 – Standards Handbook (latest edition)
- D. AMCA 210 – Laboratory Methods of Testing Fans for Rating Purposes (latest edition)
- E. AMCA 300 – Test Code for Sound Rating Air Moving Devices (latest edition)
- F. AMCA 301 – Method of Publishing Sound Ratings for Air Moving Devices (latest edition)
- G. NEMA MG-1 – Motors and Generators (latest edition)
- H. NFPA 70 – National Electrical Code (latest edition)
- I. IEEE – 112B, 587 and 519 (latest edition)

1.5 SUBMITTALS

- A. Submit under provisions of UT Spec Section 23 00 00.
- B. Shop Drawings: Indicate assembly, unit dimensions, weight loading, required clearances, construction details, field connection details, and electrical characteristics and connection requirements.
- C. Product Data:
 - 1. Provide literature that indicates dimensions, weights, capacities, ratings, performance, gages and finishes of materials, and electrical characteristics and connections requirements.
 - 2. Submit sound power level data for casing radiation over full operating range as tested and certified per AMCA standards.
 - 3. Submit electrical requirements for power supply wiring including wiring diagrams for interlock and control wiring, clearly indicating factory-installed and field-installed wiring.
- D. Manufacturer's Installation Instructions

1.6 OPERATION AND MAINTENANCE DATA

- A. Submit under provisions of UT Spec Section 23 00 00.
- B. Maintenance Data: Include instructions for routine service, spare parts lists, and wiring diagrams.

1.7 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience, who issues complete catalog data on total product.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Deliver, store, protect and handle products to site under provisions of UT Spec Section 23 00 00.
- B. Accept products on site in factory-fabricated protective containers, with factory-installed shipping skids and lifting lugs. Inspect for damage.
- C. Store in clean, dry place and protect from weather and construction traffic. Handle carefully to avoid damage to components, enclosures, and finish.

1.9 SCHEDULES ON DRAWINGS:

- A. In general, all capacities of equipment and electrical characteristics are shown in schedules on the Drawings. Reference shall be made to the schedules for such information. The capacities shown are minimum capacities. Variations in the capacities of the scheduled equipment supplied under this contract will be permitted only with the written direction of The University. All equipment shall be shipped to the job with not less than a prime coat of paint or as specified hereinafter. Where installation instructions are not included in these Specifications or on the Drawings, the manufacturer's instructions shall be followed.

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. ABB with minimum 6 pulse option
- B. Toshiba with minimum 6 pulse option
- C. Yaskawa Z1000 with minimum 6 pulse option
- D. See UT Spec Section 23 27 26 00-2, 2.3, A, 5

Substitutions: Under provisions of UT Specs Section 23 00 00. The equipment as supplied by any of the acceptable manufacturers or an approved equal shall comply with all of the provisions of this specification.

2.2 GENERAL

- A. Furnish and install complete Pulse Width Modulation (PWM) using variable voltage, variable frequency (VVD) speed controllers, as specified herein. All of the variable speed controllers shall be applied by one manufacturer for this project. Motors must have a "three contractor bypass" as specified herein, to allow them to run if the controller malfunctions. All safety devices shall be energized. If an equal is proposed and accepted, Contractor must include installation and start-up by manufacturer's authorized personnel. All packages shall be factory assembled and tested.
- B. The Contractor shall furnish and install Variable Speed Drive motor controllers to vary the speed of the supply, return and relief air fans and pumps as shown in the fan and pump schedules on the Drawings. One controller shall control the speed of one motor only. See schedules and Drawings for quantity of controllers required.

- C. The variable speed drives shall be equipped with proper filtration devices for the distance from the motors. Refer to the drawings for distances. The exhaust fans specifically will require filtrations.
- D. The variable speed drive shall produce an adjustable AC voltage and frequency output for complete motor control using solid-state technology. The VSD shall be automatically controlled by a grounded electronic (4-20 mA) control signal. The drive shall produce an output volts/Hertz pattern to produce adequate starting torque under all conditions and operate smoothly at all operating speeds on variable torque load. The VSD shall be self-contained totally enclosed in NEMA 12 ventilated cabinet and capable of operation between 0 degrees and 40 degrees Celsius.
- E. VSD's shall be ETL or UL listed. All components used on option units shall be UL listed and NEMA or IEC rated. VSD's shall be designed to meet IEEE-587 and shall comply with all applicable provisions of the latest revision of the National Electric Code. The VSD shall comply with the IEEE-519 with respect to the line noise generation.
- F. The controllers shall be suitable for use with both new and used standard, high efficiency and premium efficiency 3-phase, squirrel cage, induction motors.
- G. The minimum output amperage of the VSD shall be equal to 100% or greater than the load's FLA, as shown in the schedules. The VSD shall have an overload capacity of at least 120% for 60 seconds and 110% continuous.
- H. All components shall be factory mounted and wired on a dead-front, grounded, freestanding or wall mounted enclosure arranged for top or bottom conduit entry.
- I. The controller enclosure shall be provided with the manufacturer's illustrated operating instructions and parts list mounted inside the enclosure door.
- J. PWM controllers shall be designed to provide stepless motor control from 5 percent to 100 percent of the base speed.
- K. 480/120 Volt control power transformer for control circuits shall have two fuses on the primary and one fuse on the secondary.
- L. The VSD shall have an electronic output current overload limit, adjusted to protect the VSD. This protection shall be coordinated with the bimetallic motor overload relay provided in the bypass compartment to protect the motor in all modes.
- M. The frequency of the carrier frequency for the PWM control shall be programmable to prevent resonance in the mechanical system, or other methods of controlling motor noise shall be provided. Sound enclosures over the motor are not acceptable. The VSD shall also provide a feature for excluding or jumping bands of resonant sine-coded frequencies or future control connections to add this cost at a later date.
- N. The VSD shall have independently adjustable acceleration and deceleration circuits of minimum range, 5 to 120 seconds adjustable minimum and maximum speed limits. Extended time periods are also acceptable.
- O. The VSD shall have user programmable auto-restart after power failure, power sure, or overcurrent. VSD shall shutdown after multiple restarts. VSD shall provide fuse-less electronic power protection for ground fault protection. Isolation transformers for ground fault protection are not acceptable. Ground fault shall not cause breaker or fuses to open. In case of an output ground fault or similar abnormal output condition, the VSD shall be fully operational after clearing the output fault condition and resetting the VSD.
- P. The VSD must be able to start a load free-wheeling in either direction.
- Q. Under all conditions the drive shall be able to withstand the opening or closing of a disconnect on the drive output without damage.

- R. All control adjustments shall be made without the necessity of an extender board or specialized meters, but rather from front access controls.
- S. Low voltage logic and 120V control circuits shall be physically isolated from the 480V power circuits. Signal circuit commons shall be grounded at the receiving end.
- T. The VSD shall include a power ride-through feature to allow continuous operation through up to a three cycle line loss.
- U. The drive shall not be phase sequence sensitive.
- V. Components shall be pretested and each complete VSD shall have a full load factory burn-in and electronic overload test.
- W. The VSD shall provide the following minimum performance:
 - 1. Minimum of .95 efficiency, at all speeds.
 - 2. Minimum of .95 displacement power factor and .85 true power factor at all speeds.

2.3 FEATURES

- A. The VSD shall incorporate the following minimum features:
 - 1. Input power: 460 V/3 phase/60 Hz.
 - 2. Input circuit breaker
 - 3. Input line filter capable of protection the electronics against transient voltage spikes or notches, as well as back-feed of RF (Radio Frequency) interference, into the incoming power supply.
 - 4. Fuse-less electronic power protection for ground fault protection. Isolation transformers for ground fault protection are not acceptable. Ground fault shall not cause fuses to open.
- B. The following door mounted devices:
 - 1. "Power on" light
 - 2. Hand/off/auto (or equivalent) selector switch
 - 3. Manual speed control during operation
 - 4. Inverter/Bypass mode selector switch
 - 5. Digital display unit
 - 6. Status, frequency/percent speed and fault diagnostics
 - 7. Door interlocked Main Input Disconnect Switch, lockable in the off position
- C. The Cabinet shall contain group terminals for control signals:
 - 1. Input electronic signal, Process Feedback to control speed.
 - 2. Output electronic signal to report frequency.
 - 3. Output contact to open on VSD Fault, Motor Overload, or External/Life Safety shutdown.
 - 4. Start-Stop
 - 5. Input contact to open for External/Life Safety shutdowns.
- D. The Drive Package must be capable of External/Life Safety shutdown whether in the drive or in the bypass mode.
- E. If the VSD manufacturer recommends, the cabinet shall contain a Test selector switch to facilitate static testing of the drive at startup or while the motor operates in the bypass mode. This switch should be mounted inside the cabinet for technician access.

2.4 DISCONNECT AND INTERFACE

- A. The following shall be mounted within the enclosure:

1. Line, load and bypass contactors capable of interrupting the locked rotor rating of the driven motor. Bypass and load contactors must be mechanically interlocked to prevent simultaneous closure.
2. Overload relay
3. A dedicated terminal strip to allow the controller to be interconnected with external shutdown contacts from smoke detectors, fire detectors, damper interlocks, freeze-stats, time clocks, remote master on-off switch, energy management and control system (FCMS) and input signals. The system must be capable of shutdown whether in the drive or in the bypass mode by remote detectors.
4. Input Circuit Breaker

2.5 FAULT DETECTION DEVICES

- A. A diagnostic display center visible from outside the Package Cabinet, providing an indication of the VSD's output frequency and the following operating and fault conditions:
 1. Output current value, Amps
 2. Output frequency, Hertz
 3. Inverter status and mode
 4. Programmable internal set-points and limits
 5. Overheating fault
 6. Low AC line voltage
 7. Current overload
 8. High DC bus voltage
 9. VSD output fault
 10. Capacitor charge status
- B. The VSD shall incorporate the following Protective Features:
 1. Instantaneous overcurrent trip
 2. Unit over temperature protection
 3. High DC bus voltage, 800 VDC
 4. Low input voltage, 15% or recommended value per manufacturer
 5. DC bus fuse protection
 6. Input surge protection, MOV, or hybrid TSS circuit
 7. Ground fault protection
 8. Phase to phase fault protection

2.6 CONTROL

- A. All control adjustments shall be made through the interface
- B. Low voltage lotic and 115V control circuits shall be electrically isolated from the power circuits. Signal circuit common shall be grounded at the VSD only.
- C. The VSD shall include a power ride-through feature to allow continuous operation through up to a three to five cycle line loss.
- D. Electronic output overload protection shall be provided. The drive shall not be phase sequence sensitive.
- E. The VSD shall have independently adjustable acceleration and deceleration circuits of 5 to 120 seconds. Extended time periods are also acceptable.
- F. The VSD shall have full function output current limit adjustable from 10 to 100 percent.

2.7 SYSTEM OPERATION

- A. All safety devices shall operate in all modes of operation. Two switches shall be mounted on the Package Cabinet door: a two position Inverter/Bypass switch and a three position Hand/Off/Auto (or equivalent) switch. Six modes of operation will be defined by the Inverter/Bypass and Hand/Off/Auto Selector switches.
- B. **“Inverter selected with HOA in Off” Mode** - all contactors open, VSD 480 Volt power off, all 120 Volt and VSD Control Power on, motor will not operate.
- C. **“Inverter selected with HOA in Hand” Mode** - Run contactors closed, VSD varies motors speed per setting of the manual speed control at VSD.
- D. **“Inverter selected with HOA in Auto” Mode** – Run contactors operate per external start-stop signal, VSD varies motor speed per signal from the PI Controller. (The PI Controller combines a Process Feedback Sensor control signal with a Set-point Reset control signal to achieve an externally controlled motor speed around a remotely resettable process value.)
- E. **“Bypass selected with HOA in Off” Mode** - all contactors open, VSD 480 Volt power off, all 120 Volt and VSD Control Power on, motor will not operate.
- F. **“Bypass selected with HOA in Hand” Mode** – Bypass contactor closed, VSD 480 Volt power off, all 120 Volt and VSD Control Power on, motor operates at full speed.
- G. **“Bypass selected with HOA in Auto” Mode** – Bypass contactors closed, VSD 480 Volt power off, all 120 Volt and VSD Control Power on, motor operates at full speed with start-stops controlled by external start-stop signal.

PART 3 EXECUTION

- 3.1 As part of the purchase price and agreement, a full, unconditional, one (1) year warranty on all parts and labor shall be provided. The warranty shall include all parts, labor, shipping, field service or technician time, labor or travel expenses and verbal or written correspondence with the VSD manufacturer or his representatives, included that which might be incidental to the proper installation and operation of the equipment.
- 3.2 The manufacturer's representative shall provide a list of recommended spare parts.
- 3.3 The manufacturer's representative shall provide terminal block to terminal block wiring diagrams coordinated with The University to provide a complete and functional operating system. Furnish detailed drawings showing construction, dimensions, wiring diagrams and installation procedures for engineer's approval.
- 3.4 The manufacturer shall provide a factory trained technician to start the VSD and place it into operation.
- 3.5 The successful vendor shall provide for and present to The University, at no cost to The University, a training and troubleshooting course at The University's location. This course shall be comprised of a

minimum of two (2) days of classroom instruction for a minimum of four (4) hours per day complete with visual aids, documentation, circuit diagrams and hands-on training for a group of approximately 6 people. This course is not to be construed as a sales meeting, but rather as a school to familiarize The University with the care, troubleshooting and servicing of the VSD.

- 3.6 VSD's shall be wall hung units. Contractor shall provide uni-strut mounting bracket for drives. Contractor shall reinforce the wall studs with bracing as required to adequately support the drive. Installation of the VSD shall allow for clearance in front of the drive as required by the latest revision of the National Electric Code for an electrical panel.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 31 00 00 - PHOTOVOLTAIC POWER SYSTEM GRID CONNECTED**PART 1 - GENERAL****1.1 SUMMARY**

- A. Description of Work: This section describes in general the work required to furnish and install a complete, operational grid connected photovoltaic power system.
- B. The intent of this portion of the specifications and drawings is a complete, operational roof-mounted solar photovoltaic array and all balance of system components for the building and Carport. The system shall include, but not be limited to:
 - 1. Photovoltaic panels, modules and arrays.
 - 2. Array supporting structures.
 - 3. Interconnect wiring, disconnecting means and overcurrent protection.
 - 4. UL listed grid-connect inverter systems.
 - 5. Ancillary metering, monitoring software and display software.

1.2 DESIGN AND CONSTRUCTION REQUIREMENTS

- A. The Contractor will be required to provide a turn-key photovoltaic power system based on the components used in the basis of design included herein. The contractor is not limited to design the proposed system using those specific components used to provide a basis of design; however, the Contractor will be required to demonstrate that the system will perform in accordance with these specifications. That demonstration will be in the form of a submittal indicating the projected energy production of the proposed system over a period of a year using generally available TMY3 meteorological files for San Antonio, Texas and a generally accepted solar simulation program. Examples of acceptable programs include, but are not limited to PVSYST and PV Design Studio. The required energy production including accounts for losses for the Rooftop system is 159 MWh/year based on a ten degree module slope and seven degree inclination of the module racks. The required energy production of the carport system is 82 MWh/year based on a ten degree module slope. The minimum specific production of each system shall be a minimum of 1450 kWh/kWp per year.

1.3 DESIGN AND CONSTRUCTION CONSTRAINTS

- A. The Contractor will be required to design rooftop systems that accommodate roof mounted equipment such as vents and fans that are currently designed for the building. Copies of drawings showing the roof mounted equipment can be obtained from the existing general contractor. Roof mounted module framework will be required to be mounted on vertical stub columns that extend through the roof of the building. The height of the array shall be limited to 5"-6" above the roof deck (See Architectural attachments). Additional structural support members will be required to span the stub columns and shall be furnished by the contractor to support the module framework. A Structural Engineer's seal will be required on the structural drawing submittal.

1.4 QUALITY ASSURANCE AND REFERENCE STANDARD

- A. Codes and Standards:
 - 1. NFPA 70-2008 National Electrical Code. (latest edition)

2. IEEE 929, P929, 928, 1262, P1373, P1374.
3. UL 1741 Std. For Static Inverters & Charge Controllers.
4. IEEE 519.
5. ASTM E1036-B5.
6. IEC 61215, TC-82.

- B. Related Work: This section is a Division 26 Specification and as such will be taken as an integral part of all other Divisions 26 sections, including Section 26 05 00, "Materials and Methods".

1.5 SUBMITTALS

- A. Submit manufacturer's drawings and data demonstrating compliance with these specifications and the drawings. Information shall include, but not be limited to:
1. Simulated Annual Power Production Data for Carport and Rooftop systems
 2. Photovoltaic modules.
 3. Inverter systems.
 4. Terminals and terminal blocks.
 5. DC rated circuit breakers and fusing.
 6. Operating and Maintenance Manuals.
 7. Combiner Boxes and Fusing.
 8. Modular Support Structures.
 9. System Mounting Hardware.
 10. Metering Hardware and software.
 11. Sealed Structural Primary Support Drawings

PART 2 - PRODUCTS

2.01 MATERIALS AND WORKMANSHIP

- A. Materials, equipment and parts comprising the units specified herein shall be new and unused, of current manufacture, of highest grade, and assembled in a workmanlike manner.

2.02 MANUFACTURER

- A. All photovoltaic system components and all major items of auxiliary equipment shall be manufactured by manufacturers regularly engaged in the manufacture of photovoltaic system components. Each component shall be factory assembled and tested by the manufacturer. Delivery, parts, service and warranty shall be furnished by the manufacturer or an authorized dealer within 300 miles of the project. Refer to other sections of this specification for compliance with the Buy American Act requirements. Acceptable manufacturers of system components shall be:
1. BP Solar.

2. Cutler Hammer.
3. Gould Shawmut.
4. Littlefuse.
5. Square D.
6. Trace Technologies (Xantrex).
7. Sharp.
8. SMA
9. Suntech
10. Amtec Solar.
11. UniRac Solar Mounting Systems.
12. Schott Solar
13. Satcon
14. PV Powered
15. Solar World
16. Tyco
17. Sunlink

B. Acceptable manufacturers of solar data logging, metering and display systems:

1. Watts Up
2. Fat Spaniel Technologies
3. Xantrex
4. Draker Solar Design
5. Eaton
6. or Approved Equal.

2.03 WARRANTY

- A. Equipment furnished under this section shall be warranted against defective parts and workmanship as outlined under Division 1 and in accordance with the terms of the manufacturer's and dealer's standard warranty for a period of no less than five years. Solar collector panels shall have a manufacturer's limited warranty for power output of 25 years.

2.04 STARTUP AND TRAINING

- A. Upon completion of the installation, the contractor shall perform startup by a factory trained and authorized dealer service representative. Contractor shall supply maintenance and instruction books to The University during startup and demonstration. In addition, the Contractor shall furnish training in the amount of 8 hours to The University on startup, operation, maintenance and troubleshooting of the complete system. See Paragraph 3.2.

2.05 PHOTOVOLTAIC MODULES (Basis of Design)

- A. Photovoltaic modules shall consist of multicrystalline silicon laminated between sheets of ethylene vinyl acetate (EVA) and high transmissivity low-iron tempered glass. Each module shall be assembled in an extruded and anodized aluminum frame and shall include bypass diodes. Each module shall include TWO IP54 rated raintight junction boxes for wiring connections to system panels and the array. Nominal performance characteristics per module shall be:

Roof Mount:

Maximum Power (P_{max})	270W nominal
Voltage at P_{max} (V_{mp})	30.3V
Current at P_{max} (I_{mp})	7.6A
Short Circuit Current (I_{sc})	8.24A
Open Circuit Voltage (V_{oc})	37.0V
Nominal Size	1640 mm x 994 mm

Carport Mount:

Maximum Power (P_{max})	208W nominal
Voltage at P_{max} (V_{mp})	28.5V
Current at P_{max} (I_{mp})	7.3A
Short Circuit Current (I_{sc})	8.13A
Open Circuit Voltage (V_{oc})	36.1V
Nominal Size	1640 mm x 994 mm

2.06 POWER CONVERSION INVERTER SYSTEM

- A. The photovoltaic system inverter assembly shall be designed to output 480V three phase ac power. The inverter assembly shall incorporate insulated gate bipolar transistor based power electronics to convert nominal 300-660V DC input to a pulse width modulated 480V three phase output. The inverter shall contain an integrated operator interface for access to metering, status and control functions. In addition, the inverter shall have the following salient performance characteristics and features:

IGBT Device protection:	DC Overvoltage, Overtemp, Overcurrent
Utility Islanding Protection	In accordance with UL 1741 and IEEE 928/929
Full Load Efficiency	>96%
Nominal Line Frequency	60Hz
Line Voltage	480VAC Nominal, 3 Phase, +6%, -12%
Power Factor	Unity +/- 0.02
AC Current Distortion	IEEE 519 compliant, <5%
PV Array Configuration	Neg. Grounded with Monopole or Bipolar Available
Max V_{oc}	660VDC
Ripple Current, Full Load	1.6A rms (5%)
Interface	Serial RS 485
Display	LCD Backlit 4-line X 20 Character
User Settable Parameters	PV start voltage, PV shutdown power

Protective Functions	AC Over/Under: voltage, current and frequency Inverter Overtemperature Active anti-islanding DC Overvoltage
Manual stop	Manual Emergency stop pushbutton
Ambient Temperature	-20 - +50 Deg C.
Relative Humidity	95% Non Condensing
Elevation	to 6600 feet without derating
Enclosure	NEMA 4
Cooling	Fan Forced
Remote Alarming	Integral or external Form C contacts to indicate fault at the inverter

2.07 INVERTER FAULT REPORTING

- A. The inverter system shall provide remote indication of an inverter fault condition to the building BAS system. The reporting shall occur through the use of Form C contacts integral to the inverter, or provided in supplementary relays. Contractor shall coordinate the programming of additional BAS points necessary to indicate the inverter faults on the BAS system.

2.08 COMBINER BOXES AND FUSED COMBINERS

- A. Combiner Boxes shall be UL1741 listed and contain integral finger safe fusing. Enclosures shall be NEMA 4X. The combiner shall be rated for use on 1000VDC systems. Basis of design shall be Amtec Solar, Prominence Series.

2.09 TERMINALS

- A. Only W-listed terminals shall be used where connections are required and connector blocks are not furnished with a component. Only heavy-duty die crimpers shall be used for crimping connections. Unlisted electronics or automotive grade terminals will not be permitted.

2.10 MOUNTING RAIL SYSTEM

- A. Module mounting structure shall consist of a modular extended aluminum system consisting of rails and mounting hardware engineered to meet ASCE7-05 design wind loading for hurricane prone regions. Acceptable frame systems and procedures are Unirac Solar Mount installed in accordance with the Sun Frame Code compliant Installation Manual 809. Installer must demonstrate compliance with this installation guideline and wind load criteria. The rail design must be prepared by a Structural Engineer Licensed in the State of Texas.

2.11 MONITORING AND DISPLAY SYSTEM

- A. The PV contractor/system integrator will be required to provide a display and monitoring system that provides for real time display of the array operating parameters as well as historical data. The system shall consist of the following components as a minimum:
 1. A Graphic Flat Screen display unit will be provided by The University that will display information logged by the software provided and programmed by the systems integrator-contractor.
 2. Rough-in conduit systems to provide for interconnecting wiring to The University furnished LAN switch, server and display equipment.
 3. Wiring, gateways and hardware interfaces necessary to provide for connection to owner's LAN switch.

4. Software package that provides for the retrieval and display of historical data and display of real time parameters of the PV system.
- B. Integration and Data Logging Software shall be capable of providing definable graphics that allow for displaying of real time power output on AC and DC sides and trending information on each array output as well as capability to indicate system alarms. The software shall be IP based and shall allow for web-based monitoring of the PV systems. The contractor shall provide the software for installation on The University's server. Data logging shall include a minimum storage capacity of five years of accumulated data. Displayed data shall be graphically indicated using easily interpreted meters or graphs. As a minimum, the following information shall be displayed:
 1. Solar Irradiance in real time
 2. Outdoor Air Temperature in real time
 3. Wind in real time
 4. Array Cell temperature in real time
 5. Power Production in real time in W/m² and peak watts
 6. Historical Data including cumulative energy production in kWh and kWh/m² for Today, This Month, This Year and Total since installed.
 7. Cumulative Environmental Benefits to include estimated values for CO₂, NO_x, and SO_x avoided.

PART 3 – EXECUTION

3.01 INSTALLATION

- A. General Requirements: Install all system components in strict compliance with the Latest Editions of NEC and in accordance with recommended practices as outlined in SAND96-2797 incorporated herein by reference.
- B. All system wiring is required to be installed in conduit in accordance with Section 26 05 33 including roof mounted conductors.
- C. At all panel (single and multiple module) connections, a terminal bar or busbar connection is required to allow the selective disconnecting of any module or panel. Multiple wire splices or daisy chaining will not be permitted even if indicated schematically on the drawings
- D. Use only 1000VDC rated fuses, circuit breakers, terminal blocks, disconnects and other components on the PV system.
- E. Use of other than type XHHW-2, RHW-2 conductors or cabling specifically designed for use on solar PV systems is not permitted without the consultation of the Engineer.
- F. Voltage drop shall be limited on all conductors such that DC side power is available under all conditions that the PV array is producing sufficient voltage to turn the inverter on, but in no case shall be more than 2%.
- G. Contractor shall provide a minimum of one and a maximum of three spare fuses for all fuse types used in any capacity on the Photovoltaic System.
- H. Provide any manufacturer software that is specific to the inverters and for monitoring the inverters to UTHSCSA facilities for installation on personal computers designated by the UTHSCSA.

3.02 COMMISSIONING AND TRAINING

- A. The PV integrator shall perform system startup and commissioning on the completed system. As a minimum, the contractor shall verify the installation by performing a Megger test on each Homerun, measuring The Voc on each string and perform the startup sequence in accordance with the inverter manufacturer's instructions. Following startup, measurements of Imp for each string shall be performed.
- B. Performance verification shall include measurement of cell temperature, irradiance and inverter AC output. The output shall be compared to the predicted performance of the system in order to verify that the system is performing as designed.
- C. The PV integrator shall provide a minimum of eight hours of instruction and training on the PV system to The University. Training shall include a physical walkthrough of all installed components, Training on the operation, maintenance and safety related features and procedures for the system shall be included as a part of the system training.

SECTION 26 51 00 00 - INTERIOR AND EXTERIOR LIGHTING**PART 1 GENERAL****1.1 WORK INCLUDED**

- A. Interior lighting fixtures and accessories
- B. Exterior lighting fixtures and accessories
- C. Emergency lighting units
- D. Emergency exit signs
- E. Emergency fluorescent lamp power supplies
- F. Lamps
- G. Ballasts
- H. Site lighting poles
- I. Lighting controls

1.3 SUBMITTALS

- A. Provide submittals in accordance with and in additional to Section 26 00 00.UT, Basic Electrical Requirements, and Division 1 for submittal requirement.
- B. Submit manufacturer's data on interior and exterior lighting fixtures in booklet form, with separate sheet for each fixture, assembled by luminaire "type" in alphabetical order, with the proposed fixture and accessories clearly labeled.

- C. Submit dimensioned drawings and performance data including complete photometric test data for each luminaire, candlepower distribution curves in two or more planes, candlepower chart zero to 90 degrees, lumen output zonal summary chart, average and maximum brightness data, and coefficients of utilization for zonal cavity calculations, , spacing to mounting height ration, efficiency and visual comfort probability. Also provide luminaire weights, mounting data, and accessory information for each luminaries type.
- D. Lamps: Catalog cuts showing voltages, colors, approximate hours life, approximate initial lumens, lumen maintenance curve, lamp type and base.
- E. Ballasts: Catalog cuts showing type, wiring diagram, nominal watts, input voltage, starting current, input watts, sound rating, power factor and low temperature characteristics.
- F. Site lighting pole data and catalog cuts, including wind loading, complete dimensions and finish.
- G. Shop drawings for site lighting luminaries showing pertinent physical characteristics, including fastening details, ballast type and location.
- H. Controls: Catalog cuts and/or shop drawings showing dimensions, voltage capacity, contact ratings, wiring diagrams, operating levels, and temperature ratings.
- I. Lighting design shall be in compliance with power allowance for lighting, which is stipulated by ASHRAE 90.1. Compliance forms along with engineering data associated with it shall be submitted for Owner's review during design phase.

1.4 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Deliver lighting fixtures individually wrapped in factory-fabricated fiberboard type containers. Parabolic louvers shall be shipped in thermally sealed polyethylene wrapper.
- B. Handle lighting fixtures carefully to prevent breakage, denting and scoring the fixture finish. Do not install damaged lighting fixtures.
- C. Store lighting fixtures in a clean, dry space and protected from the weather.

PART 2 – PRODUCTS

2.1 GENERAL

- A. Lighting fixtures and accessories shall comply with the design and function requirements of the project. Design characteristics shall be as noted in manufacturer's submittal data.
- B. Provide lighting fixtures of the size, type and rating as scheduled, complete with, but not limited to, lamps, lamp holders, reflectors, ballasts, poles and wiring.

2.2 INTERIOR LIGHTING FIXTURES

- A. Fluorescent Fixtures
 - 1. Lenses shall be UV stabilized, injection-molded, clear, 0.150- inch minimum thickness virgin acrylic. Provide a minimum of 8 hold-down lens retaining clips for troffers utilizing framed diffuser lenses.
 - 2. Parabolic aluminum louvers shall be semi-specular, low-iridescence finish silver anodized aluminum, 2 or 3 inches deep as per drawings. Louvers shall be roll formed with roll grain horizontal to view plane. Louver intersections shall be of a close-fitting, tab-and-slot construction permitting no light leaks.
 - 3. Parabolic plastic louvers shall be vacuum-metalized polystyrene with specular finish and antistatic properties.
 - 4. Lighting fixture door frames shall be flush steel hinged and equipped with rotary-action cam latches.
 - 5. Lighting fixture housing shall be minimum 22-guage, cold-rolled steel with pre-punched knockouts and access plate for electrical connections. End plates shall be minimum 20-guage with pre-punched hanger holes. Ballast mounts shall be separated for heat dissipation.
 - 6. Three lamp luminaries for dual level switching shall have outer two lamps on one ballast, inner lamp on second ballast, shared with adjacent luminaire's inner lamp if practical.

- B. Incandescent fixtures shall not be used.
- C. Lighting track shall be surface mount or pendant mount per the requirement on drawings, by manufacturer of track mounted light fixtures.
- D. High Bay, Low Bay HID Fixtures
 - 1. Provide rugged, lightweight, cast aluminum ballast housing with a baked electro-coat paint finish.
 - 2. Optic reflector shall be fully fluted, anodized aluminum providing high efficiency. Where enclosed and gasketed type fixtures are specified, provide luminaires designed for continuous operation in an ambient temperature of 55° C.
- E. Lamp Holders or Sockets
 - 1. Incandescent lamp holders shall be screw base and have porcelain insulating shells and be rated for heavy duty, 660W.
 - 2. Fluorescent Sockets: Fluorescent lamp holders shall be heat-resistant porcelain or plastic, designed and rated for the lamp type specified. Lamp holders shall be designed to maintain solid electrical contact at all times. The detent position for bi-pin lamp holders shall be a positive lock so that mechanical effort shall be required to rotate the lamps. Lamp holder shall be specifically compatible with lamping.
 - 3. HID Medium and Mogul Base Sockets: Provide glazed porcelain pulse-rated heavy duty sockets with silicone leads hard soldered to nickel plated brass screw shell. Lamp holders shall also employ a positive spring locking means to maintain good electrical contact at the center terminal of the lamp.
 - 4. Lamp holders and sockets shall be provided with minimum 18 AWG wiring leads.
- F. Reflector Finishes
 - 1. Painted Finishes: Provide electro-statically applied dry polyester white powder coat finish with minimum reflectance of 88 percent on all light reflecting surfaces.
 - 2. Specular/Semispecular Finishes: Provide Alzak-type anodized finish on aluminum louvers and reflectors as specified in Luminaire Schedule as shown on the drawings. Minimum reflectivity shall be:
 - a. Specular: 80 percent
 - b. Semi-specular: 75 percent
- G. UL Listing
 - 1. All Luminaires and components shall be UL tested, listed, and labeled.
 - 2. Luminaires installed under canopies, roofs, or similar damp or wet locations shall be UL listed and labeled as suitable for damp or wet locations.
 - 3. Recessed luminaires installed in fire rated ceilings and using a fire rated protective cover shall be thermally protected for this application and shall be approved for the installation in a fire-rated ceiling.

2.3 EXTERIOR LIGHTING FIXTURES

- A. Enclosures shall be complete with gaskets to form weatherproof seal and UL approved for wet locations.
- B. Provide low temperature ballasts with reliable starting to 0 degrees F.

2.4 BATTERY BACKED EMERGENCY LIGHTING UNITS

- A. Acceptable Manufacturers
 - 1. Dual Lite
 - 2. Lithonia
 - 3. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in 16010, and Division 1 for substitution requirement.

B General Requirements

1. Provide emergency lighting units self-contained complete with batteries, charger, and lamps to provide automatic emergency lighting upon failure of normal power. Battery fixtures shall not be used unless called for on drawings.
2. Battery shall be 6 or 12 volts, sealed maintenance free, nickel cadmium type, 24-watt rated capacity, with 1.5 hours minimum capacity to supply the connected lamp load.
3. Charger shall be solid state capable of maintaining the battery fully charged during normal conditions, and capable of recharging discharged battery to full charged within 24 hours.
4. Lamps shall be 12 watt minimum, sealed beam Tungsten Halogen type.
5. Unit housing shall be thermoplastic or steel with beige finish.
6. Indicators: Provide lamps to indicate AC ON and RECHARGING.
7. Provide test switch to manually transfer unit from normal supply to battery supply.
8. Unit shall be 120 or 277 volt. As per drawings.

2.5 EXIT SIGNS**A. Acceptable Manufacturers**

1. Dual Lite
2. Lithonia
3. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in 16010, and Division 1 for substitution requirement.

B. General Requirements

1. Provide red LED with red diffuser exit signs at the locations per drawings. Exit signs shall have stencil face, 6-inch high red letters on white background, or as specified otherwise, with red Chevron type directional arrows as indicated on drawings.
2. Battery backed exit signs shall be provided with integral battery-operated emergency power supply, including power failure relay, test switch, AC ON pilot light, battery, and fully-automatic charger. Provide test switch to manually transfer unit from normal supply to battery supply. Battery fixtures shall not be used unless called for on drawings.
3. Battery shall be sealed maintenance free, nickel cadmium type, 6 or 12 volts, 24-watt rated capacity, with 1.5 hour minimum capacity to supply connected lamp load. Battery fixtures shall not be used unless called for on drawings.
4. Unit shall be 120 or 277 volt. As per drawings.

2.6 LAMPS**A. Acceptable Manufacturers**

1. General Electric Company
2. Philip Lighting Company
3. Sylvania
4. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in 16010, and Division 1 for substitution requirement.

B. General Requirements

1. Lamps including linear fluorescent, compact fluorescent, and HID shall be low mercury type and shall pass all federal TCLP (Toxicity Characteristic Leaching Procedure) test requirements in effect at the time of manufacture. All lamps shall be energy saving and rapid or program start type.

2. Linear fluorescent lamps shall be T8 lamps. Compact lamps shall be twin or double twin tubes. All lamps for one project shall be provided by the same manufacturer with color temperature as indicated on drawings. Operation voltage and wattage shall be as indicated on drawings. No U-tube lamps are acceptable.
3. Mercury vapor HID lamps shall not be used.
4. Metal halide HID lamps shall be phosphor coated, suitable for the burning position required, and pulse start.
5. High-pressure sodium HID lamps shall be clear or diffuse coated.
6. Maintenance Stock: Furnish a stock of replacement lamps in the original cartons or packing sleeves, amounting to 10% (but not less than two lamps in each case) of each type and size lamp used in each fixture type. Deliver replacement stock as directed to Owner's storage space.

2.7 BALLASTS

A. Acceptable Manufacturers

1. Advance
2. General Electric
3. Other manufacturers equal in design and function will be considered upon A/E approval following substitution procedure in 16010, and Division 1 for substitution requirement.

B. General Requirements

All ballasts shall be UL listed and have the UL symbol on the label.

1. Ballasts for fluorescent lamps

- a. Provide MVOLT ballasts for all operations except for under-counter fixtures that shall be rated for 120V operation. Ballasts shall be electronic type, rapid start, and power factor of 95 percent or greater, suitable to operate at 60 Hz input frequency.
- b. Electronic ballasts shall comply with all FCC and NEMA limits governing EMI and RFI, and shall have Total Harmonic Distortion (THD) of less than 10 percent.
- c. Ballasts shall be Class P thermally protected.
- d. Sound level criteria
 - 1) Nominal 430 mA Lamps: Class A sound rated.
 - 2) Nominal 800 mA Lamps: Class B sound rated.
 - 3) Nominal 1500 mA Lamps: Class D sound rated. Provide isolation mounting and insulation to reduce sound transmission and radiation.
- e. Electronic Dimming Ballasts: Compatible with lamp and dimming system, labeled for use and listed as compatible by dimmer manufacturer with a minimum full-to-20 percent dimming range.
- f. Exterior Fluorescent Ballasts: Provide zero degree starting rating.

2. Ballasts for HID lamps

- a. HID ballast shall be multi-tap encased and potted thermally protected high power factor of 90 percent or greater, constant wattage regulating, and autotransformer type. Ballast ambient operating temperature range shall be -20 to +130 degrees F. Ballasts shall be compatible to the lamps chosen for specific burning position, and compensate for the loss in efficiency.
- b. Provide isolation mounting and insulation of HID ballasts to reduce sound transmission or radiation.

- c. Each HID ballast shall have a fast acting primary inline fuse built into the fixture assembly by the manufacturer.

2.8 LIGHTING POLES

- A. Lighting poles shall be metal, type and finish as specified in Luminaire Schedule as shown on the drawings.
- B. Site lighting poles shall meet wind load rating requirements per local building code.
- C. Pole foundation shall be design by A/E. Refer to pole base details as shown on the drawings for specific pole base requirements.
- D. The entire pole assembly shall be designed to withstand a steady wind load rating requirements per local building code and a gust factor of 1.3 without permanent deflection.
- E. Anchor bolts shall be fabricated from commercial quality hot rolled carbon steel bar with guaranteed minimum yield strength of 55,000 psi. Bolts shall have an "L" bend on one end and be galvanized a minimum of 12" on the tread end. Furnish four bolts and bolt setting template with each set of anchor bolts. Furnish one hex nut, 2 hardened steel washers, and one hex nut with a stainless steel locking pin with each bolt. Furnish two leveling shims with each anchor bolt set.
- F. Standard finish for pole and accessories shall be a factory applied polyester thermosetting powder coating electro-statically applied to the surface of the substrate to a minimum thickness of 3 mil. Color as specified.
- G. Provide and install pole base covers on all poles. Each pole to have internal grounding lug and ground rod.

2.9 LIGHTING CONTROL

- A. Refer to Section 26 27 26.UT Wiring Devices and Floor Boxes for lighting switch, dimming control, and occupancy sensor.
- B. Photocell shall be automatic dawn on, dusk off switching; moisture, temperature, and vibration-resistant die-cast aluminum housing; time delay feature to prevent false switching; field adjustable to control operating levels.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Prior to order lighting fixture, check the building electrical system requirements, architectural finishes, and the type of ceilings that lighting fixture will be installed. Any discrepancies of compatibility pertaining trim, frames, color, mounting, ballast, voltage and etc. shall be brought to the attention of A/E by written notice. Do not proceed with procurement until discrepancies are resolved in a satisfactory manner.
- B. Installer shall examine the areas and conditions that light fixtures are to be installed and notify the Contractor in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF LIGHTING FIXTURES

- A. Install light fixtures in accordance with the manufacturer's written instructions, the applicable requirements of NEC and national and local code, standard, and regulations. Install lamps in accordance with manufacturer's instructions.
- B. Install luminaries at locations as shown on the Drawings; install aligned, aimed, and leveled. Install fixtures in accordance with manufacturer's installation instructions complete with mounting accessories, trim and support materials. Fasten fixtures securely to structural support members of the building; solid pendant fixtures shall be plumb.
- C. Coordinate with other crafts to avoid conflicts between luminaires, supports, fittings and mechanical equipment.
- D. Surface Mounted Fluorescent Fixture:

1. Mount with support rails attached to ceiling suspension support system, provided ceiling system has been certified to be suitable to support weight of fixtures.
 2. Where ceiling system has not been certified to support weight of fixtures, fixtures shall be supported at four points near each corner of fixtures.
 3. Provide a minimum 5/8" air space between the fixture and the ceiling.
- E. Recessed Fluorescent Fixtures:
1. Handle specular/semi-specular louvers and down light cones using only new clean white cotton or silk gloves. Do not touch louvers or cones with bare hands. Leave luminaries clean and free of any visible dust, debris, or fingerprints with all lamps operational at time of acceptance of work.
 2. All recessed fluorescent fixtures shall be supported from building structure above ceiling with galvanized steel wire at not less than 2 points diagonally across fixture. Size of wire shall be capable of supporting weight of fixtures.
 3. Recessed luminaries trims shall fit snugly to the mounting surface and shall not exhibit light leaks or gaps. Provide feed-through junction boxes or provide separate junction boxes. All components shall be accessible through the ceiling opening.
 4. Connect recessed luminaries to junction box with flexible steel conduit and fixture wire.
- F. HID Fixtures
1. Mount with support rails attached to ceiling suspension support system, provided ceiling system has been certified to be suitable to support weight of fixtures.
- G. Pole Mount Lighting
1. Provide in-line fusing at handhole for all pole-mounted luminaries.
 2. Provide removable unitized ballast/component tray with separable connector in all pole-mounted luminaries.
 3. Construct base of concrete with dimension and depth as noted on the drawings.
 4. Install anchor bolts with minimum projection above top of bases, as specified by pole manufacturer. Ground as indicated on drawings.
 5. Mount standards on bases plumb and true utilizing shims as necessary. Grout thoroughly between base-plate and foundation using non-shrink grout.
 6. Touch up chips and scratches on poles (to match new finish) upon completion.
- H. Lighting Fixtures Adjustment
1. Adjust to illuminate intended areas as directed.
 2. Adjust exterior fixtures during hours of darkness.
- I. Immediately before final observation, clean all fixtures, inside and out, including plastics and glassware, and adjust all trim to properly fit adjacent surface, replace broken or damaged parts, and lamp and test all fixtures for electrical as well as mechanical operation.
- J. Protect installed fixtures from damage during the remainder of the construction period.
- K. Upon completion of installation of interior lighting fixtures, and after circuitry has been energized, apply electrical energy to demonstrate capability and compliance with requirements. When possible, correct malfunctioning units at the site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed with retesting.
- L. Incandescent lamps shall be new at time of final acceptance. Fluorescent lamps may be used in the final finishing of the building. Those that have exceeded more than 1/3 of their rated life (as established by Construction Inspector records), or that have blackened ends or inoperable shall be replaced with new lamps before final acceptance.

M. Lamp Disposal

1. The procedure of disposal of lamps that are mercury containing shall follow the guideline set by EPA (definitions in Title 40 Code of Federal Regulations 261 Subpart C, January 2000).

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 27 41 00 00 - AUDIO VISUAL**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.
- C. Drawings and specifications may be applicable to the project. Items contained in specifications may not be located on drawings and vice versa. In the event of discrepancy Contractor to verify quantities and scope of work prior to bid/proposal.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Quality Standards: Comply with the following applicable standards
 - 1. ANSI
 - 2. AIA
 - 3. ISO
 - 4. UL
 - 5. FCC
 - 6. TIA/EIA
 - 7. NFPA
 - 8. UL

B. Statement of Warranty:

1. Contractor to furnish (1) year warranty on materials, cost, and labor from date of final acceptance. Any deviations from this requirement will be specified by Academic Technology Services prior to bid or proposal. Contractor to verify warranty requirements during bid or proposal phase.

1.04 SUBMITTALS

A. Contractor Qualifications:

1. Contractor to provide the following information and qualifications as part of the submittal package:
 - a. Years in operation
 - b. Minimum of (3) projects similar in scope that are still in current operation. Include all project information including cost, location, owner, and date of completion.
 - c. Certifications of project managers and installers for each applicable product

B. Product Data:

1. Submittal for each product to include physical dimensions, operational statistics, and list of all applicable components. In the event that a product has multiple options, they must be indicated on the submittal or the submittal will be returned as incomplete.
2. Project quantities to be indicated on submittal.

C. Record Documents:

1. Shop Drawings: Shop drawings to include suggested pathways, schematics, riser diagrams, and any other information requested by UTHSCSA during the bid process or contract negotiation.
2. Shop drawings to be completed using current version of AutoCAD or Revit as determined by UTHSCSA during bid phase. As built drawings to be returned both electronically (CAD/Revit) as well as paper copy. Paper copy to be same size as original issued drawings.
3. Submittals not using the numbering identification system shown on Drawings, Schedules, and Specifications will be rejected.

1.01 DELIVERY, STORAGE AND HANDLING

- A. Equipment to be delivered, installed, and stored according to direction from UTHSCSA Academic Technology Services. In the event that contractor provides product but does not install, coordinate handoff requirements with Academic Technology Services.
- B. Items must be provided in original packaging with labeling for inspection by Academic Technology Services or other UTHSCA department.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All products and materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Originating UTHSCSA department will determine acceptability of proposed equipment. Equipment must be approved prior to purchase. Equipment purchased prior to approval will be at Contractor's risk and subject to rejection by UTHSCSA.
- C. If manufacturer's specified equipment or accessories have been discontinued, Contractor must inform UTHSCSA immediately and prepare a submittal for approved equal.
- D. All discrepancies between drawings and specifications must be brought to the attention of UTHSCSA during the bid or proposal process.
- E. All equipment, components, and wire must be new and of highest quality.
- F. Contractor must provide UTHSCSA with OEM documentation including compliance with industry standards and performance characteristics.
- G. Contractor to review drawings and specifications and verify with UTHSCSA prior to bid/proposal if the scope of work and responsibility for equipment is not clear.

2.02 ACCEPTABLE MANUFACTURERS

- A. The following manufacturers will be acceptable for product listed. Model numbers will be at the discretion of UTHSCSA and provided by Academic Technology Services prior to bid/proposal.
 - 1. Projector: Panasonic or approved equal
 - 2. Projection Screen: Da-Lite or approved equal
 - 3. Projector and Television Mount: Chief or approved equal
 - 4. Television: Sharp or approved equal

5. Video Conferencing System: Tandburg or approved equal
6. Audio Signal Processor: Biamp or approved equal
7. Ceiling Speakers: Atlas Sound or approved equal
8. Microphone System: Audio Technica or approved equal
9. Microphone: Shure or approved equal
10. Blue Ray Player: Sony or approved equal
11. Audio Visual Controls: Crestron or approved equal

PART 3 - EXECUTION

3.01 PREPARATION

A. Required Coordination:

1. Contractor to inform UTHSCSA of (2) weeks prior to performing work and be available for a pre-construction meeting.
2. Contractor to update shop drawings on a weekly basis and have them on site for inspection by UTHSCSA

3.02 INSTALLATION

A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.

B. Installation Instructions:

1. Contractor to inform UTHSCSA before cutting into structural members including but not limited to floors, walls, roofs, girders, and beams.
2. Work area to be kept clean from trash or debris and disposed of daily. Disposal methods to be indicated in Contract or General Conditions.
3. If deviations from plans and specifications, Contractor to inform UTHSCSA immediately and provide suggestion on remedy for situation. Any work performed prior to written approval will be at risk for the Contractor.

4. Any damage to equipment during construction will be corrected by Contractor at no cost to UTHSCSA.
5. All cabling shall be properly secured per UTHSCSA and industry standards.
6. Contractor to protect equipment from damage from others working onsite.
7. All systems to be tested and be in working order prior to substantial completion.

3.03 CLOSE OUT DOCUMENTS

- A. As-Built drawings to be provided with the following conditions:
 1. Provided at time of substantial completion or final payment will be withheld.
 2. Drawings to be completed using current version of AutoCAD or Revit as determined by UTHSCSA during bid phase. As built drawings to be returned both electronically (CAD/Revit) as well as (3) paper copies. Paper copy to be same size as original issued drawings.
 3. As-built drawings to include constructed pathways, schematics, riser diagrams, and any other information requested by UTHSCSA during the bid process, contract negotiation, or shop drawings.
 4. Two copies of Contractor's warranty items with firm contact information, start date, and end date for warranty items.

SECTION 28 13 33 00 - ELECTRONIC ACCESS CONTROL, UTHSC-SA FACILITY STANDARDS
S28 13 33 00 GUIDELINE
EDITED DATE: APRIL 2, 2013
ACCESS CONTROL AND SECURITY REQUIREMENTS

Section 1 Thru 5 are covered in previous sections.

CATEGORY/ITEM	SPECIFICATION/STANDARD	PRESENT SYSTEM MANUFACTURER
6. ALARMS: SYSTEM	a. Monitored in the UT Police Dispatch and designated remote sites by a CBORD brand, PC-based security system.	CBORD
	b. Transition to Squadron Panels instead of A1000 and terminal server configuration in new construction and renovations.	
	c. The Wyreless system is authorized in applications where cable pulls are not practical. Interference from other Radio Frequency (RF) inputs should be considered and tested for	
7. ACCESS CONTROLS: CARD READERS	a. For General Purposes, CBORD Model MR5 Reader. For special applications requiring a PIN Code enabled access, CBORD Model A2005; up-gradeable to, but currently without smart-card reader option.	CBORD
	b. Other types of readers, such as proximity devices, and biometrics are based on user department request, or unique security needs (BSL-3 or MRI/PET Facilities) but must be compatible with the central CBORD system.	
	c. Installation of Biometric readers in existing facilities requires changeover to Squadron Panels	
	d. All new alarm panel will be Squadron Series panels.	
8. ALARMS: SYSTEM	a. Monitored in the UT Police Dispatch and designated remote sites by a CBORD brand, PC-based security system.	CBORD Support Requirements: 110 Emergency Power. Data Port and IP Address
	b. Transition to Squadron Panels instead of A1000 panels and Terminal Server Configuration in new construction and renovations.	
	c. The Wyreless Card Reader system is authorized in applications where cable pulls are not practical.	

	d. All new alarm panels will be Squadron Series panels.	
9. ALARMS: DOOR CONTACT POINTS	a. Balanced Magnetic Switch, either normally-open or normally-closed to indicate alarm state; software can be adjusted to read either way.	Sentrol Brand Model 1078/1075/1065 series. See Attachment #4 for further specifications
	b. Ensure that corresponding magnet is of proper strength as specified by contact manufacturer.	
	c. Wire cluster should be of the 3 wire configuration to facilitate Normally Open/Closed configuration changes	
10. ALARMS: PANIC ALARM SWITCHES	a. No momentary-contact switches; purpose-built (Mouse Trap style) panic switches, which have to be manually reset, are approved.	Sentrol Brand Model 3040. See Attachment #5 for further specifications.
	b. Wireless switches are approved for limited applications over short distances. RF Interference must be considered	
	c. Newly installed panic switches will be installed by UT Police. They will receive Lynx System panic alarm by Micro Technology Services, Inc.	
11. ALARMS: GLASS BREAKAGE	a. Specific model will be recommended by University Police on a case-by-case basis to ensure proper coverage depending on the nature of the area in question.	Sentrol Brand Model 5812NT/5600 Series 5812A Series. See Attachment #6 for further specifications.
	b. Use of combination Glass Break and motion sensor units is recommended to maximize sensor coverage	
12. ALARMS: MOTION	a. Specific model will be recommended by University Police on a case-by-case basis to ensure proper coverage depending on the nature of the area in question.	Sentrol Brand Model 6150 Series . See Attachment #7 for further specifications.
13. ALARM SYSTEM WIRING	See Cable Standards. Wiring type and gauge may change from the cable standard table due to length of cable pulls and other factors. Consult with Vendor/Contractor during the design phases for best wire type	See Cable Standards
14. CAMERAS: SYSTEM	a. All new installations and retrofits will be the color camera.	Salient Systems CompleteView 16-Camera Digital Video Server with 400GB HD Storage Salient has 4, 8 and 12 camera DVRs
	b. Replacement of 1980's technology CCTV camera and monitor system with Salient Systems DVR as a minimum Standard should be a priority over the next 2 Fiscal Years.	

	<p>c. There is no manufacturer's standard for mounting height on light poles. Consider Height capability of available "cherry picker" lift equipment used for maintenance, as well as the physical environment, on a case-by-case basis, to prevent blind spots. Wall mounted exterior static cameras will be mounted at 8 ft</p> <p>d. Camera systems will generally remain as listed, however, due to rapid changes in Camera Surveillance Technology, leverage the best available to maximize security budgets. .</p> <p>e. Options include but are not limited to Wireless transmission via microwave, video over IP transmission and other emerging Technologies</p> <p>f. Primary requirements are compatibility/ability to integrate with present systems and the capability to retain video for a minimum of 90 days.</p>	<p>available. Always plan for expansion. Support Requirements: 110 Emergency Power, data port and IP address</p>
	<p>g. Future installations should integrate camera systems with the alarm/access system so that when an alarm is received, a camera provides immediate visual assessment of the alarmed area..</p>	
15. CAMERAS: EXTERIOR	<p>a. Pan Tilt Zoom cameras will be used in exterior parking areas.</p>	<p>Compatible with Salient Systems Software. Dome Network Camera. See Attachment #8 for further specifications</p>
	<p>b. Static Cameras are permitted in exterior parking areas if cameras can be placed to maximize coverage while providing cost savings.</p>	<p>Compatible with Salient Software. Color Camera w/ Vari-focal, Auto-iris Lens, Housing, and Arm. Power Supply: Pelco MCS Series</p>
16. CAMERAS: INTERIOR	<p>a. Mounting Height: 8 ft</p>	<p>Ikegami KIT-501OD Hi-res. Color Camera w/ Vari-focal, Auto-iris Lens, Housing, and Arm. Power Supply: Pelco MCS Series. SPECO Static Dome camera. See Attachment #9 for further specifications</p>
	<p>b. SPECO Domes will be ceiling mounted or wall mounted at 8 ft</p>	
	<p>c. For cameras in Funds Facilities or other areas that could expect criminal activity, the camera must have the resolution to produce a recognizable screenshot photo of a suspect</p>	
17. CAMERA SYSTEM WIRING	<p>See Cable Standards. Wiring type and gauge may change from the cable standard table due to length of cable pulls and other factors. Consult with Vendor/Contractor during the design phases for best wire type.</p>	<p>See Cable Standards</p>

18. COMMUNICATIONS: INTERCOMS, UTHSC-SA MAIN CAMPUS	a. Calls for Talk-a-Phone or Wurtec call boxes will ring in dispatch office via select phone line.	1. Intercom Call Boxes: Talk-a-Phone Series or Wurtec Call Boy Device See Attachment # 11 for further specifications
	b. Wireless systems should be considered in areas or circumstances in which the costs of hard wiring are prohibitive.	
19. COMMUNICATIONS: INTERCOMS, UTHSC-SA REMOTE LOCATIONS	a. Will annunciate in a central location, such as a dispatch or shift commander's office, or annunciate directly at an on-duty Police Officers Radio.	1. Talkaphone model ETP-400C/ETP 401C 2. Connectivity model A-1410-1B See Attachment # 12 for further specifications
	b. Wireless systems should be considered in areas or circumstances in which the costs of hard wiring are prohibitive.	
20. COMMUNICATIONS: POLICE RADIOS	a. UHF Radios. transmit/receive on a two-frequency repeater channel for greater range. Other manufacturers are authorized as long as they integrate with the present Motorola System.	Motorola. Model numbers and configurations will differ based on location, terrain, frequencies, and technologies available. Will be designed/engineered based on conditions. Transition to Interoperability and 800 MHz systems any require other manufacturers be considered due to requirements
	b. Minimum of 2 repeater equipped frequencies for back up and emergency use.	
	c. Several single-frequency channels for direct communication (talk-around) when the repeater is unavailable due to loss or distance, or busy due to emergency traffic	
	d. Plan for interagency communications capability. First priority will be for the Medical Center Agencies. Second Priority will be surrounding agencies to include the TRP and Satellite locations	
21. COMMUNICATIONS: POLICE RADIOS, FREQUENCIES USED	Frequencies See Frequency Plans	N/A
Lighting Standards comply with Illuminating Engineering Society of North America (IESNA) Lighting Standards.		
22. LIGHTING: PARKING LOTS	Minimum light levels measured at a midway point between poles/fixtures: 2-3 Foot Candles.	High Pressure Sodium. Manufacturer and

23. LIGHTING: PRINCIPAL WALKWAYS	Minimum light levels measured at a midway point between poles/fixtures: 2-3 Foot Candles.	additional specifications will be designed/engineered based on conditions
24. LIGHTING: PRIMARY BUILDING ENTRYWAYS	Minimum light levels measured at a midway point between poles/fixtures: 5 Foot Candles.	
Parking/Automated Gate Equipment		
26. Parking access control and revenue management	All parking control systems will be compatible with the Federal APD parking control and revenue management system in place. This includes gate controllers, Cash registers and control systems and attendant booths. They shall also be compatible with controls provided by CBORD	Federal APD only
CATEGORY/ITEM	SPECIFICATION/STANDARD	PRESENT SYSTEM MANUFACTURER
6. ALARMS: SYSTEM	a. Monitored in the UT Police Dispatch and designated remote sites by a CBORD brand, PC-based security system.	CBORD
	b. Transition to Squadron Panels instead of A1000 and terminal server configuration in new construction and renovations.	
	c. The Wyreless system is authorized in applications where cable pulls are not practical. Interference from other Radio Frequency (RF) inputs should be considered and tested for	
7. ACCESS CONTROLS: CARD READERS	a. For General Purposees, CBORD Model MR5 Reader. For special applications requiring a PIN Code enabled access, CBORD Model A2005; up-gradeable to, but currently without smart-card reader option.	CBORD
	b. Other types of readers, such as proximity devices, and biometrics are based on user department request, or unique security needs (BSL-3 or MRI/PET Facilities) but must be compatible with the central CBORD system.	
	c. Installation of Biometric readers in existing facilities requires changeover to Squadron Panels d. All new alarm panel will be Squadron Series panels.	
8. ALARMS: SYSTEM	a. Monitored in the UT Police Dispatch and designated remote sites by a CBORD brand, PC-based security system.	CBORD Support Requirements: 110 Emergency Power. Data Port and IP Address
	b. Transition to Squadron Panels instead of A1000 panels and Terminal Server Configuration in new construction and renovations.	
	c. The Wyreless Card Reader system is authorized in applications where cable pulls are not practical. d. All new alarm panels will be Squadron	

	Series panels.	
9. ALARMS: DOOR CONTACT POINTS	a. Balanced Magnetic Switch, either normally-open or normally-closed to indicate alarm state; software can be adjusted to read either way.	Sentrol Brand Model 1078/1075/1065 series. See Attachment #4 for further specifications
	b. Ensure that corresponding magnet is of proper strength as specified by contact manufacturer.	
	c. Wire cluster should be of the 3 wire configuration to facilitate Normally Open/Closed configuration changes	
10. ALARMS: PANIC ALARM SWITCHES	a. No momentary-contact switches; purpose-built (Mouse Trap style) panic switches, which have to be manually reset, are approved.	Sentrol Brand Model 3040. See Attachment #5 for further specifications.
	b. Wireless switches are approved for limited applications over short distances. RF Interference must be considered	
	c. Newly installed panic switches will be installed by UT Police. They will receive Lynx System panic alarm by Micro Technology Services, Inc.	
11. ALARMS: GLASS BREAKAGE	a. Specific model will be recommended by University Police on a case-by-case basis to ensure proper coverage depending on the nature of the area in question.	Sentrol Brand Model 5812NT/5600 Series 5812A Series. See Attachment #6 for further specifications.
	b. Use of combination Glass Break and motion sensor units is recommended to maximize sensor coverage	
12. ALARMS: MOTION	a. Specific model will be recommended by University Police on a case-by-case basis to ensure proper coverage depending on the nature of the area in question.	Sentrol Brand Model 6150 Series . See Attachment #7 for further specifications.
13. ALARM SYSTEM WIRING	See Cable Standards. Wiring type and gauge may change from the cable standard table due to length of cable pulls and other factors. Consult with Vendor/Contractor during the design phases for best wire type	See Cable Standards
14. CAMERAS: SYSTEM	a. All new installations and retrofits will be the color camera.	Salient Systems CompleteView 16-Camera Digital Video Server with 400GB HD Storage Salient has 4, 8 and 12 camera DVRs available. Always plan for expansion. Support Requirements: 110 Emergency Power, data port and IP address
	b. Replacement of 1980's technology CCTV camera and monitor system with Salient Systems DVR as a minimum Standard should be a priority over the next 2 Fiscal Years.	
	c. There is no manufacturer's standard for mounting height on light poles. Consider Height capability of available "cherry picker" lift equipment used for maintenance , as well as the physical environment, on a case-by-case basis, to prevent blind spots. Wall mounted exterior static cameras will be mounted at 8 ft	

	<p>d. Camera systems will generally remain as listed, however, due to rapid changes in Camera Surveillance Technology, leverage the best available to maximize security budgets. .</p> <p>e. Options include but are not limited to Wireless transmission via microwave, video over IP transmission and other emerging Technologies</p> <p>f. Primary requirements are compatibility/ability to integrate with present systems and the capability to retain video for a minimum of 90 days.</p>	
	<p>g. Future installations should integrate camera systems with the alarm/access system so that when an alarm is received, a camera provides immediate visual assessment of the alarmed area..</p>	
15. CAMERAS: EXTERIOR	<p>a. Pan Tilt Zoom cameras will be used in exterior parking areas.</p>	<p>Compatible with Salient Systems Software. Dome Network Camera Attachment #8 for further specifications</p>
	<p>b. Static Cameras are permitted in exterior parking areas if cameras can be placed to maximize coverage while providing cost savings.</p>	<p>Compatible with Salient Software. Color Camera w/ Vari-focal, Auto-iris Lens, Housing, and Arm. Power Supply: Pelco MCS Series</p>
16. CAMERAS: INTERIOR	<p>a. Mounting Height: 8 ft</p>	<p>Ikegami KIT-501OD Hi-res. Color Camera w/ Vari-focal, Auto-iris Lens, Housing, and Arm. Power Supply: Pelco MCS Series. SPECO Static Dome camera. See Attachment #9 for further specifications</p>
	<p>b. SPECO Domes will be ceiling mounted or wall mounted at 8 ft</p>	
	<p>c. For cameras in Funds Facilities or other areas that could expect criminal activity, the camera must have the resolution to produce a recognizable screenshot photo of a suspect</p>	
17. CAMERA SYSTEM WIRING	<p>See Cable Standards. Wiring type and gauge may change from the cable standard table due to length of cable pulls and other factors. Consult with Vendor/Contractor during the design phases for best wire type.</p>	<p>See Cable Standards</p>
18. COMMUNICATIONS: INTERCOMS, UTHSC-SA MAIN CAMPUS	<p>a. Calls for Talk-a-Phone or Wurtec call boxes will ring in dispatch office via select phone line.</p> <p>b. Wireless systems should be considered in areas or circumstances in which the costs of hard wiring are prohibitive.</p>	<p>1. Intercom Call Boxes: Talk-a-Phone Series or Wurtec Call Boy Device See Attachment # 11 for further specifications</p>

19. COMMUNICATIONS: INTERCOMS, UTHSC-SA REMOTE LOCATIONS	a. Will annunciate in a central location, such as a dispatch or shift commander's office, or annunciate directly at an on-duty Police Officers Radio.	1 Talkaphone model ETP-400C/ETP 401C 2. Connectivity model A-1410-1B See Attachment # 12 for further specifications
	b. Wireless systems should be considered in areas or circumstances in which the costs of hard wiring are prohibitive.	
20. COMMUNICATIONS: POLICE RADIOS	a. UHF Radios. transmit/receive on a two-frequency repeater channel for greater range. Other manufacturers are authorized as long as they integrate with the present Motorola System.	Motorola. Model numbers and configurations will differ based on location, terrain, frequencies, and technologies available. Will be designed/engineered based on conditions. Transition to Interoperability and 800 MHz systems any require other manufacturers be considered due to requirements
	b. Minimum of 2 repeater equipped frequencies for back up and emergency use.	
	c. Several single-frequency channels for direct communication (talk-around) when the repeater is unavailable due to loss or distance, or busy due to emergency traffic	
	d. Plan for interagency communications capability. First priority will be for the Medical Center Agencies. Second Priority will be surrounding agencies to include the TRP and Satellite locations	
21. COMMUNICATIONS: POLICE RADIOS, FREQUENCIES USED	Frequencies See Frequency Plans	N/A
Lighting Standards comply with Illuminating Engineering Society of North America (IESNA) Lighting Standards.		
22. LIGHTING: PARKING LOTS	Minimum light levels measured at a midway point between poles/fixtures: 2-3 Foot Candles.	High Pressure Sodium. Manufacturer and additional specifications will be designed/engineered based on conditions
23. LIGHTING: PRINCIPAL WALKWAYS	Minimum light levels measured at a midway point between poles/fixtures: 2-3 Foot Candles.	
24. LIGHTING: PRIMARY BUILDING ENTRYWAYS	Minimum light levels measured at a midway point between poles/fixtures: 5 Foot Candles.	
Parking/Automated Gate Equipment		
26. Parking access control and revenue management	All parking control systems will be compatible with the Federal APD parking control and revenue management system in place. This includes gate controllers, Cash registers and control systems and attendant booths. They shall also be compatible with controls provided by CBORD	Federal APD only

ACCESS CONTROL AND SECURITY REQUIREMENTS – Cable Requirements:

Device	Manufacturer	Model Number	Required Cable	Cable Type(s)	Qty of Cable
--------	--------------	--------------	----------------	---------------	--------------

Door Position Switch	GE	1078 Series	Belden 82723	22 AWG, 4 Conductor, Shielded w/ Drain	1
Glass Break Sensor	Sentrol	5885	Belden 88489	18 AWG, 4 Conductor, Shielded w/ Drain	1
Card Reader/Door Position Switch Combo	Cbord		Belden 658 AFS	22 AWG, Composite 3 Pair	1
Duress Button	Sentrol	3040/3050	Belden 82723	22 AWG, 4 Conductor, Shielded w/Drain	1
Interior Pan/Tilt/Zoom Camera	Compatible w/ Salient Systems Software		Belden 8212	20 AWG, Solid, Coax	1
			Belden 9178	12 AWG, 2 Conductor, Stranded	1
			Belden DataTwist 350	24 AWG, 4-Pair, UTP	1
Interior Static Camera	Compatible w/ Salient Systems Software		Belden 8212	20 AWG, Solid, Coax	1
			Belden 9178	12 AWG, 2 Conductor, Stranded	1
Exterior Pan/Tilt/Zoom Camera	Compatible w/ Salient Systems Software		Beldon 8212	20 AWG, Solid, Coax	1
			Beldon 9718	12 AWG, 2 Conductor, Stranded	1
			Beldon DataTwist 350	24 AWG, 4-Pair, UTP	1
Parking Lot Emergency Phone (Blue Phone)	Talk-A-Phone	ETP-400C	Beldon DataTwist 350	24 AWG, 4-Pair UTP	2
				110v power	1

Building Emergency Phone/Intercom	Talk-A-Phone Or Wurtec	ETP-401C	Beldon 83704	16AWG, 4 Conductor	1
			Beldon DataTwist 350	24 AWG, 4-Pair, UTP	1
1600 Emergency Stanchon for Parking Lot Phone (Blue Phone)	Or Wurtec	Tower with Strobes	N/A	N/A	N/A
Stainless Steel Extension for Building Emergency Phone/Intercom	Talk-A-Phone	ETP Surface Mount Box	N/A	N/A	N/A
Emergency Strobe			Belden 82723	22 AWG, 4 Conductor, Shielded w/ Drain	2
Motion Sensor	Sentrol	6150	Belden 82723	22 AWG, 4 Conductor, Shielded w/ Drain	2

Substitution for the Cable brands and model numbers listed are authorized if the substitute is of equal or higher quality. Verify compatibility with the applicable installer prior to authorizing the substitution.

SECTION 28 13 33 16 - PERIMETER SECURITY**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for perimeter security. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Perimeter detection and alarm system.
 - b. Integration of other electronic and electrical systems and equipment.

C. Definitions

1. CCTV: Closed-circuit television.
2. EMI: Electromagnetic interference.
3. PIR: Passive infrared.
4. RFI: Radio-frequency interference.
5. UPS: Uninterruptible power supply.
6. Control Unit: System component that monitors inputs and controls outputs through various circuits.
7. Master Control Unit: System component that accepts inputs from other control units and may also perform control-unit functions. The unit has limited capacity for the number of protected zones and is installed at an unattended location or at a location where it is not the attendant's primary function to monitor the security system.
8. Monitoring Station: Facility that receives signals and has personnel in attendance at all times to respond to signals. A central station is a monitoring station that is listed.
9. Protected Zone: A protected premises or an area within a protected premise that is provided with means to prevent an unwanted event.
10. Standard Intruder: A person who weighs 100 lb (45 kg) or less and whose height is 60 inches (1525 mm) or less; dressed in a long-sleeved shirt, slacks, and shoes unless environmental conditions at the site require protective clothing.
11. Standard-Intruder Movement: Any movement, such as walking, running, crawling, rolling, or jumping, of a "standard intruder" in a protected zone.
12. Systems Integration: The bringing together of components of several systems containing interacting components to achieve indicated functional operation of combined systems.
13. Zone. A defined area within a protected premise. It is a space or area for which an intrusion must be detected and uniquely identified. The sensor or group of sensors must then be assigned to perform the detection, and any interface equipment between sensors and communication must link to master control unit.

D. Action Submittals

1. Product Data: Components for sensing, detecting, systems integration, and control, including dimensions and data on features, performance, electrical characteristics, ratings, and finishes.
2. Shop Drawings: Detail assemblies of standard components that are custom assembled for specific application on this Project.
 - a. Functional Block Diagram: Show single-line interconnections between components including interconnections between components specified in this Section and those furnished under other Sections. Indicate methods used to achieve systems integration. Indicate control, signal, and data communication paths and identify programmable logic controllers **OR** networks, **as directed**, and control interface devices and media to be used. Describe characteristics of network and other data communication lines.

- 1) Indicate methods used to achieve systems integration.
- 2) Indicate control, signal, and data communication paths and identify PLCs, networks, control interface devices, and media to be used.
- 3) Describe characteristics of network and other data communication lines.
- 4) Describe methods used to protect against power outages and transient voltages including types and ratings of isolation and surge suppression devices used in data, communication, signal, control, and ac and dc power circuits.
- b. Raceway Riser Diagrams: Detail raceway runs required for perimeter security and for systems integration. Include designation of devices connected by raceway, raceway type, and size, and type and size of wire and cable fill for each raceway run.
- c. UPS: Sizing calculations.
- d. Site and Floor Plans: Indicate final outlet and device locations, routing of raceways, and cables inside and outside the building. Include room layout for central-station control-unit console, terminal cabinet, racks, and UPS.
- e. Master Control Unit Console Layout: Show required artwork and device identification.
- f. Device Address List: Coordinate with final system programming.
- g. System Wiring Diagrams: Include system diagrams unique to Project. Show connections for all devices, components, and auxiliary equipment. Include diagrams for equipment and for system with all terminals and interconnections identified.
- h. Details of surge-protection devices and their installation.
- i. Sensor detection patterns and adjustment ranges.
3. Equipment and System Operation Description: Include method of operation and supervision of each component and each type of circuit. Show sequence of operations for manually and automatically initiated system or equipment inputs. Description must cover this specific Project; manufacturer's standard descriptions for generic systems are not acceptable.
4. Samples for Initial Selection: For units with factory-applied color finishes.
5. Samples for Verification: For each type of exposed finish required.

E. Informational Submittals

1. Qualification Data: For Installer, security systems integrator, and testing agency.
2. Field quality-control test reports.
3. Warranty: Sample of special warranty.
4. Other Information Submittals:
 - a. Test Plan and Schedule: Test plan defining all tests required to ensure that system meets technical, operational, and performance specifications within 60 days of date of Contract award.
 - b. Examination reports documenting inspections of substrates, areas, and conditions.
 - c. Anchor inspection reports documenting inspections of built-in and cast-in anchors.

F. Closeout Submittals

1. Operation and Maintenance Data: For perimeter security system to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation And Maintenance Data", include the following:
 - a. Data for each type of product, including features and operating sequences, both automatic and manual.
 - b. Master control-unit hardware and software data.

G. Maintenance Material Submittals

1. One spare control-unit board(s) for strain-sensitive cable system and one cable repair and splice kit(s).
2. One of each type of microwave sensor and one of each type of power supply for microwave perimeter security system.
3. One of each spare sensor and PIR unit and one alignment telescope(s) for long-range PIR system.
4. One spare control-unit board(s) for electrostatic-field system.
5. One spare control-unit board(s) for buried, ported coaxial cable system, 10 feet (3 m) of cable; and one cable repair and splice kit(s).

6. Fuses: Three of each kind and size.
7. Tool Kit: Provide six sets of tools for use with security fasteners, each packaged in a compartmented kit configured for easy handling and storage.
8. Security Fasteners: Furnish no fewer than 1 box for every 50 boxes or fraction thereof, of each type and size of security fastener installed.

H. Quality Assurance

1. Installer Qualifications:
 - a. An employer of workers, at least one of whom is a technician certified by the National Burglar & Fire Alarm Association.
 - b. Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
2. Security Systems Integrator Qualifications: An experienced perimeter security equipment supplier and Installer who has completed systems integration work for installations similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful in-service performance.
3. Testing Agency Qualifications: Member company of NETA or an NRTL.
 - a. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.
4. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
5. FMG Compliance: FMG-approved and -labeled perimeter security devices and equipment.
6. Comply with NFPA 70.

I. Project Conditions

1. Environmental Conditions: Capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
 - a. Altitude: Sea level to 4000 feet (1220 m).
 - b. Master Control Unit: Rated for continuous operation in an ambient of 60 to 85 deg F (16 to 29 deg C) and a relative humidity of 20 to 80 percent, noncondensing.
 - c. Exterior Environment: System components installed in locations exposed to weather shall be rated for continuous operation in ambients of minus 30 to plus 122 deg F (minus 34 to plus 50 deg C) dry bulb and 20 to 90 percent relative humidity, condensing. Comply with UL 294 and UL 639 for outdoor-use equipment. Rate for continuous operation when exposed to rain as specified in NEMA 250, winds up to 85 mph (137 km/h) and snow cover up to 24 inches (610 mm) thick.
 - d. Hazardous Environment: System components located in areas where fire or explosion hazards may exist because of flammable gases or vapors, flammable liquids, combustible dust, or ignitable fibers or flyings shall be rated, listed, and installed according to NFPA 70.

J. Warranty:

1. Special Warranty: Manufacturer's standard form in which manufacturer and Installer agree to repair or replace components of perimeter security devices and equipment that fail in materials or workmanship within specified warranty period.
 - a. Warranty Period: Two years from date of Substantial Completion.

1.2 PRODUCTS

A. Functional Description Of System

1. Description: Perimeter protection system with fence-mounted systems **OR** buried sensors **OR** volumetric detectors, **as directed**, integrated into a single perimeter detection and alarm system.
2. Supervision: System components shall be continuously monitored for normal, alarm, supervisory and trouble conditions. Indicate deviations from normal conditions at any location in system. Indication includes identification of device or circuit in which deviation has occurred and whether deviation is an alarm or malfunction.

- a. Alarm Signal: Display at central-station control unit and actuate audible and visual alarm devices.
- b. Trouble Condition Signal: Distinct from other signals, indicating that system is not fully functional. Trouble signal shall indicate system problems such as battery failure, open or shorted transmission line conductors, or controller failure.
- c. Supervisory Condition Signal: Distinct from other signals, indicating an abnormal condition as specified for the particular device or controller.
3. System Control: Central-station control unit shall directly monitor gate detection devices, perimeter detection units, and connecting wiring.
OR
 System Control: One or more remote, addressable controllers operate under control of a central-station control-unit microcomputer in a multiplexed distributed control system or as part of a network. Controllers shall receive programming by multiplexed signal transmission from a central-station control-unit microprocessor or microcomputer and hold data in nonvolatile memory. System shall automatically reboot program without error or loss of status or alarm data after any system disturbance, **as directed**.
4. Operator Commands:
 - a. Help with System Operation: Display all commands available to operator. Help command, followed by a specific command, shall produce a short explanation of the purpose, use, and system reaction to that command.
 - b. Acknowledge Alarm: To indicate that alarm message has been observed by operator.
 - c. Place Protected Zone in Access: Disable all intrusion-alarm circuits of a specific protected zone. Tamper circuits may not be disabled by operator.
 - d. Place Protected Zone in Secure: Activate all intrusion-alarm circuits of a protected zone.
 - e. Protected Zone Test: Initiate operational test of a specific protected zone.
 - f. System Test: Initiate system-wide operational test.
 - g. Print Reports.
5. Timed Control at Central-Station Control Unit: Allow automatically timed "secure" and "access" functions of selected protected zones.
6. Automatic Control of Related Systems: Alarm or supervisory signals from certain perimeter security devices control the following functions in related systems:
 - a. Switch selected lights.
 - b. Open a signal path between certain intercommunication stations.
 - c. Shift sound system to "listening mode" and open a signal path to certain system speakers.
 - d. Switch signal to selected monitor from closed-circuit television camera in vicinity of sensor signaling an alarm.
7. Printed Record of Events: Print a record of alarm, supervisory, and trouble events on system printer. Sort and report by protected zone, device, and function. When central-station control unit receives a signal, print a report of alarm, supervisory, or trouble condition. Report type of signal (alarm, supervisory, or trouble), protected zone description, date, and time of occurrence. Differentiate alarm signals from other indications. When system is reset, report reset event with the same information concerning device, location, date, and time. Commands shall initiate the reporting of a list of current alarm, supervisory, and trouble conditions in system or a log of past events.
8. Response Time: Two seconds between actuation of any alarm and its indication at central-station control unit.
9. Circuit Supervision: Supervise all signal and data transmission lines, links with other systems, controllers, and sensors from central-station control unit. Indicate circuit and detection device faults with both protected zone and trouble signals, sound a distinctive audible tone, and illuminate an LED. Maximum permissible elapsed time between occurrence of a trouble condition and indication at central-station control unit is 20 seconds. Initiate an alarm in response to opening, closing, shorting, or grounding of a signal or data transmission line.
10. Programmed Secure-Access Control: System shall be programmable to automatically change status of various combinations of protected zones between secure and access conditions at scheduled times. Status changes may be preset for repetitive, daily, and weekly; specially scheduled operations may be preset up to a year in advance. Manual secure-access control stations shall override programmed settings.

11. Manual Secure-Access Control: Coded entries at manual stations shall change status of associated protected zone between secure and access conditions.
- B. System Component Requirements
1. Compatibility: Detection devices and their communication features, connecting wiring, and master control unit shall be selected and configured with accessories for full compatibility with the existing equipment.
 2. Perimeter Security Units: Listed and labeled by a qualified testing agency for compliance with UL 639.
 3. Surge Protection: Protect components from voltage surges originating external to equipment housing and entering through power, communication, signal, control, or sensing leads. Include surge protection for external wiring of each conductor entry connection to components.
 - a. Minimum Protection for Power Lines 120 V and More: Auxiliary panel suppressors complying with requirements in Division 26 Section "Transient-voltage Suppression For Low-voltage Electrical Power Circuits".
 - b. Minimum Protection for Communication, Signal, Control, and Low-Voltage Power Lines: Comply with requirements in Division 26 Section "Transient-voltage Suppression For Low-voltage Electrical Power Circuits" as recommended by manufacturer for type of line being protected.
 4. Interference Protection: Components shall be unaffected by radiated RFI and electrical induction of 15 V/m over a frequency range of 10 to 10,000 MHz and conducted interference signals up to 0.25-V RMS injected into power supply lines at 10 to 10,000 MHz.
 5. Tamper Protection: Tamper switches on detection devices, controllers, annunciators, pull boxes, junction boxes, cabinets, and other system components shall initiate a tamper-alarm signal when unit is opened or partially disassembled and when entering conductors are cut or disconnected. Central-station control-unit alarm display shall identify tamper alarms and indicate locations.
 6. Self-Testing Devices: Automatically test themselves periodically, but not less than once per hour, to verify normal device functioning and alarm initiation capability. Devices transmit test failure to central-station control unit.
 7. Antimasking Devices: Automatically check operation continuously or at intervals of a minute or less, and use signal-processing logic to detect blocking, masking, jamming, tampering, or other operational dysfunction. Devices transmit detection of operational dysfunction to central-station control unit as an alarm signal.
 8. Addressable Devices: Transmitter and receivers shall communicate unique device identification and status reports to central-station control unit.
 9. Remote-Controlled Devices: Individually and remotely adjustable for sensitivity and individually monitored at central-station control unit for calibration, sensitivity, and alarm condition.
- C. Enclosures
1. Interior Sensors: Enclosures that protect against dust, falling dirt, and dripping noncorrosive liquids.
 2. Interior Electronics: NEMA 250, Type 12.
 3. Exterior Electronics: NEMA 250, Type 4X fiberglass **OR** stainless steel, **as directed**.
 4. Corrosion Resistant: NEMA 250, Type 4X PVC **OR** stainless steel, **as directed**.
 5. Terminal cabinets in handholes and manholes shall be NEMA 250, Type 6 **OR** 6P, **as directed**.
 6. Screw Covers: Where enclosures are accessible to inmates, secure with security fasteners of type appropriate for enclosure.
- D. Secure And Access Devices
1. Keypad and Display Module: Arranged for entering and executing commands for system-status changes and for displaying system-status and command-related data.
 2. Key-Operated Switch: Change protected zone between secure and access conditions.
- E. Strain-Sensitive Cable

1. Description: Strain-sensitive, coaxial transducer cable shall monitor chain-link-type and welded-mesh-type fence and generate an alarm when a standard intruder attempts to climb over, cut through, or lift fence fabric.
2. Environment: Suitable for exterior installation and the following conditions:
 - a. Ambient Temperatures: Ranging from minus 22 to plus 158 deg F (minus 30 to plus 70 deg C).
3. Transducer Cable:
 - a. Ultraviolet-resistant cable furnished by system manufacturer.
 - b. Suitable for up to 1000 feet (300 m) of sensor cable per single-zone controller and up to 2000 feet (600 m) of sensor cable per dual-zone processor.
 - c. Sensitivity shall be uniform throughout its entire length, requiring only one variable sensitivity adjustment throughout its entire length.
4. Control Unit:
 - a. Field mounted, with tamper switch at controller board.
 - b. Electronic circuitry shall discriminate between acceptable fence movement and intrusion-related disturbances.
 - c. Sensitivity, count control, and climb-over processors shall be adjustable with a minimum of five individual count-control and climb-over adjustments.
 - d. Controller output shall have adjustable pulse width to adjust the time the alarm relay will activate per detected intrusion attempt.
5. System Performance:
 - a. Immune to RFI and EMI environments; interference shall have no effect on normal operational characteristics.
 - b. Trouble and Tamper: Entire sensor system shall be fully supervised with individually monitored tamper and supervision alarms. Disconnecting, cutting, or shorting of strain-sensitive cable results in supervisory alarm.
 - c. Intrusion Simulation: Each zone shall have a self-test feature that, when activated by a signal from central-station control unit, will produce an intrusion alarm and verify operation of sensor.

F. Microwave Intrusion Detectors

1. Description: Volumetric microwave detection system.
2. Device Performance: Microwave transmitter establishes an electromagnetic field in an adjustable detection pattern and detects intrusion by monitoring changes in that pattern.
 - a. Movement Sensitivity: Adjustable, able to detect standard-intruder movement within sensor's detection pattern at any speed between 0.1 to 50 fps (0.03 to 15.2 m/s). Sensor sensitivity adjustments shall be accessible only when sensor housing is removed, and sensors shall comply with 47 CFR 15.
 - b. Detection range: 15 to 600 feet (5 to 180 m).
 - c. Range Sensitivity: Adjustable for setting area of protection between 15 to 500 feet (5 to 152 m) in range and from 2 to 40 feet (0.6 to 12 m) in beam diameter.
 - d. Trouble and Tamper: Fully supervised with individually monitored tamper and supervision alarms. System failure shall result in tamper alarm. System jamming or wrong modulation shall result in supervisory alarm.
 - e. Activation Indicator: LED indicator shall not be visible during normal operation. Indicator shall light when sensor detects a standard intruder. Locate test-enabling switch under sensor housing cover.
 - f. Remote Test: When initiated by central-station control unit, start a test sequence for each detector element that simulates standard-intruder movement within sensor's detection patterns, causing an alarm.
3. Environment: Suitable for exterior installation and the following conditions:
 - a. Ambient Temperatures: Ranging from minus 30 to plus 158 deg F (minus 34 to plus 70 deg C) and in rainfall up to 4 inches (100 mm).

G. Electrostatic Field

1. Description: Electronically balanced phase electrostatic-field detection system consisting of a field generator that generates an electrical field in one or more field wires and that has two or

- more sensing wires, a sense filter, amplifier, and a controller. Detection fields shall have a minimum of four different frequencies so adjacent zones cannot interfere with each other.
 2. Environment: Suitable for exterior installation and the following conditions:
 - a. Ambient Temperatures: Ranging from minus 22 to plus 158 deg F (minus 30 to plus 70 deg C).
 3. System Performance:
 - a. Detect, via sense wires, a compound signal form consisting of amplitude change, rate of change, and pre-set time disturbance that forms a "signature" of human movement. Generate an alarm when all exist simultaneously. Provide detection fields of not less than four different frequencies so adjacent zones do not interfere with each other.
 - b. Control Units: Single or multiple zone, with sense filter. Front panel with calibration meter, status of alarm transmitter, sensitivity selector, test point selector, power indicator, and power control. Control unit shall reject signals due to wind and small objects striking the wires.
 - c. Motion Detection: Sense standard-intruder movement at rates from 0.15 to 26 fps (0.045 to 8.0 m/s).
 - d. Zone Length: Not to exceed 500 feet (152 m) **OR** 325 feet (100 m), **as directed**.
 - e. Supervision: Generate trouble signal if field or sense wires are cut or shorted to ground or to each other. Generate supervisory alarm if received signal is substantially reduced.
 4. Insulators, Wire-Tensioning Devices, and Brackets: Manufacturer's standard for mounting and tensioning of wires.
 5. Field and Sensing Wires: Stainless steel.
- H. Buried, Ported Coaxial Cable
1. Description: Buried electrostatic-field detection system consisting of parallel, ported coaxial cables that generate a detection field between cables.
 2. Environment: Suitable for exterior installation and the following conditions:
 - a. Ambient Temperatures: Ranging from minus 22 to plus 158 deg F (minus 30 to plus 70 deg C).
 3. System Performance: One of two parallel cables receives a continuous wave signal from a transmitter module. Second cable, connected to a sensor module, detects, preamplifies, and analyzes variations in signal. When system senses "signature" of a standard intruder in the detection zone, based on mass, motion, and time of day, it generates an alarm.
 - a. Transmitter: Locate at one end of zone, with standby battery.
 - b. Preamplifier-Sensor: Locate at opposite end from transmitter, with standby battery.
 - c. Front panel with sensitivity calibration meter, calibrated self-test potentiometer, power switch, and LED normal and malfunction indicators.
 - d. Electromagnetic Radiation: Less than 50 mV per meter at 30 m.
 - e. Motion Detection: Sense standard-intruder movement at rates from 0.17 to 26 fps (0.05 to 8.0 m/s).
 - f. Zone Length: Not to exceed 500 feet (152 m) **OR** 325 feet (100 m), **as directed**.
 - g. Zone Width: Not to exceed 15 feet (4.6 m), with an average width of 12 feet (3.7 m).
 - h. Zone Height: Approximately 3.3 feet (1.0 m), depending on sensitivity setting.
 - i. Supervision: Generate trouble signal if cable is cut or shorted to ground. Generate supervisory alarm if cabinets are tampered with.
 4. Enclosures: Hinged cover with tamper switch and security fasteners.
 5. Buried, Ported Coaxial Cable: Approximately 1/2-inch (1.3-mm) diameter, minimum 10 AWG center conductor, foam polyethylene dielectric, braided copper outer conductor, and polyethylene jacket.
- I. Long-Range PIR Detectors
1. Description: Volumetric passive infrared detection system.
 2. Listed and labeled by a qualified testing agency for compliance with SIA PIR-01.
 3. Environment: Suitable for exterior installation and the following conditions:
 - a. Ambient Temperatures: Ranging from minus 30 to plus 150 deg F (minus 34 to plus 65 deg C).

4. System Performance: Detect an interruption of dual-infrared light beams that link transmitters and receivers. Generate an alarm when signal is interrupted due to presence of an object that interrupts both beams.
 - a. Sensitivity: Field adjustable to allow adjustment of range from 25 to 500 feet (7.6 to 152 m), generating an alarm within 20 to 50 ms when both beams are interrupted.
 - b. Detection system shall adjust automatically to compensate for weather, including fog, rain, snow, blowing dust, and rapid temperature changes.
 - c. Motion Detection: Detect standard-intruder movement at rates from 0.1 to 50 fps (0.03 to 15.2 m/s).
 - d. Supervision: Generate supervisory alarm if any portion of system is tampered with.
 - e. Remote Test: When initiated by central-station control unit, start a test sequence for each detector element that simulates standard-intruder movement within sensor's detection patterns, causing an alarm.

- J. Geophone Fence Detection
 1. Description: Fence-mounted system to detect attempts to cut or climb the protected fence, using geophone sensors that respond to specific shock or vibrations.
 2. Environment: Suitable for exterior installation and the following conditions:
 - a. Ambient Temperatures: Ranging from minus 30 to plus 150 deg F (minus 34 to plus 65 deg C).
 3. System Performance:
 - a. Controller: 10 zone capacity for processing geophone generated analog signals. Each zone shall consist of not more than 10 sensors.
 - 1) Adjustments: For each zone provide stepped gain control for sensitivity, and switches for geophone signal filters to minimize nuisance alarms. System shall adjust automatically to compensate for weather, including fog, rain, snow, blowing dust, and rapid temperature changes.
 - 2) Trouble Condition Signal: Generate when any zone fails.
 - 3) Supervisory Condition Signal: Generate on interference with controller operation or when detecting a break-in into a enclosure housing electronics.
 - b. Sensors: Fence mounted 20 feet (6 m) o.c.
 - c. Cable for Interconnection of System Components: Shielded, PVC jacketed and armored, as supplied by system manufacturer.
 - d. Test each zone simulating an alarm condition. Test by command from central-station control **OR** test switch at controller inside the enclosure, **as directed**.

- K. Video Motion Sensor
 1. Description: Video-surveillance based detection system.
 2. Device Performance: Detect changes in video signal within a user-defined protected zone. Provide an alarm output for each video input.
 - a. Detect movement within protected zone of standard intruders wearing clothing with a reflectivity that differs from that of background scene by a factor of 2. Reject all other changes in video signal.
 - b. Modular design that allows for expansion or modification of number of inputs.
 - c. Adjustable Controls:
 - 1) Number of detection zones.
 - 2) Size of detection zones.
 - 3) Sensitivity of detection of each protected zone.
 - d. Mounting: Standard 19-inch (480-mm) rack as described in EIA 310.
 3. Environment: Suitable for installation in interior air-conditioned spaces.

- L. Gate Units
 1. Description: Fence mounted gate-movement detector, blanced-magnetic type, UL listed for outdoor locations. Units shall be designed for mounting on single- or double-leaf swinging or rolling gates and have armored jumper cables between switch and stationary junction box for wiring to central-station control unit and tamper switches in junction box.

2. Device Performance: Bias magnet and at least three encapsulated-reed switches that resist compromise from introduction of foreign magnetic fields, with integral overcurrent protective device to limit current to 80 percent of switch capacity.
 3. Remote Test: Simulate movement of actuating magnet from central-station control unit.
- M. Field-Mounted Control Units
1. Field-mounted control units shall include the power supply and detector specific functions, and provide for communications with the master control unit. Control unit shall include read-only resident software needed for startup, a time clock, and all automatic operations. Software shall be downloaded from the master control unit.
 2. Battery Backup: UPS, providing 6 hours of run time during a power outage, with 2-rate automatic battery charger to fully recharge batteries within 12 hours after normal power is restored.
 - a. Batteries: Rechargeable, valve-regulated, recombinant, sealed, lead-acid type with nominal 10-year life expectancy.
 - b. Battery Charger: Solid-state, fully automatic, variable-charging-rate type. Charger shall recharge fully discharged battery within 24 hours.
 3. Annunciation: Indicate a change in system condition and switching of system or component to backup power.
- N. Master Control Unit
1. Description: Supervise sensors and detection subsystems and their connecting communication links, status control (secure or access) of sensors and detector subsystems, activation of alarms and supervisory and trouble signals, and other indicated functions.
 - a. System software and programs shall be held in flash electrically erasable programmable read-only memory (EEPROM), retaining the information through failure of primary and secondary power supplies.
 - b. Include a real-time clock for time annotation of events on the event recorder and printer.
 - c. Addressable initiation devices that communicate device identity and status.
 - d. Control circuits for operation of mechanical equipment in response to an alarm.
 2. Construction: Freestanding equipment rack **OR** Desk-mounted console, **as directed**, modular, with separate and independent alarm and supervisory system modules. Alarm-initiating protected zone boards shall be plug-in cards. Arrangements that require removal of field wiring for module replacement are unacceptable.
 3. Comply with UL 609 **OR** UL 681 **OR** UL 1076, **as directed**.
 4. Console Controls and Displays: Arranged for interface between human operator at master control unit and addressable system components including annunciation and supervision. Display alarm, supervisory, and component status messages and the programming and control menu.
 - a. Annunciator and Display: LCD type, one **OR** two **OR** three line(s) of 40 **OR** 80 characters, minimum, **as directed**.
 - b. Keypad: Arranged to permit entry and execution of programming, display, and control commands
 - c. Control-Unit Network: Automatic communication of alarm, status changes, commands, and other communications required for system operation. Communication shall return to normal after partial or total network interruption such as power loss or transient event. Total or partial signaling network failures shall identify the failure and record the failure at the annunciator display and at the system printer.
 - d. Field Device Network: Communicate between the control unit and field devices of the system. Communications shall consist of alarm, network status, and status and control of field-mounted processors. Each field-mounted device shall be interrogated during each interrogation cycle.
 - e. Operator Controls: Manual switches and push-to-test buttons that do not require a key to operate. Prevent resetting of alarm, supervisory, or trouble signals while alarm or trouble condition persists. Include the following:
 - 1) Acknowledge alarm.
 - 2) Silence alarm.
 - 3) System reset.

- 4) LED test.
 - f. Timing Unit: Solid state, programmable, 365 days.
 - g. Confirmation: Relays, contactors, and other control devices shall have auxiliary contacts that provide confirmation signals to system for their on or off status. Software shall interpret such signals, display equipment status, and initiate failure signals.
 - h. Alarm Indication: An audible signal sounds and an LED lights at master control unit identifying the protected zone **OR** addressable detector, **as directed**, originating the alarm. Annunciator panel displays a common alarm light and sounds an audible tone.
 - i. Alarm Indication: An audible signal sounds and a plain-language identification of the protected zone **OR** addressable detector, **as directed** originating the alarm appears on LED or LCD display at master control unit. Annunciator panel displays a common alarm light and sounds an audible tone.
 - j. Alarm Indication: An audible signal sounds and a plain-language identification of the protected zone **OR** addressable detector, **as directed** originating the alarm appears on LED, LCD or cathode-ray-tube display, **as directed** at master control unit. Annunciator panel alarm light and audible tone identify protected zone signaling an alarm.
 - k. Alarm activation sounds a bell **OR** siren **OR** strobe **OR** bell or siren and strobe, **as directed**.
 5. Protected Zones: Quantity of alarm and supervisory zones as indicated, with capacity for expanding number of protected zones by a minimum of 25 percent.
 6. Power Supply Circuits: Master control units shall provide power for remote power-consuming detection devices. Circuit capacity shall be adequate for at least a 25 percent increase in load.
 7. UPS: Comply with Division 26 Section "Static Uninterruptible Power Supply". UPS shall be sized to provide a minimum of six hours of master control-unit operation.
 8. Cabinet: Lockable, steel enclosure arranged so operations required for testing, normal operation, and maintenance are performed from front of enclosure. If more than a single cabinet is required to form a complete control unit, provide exactly matching modular enclosures. Accommodate all components and allow ample gutter space for field wiring. Identify each enclosure by an engraved, laminated, phenolic-resin nameplate. Lettering on enclosure nameplate shall not be less than 1 inch (25 mm) high. Identify, with permanent labels, individual components and modules within cabinets.
 9. Transmission to Monitoring Station: A communications device to automatically transmit alarm, supervisory, and trouble signals to the monitoring station, operating over a standard voice grade telephone leased line. Comply with UL 1635.
 10. Printout of Events: On receipt of signal, print alarm, supervisory, and trouble events. Identify zone, device, and function. Include type of signal (alarm, supervisory, or trouble) and date and time of occurrence. Differentiate alarm signals from all other printed indications. Also print system reset event, including same information for device, location, date, and time. Commands initiate the printing of a list of existing alarm, supervisory, and trouble conditions in the system and a historical log of events.
- O. Audible And Visual Alarm Devices
1. Bell: UL listed, 10 inches (254 mm) in diameter, rated to produce a minimum sound output of 84 dB at 10 feet (3 m) from central-station control unit.
 - a. Enclosure: Weather-resistant steel box equipped with tamper switches on cover and on back of box.
 2. Klaxon Weatherproof Motor-Driven Hooter: UL listed, rated to produce a minimum sound output of 120 dB at 3 feet (1 m), plus or minus 3 dB, at a frequency of 470 Hz. Rated for intermittent use - two minutes on, five minutes off.
 - a. Designed for use in industrial areas and in high noise, severe weather marine environments.
 3. Siren: 30-W speaker with siren driver, rated to produce a minimum sound output of 103 dB at 10 feet (3 m) from central-station control unit.
 - a. Enclosure: Weather-resistant steel box with tamper switches on cover and on back of box.
 4. Strobe: Xenon light complying with UL 1638, with a clear polycarbonate lens.
 - a. Light Output: 115 cd, minimum.
 - b. Flash Rate: 60 per minute.

P. Security Fasteners

1. Operable only by tools produced for use on specific type of fastener by fastener manufacturer or other licensed fabricator. Drive system type, head style, material, and protective coating as required for assembly, installation, and strength.
2. Drive System Types: Pinned Torx-Plus, pinned Torx, or pinned hex (Allen).
3. Socket Flat Countersunk Head Fasteners:
 - a. Heat-treated alloy steel, ASTM F 835 (ASTM F 835M).
 - b. Stainless steel, ASTM F 879 (ASTM F 879M), Group 1 CW.
4. Socket Button Head Fasteners:
 - a. Heat-treated alloy steel, ASTM F 835 (ASTM F 835M).
 - b. Stainless steel, ASTM F 879 (ASTM F 879M), Group 1 CW.
5. Socket Head Cap Fasteners:
 - a. Heat-treated alloy steel, ASTM A 574 (ASTM A 574M).
 - b. Stainless steel, ASTM F 837 (ASTM F 837M), Group 1 CW.
6. Protective Coatings for Heat-Treated Alloy Steel:
 - a. Zinc chromate, ASTM F 1135, Grade 3 or 4; for exterior applications and interior applications where indicated.
 - b. Zinc phosphate with oil, ASTM F 1137, Grade I, or black oxide, unless otherwise indicated.

Q. Source Quality Control

1. Electrostatic-Field and Buried, Ported Coaxial Cable Systems Electronics: Precondition at factory by subjecting modules to at least 4 days' operational burn-in at temperatures not less than 140 deg F (60 deg C).

1.3 EXECUTION**A. Examination**

1. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of perimeter security.
2. Examine roughing-in for embedded and built-in anchors to verify actual locations of perimeter security connections before perimeter security installation.
3. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of perimeter security.
4. Inspect built-in and cast-in anchor installations, before installing perimeter security, to verify that anchor installations comply with requirements. Prepare inspection reports.
 - a. Remove and replace anchors where inspections indicate that they do not comply with requirements. Reinspect after repairs or replacements are made.
 - b. Perform additional inspections to determine compliance of replaced or additional anchor installations. Prepare inspection reports.
5. For material whose orientation is critical for its performance as a ballistic barrier, verify installation orientation.
6. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Systems Integration

1. Integrate perimeter security system with the following systems and equipment:
 - a. Electronic door hardware.
 - b. Elevators.
 - c. Network lighting controls.
 - d. Intercommunications and program systems.
 - e. Public address and mass notification systems.
 - f. Access control.
 - g. Fire-alarm system.
 - h. Intrusion detection system.
 - i. Video surveillance.

C. System Installation

1. Comply with UL 681 and NFPA 731.
2. Equipment Mounting: Install master control unit on finished floor with tops of cabinets not more than 72 inches (1830 mm) above the finished floor.
 - a. Comply with requirements for seismic-restraint devices specified in Division 26 Section "Vibration And Seismic Controls For Electrical Systems".
3. Install wall-mounted equipment, with tops of cabinets not more than 72 inches (1830 mm) above the finished floor.
 - a. Comply with requirements for seismic-restraint devices specified in Division 26 Section "Vibration And Seismic Controls For Electrical Systems".
4. Connecting to Existing Equipment: Verify that existing perimeter security system is operational before making changes or connections.
 - a. Connect new equipment to existing control panel in existing part of the building.
 - b. Connect new equipment to existing monitoring equipment at the Supervising Station.
 - c. Expand, modify, and supplement existing **control** or **monitoring** equipment as necessary to extend existing **control** or **monitoring** functions to the new points. New components shall be capable of merging with existing configuration without degrading the performance of either system.
5. Security Fasteners: Where accessible to inmates, install perimeter security components using security fasteners with head style appropriate for fabrication requirements, strength, and finish of adjacent materials except that a maximum of two different sets of tools shall be required to operate security fasteners for Project. Provide stainless-steel security fasteners in stainless-steel materials.
6. Wiring Method: Install power, signal, and data transmission wire and cable in raceways according to Division 26 Section(s) "Underground Ducts And Raceways For Electrical Systems" AND "Raceway And Boxes For Electrical Systems". Minimum conduit size shall be 1/2 inch (13 mm). Control and data transmission wiring shall not share raceways with any other system.
7. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points. Use lacing bars and distribution spools. Separate power-limited and non-power-limited conductors as recommended in writing by manufacturer. Install conductors parallel with or at right angles to sides and back of enclosure. Connect conductors that are terminated, spliced, or interrupted in any enclosure associated with perimeter security system to terminal blocks. Mark each terminal according to system's wiring diagrams. Make all connections with approved crimp-on terminal spade lugs, pressure-type terminal blocks, or plug connectors.
8. Wires and Cables:
 - a. Conductors: Size as recommended in writing by system manufacturer, unless otherwise indicated.
 - b. 120-V Power Wiring: Install according to Division 26 Section "Low-voltage Electrical Power Conductors And Cables", unless otherwise indicated.
 - c. Cable for Low-Voltage Control and Signal Circuits: Install unshielded, twisted-pair cable, unless otherwise indicated or if manufacturer recommends shielded cable, according to Division 28 Section "Conductors And Cables For Electronic Safety And Security".
 - d. Data and Television Signal Transmission Cables: Install according to Division 28 Section "Conductors And Cables For Electronic Safety And Security"
9. Splices, Taps, and Terminations: Make connections only on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.
10. Install power supplies and other auxiliary components for detection devices at controllers, unless otherwise indicated or required by manufacturer. Do not install such items near devices they serve.
11. Stain-Sensitive Transducer Cable: Attached to fence at 12-inch (300-mm) intervals with tie wraps.
12. Electrostatic-Field System: Install field and sense wires on insulators and standoffs on a fence, wall, or roof. Provide intermediate supports recommended in writing by manufacturer as needed for specified performance.
13. Buried, Ported Coaxial Cable: Transmitters may be located at one end of parallel coaxial cables, and preamplifier-sensor module may be located at opposite end. Install cable so shield is uniform throughout the length, without twisting or distorting cable during installation. Field-cut cables to

exact zone length at the site. To attach data transmission cable to sensing cable, use heat-shrink splice kits approved by manufacturer. Provide sufficient overlap of detector cables to eliminate the possibility of entry between zones.

D. Identification

1. Identify system components wiring, cabling, and terminals. Comply with identification requirements in Division 26 Section "Identification For Electrical Systems".
2. Install instructions frame in a location visible from master control unit.

E. Grounding

1. Ground the master control unit and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to master control unit.
2. Ground system components and conductor and cable shields to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.
3. Signal Ground Terminal: Locate at main equipment rack or cabinet. Isolate from power system and equipment grounding. Provide 5-ohm ground. Measure, record, and report ground resistance.
4. Install grounding electrodes of type, size, location, and quantity indicated. Comply with installation requirements in Division 26 Section "Grounding And Bonding For Electrical Systems".

F. Field Quality Control

1. Pretesting: After installation, align, adjust, and balance system and perform complete pretesting to determine compliance of system with requirements in the Contract Documents. Correct deficiencies observed in pretesting. Replace malfunctioning or damaged items with new ones and retest until satisfactory performance and conditions are achieved. Prepare forms for systematic recording of acceptance test results.
 - a. Report of Pretesting: After pretesting is complete, provide a letter certifying that installation is complete and fully operable; include names and titles of witnesses to preliminary tests.
2. Testing Agency: Engage a qualified testing and inspecting agency to perform tests and inspections.
3. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components and equipment installations, including connections.
4. Tests and Inspections: Comply with provisions in NFPA 731, Ch.9, "Testing and Inspections."
 - a. Inspection: Verify that units and controls are properly labeled and interconnecting wires and terminals are identified.
 - b. Operational Tests: Schedule tests after pretesting has been successfully completed. Test all modes of system operation and perimeter security at each detection device. Test for detection of intrusion and for false alarms in each protected zone. Test for false alarms by simulating activities outside indicated detection patterns.
 - c. Electrical Tests: Comply with NFPA 72, Section A-7. Minimum required tests are as follows:
 - 1) Verify the absence of unwanted voltages between circuit conductors and ground.
 - 2) Test all conductors for short circuits using an insulation-testing device.
 - 3) With each circuit pair, short circuit at the far end of circuit and measure circuit resistance with an ohmmeter. Record circuit resistance of each circuit on Record Drawings.
 - 4) Verify that each controller is in normal condition as detailed in manufacturer's operation and maintenance manual.
 - 5) Test signal and data transmission circuits complying with requirements in Division 28 Section "Conductors And Cables For Electronic Safety And Security" for proper signal transmission under open-circuit conditions. One connection each should be opened at not less than 10 percent of initiating and indicating devices. Observe proper signal transmission according to class of wiring used.
 - 6) Verify that transient surge-protection devices are installed according to manufacturer's written instructions.
 - 7) Test each initiating and indicating device for alarm operation and proper response at central-station control unit.

- 8) Test both primary and secondary power. Verify, by test, that UPS is capable of operating the system for period and in manner specified.
 - d. Geophone System Tests: Test each zone at a minimum of two different locations. Test each zone as follows:
 - 1) Horizontal Movement: Adjust sensitivity to screen out alarms from wind.
 - 2) Vertical Climb: 100 percent detection required. Set count at 3 occurrences within 90-second window.
 - 3) Cut Test: 100 percent detection required. Set count at 2 occurrences within 120-second window.
 - 4) Set sensitivity to value as low as possible, consistent with reliable detection.
 - 5) If performance tests fail, make adjustments to sensors to comply with requirements. Retest failing and adjacent zones to comply with test.
 - e. Strain-Sensitive Cable System Tests: Adjust sensitivity and count control to value as low as possible, consistent with reliable detection.
 - f. Microwave Perimeter Security System Tests: Adjust sensitivity to value as low as possible, consistent with reliable detection.
 - g. Long-Range PIR System Tests: Adjust sensitivity and hold time between activity duration to value as low as possible, consistent with reliable detection.
 5. Report of Tests and Inspections: Prepare a written record of tests, inspections, and detailed test results in the form of a test log.
 6. Tag all equipment, stations, and other components at which tests have been satisfactorily completed.
- G. Demonstration
1. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain perimeter security.
- H. Adjusting
1. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other than normal occupancy hours for this purpose. Visits for this purpose shall be in addition to any required by warranty.

END OF SECTION 28 13 33 16

SECTION 28 13 33 16a - INTRUSION DETECTION**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for intrusion detection. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section includes:
 - a. Intrusion detection with communication links to perform monitoring, alarm, and control functions.
2. Integration of other electronic and electrical systems and equipment.

C. Definitions

1. CCTV: Closed-circuit television.
2. PIR: Passive infrared.
3. RFI: Radio-frequency interference.
4. UPS: Uninterruptible power supply.
5. Control Unit: System component that monitors inputs and controls outputs through various circuits.
6. Master Control Unit: System component that accepts inputs from other control units and may also perform control-unit functions. The unit has limited capacity for the number of protected zones and is installed at an unattended location or at a location where it is not the attendant's primary function to monitor the security system.
7. Monitoring Station: Facility that receives signals and has personnel in attendance at all times to respond to signals. A central station is a monitoring station that is listed.
8. Protected Zone: A protected premises or an area within a protected premises that is provided with means to prevent an unwanted event.
9. Standard Intruder: A person who weighs 100 lb (45 kg) or less and whose height is 60 inches (1525 mm) or less; dressed in a long-sleeved shirt, slacks, and shoes unless environmental conditions at the site require protective clothing.
10. Standard-Intruder Movement: Any movement, such as walking, running, crawling, rolling, or jumping, of a "standard intruder" in a protected zone.
11. Systems Integration: The bringing together of components of several systems containing interacting components to achieve indicated functional operation of combined systems.
12. Zone. A defined area within a protected premises. It is a space or area for which an intrusion must be detected and uniquely identified. The sensor or group of sensors must then be assigned to perform the detection, and any interface equipment between sensors and communication must link to master control unit.

D. Action Submittals

1. Product Data: Components for sensing, detecting, systems integration, and control, including dimensions and data on features, performance, electrical characteristics, ratings, and finishes.
2. Show Drawings: Detail assemblies of standard components that are custom assembled for specific application on the Project.
 - a. Functional Block Diagram: Show single-line interconnections between components including interconnections between components specified in this Section and those furnished under other Sections. Indicate methods used to achieve systems integration. Indicate control, signal, and data communication paths and identify programmable logic controllers **OR** networks, **as directed** and control interface devices and media to be used. Describe characteristics of network and other data communication lines.

- 1) Indicate methods used to achieve systems integration.
- 2) Indicate control, signal, and data communication paths and identify PLCs, networks, control interface devices, and media to be used.
- 3) Describe characteristics of network and other data communication lines.
- 4) Describe methods used to protect against power outages and transient voltages including types and ratings of isolation and surge suppression devices used in data, communication, signal, control, and ac and dc power circuits.
- b. Raceway Riser Diagrams: Detail raceway runs required for intrusion detection and for systems integration. Include designation of devices connected by raceway, raceway type and size, and type and size of wire and cable fill for each raceway run.
- c. UPS: Sizing calculations.
- d. Site and Floor Plans: Indicate final outlet and device locations, routing of raceways, and cables inside and outside the building. Include room layout for master control-unit console, terminal cabinet, racks, and UPS.
- e. Master Control-Unit Console Layout: Show required artwork and device identification.
- f. Device Address List: Coordinate with final system programming.
- g. System Wiring Diagrams: Include system diagrams unique to Project. Show connections for all devices, components, and auxiliary equipment. Include diagrams for equipment and for system with all terminals and interconnections identified.
- h. Details of surge-protection devices and their installation.
- i. Sensor detection patterns and adjustment ranges.
3. Equipment and System Operation Description: Include method of operation and supervision of each component and each type of circuit. Show sequence of operations for manually and automatically initiated system or equipment inputs. Description must cover this specific Project; manufacturer's standard descriptions for generic systems are unacceptable.
4. Samples for Initial Selection: For units with factory-applied color finishes.
5. Samples for Verification: For each type of exposed finish required.

E. Information Submittals

1. Qualification Data: For Installer **OR** intrusion detection systems integrator **OR** testing agency, **as directed**.
2. Field quality-control reports.
3. Warranty: Sample of special warranty.
4. Other Information Submittals:
 - a. Test Plan and Schedule: Test plan defining all tests required to ensure that system meets technical, operational, and performance specifications within 60 days of date of Contract award.
 - b. Examination reports documenting inspections of substrates, areas, and conditions.
 - c. Anchor inspection reports documenting inspections of built-in and cast-in anchors.

F. Closeout Submittals

1. Operation and Maintenance Data: For intrusion detection system to include in emergency, operation, and maintenance manuals," include the following:
 - a. Data for each type of product, including features and operating sequences, both automatic and manual.
 - b. Master control-unit hardware and software data.

G. Quality Assurance

1. Installer Qualifications:
 - a. An employer of workers, at least one of whom is a technician certified by the National Burglar & Fire Alarm Association.
 - b. Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
2. Intrusion Detection Systems Integrator Qualifications: An experienced intrusion detection equipment supplier and Installer who has completed systems integration work for installations similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful in-service performance.

3. Testing Agency Qualifications: An independent testing agency, with the experience and capability to conduct the testing indicated, that is a member company of the National Burglar & Fire Alarm Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to Owner's insurance underwriter.
 - a. Testing Agency's Field Supervisor: Person currently certified as an advanced alarm technician by the National Burglar & Fire Alarm Association to supervise on-site testing specified in Part 3.
4. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
5. Control Units, Devices, and Communications with Monitoring Station: Listed and labeled by a qualified testing agency for compliance with SIA CP-01.
6. FM Global Compliance: FMG-Approved and -labeled intrusion detection devices and equipment.
7. Comply with NFPA 70.

H. Project Conditions

1. Environmental Conditions: Capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
 - a. Altitude: Sea level to 4000 feet (1220 m).
 - b. Master Control Unit: Rated for continuous operation in an ambient of 60 to 85 deg F (16 to 29 deg C) and a relative humidity of 20 to 80 percent, noncondensing.
 - c. Interior, Controlled Environment: System components, except master station control unit, installed in air-conditioned **OR** temperature-controlled, **as directed**, interior environments shall be rated for continuous operation in ambients of 36 to 122 deg F (2 to 50 deg C) dry bulb and 20 to 90 percent relative humidity, noncondensing.
 - d. Interior, Uncontrolled Environment: System components installed in non-air-conditioned **OR** non-temperature-controlled, **as directed**, interior environments shall be rated for continuous operation in ambients of 0 to 122 deg F (minus 18 to plus 50 deg C) dry bulb and 20 to 90 percent relative humidity, noncondensing.
 - e. Exterior Environment: System components installed in locations exposed to weather shall be rated for continuous operation in ambients of minus 30 to plus 122 deg F (minus 34 to plus 50 deg C) dry bulb and 20 to 90 percent relative humidity, condensing. Comply with UL 294 and UL 639 for outdoor-use equipment. Rate for continuous operation when exposed to rain as specified in NEMA 250, winds up to 85 mph (137 km/h) and snow cover up to 24 inches (610 mm) thick.
 - f. Hazardous Environment: System components located in areas where fire or explosion hazards may exist because of flammable gases or vapors, flammable liquids, combustible dust, or ignitable fibers or flyings shall be rated, listed, and installed according to NFPA 70.

I. Warranty

1. Special Warranty: Manufacturer's standard form in which manufacturer and Installer agree to repair or replace components of intrusion detection devices and equipment that fail in materials or workmanship within specified warranty period.
2. Warranty Period: Two years from date of Substantial Completion.

1.2 PRODUCTS

A. Functional Description Of System

1. Description: Hard-wired **OR** Multiplexed, modular, microprocessor-based controls, intrusion sensors and detection devices, and communication links to perform monitoring, alarm, and control functions.
2. Supervision: System components shall be continuously monitored for normal, alarm, supervisory, and trouble conditions. Indicate deviations from normal conditions at any location in system. Indication includes identification of device or circuit in which deviation has occurred and whether deviation is an alarm or malfunction.

- a. Alarm Signal: Display at master station control unit and actuate audible and visual alarm devices.
- b. Trouble Condition Signal: Distinct from other signals, indicating that system is not fully functional. Trouble signal shall indicate system problems such as battery failure, open or shorted transmission line conductors, or controller failure.
- c. Supervisory Condition Signal: Distinct from other signals, indicating an abnormal condition as specified for the particular device or controller.
3. System Control: Master station control unit shall directly monitor intrusion detection units and connecting wiring.
OR
 System Control: Master station control unit shall directly monitor intrusion detection devices, perimeter detection units **OR** controllers associated with perimeter detection units, **as directed**, and connecting wiring in a multiplexed distributed control system or as part of a network.
4. System shall automatically reboot program without error or loss of status or alarm data after any system disturbance.
5. Operator Commands:
 - a. Help with System Operation: Display all commands available to operator. Help command, followed by a specific command, shall produce a short explanation of the purpose, use, and system reaction to that command.
 - b. Acknowledge Alarm: To indicate that alarm message has been observed by operator.
 - c. Place Protected Zone in Access: Disable all intrusion-alarm circuits of a specific protected zone. Tamper circuits may not be disabled by operator.
 - d. Place Protected Zone in Secure: Activate all intrusion-alarm circuits of a protected zone.
 - e. Protected Zone Test: Initiate operational test of a specific protected zone.
 - f. System Test: Initiate system-wide operational test.
 - g. Print Reports.
6. Timed Control at Master station control unit: Allow automatically timed "secure" and "access" functions of selected protected zones.
7. Automatic Control of Related Systems: Alarm or supervisory signals from certain intrusion detection devices control the following functions in related systems:
 - a. Switch selected lights.
 - b. Shift elevator control to a different mode.
 - c. Open a signal path between certain intercommunication stations.
 - d. Shift sound system to "listening mode" and open a signal path to certain system speakers.
 - e. Switch signal to selected monitor from closed-circuit television camera in vicinity of sensor signaling an alarm.
8. Printed Record of Events: Print a record of alarm, supervisory, and trouble events on system printer. Sort and report by protected zone, device, and function. When master station control unit receives a signal, print a report of alarm, supervisory, or trouble condition. Report type of signal (alarm, supervisory, or trouble), protected zone description, date, and time of occurrence. Differentiate alarm signals from other indications. When system is reset, report reset event with the same information concerning device, location, date, and time. Commands shall initiate the reporting of a list of current alarm, supervisory, and trouble conditions in system or a log of past events.
9. Response Time: Two seconds between actuation of any alarm and its indication at master station control unit.
10. Circuit Supervision: Supervise all signal and data transmission lines, links with other systems, and sensors from master station control unit. Indicate circuit and detection device faults with both protected zone and trouble signals, sound a distinctive audible tone, and illuminate an LED. Maximum permissible elapsed time between occurrence of a trouble condition and indication at master station control unit is 20 seconds. Initiate an alarm in response to opening, closing, shorting, or grounding of a signal or data transmission line.
11. Programmed Secure-Access Control: System shall be programmable to automatically change status of various combinations of protected zones between secure and access conditions at scheduled times. Status changes may be preset for repetitive, daily, and weekly; specially

scheduled operations may be preset up to a year in advance. Manual secure-access control stations shall override programmed settings.

12. Manual Secure-Access Control: Coded entries at manual stations shall change status of associated protected zone between secure and access conditions.

B. System Component Requirements

1. Compatibility: Detection devices and their communication features, connecting wiring, and master station control unit shall be selected and configured with accessories for full compatibility with existing equipment:
2. Surge Protection: Protect components from voltage surges originating external to equipment housing and entering through power, communication, signal, control, or sensing leads. Include surge protection for external wiring of each conductor entry connection to components.
 - a. Minimum Protection for Power Lines 120 V and More: Auxiliary panel suppressors complying with requirements in Division 26 Section "Transient-voltage Suppression For Low-voltage Electrical Power Circuits".
 - b. Minimum Protection for Communication, Signal, Control, and Low-Voltage Power Lines: Comply with requirements in Division 26 Section "Transient-voltage Suppression For Low-voltage Electrical Power Circuits" as recommended by manufacturer for type of line being protected.
3. Intrusion Detection Units: Listed and labeled by a qualified testing agency for compliance with UL 639.
4. Interference Protection: Components shall be unaffected by radiated RFI and electrical induction of 15 V/m over a frequency range of 10 to 10,000 MHz and conducted interference signals up to 0.25-V RMS injected into power supply lines at 10 to 10,000 MHz.
5. Tamper Protection: Tamper switches on detection devices, controllers, annunciators, pull boxes, junction boxes, cabinets, and other system components shall initiate a tamper-alarm signal when unit is opened or partially disassembled and when entering conductors are cut or disconnected. Central-station control-unit alarm display shall identify tamper alarms and indicate locations.
6. Self-Testing Devices: Automatically test themselves periodically, but not less than once per hour, to verify normal device functioning and alarm initiation capability. Devices transmit test failure to master station control unit.
7. Antimasking Devices: Automatically check operation continuously or at intervals of a minute or less, and use signal-processing logic to detect blocking, masking, jamming, tampering, or other operational dysfunction. Devices transmit detection of operational dysfunction to master station control unit as an alarm signal.
8. Addressable Devices: Transmitter and receivers shall communicate unique device identification and status reports to master station control unit.
9. Remote-Controlled Devices: Individually and remotely adjustable for sensitivity and individually monitored at master station control unit for calibration, sensitivity, and alarm condition.

C. Enclosures

1. Interior Sensors: Enclosures that protect against dust, falling dirt, and dripping noncorrosive liquids.
2. Interior Electronics: NEMA 250, Type 12.
3. Exterior Electronics: NEMA 250, Type 4X fiberglass **OR** stainless steel, **as directed**.
4. Corrosion Resistant: NEMA 250, Type 4X PVC **OR** stainless steel, **as directed**.
5. Screw Covers: Where enclosures are accessible to inmates, secure with security fasteners of type appropriate for enclosure.

D. Secure And Access Devices

1. Keypad and Display Module: Arranged for entering and executing commands for system-status changes and for displaying system-status and command-related data.
2. Key-Operated Switch: Change protected zone between secure and access conditions.

E. Door And Window Switches

1. Description: Balanced-magnetic switch, complying with UL 634, installed on frame with integral overcurrent device to limit current to 80 percent of switch capacity. Bias magnet and minimum of two **OR** three, **as directed**, encapsulated reed switches shall resist compromise from introduction of foreign magnetic fields.
2. Flush-Mounted Switches: Unobtrusive and flush with surface of door and window frame.
3. Overhead Door Switch: Balanced-magnetic type, listed for outdoor locations, and having door-mounting magnet and floor-mounting switch unit.
4. Remote Test: Simulate movement of actuating magnet from master station control unit.

F. PIR Sensors

1. Listed and labeled by a qualified testing agency for compliance with SIA PIR-01.
2. Description: Sensors detect intrusion by monitoring infrared wavelengths emitted from a human body within their protected zone and by being insensitive to general thermal variations.
 - a. Wall-Mounting Unit Maximum Detection Range: 125 percent of indicated distance for individual units and not less than 50 feet (15 m). Provide adjustable coverage pattern as indicated.
 - b. Ceiling-Mounting Unit Spot-Detection Pattern: Full 360-degree conical.
 - c. Ceiling-Mounting Unit Pattern Size: 84-inch (2135-mm) diameter at floor level for units mounted 96 inches (2440 mm) above floor; 18-foot (5.5-m) diameter at floor level for units mounted 25 feet (7.6 m) above floor.
3. Device Performance:
 - a. Sensitivity: Adjustable pattern coverage to detect a change in temperature of 2 deg F (1deg C) or less, and standard-intruder movement within sensor's detection patterns at any speed between 0.3 to 7.5 fps (0.09 to 2.3 m/s) across 2 adjacent segments of detector's field of view.
 - b. Test Indicator: LED test indicator that is not visible during normal operation. When visible, indicator shall light when sensor detects an intruder. Locate test enabling switch under sensor housing cover.
 - c. Remote Test: When initiated by master station control unit, start a test sequence for each detector element that simulates standard-intruder movement within sensor's detection patterns, causing an alarm.

G. Microwave Intrusion Detectors (Interior)

1. Device Performance: Microwave transmitter establishes an electromagnetic field in an adjustable detection pattern and detects intrusion by monitoring changes in that pattern.
 - a. Sensitivity: Adjustable, able to detect standard-intruder movement within sensor's detection pattern at any speed between 0.3 to 7.5 fps (0.09 to 2.3 m/s). Sensor sensitivity adjustments shall be accessible only when sensor housing is removed, and sensors shall comply with 47 CFR 15.
 - b. Activation Indicator: LED indicator shall not be visible during normal operation. Indicator shall light when sensor detects a standard intruder. Locate test-enabling switch under sensor housing cover.
 - c. Remote Test: When initiated by master station control unit, start a test sequence for each detector element that simulates standard-intruder movement within sensor's detection patterns, causing an alarm.

H. Acoustic-Type, Glass-Break Sensors

1. Listed and labeled by a qualified testing agency for compliance with SIA GB-01.
2. Device Performance: Detect unique, airborne acoustic energy spectrum caused by breaking glass.
 - a. Sensor Element: Microprocessor-based, digital device to detect breakage of plate, laminate, tempered, and wired glass while rejecting common causes of false alarms. Detection pattern shall be at least a 20-foot (6-m) range.
 - b. Hookup Cable: Factory installed, not less than 72 inches (1830 mm).
 - c. Activation Indicator: LED on sensor housing that lights when responding to vibrations, remaining on until manually reset at sensor controller or at master station control unit.

- d. Controller: Integral with sensor housing or in a separate assembly, locally adjustable by control under housing cover.
 - e. Glass-Break Simulator: A device to induce frequencies into protected glass pane that simulate breaking glass without causing damage to glass.
 - I. Piezoelectric-Type, Glass-Break Sensors
 1. Listed and labeled by a qualified testing agency for compliance with SIA GB-01.
 2. Device Performance: Detect unique, high-frequency vibrations caused by breaking glass.
 - a. Sensor Element: Piezoelectric crystals in a housing designed to mount directly to glass surface with adhesive provided by element manufacturer. Circular detection pattern, with at least a 60-inch (1525-mm) radius on a continuous glass pane. Sensor element shall not be larger than 4 sq. in. (25.80 sq. cm).
 - b. Hookup Cable: Factory installed, not less than 72 inches (1830 mm).
 - c. Activation Indicator: LED on sensor housing that lights when responding to vibrations, remaining on until manually reset at sensor controller or at master station control unit.
 - d. Controller: Integral with sensor housing or in a separate assembly, locally adjustable by control under housing cover.
 - e. Glass-Break Simulator: A device to induce frequencies into protected glass pane that simulate breaking glass without causing damage to glass.
 - J. Vibration Sensors
 1. Listed and labeled by a qualified testing agency for compliance with SIA GB-01.
 2. Description: A sensor controller and piezoelectric crystal sensor elements that are designed to be rigidly mounted to structure being protected.
 3. Device Performance: Detects high-frequency vibrations generated by use of such tools as oxyacetylene torches, oxygen lances, high-speed drills and saws, and explosives that penetrate a structure while not responding to any other mechanical vibration.
 - a. Circular detection pattern, with at least a 72-inch (1830-mm) radius on protected structure.
 - b. Hookup Cable: Factory installed, not less than 72 inches (1830 mm).
 - c. Controller: Integral with sensor housing or in a separate assembly, locally adjustable by control under housing cover.
 - d. Glass-Break Simulator: A device to induce frequencies to protected glass pane that simulate breaking glass without causing damage to glass.
 - K. Photoelectric Sensors
 1. Device Performance: Detect an interruption of a pulsed, infrared, light beam that links transmitter and receiver.
 - a. Sensitivity: Detect standard-intruder movement within sensor's detection patterns at any speed of less than 7.5 fps (2.3 m/s) though the beam. Allow installation of multiple sensors within same protected zone that will not interfere with each other.
 - b. Activation Indicator: LED indicator shall not be visible during normal operation. Indicator shall light when sensor detects a standard intruder. Locate test enabling switch under sensor housing cover.
 - c. Remote Test: When initiated by master station control unit, start a test sequence for each detector element that simulates standard-intruder movement within sensor's detection patterns, causing an alarm.
 - L. Microwave-PIR Dual-Technology Motion Sensors
 1. Description: Single unit combining a sensor that detects changes in microwave signals and a PIR sensor that detects changes in ambient level of infrared emissions caused by standard-intruder movement within detection pattern.
 2. Device Performance: An alarm is transmitted when either sensor detects a standard intruder within a period of three to eight seconds from when the other sensor detects a standard intruder.
 - a. Minimum Detection Pattern: A room 20 by 30 feet (6 by 9 m).
 - b. PIR Sensor Sensitivity: Adjustable pattern coverage to detect a change in temperature of 2 deg F (1 deg C) or less, and standard-intruder movement within sensor's detection

patterns at any speed between 0.3 to 7.5 fps (0.09 to 2.3 m/s) across 2 adjacent segments of detector's field of view.

- c. Microwave Sensor Sensitivity: Adjustable, able to detect standard-intruder movement within sensor's detection pattern at any speed between 0.3 to 7.5 fps (0.09 to 2.3 m/s). Sensor sensitivity adjustments shall be accessible only when sensor housing is removed, and sensors shall comply with 47 CFR 15.
- d. Activation Indicator: LED indicator shall not be visible during normal operation. Indicator shall light when sensor detects a standard intruder. Locate test enabling switch under sensor housing cover.
- e. Remote Test: When initiated by master station control unit, start a test sequence for each detector element that simulates standard-intruder movement within sensor's detection patterns, causing an alarm.

M. Duress-Alarm Switches

- 1. Description: A switch with a shroud over the activating lever that allows an individual to covertly send a duress signal to master station control unit, with no visible or audible indication when activated. Switch shall lock in activated position until reset with a key.
 - a. Minimum Switch Rating: 50,000 operations.
 - b. Foot Rail: Foot activated, floor mounting.
 - c. Push Button: Finger activated, suitable for mounting on horizontal or vertical surface.

N. Video Motion Sensor (Interior)

- 1. Device Performance: Detect changes in video signal within a user-defined protected zone. Video inputs shall be composite video as defined in EIA 170. Provide an alarm output for each video input.
 - a. Detect movement within protected zone of standard intruders wearing clothing with a reflectivity that differs from that of background scene by a factor of 2. Reject all other changes in video signal.
 - b. Modular design that allows for expansion or modification of number of inputs.
 - c. Controls:
 - 1) Number of detection zones.
 - 2) Size of detection zones.
 - 3) Sensitivity of detection of each protected zone.
 - d. Mounting: Standard 19-inch (480-mm) rack as described in EIA 310.

O. Master Control Units

- 1. Description: Supervise sensors and detection subsystems and their connecting communication links, status control (secure or access) of sensors and detector subsystems, activation of alarms and supervisory and trouble signals, and other indicated functions.
 - a. System software and programs shall be held in flash electrically erasable programmable read-only memory (EEPROM), retaining the information through failure of primary and secondary power supplies.
 - b. Include a real-time clock for time annotation of events on the event recorder and printer.
 - c. Addressable initiation devices that communicate device identity and status.
 - d. Control circuits for operation of mechanical equipment in response to an alarm.
- 2. Construction: Freestanding equipment rack **OR** Desk-mounted console, **as directed** modular, with separate and independent alarm and supervisory system modules. Alarm-initiating protected zone boards shall be plug-in cards. Arrangements that require removal of field wiring for module replacement are unacceptable.
- 3. Comply with UL 609 **OR** UL 1023 **OR** UL 1076, **as directed**.
- 4. Console Controls and Displays: Arranged for interface between human operator at master control unit and addressable system components including annunciation and supervision. Display alarm, supervisory, and component status messages and the programming and control menu.
 - a. Annunciator and Display: LCD, one **OR** two **OR** three line(s), as directed of 40 **OR** 80 characters, as directed, minimum.

- b. Keypad: Arranged to permit entry and execution of programming, display, and control commands.
- c. Control-Unit Network: Automatic communication of alarm, status changes, commands, and other communications required for system operation. Communication shall return to normal after partial or total network interruption such as power loss or transient event. Total or partial signaling network failures shall identify the failure and record the failure at the annunciator display and at the system printer.
- d. Field Device Network: Communicate between the control unit and field devices of the system. Communications shall consist of alarm, network status, and status and control of field-mounted processors. Each field-mounted device shall be interrogated during each interrogation cycle.
- e. Operator Controls: Manual switches and push-to-test buttons that do not require a key to operate. Prevent resetting of alarm, supervisory, or trouble signals while alarm or trouble condition persists. Include the following:
 - 1) Acknowledge alarm.
 - 2) Silence alarm.
 - 3) System reset.
 - 4) LED test.
- f. Timing Unit: Solid state, programmable, 365 days.
- g. Confirmation: Relays, contactors, and other control devices shall have auxiliary contacts that provide confirmation signals to system for their on or off status. Software shall interpret such signals, display equipment status, and initiate failure signals.
- h. Alarm Indication: Audible signal sounds and a plain-language identification **OR** LED **OR** LCD **OR** cathode ray-tube display at master control unit identifying the protected zone **OR** addressable detector, **as directed** originating the alarm. Annunciator panel displays a common alarm light and sounds an audible tone.
- i. Alarm activation sounds a bell or siren or strobe **OR** bell or siren and strobe, **as directed**.
- 5. Protected Zones: Quantity of alarm and supervisory zones as indicated, with capacity for expanding number of protected zones by a minimum of 25 percent.
- 6. Power Supply Circuits: Master station control units shall provide power for remote power-consuming detection devices. Circuit capacity shall be adequate for at least a 25 percent increase in load.
- 7. UPS: Comply with Division 26 Section "Static Uninterruptible Power Supply". UPS shall be sized to provide a minimum of six hours of central-station control-unit operation.
- 8. Cabinet: Lockable, steel enclosure arranged so operations required for testing, normal operation, and maintenance are performed from front of enclosure. If more than a single cabinet is required to form a complete control unit, provide exactly matching modular enclosures. Accommodate all components and allow ample gutter space for field wiring. Identify each enclosure by an engraved, laminated, phenolic-resin nameplate. Lettering on enclosure nameplate shall not be less than 1 inch (25 mm) high. Identify, with permanent labels, individual components and modules within cabinets.
- 9. Transmission to Monitoring Station: A communications device to automatically transmit alarm, supervisory, and trouble signals to the monitoring station, operating over a standard voice grade telephone leased line. Comply with UL 1635.
- 10. Printout of Events: On receipt of signal, print alarm, supervisory, and trouble events. Identify zone, device, and function. Include type of signal (alarm, supervisory, or trouble) and date and time of occurrence. Differentiate alarm signals from all other printed indications. Also print system reset event, including same information for device, location, date, and time. Commands initiate the printing of a list of existing alarm, supervisory, and trouble conditions in the system and a historical log of events.

P. Audible And Visual Alarm Devices

- 1. Bell: 10 inches (254 mm) in diameter, rated to produce a minimum sound output of 84 dB at 10 feet (3 m) from master control unit.
 - a. Enclosure: Weather-resistant steel box equipped with tamper switches on cover and on back of box.

2. Klaxon Weatherproof Motor-Driven Hooter: UL listed, rated to produce a minimum sound output of 120 dB at 3 feet (1 m), plus or minus 3 dB, at a frequency of 470 Hz. Rated for intermittent use: two minutes on and five minutes off.
 - a. Designed for use in industrial areas and in high-noise, severe-weather marine environments.
3. Siren: 30-W speaker with siren driver, rated to produce a minimum sound output of 103 dB at 10 feet (3 m) from master control unit.
 - a. Enclosure: Weather-resistant steel box with tamper switches on cover and on back of box.
4. Strobe: Xenon light complying with UL 1638, with a clear polycarbonate lens.
 - a. Light Output: 115 cd, minimum.
 - b. Flash Rate: 60 per minute.

Q. Security Fasteners

1. Operable only by tools produced for use on specific type of fastener by fastener manufacturer or other licensed fabricator. Drive system type, head style, material, and protective coating as required for assembly, installation, and strength.
2. Drive System Types: Pinned Torx-Plus **OR** pinned Torx **OR** pinned hex (Allen), **as directed**.
3. Socket Flat Countersunk Head Fasteners:
 - a. Heat-treated alloy steel, ASTM F 835 (ASTM F 835M).
 - b. Stainless steel, ASTM F 879 (ASTM F 879M), Group 1 CW.
4. Socket Button Head Fasteners:
 - a. Heat-treated alloy steel, ASTM F 835 (ASTM F 835M).
 - b. Stainless steel, ASTM F 879 (ASTM F 879M), Group 1 CW.
5. Socket Head Cap Fasteners:
 - a. Heat-treated alloy steel, ASTM A 574 (ASTM A 574M).
 - b. Stainless steel, ASTM F 837 (ASTM F 837M), Group 1 CW.
6. Protective Coatings for Heat-Treated Alloy Steel:
 - a. Zinc chromate, ASTM F 1135, Grade 3 or Grade 4, for exterior applications and interior applications where indicated.
 - b. Zinc phosphate with oil, ASTM F 1137, Grade I, or black oxide unless otherwise indicated.

1.3 EXECUTION

A. Examination

1. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of intrusion detection.
2. Examine roughing-in for embedded and built-in anchors to verify actual locations of intrusion detection connections before intrusion detection installation.
3. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of intrusion detection.
4. Inspect built-in and cast-in anchor installations, before installing intrusion detection, to verify that anchor installations comply with requirements. Prepare inspection reports.
 - a. Remove and replace anchors where inspections indicate that they do not comply with requirements. Reinspect after repairs or replacements are made.
 - b. Perform additional inspections to determine compliance of replaced or additional anchor installations. Prepare inspection reports.
5. For material whose orientation is critical for its performance as a ballistic barrier, verify installation orientation.
6. Proceed with installation only after unsatisfactory conditions have been corrected.

B. System Integration

1. Electronic door hardware.
2. Elevators.
3. Network lighting controls.
4. Intercommunications and program systems.

5. Public address and mass notification systems.
6. Access control.
7. Fire-alarm system.
8. Perimeter security system.
9. Video surveillance.

C. System Installation

1. Comply with UL 681 and NFPA 731.
2. Equipment Mounting: Install master control unit on finished floor with tops of cabinets not more than 72 inches (1830 mm) above the finished floor.
 - a. Comply with requirements for seismic-restraint devices specified in Division 26 Section "Vibration And Seismic Controls For Electrical Systems".
3. Install wall-mounted equipment, with tops of cabinets not more than 72 inches (1830 mm) above the finished floor.
 - a. Comply with requirements for seismic-restraint devices specified in Division 26 Section "Vibration And Seismic Controls For Electrical Systems".
4. Connecting to Existing Equipment: Verify that existing perimeter security system is operational before making changes or connections.
 - a. Connect new equipment to existing control panel in existing part of the building.
 - b. Connect new equipment to existing monitoring equipment at the Supervising Station.
 - c. Expand, modify, and supplement existing control **OR** monitoring equipment, **as directed** as necessary to extend existing control **OR** monitoring functions, **as directed** to the new points. New components shall be capable of merging with existing configuration without degrading the performance of either system.
5. Security Fasteners: Where accessible to inmates, install intrusion detection components using security fasteners with head style appropriate for fabrication requirements, strength, and finish of adjacent materials except that a maximum of two different sets of tools shall be required to operate security fasteners for Project. Provide stainless-steel security fasteners in stainless-steel materials.

D. Wiring Installation

1. Wiring Method: Install wiring in metal raceways according to Division 26 Section "Raceway And Boxes For Electrical Systems". Conceal raceway except in unfinished spaces and as indicated. Minimum conduit size shall be 1/2 inch (13 mm). Control and data transmission wiring shall not share conduit with other building wiring systems.
2. Wiring Method: Install wiring in raceways except in accessible indoor ceiling spaces and in interior hollow gypsum board partitions where cable may be used. Conceal raceways and wiring except in unfinished spaces and as indicated. Minimum conduit size shall be 1/2 inch (13 mm). Control and data transmission wiring shall not share conduit with other building wiring systems.
3. Wiring Method: Cable, concealed in accessible ceilings, walls, and floors when possible.
4. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points. Use lacing bars and distribution spools. Separate power-limited and non-power-limited conductors as recommended in writing by manufacturer. Install conductors parallel with or at right angles to sides and back of enclosure. Connect conductors that are terminated, spliced, or interrupted in any enclosure associated with intrusion system to terminal blocks. Mark each terminal according to system's wiring diagrams. Make all connections with approved crimp-on terminal spade lugs, pressure-type terminal blocks, or plug connectors.
5. Wires and Cables:
 - a. Conductors: Size as recommended in writing by system manufacturer, unless otherwise indicated.
 - b. 120-V Power Wiring: Install according to Division 26 Section "Low-voltage Electrical Power Conductors And Cables", unless otherwise indicated.
 - c. Control and Signal Transmission Conductors: Install unshielded, twisted-pair cable, unless otherwise indicated or if manufacturer recommends shielded cable, according to Division 28 Section "Conductors And Cables For Electronic Safety And Security".
 - d. Data and Television Signal Transmission Cables: Install according to Division 28 Section "Conductors And Cables For Electronic Safety And Security".

6. Splices, Taps, and Terminations: Make connections only on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.
 7. Install power supplies and other auxiliary components for detection devices at controllers, unless otherwise indicated or required by manufacturer. Do not install such items near devices they serve.
 8. Identify components with engraved, laminated-plastic or metal nameplate for master station control unit and each terminal cabinet, mounted with corrosion-resistant screws. Nameplates and label products are specified in Division 26 Section "Identification For Electrical Systems".
- E. Identification
1. Identify system components, wiring, cabling, and terminals. Comply with identification requirements as specified in Division 26 Section "Identification For Electrical Systems".
 2. Install instructions frame in a location visible from master control unit.
- F. Grounding
1. Ground the master control unit and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to master control unit.
 2. Ground system components and conductor and cable shields to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.
 3. Signal Ground Terminal: Locate at main equipment rack or cabinet. Isolate from power system and equipment grounding. Provide 5-ohm ground. Measure, record, and report ground resistance.
 4. Install grounding electrodes of type, size, location, and quantity indicated. Comply with installation requirements in Division 26 Section "Grounding And Bonding For Electrical Systems".
- G. Field Quality Control
1. Pretesting: After installation, align, adjust, and balance system and perform complete pretesting to determine compliance of system with requirements in the Contract Documents. Correct deficiencies observed in pretesting. Replace malfunctioning or damaged items with new ones and retest until satisfactory performance and conditions are achieved. Prepare forms for systematic recording of acceptance test results.
 - a. Report of Pretesting: After pretesting is complete, provide a letter certifying that installation is complete and fully operable; include names and titles of witnesses to preliminary tests.
 2. Testing Agency: Engage a qualified testing and inspecting agency to perform tests and inspections.
 3. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect test, and adjust components, assemblies, and equipment installations connections.
 4. Perform tests and inspections.
 - a. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
 5. Test and Inspections: Comply with provisions in NFPA 731, Ch.9, "Testing and Inspections."
 - a. Inspection: Verify that units and controls are properly labeled and interconnecting wires and terminals are identified.
 - b. Test Methods: Intrusion detection systems and other systems and equipment that are associated with detection and accessory equipment shall be tested according to Table "Test Methods" and Table "Test Methods of Initiating Devices."
 6. Documentation: Comply with provisions in NFPA 731, Ch. 4, "Documentation."
 7. Tag all equipment, stations, and other components for which tests have been satisfactorily completed.
 - 8.
- H. Adjusting
1. Occupancy Adjustments: When requested within 12 months of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to three visits to Project during other than normal occupancy hours for this purpose. Visits for this purpose shall be in addition to any required by warranty.

- I. Demonstration
 1. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain intrusion detection system. Comply with documentation provisions in NFPA 731, Ch.4, "Documentation and User Training."

END OF SECTION 28 13 33 16a

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 28 23 00 00 - VIDEO SURVEILLANCE**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for video surveillance. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section includes a video surveillance system consisting of cameras, digital video recorder, data transmission wiring, and a control station with its associated equipment.
2. Video surveillance system shall be integrated with monitoring and control system specified in Division 13 Section "Perimeter Security", "Intrusion Detection", "Security Access", and PLC Electronic Detention Monitoring and Control Systems", which specifies systems integration.

C. Definitions

1. AGC: Automatic gain control.
2. BNC: Bayonet Neill-Concelman - type of connector.
3. B/W: Black and white.
4. CCD: Charge-coupled device.
5. FTP: File transfer protocol.
6. IP: Internet protocol.
7. LAN: Local area network.
8. MPEG: Moving picture experts group.
9. NTSC: National Television System Committee.
10. PC: Personal computer.
11. PTZ: Pan-tilt-zoom.
12. RAID: Redundant array of independent disks.
13. TCP: Transmission control protocol - connects hosts on the Internet.
14. UPS: Uninterruptible power supply.
15. WAN: Wide area network.

D. Performance Requirements

1. Seismic Performance: Video surveillance system shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

E. Submittals

1. Product Data: For each type of product indicated. Include dimensions and data on features, performance, electrical characteristics, ratings, and finishes.
2. Shop Drawings: For video surveillance. Include plans, elevations, sections, details, and attachments to other work.
 - a. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - b. Functional Block Diagram: Show single-line interconnections between components for signal transmission and control. Show cable types and sizes.
 - c. Dimensioned plan and elevations of equipment racks, control panels, and consoles. Show access and workspace requirements.
 - d. UPS: Sizing calculations.
 - e. Wiring Diagrams: For power, signal, and control wiring.

3. Equipment List: Include every piece of equipment by model number, manufacturer, serial number, location, and date of original installation. Add pretesting record of each piece of equipment, listing name of person testing, date of test, set points of adjustments, name and description of the view of preset positions, description of alarms, and description of unit output responses to an alarm.
4. Seismic Qualification Certificates: For video surveillance, cameras, camera-supporting equipment, accessories, and components, from manufacturer.
 - a. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - b. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - c. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
 - d. Field quality-control reports.
 - e. Operation and Maintenance Data: For cameras, power supplies, infrared illuminators, monitors, videotape recorders, digital video recorders, video switches, and control-station components to include in emergency, operation, and maintenance manuals. Include the following:
 - 1) Lists of spare parts and replacement components recommended to be stored at the site for ready access.
5. Warranty: Sample of special warranty.

F. Quality Assurance

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Comply with NECA 1.
3. Comply with NFPA 70.
4. Electronic data exchange between video surveillance system with an access-control system shall comply with SIA TVAC.

G. Project Conditions

1. Environmental Conditions: Capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
 - a. Control Station: Rated for continuous operation in ambient temperatures of 60 to 85 deg F (16 to 29 deg C) and a relative humidity of 20 to 80 percent, noncondensing.
 - b. Interior, Controlled Environment: System components, except central-station control unit, installed in air-conditioned **OR** temperature-controlled, **as directed**, interior environments shall be rated for continuous operation in ambient temperatures of 36 to 122 deg F (2 to 50 deg C) dry bulb and 20 to 90 percent relative humidity, noncondensing. Use NEMA 250, Type 1 enclosures.
 - c. Interior, Uncontrolled Environment: System components installed in non-air-conditioned **OR** non-temperature-controlled, **as directed**, interior environments shall be rated for continuous operation in ambient temperatures of 0 to 122 deg F (minus 18 to plus 50 deg C) dry bulb and 20 to 90 percent relative humidity, noncondensing. Use NEMA 250, Type 3R **OR** Type 4 **OR** Type 12 **OR** Type 12K, **as directed**, enclosures.
 - d. Exterior Environment: System components installed in locations exposed to weather shall be rated for continuous operation in ambient temperatures of minus 30 to plus 122 deg F (minus 34 to plus 50 deg C) dry bulb and 20 to 90 percent relative humidity, condensing. Rate for continuous operation when exposed to rain as specified in NEMA 250, winds up to 85 mph (137 km/h) and snow cover up to 24 inches (610 mm) thick, **as directed**. Use NEMA 250, Type 3 **OR** Type 3R **OR** Type 3S **OR** Type 4 **OR** Type 4X, **as directed**, enclosures.
 - e. Hazardous Environment: System components located in areas where fire or explosion hazards may exist because of flammable gases or vapors, flammable liquids, combustible dust, or ignitable fibers shall be rated, listed, and installed according to NFPA 70.

- f. Corrosive Environment: System components subject to corrosive fumes, vapors, and wind-driven salt spray in coastal zones. Use NEMA 250, Type 4X **OR** Type 6P, **as directed**, enclosures.
- g. Security Environment: Camera housing for use in high-risk areas where surveillance equipment may be subject to physical violence.

H. Warranty

- 1. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of cameras, equipment related to camera operation, and control-station equipment that fail in materials or workmanship within specified warranty period.
 - a. Warranty Period: Three years from date of Substantial Completion.

1.2 PRODUCTS

A. System Requirements

- 1. Video-signal format shall comply with NTSC standard, composite interlaced video. Composite video-signal termination shall be 75 ohms.
- 2. Surge Protection: Protect components from voltage surges originating external to equipment housing and entering through power, communication, signal, control, or sensing leads. Include surge protection for external wiring of each conductor's entry connection to components.
 - a. Minimum Protection for Power Connections 120 V and More: Auxiliary panel suppressors complying with requirements in Division 16 Section "Transient Voltage Suppression."
 - b. Minimum Protection for Communication, Signal, Control, and Low-Voltage Power Connections: Comply with requirements in Division 16 Section "Transient Voltage Suppression" as recommended by manufacturer for type of line being protected.
- 3. Tamper Protection: Tamper switches on enclosures, control units, pull boxes, junction boxes, cabinets, and other system components shall initiate a tamper-alarm signal when unit is opened or partially disassembled. Control-station, control-unit alarm display shall identify tamper alarms and indicate locations.

B. Standard Cameras

- 1. B/W Camera:
 - a. Comply with UL 639.
 - b. Pickup Device: CCD interline transfer, 252,000 512(H) by 492(V) pixels, **unless directed otherwise**.
 - c. Horizontal Resolution: 380 lines.
 - d. Signal-to-Noise Ratio: Not less than 46 dB.
 - e. With AGC, manually selectable on or off.
 - f. Sensitivity: Camera shall provide usable images in low-light conditions, delivering an image at a scene illumination, as approved by The University, with camera AGC off, **as directed**.

OR

Sensitivity: Camera shall deliver 1-V peak-to-peak video signal at the minimum specified light level. Illumination for the test shall be with lamps rated at approximately 2200-K color temperature, and with camera AGC off.

 - g. Manually selectable modes for backlight compensation or normal lighting.
 - h. Scanning Synchronization: Determined by external synch over the coaxial cable. Camera shall revert to internally generated synchronization on loss of external synch signal.
 - i. Motion Detector: Built-in digital.
- 2. Color Camera:
 - a. Comply with UL 639.
 - b. Pickup Device: CCD interline transfer, 380,000 771(H) by 492(V) pixels, **unless directed otherwise**.
 - c. Horizontal Resolution: 480 lines.
 - d. Signal-to-Noise Ratio: Not less than 50 dB, with camera AGC off.

- e. With AGC, manually selectable on or off.
- f. Sensitivity: Camera shall provide usable images in low-light conditions, delivering an image at a scene illumination, as approved by The University, with camera AGC off, **as directed**.
- OR**
- Sensitivity: Camera shall deliver 1-V peak-to-peak video signal at the minimum specified light level. Illumination for the test shall be with lamps rated at approximately 2200-K color temperature, and with camera AGC off.
- g. Manually selectable modes for backlight compensation or normal lighting.
- h. Scanning Synchronization: Determined by external synch over the coaxial cable. Camera shall revert to internally generated synchronization on loss of external synch signal.
- i. White Balance: Auto-tracing white balance, with manually settable fixed balance option.
- j. Motion Detector: Built-in digital.
- 3. Automatic Color Dome Camera: Assembled and tested as a manufactured unit, containing dome assembly, color camera, motorized pan and tilt, zoom lens, and receiver/driver.
 - a. Comply with UL 639.
 - b. Pickup Device: CCD interline transfer, 380,000 768(H) by 494(V) pixels, **unless directed otherwise**.
 - c. Horizontal Resolution: 480 lines.
 - d. Signal-to-Noise Ratio: Not less than 50 dB, with camera AGC off.
 - e. With AGC, manually selectable on or off.
 - f. Sensitivity: Camera shall provide usable images in low-light conditions, delivering an image at a scene illumination, as approved by The University, with camera AGC off, **as directed**.
 - OR**
 - Sensitivity: Camera shall deliver 1-V peak-to-peak video signal at the minimum specified light level. Illumination for the test shall be with lamps rated at approximately 2200-K color temperature, and with camera AGC off.
 - g. Manually selectable modes for backlight compensation or normal lighting.
 - h. Pan and Tilt: Direct-drive motor, 360-degree rotation angle, and 180-degree tilt angle. Pan-and-tilt speed shall be controlled by operator. Movement from preset positions shall be not less than 300 degrees per second.
 - i. Preset Positioning: Eight user-definable scenes, each allowing 16-character titles. Controls shall include the following:
 - 1) In "sequence mode," camera shall continuously sequence through preset positions, with dwell time and sequencing under operator control.
 - 2) Motion detection shall be available at each camera position.
 - 3) Up to four preset positions may be selected to be activated by an alarm. Each of the alarm positions may be programmed to output a response signal.
 - j. Scanning Synchronization: Determined by external synch over the coaxial cable. Camera shall revert to internally generated synchronization on loss of external synch signal.
 - k. White Balance: Auto-tracing white balance, with manually settable fixed balance option.
 - l. Motion Detector: Built-in digital.
 - m. Dome shall support multiplexed control communications using coaxial cable recommended by manufacturer.
- C. Submersible Cameras
 - 1. Camera: Color, designed for underwater monitoring and for inspecting pipes and storm drains. Attributes as follows:
 - a. Infrared LEDs to provide illumination in zero-light conditions.
 - b. 60-foot (18.3-m) factory-installed cable with BNC connector for video and a 2.1-mm jack for 12-V dc power supply.
 - c. An adjustable swivel mount and attachment base.
 - d. Pickup Device: CCD interline transfer, 290,000 500(H) by 580(V) pixels, **unless directed otherwise**.
 - e. Horizontal Resolution: 380 lines.
 - f. Signal-to-Noise Ratio: Not less than 50 dB.

- g. With AGC, from 4 to 39 dB.
- h. Sensitivity: Camera shall provide usable images in low-light conditions, delivering an image at a scene illumination of 0.1 lux at f/2.0.
- i. Scanning Synchronization: Internal.
- j. White Balance: Auto-tracing white balance, for colors ranging from 2800 to 8200 deg K.

D. Reinforced Dome Cameras

- 1. Camera: Designed for high-abuse locations, with a weathertight semirecessed **OR** surface, **as directed**, mounting, impact-resistance polycarbonate dome, and heavy-gage, 6061 T6 aluminum body.
 - a. Suitable for exterior environment, rated for continuous operation in ambient temperatures of minus 40 to plus 122 deg F (minus 40 to plus 50 deg C) dry bulb and up to 85 percent relative humidity.
 - b. Pickup Device: CCD interline transfer, 290,000 510(H) by 492(V) pixels, **unless directed otherwise**.
 - c. Horizontal Resolution: 350 lines.
 - d. Signal-to-Noise Ratio: Not less than 46 dB.
 - e. With AGC and automatic backlight compensation.
 - f. Sensitivity: Camera shall provide usable images in low-light conditions, delivering an image at a scene illumination of 6 lux at f/2.0.
 - g. Scanning Synchronization: Determined by external synch over the coaxial cable. Camera shall revert to internally generated synchronization on loss of external synch signal.
 - h. White Balance: Auto-tracing white balance.

E. Lenses

- 1. Description: Optical-quality coated lens, designed specifically for video-surveillance applications and matched to specified camera. Provide color-corrected lenses with color cameras.
 - a. Auto-Iris Lens: Electrically controlled iris with circuit set to maintain a constant video level in varying lighting conditions.
 - b. Fixed Lens: With calibrated focus ring.
 - c. Zoom Lens: Motorized, remote-controlled unit, rated as "quiet operating." Features include the following:
 - 1) Electrical Leads: Filtered to minimize video signal interference.
 - 2) Motor Speed: Variable.
 - 3) Lens shall be available with preset positioning capability to recall the position of specific scenes.

F. Power Supplies

- 1. Low-voltage power supplies matched for voltage and current requirements of cameras and accessories, and of type as recommended by manufacturer of camera, infrared illuminator, **as directed**, and lens.
 - a. Enclosure: NEMA 250, Type 1 **OR** Type 3 **OR** Type 4X, **as directed**.

G. Infrared Illuminators

- 1. Description: Lighting fixtures that emit light only in the infrared spectrum, suitable for use with cameras indicated, for nighttime surveillance, without emitting visible light.
 - a. Field-Selectable Beam Patterns: Narrow, medium, and wide.
 - b. Rated Lamp Life: More than 8000 hours.
 - c. Power Supply: 12-V ac/dc **OR** 120-V ac, **as directed**.
- 2. Area Coverage: Illumination to 150 feet (50 m) in a narrow beam pattern.
- 3. Exterior housings shall be suitable for same environmental conditions as the associated camera.

H. Camera-Supporting Equipment

- 1. Minimum Load Rating: Rated for load in excess of the total weight supported times a minimum safety factor of two.

2. Pan Units: Motorized automatic-scanning units arranged to provide remote-controlled manual and automatic camera panning action, and equipped with matching mounting brackets.
 - a. Scanning Operation: Silent, smooth, and positive.
 - b. Stops: Adjustable without disassembly, to limit the scanning arc.
3. Pan-and-Tilt Units: Motorized units arranged to provide remote-controlled aiming of cameras with smooth and silent operation, and equipped with matching mounting brackets.
 - a. Panning Rotation: 0 to 355 degrees, with adjustable stops.
 - b. Tilt Movement: 90 degrees, plus or minus 5 degrees, with adjustable stops.
 - c. Speed: 12 degrees per second in both horizontal and vertical planes.
 - d. Wiring: Factory prewired for camera and zoom lens functions and pan-and-tilt power and control.
 - e. Built-in encoders or potentiometers for position feedback, and thermostat-controlled heater, **as directed**.
 - f. Pan-and-tilt unit shall be available with preset positioning capability to recall the position of a specific scene.
4. Mounting Brackets for Fixed Cameras: Type matched to items supported and mounting conditions. Include manual pan-and-tilt adjustment.
5. Protective Housings for Fixed and Movable Cameras: Steel or 6061 T6 aluminum, **as directed**, enclosures with internal camera mounting and connecting provisions that are matched to camera/lens combination and mounting and installing arrangement of camera to be housed.
 - a. Tamper switch on access cover sounds an alarm signal when unit is opened or partially disassembled. Central-control unit shall identify tamper alarms and indicate location in alarm display. Tamper switches and central-control unit are specified in Division 13 Section "Intrusion Detection."
 - b. Camera Viewing Window: Polycarbonate **OR** Lexan, **as directed**, window, aligned with camera lens.
 - c. Duplex Receptacle: Internally mounted.
 - d. Alignment Provisions: Camera mounting shall provide for field aiming of camera and permit removal and reinstallation of camera lens without disturbing camera alignment.
 - e. Built-in, thermostat-activated heater and blower units. Units shall be automatically controlled so the environmental limits of the camera equipment are not exceeded.
 - f. Sun shield shall not interfere with normal airflow around the housing.
 - g. Mounting bracket and hardware for wall or ceiling mounting of the housing. Bracket shall be of same material as the housing; mounting hardware shall be stainless steel.
 - h. Finish: Housing and mounting bracket shall be factory finished using manufacturer's standard finishing process suitable for the environment.
 - i. Enclosure Rating: as approved by The University.

I. Monitors

1. Monochrome:
 - a. Metal cabinet units designed for continuous operation.
 - b. Screen Size (Diagonal Dimension): as approved by The University.
 - c. Horizontal Resolution: 600 lines, minimum, at center.
 - d. Minimum Front Panel Devices and Controls: Power switch; power-on indicator; and brightness, horizontal-hold, vertical-hold, and contrast controls.
 - e. Mounting: Adjustable tilting and training.
 - f. Mounting: Single, 14-inch (356-mm) **OR** Dual, 9-inch (229-mm), **as directed**, vertical, EIA 19-inch (483-mm) electronic equipment rack or cabinet complying with CEA 310-E.
 - g. Electrical: 120-V ac, 60 Hz.
2. Color:
 - a. Metal cabinet units designed for continuous operation.
 - b. Screen Size (Diagonal Dimension): as approved by The University.
 - c. Horizontal Resolution: 300 lines.
 - d. Minimum Front Panel Devices and Controls: Power switch; power-on indicator; and brightness, contrast, color, and tint controls.
 - e. Degaussing: Automatic.

- f. Mounting: Single, 14-inch (356-mm) **OR** Dual, 9-inch (229-mm), **as directed**, vertical, EIA 19-inch (483-mm) electronic equipment rack or cabinet complying with CEA 310-E.
- g. Electrical: 120-V ac, 60 Hz.

J. Videotape Recorders

- 1. Description: Industrial, time-lapse type recorder, designed for continuous operation. Tape format is 1/2 inch (13 mm) using industrial-grade, T-120 cassettes.
 - a. Horizontal Resolution: 400 lines, minimum.
 - b. Recording Heads: Rotary-scan type.
 - c. Integral Timer: Permits programming of recording operation for adjustable daily and weekly periods.
 - d. Time-Lapse Operating Modes: Multiple, covering 24 to 240 hours, minimum.
 - e. Other Operating Modes:
 - 1) Manual play and recording at two- and six-hour speeds.
 - 2) Forward and reverse high-speed search.
 - 3) Reverse, slow, and single-frame play.
 - f. Alarm Recording: Operating mode is automatically switched from time-lapse to two- or six-hour recording mode when an externally generated alarm signal is received.
 - g. Audio Recording: 70 to 7000 Hz. Phono and microphone input; phono output.
 - h. Time and Date Generator: Records time and date legend in corner of recorded scenes.
 - i. Tape Counter: Displays tape position.
 - j. Manual Recording Lock: Key or keypad operated. Prevents unauthorized tampering or control changes during preset operation.
 - k. Signal-to-Noise Ratio: 45 dB for video output in standard play mode.
 - l. Mounting: Standard 19-inch (483-mm) rack complying with CEA 310-E, or freestanding desktop.

K. Digital Video Recorders

- 1. Description: Digital, time-lapse type, full-frame and motion recorder, with removable hard drive.
 - a. Recording Time: 400 hours minimum.
 - b. Resolution: 720 by 480 lines, minimum.
 - c. Programming shall be from trackball and push buttons on face of the recorder, settings shall be displayed on any video monitor connected to the recorder. Programming shall include the following:
 - 1) Motion analysis graph.
 - 2) Password protection.
 - 3) Alarm and timer controls.
 - 4) Continuous recording option.
 - 5) Time-lapse operating modes.
 - 6) Search video by time, event, or motion.
 - d. Programming: SmartMedia card for software updating, image archiving, and image transfer to a PC.
 - e. Storage: 80-GB, **unless directed otherwise**, removable hard drive. Software shall permit hot-swapping drives.
 - f. Compression: MPEG-2.
 - g. Time and Date Generator: Records time (hr:min:sec) and date legend of each frame.
 - h. Audio Recording: 70 to 7000 Hz. Phono and microphone input; phono output.
 - i. Mounting: Standard 19-inch (483-mm) rack complying with CEA 310-E, or freestanding desktop.

L. Network Video Recorders

- 1. External storage or internal 250-1, 500-GB hard disk drive.
 - a. Video and audio recording over TCP/IP network.
 - b. Video recording of MPEG-2 and MPEG-4 streams.
 - c. Video recording up to 48 Mbps for internal storage and up to 100 Mbps for external storage.
 - d. Duplex Operation: Simultaneous recording and playback.

- e. Continuous and alarm-based recording.
- f. Full-Featured Search Capabilities: Search based on camera, time, or date.
- g. Automatic data replenishment to ensure recording even if network is down.
- h. Digital certification by watermarking.
- i. Internal RAID storage or non-RAID storage of up to 1500 GB.
- j. Capable of adding external RAID storage up to 7000 GB for models with no internal storage.
- k. Full integration with LAN, Intranet, or Internet through standard Web browser or video management software.
- l. Integrated Web server FTP server functionality.
- m. Supports up to 16, 32, or 64 devices.

M. Digital Switchers

1. Quad Switch: For displaying images from four cameras on a single monitor. Provide color switcher if one or more cameras or monitors are in color.
 - a. Controls: Unit-mounted front panel.
 - b. Resolution: 720 by 480 lines, **unless directed otherwise.**
 - c. Modes: Auto, manual, and alarm. In manual mode, each channel can also be viewed in single display mode. In the event of an alarm, alarming channel shall automatically switch to full screen. If several alarms are activated, channels in alarm shall be in auto-switching mode.
 - d. Channel Loss Alarm: Audible buzzer; occurrence details shall be recorded.
 - e. Time: Indicate date and time.
 - f. Timing of Auto-Switcher: 1 to 30 seconds, selectable.
 - g. Mounting: Standard 19-inch (483-mm) rack complying with CEA 310-E, or freestanding desktop.
2. Manual Switch Bank: Low-loss, high-isolation, multiple-video switch to allow manual switching of multiple quad switches and cameras to a single output. Switches shall be illuminated.
3. Sequential Switchers: Automatically sequence outputs of multiple cameras to single monitor and videotape recorder.
 - a. Switching Time Interval: Continuously adjustable, 5 to 20 seconds minimum, with manual override.
 - b. Skip-Sequential-Hold Switch: One for each camera, with LED to indicate active camera.
 - c. Camera Identification Legend: Either on-screen message or label at skip-sequential switch.
 - d. Alarm Switching: In the event of an alarm, alarming channel shall automatically switch the monitor to full screen.
 - e. Mounting: Standard 19-inch (483-mm) rack complying with CEA 310-E.
4. PTZ Controls: Arranged for multiple-camera control, with switches to select camera to be controlled.
 - a. Pan-and-Tilt Control: Joystick type.
 - b. Zoom Control: Momentary-contact, "in-out" push button.
 - c. Automatic-Scan Control: A push button for each camera with pan capability that places camera in automatic-scanning mode.

N. IP Video Systems

1. Description:
 - a. System shall provide high-quality delivery and processing of IP-based video, audio, and control data using standard Ethernet-based networks.
 - b. System shall have seamless integration of all video surveillance and control functions.
 - c. Graphical user interface software shall manage all IP-based video matrix switching and camera control functions, two-way audio communication, alarm monitoring and control, and recording and archive/retrieval management. IP system shall also be capable of integrating into larger system environments.
 - d. System design shall include all necessary compression software for high-performance, dual-stream, MPEG-2/MPEG-4 video. Unit shall provide connections for all video

- cameras, camera PTZ control data, bidirectional audio, discreet sensor inputs, and control system outputs.
 - e. All camera signals shall be compressed, encoded, and delivered onto the network for processing and control by the IP video-management software.
 - f. Camera system units shall be ruggedly built and designed for extreme adverse environments, complying with NEMA Type environmental standards.
 - g. Encoder/decoder combinations shall place video, audio, and data network stream that can be managed from multiple workstations on the user's LAN or WAN.
 - h. All system interconnect cables, workstation PCs, PTZ joysticks, and network intermediate devices shall be provided for full performance of specified system.
- O. Video Motion Sensors (Interior)
- 1. Device Performance: Detect changes in video signal within a user-defined protected zone. Video inputs shall be composite video as defined in SMPTE 170M. Provide an alarm output for each video input.
 - a. Detect movement within protected zone of intruders wearing clothing with a reflectivity that differs from that of background scene by a factor of two. Reject all other changes in video signal.
 - b. Modular design that allows for expansion or modification of number of inputs.
 - c. Controls:
 - 1) Size of detection zones.
 - 2) Sensitivity of detection of each protected zone.
 - d. Mounting: Standard 19-inch (483-mm) rack complying with CEA 310-E.
- P. Control Stations
- 1. Description: Heavy-duty, freestanding, modular, metal furniture units arranged to house electronic equipment. Coordinate component arrangement and wiring with components and wiring of other systems.
 - 2. Equipment Mounting: Standard 19-inch (483-mm) rack complying with CEA 310-E.
 - 3. Normal System Power Supply: 120 V, 60 Hz, through a locked disconnect device and an isolation transformer in central-station control unit. Central-station control unit shall supply power to all components connected to it unless otherwise indicated.
 - 4. Power Continuity for Control Station: Batteries in power supplies of central-station control units and individual system components shall maintain continuous system operation during outages of both normal and backup ac system supply.
 - a. Batteries: Rechargeable, valve-regulated, recombinant, sealed, lead-acid type with nominal 10-year life expectancy. Capacity adequate to operate portions of system served including audible trouble signal devices for up to four hours and audible and visual alarm devices under alarm conditions for an additional 10 minutes.
 - b. Battery Charger: Solid-state, fully automatic, variable-charging-rate type. Charger shall recharge fully discharged battery within 24 hours.
 - 5. Annunciation: Indicate change in system condition and switching of system or component to backup power.
- Q. Signal Transmission Components
- 1. Cable: Coaxial cable elements have 75-ohm nominal impedance. Comply with requirements in Division 16 Section "Conductors and Cables for Electronic Safety and Security."
 - 2. Video Surveillance Coaxial Cable Connectors: BNC type, 75 ohms. Comply with requirements in Division 16 Section "Conductors and Cables for Electronic Safety and Security."

1.3 EXECUTION

A. Examination

1. Examine pathway elements intended for cables. Check raceways and other elements for compliance with space allocations, installation tolerance, hazards to camera installation, and other conditions affecting installation.
2. Examine roughing-in for LAN, WAN, and IP network before device installation.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Wiring

1. Comply with requirements in Division 16 Section "Raceways and Boxes."
OR
Wiring Method: Install cables in raceways unless otherwise indicated.
 - a. Except raceways are not required in accessible indoor ceiling spaces and attics.
OR
Except raceways are not required in hollow gypsum board partitions.
 - b. Conceal raceways and wiring except in unfinished spaces.
2. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.
3. Splices, Taps, and Terminations: For power and control wiring, use numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.
4. For LAN connection and fiber-optic and copper communication wiring, comply with Division 16 Sections "Communications Backbone Cabling" and "Communications Horizontal Cabling."
5. Grounding: Provide independent-signal circuit grounding recommended in writing by manufacturer.

C. Video Surveillance System Installation

1. Install cameras and infrared illuminators level and plumb.
2. Install cameras with 84-inch- (2134-mm-) minimum clear space below cameras and their mountings. Change type of mounting to achieve required clearance.
3. Set pan unit and pan-and-tilt unit stops to suit final camera position and to obtain the field of view required for camera. Connect all controls and alarms, and adjust.
4. Install power supplies and other auxiliary components at control stations unless otherwise indicated.
5. Install tamper switches on components indicated to receive tamper switches, arranged to detect unauthorized entry into system-component enclosures and mounted in self-protected, inconspicuous positions.
6. Avoid ground loops by making ground connections only at the control station.
 - a. For 12- and 24-V dc cameras, connect the coaxial cable shields only at the monitor end.
7. Identify system components, wiring, cabling, and terminals according to Division 16 Section "Electrical Identification."

D. Field Quality Control

1. Perform tests and inspections.
2. Tests and Inspections:
 - a. Inspection: Verify that units and controls are properly installed, connected, and labeled, and that interconnecting wires and terminals are identified.
 - b. Pretesting: Align and adjust system and pretest components, wiring, and functions to verify that they comply with specified requirements. Conduct tests at varying lighting levels, including day and night scenes as applicable. Prepare video-surveillance equipment for acceptance and operational testing as follows:
 - 1) Prepare equipment list described in "Submittals" Article.
 - 2) Verify operation of auto-iris lenses.
 - 3) Set back-focus of fixed focal length lenses. At focus set to infinity, simulate nighttime lighting conditions by using a dark glass filter of a density that produces a clear image. Adjust until image is in focus with and without the filter.

- 4) Set back-focus of zoom lenses. At focus set to infinity, simulate nighttime lighting conditions by using a dark glass filter of a density that produces a clear image. Additionally, set zoom to full wide angle and aim camera at an object 50 to 75 feet (17 to 23 m) away. Adjust until image is in focus from full wide angle to full telephoto, with the filter in place.
 - 5) Set and name all preset positions; consult Owner's personnel.
 - 6) Set sensitivity of motion detection.
 - 7) Connect and verify responses to alarms.
 - 8) Verify operation of control-station equipment.
 - c. Test Schedule: Schedule tests after pretesting has been successfully completed and system has been in normal functional operation for at least 14 days. Provide a minimum of 10 days' notice of test schedule.
 - d. Operational Tests: Perform operational system tests to verify that system complies with Specifications. Include all modes of system operation. Test equipment for proper operation in all functional modes.
 3. Video surveillance system will be considered defective if it does not pass tests and inspections.
 4. Prepare test and inspection reports.
- E. Adjusting
 1. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose. Tasks shall include, but are not limited to, the following:
 - a. Check cable connections.
 - b. Check proper operation of cameras and lenses. Verify operation of auto-iris lenses and adjust back-focus as needed.
 - c. Adjust all preset positions; consult Owner's personnel.
 - d. Recommend changes to cameras, lenses, and associated equipment to improve Owner's use of video surveillance system.
 - e. Provide a written report of adjustments and recommendations.
- F. Cleaning
 1. Clean installed items using methods and materials recommended in writing by manufacturer.
 2. Clean video-surveillance-system components, including camera-housing windows, lenses, and monitor screens.
- G. Demonstration
 1. Train Owner's maintenance personnel to adjust, operate, and maintain video-surveillance equipment.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 28 31 23 00 - FIRE ALARM SYSTEM**PART 1 – GENERAL****1.01 GENERAL AND SPECIAL CONDITIONS**

- A. The General Provisions of the Contract, including the Uniform General Conditions of the Contract, the Supplementary General Conditions, Special Conditions and Division 1 - General Requirements, apply to work specified in this Section.
- B. The Contractor shall furnish all equipment, materials, tools, labor, planning, drawings, etc. necessary for a complete fire alarm system, with said systems being made ready for operation in accordance with the requirements of these specifications, drawings and the authorities having jurisdiction. The purpose of The University furnished specifications and drawings is to convey to the Contractor the scope of work required, all of which the Contractor is responsible to furnish, install, adjust, and make operable.
- C. The omission of any necessary system component, as required by the authorities having jurisdiction, from the specifications and drawings shall not relieve the Contractor of the responsibility for providing such necessity, without additional cost to The University.
- D. The Contractor shall visit the site before submitting their bid and shall examine all existing physical conditions that may be material to the performance of their work. No extra payments will be allowed to the Contractor because of extra work made necessary by their failure to do so.
- E. Any case of error, omission, discrepancy or lack of clarity shall be promptly identified to The University and Engineer for clarification prior to the bid due date.
- F. Project specifications and drawings are issued as a combined bid package. In the event of a conflict between the drawings and the specifications, the specifications shall take precedence.
- G. All major elements of the work are believed to be adequately described herein. The Contractor is expected, as a requirement of their qualifications and licensing, to utilize their knowledge and experience to anticipate and include in the cost of the work any incidentals, which may be required, but are not specifically expressed herein, in order to provide a complete and fully functional fire alarm system in accordance with applicable codes and standards.
- H. The Contractor shall provide all devices and equipment required by the specifications and drawings. Under no circumstances shall the Contractor delete any equipment or devices without the written directive of The University.
- I. The Contractor shall furnish and install additional devices for the fire alarm and voice evacuation system to meet requirements of the standards and guides referenced in Section 1.07. The Contractor shall commence changes to the Scope of Work only upon written directive of The University.
- J. The fire alarm Contractor is responsible for coordinating all installation related aspects of the fire alarm system installation.

1.02 PERFORMANCE GUIDELINES

- A. Provide labor, materials, and equipment for a complete and functional fire alarm and supervisory signaling system as outlined in these specifications and shown on the drawings. The Contractor shall be responsible for compliance with the entire project specifications as well as the following guidelines.

- B. The guidelines are not intended to be all-inclusive and do not limit or define the Contractor's Scope of Work. The work includes the following:
1. Point addressable multiplex fire alarm control equipment, multiplex transponders, initiating devices, notification appliances, annunciators, switches, relays, software and accessories.
 2. Multiplex emergency voice evacuation notification system including notification appliance power supplies, horns and strobe notification appliances.
 3. Fully networkable with seamless integration to existing Central Fire Alarm Control Unit (FACU).
 4. Provide three (3) Johnson Controls/Notifier Graphic Floor Plan software packages or owner approved equal to interface the new fire alarm control panel to the Onyx Workstation computers located in the Campus Control Room, EHS Office and UPTD at STRF.
 5. The building fire alarm control panel shall report independently to the Central FACU over a dedicated single-mode fiber optic line connected to the existing Campus Fire Alarm Network.
 6. Conduit, wiring and system installation.
 7. Core drilling and firestopping.
 8. Cutting, patching and painting.
 9. Removal of existing fire alarm system, including equipment, devices, back boxes, wiring and raceways and repair of demolished locations. The Contractor shall return all smoke detectors, heat detectors, addressable monitor modules, addressable relay modules, pull stations and panels to The University.
 10. The existing fire alarm system shall remain fully operational while the new fire alarm system is being installed. The existing fire alarm system shall be taken out of service and demolished by floor. As individual floors are installed, acceptance tested, and put in routine service existing devices shall be deactivated and demolished. The existing FACU shall be deactivated and demolished ONLY AFTER the new FACU is in "System Normal" status and fully accepted for routine monitoring service
 11. During the replacement of the existing fire alarm system, provide a fire watch for the areas of the building that does not have protection from a fire alarm system until the new system is fully functional and accepted by the AHJ. Utilize acceptable interim life safety measures including hot work and device impairment permitting as required by AHS.
 12. Detailed shop drawings and submittal information.
 13. Coordination of the work with other trades for this project and coordination with any other Owner projects at the time of Fire Alarm Contractor's work.
 14. On-site project supervision.
 15. Permits, fees, and other charges required for the work.
 16. Record documents.

17. Operating and maintenance instructions.
18. Training of Owner's personnel.
19. Documented system pre-testing and final acceptance testing.
20. Warranty of equipment and labor.
21. Conduct weekly job progress meeting and issue weekly written job progress reports to The University and Engineer.
22. Provide a WI-FI ready Computer Tablet with the following specifications to remotely access the Fire Alarm System Network through Virtual Network Port (VPN) or current Internet Protocol Network (IPN):
 - a) Wi-Fi ready Computer tablet
 - b) 128 gigabyte Internal Memory, minimum
 - c) One High Speed USB Port, minimum
 - d) QWERTY Keyboard
 - e) Installed VPN and/or IPN software
 - f) Installed Office Professional Suite
 - g) Soft Tip Stylus
 - h) Carrying/Protective Case
23. Locate or mount the Fire Alarm Control Panel (FACP) in a 2-hour, Fire rated Enclosure (as shown on plans) and monitor with suitable detection device as required by current NFPA 72 standard. (Consultant Engineer to coordinate 2 hour enclosure with owner, enclosure may require new construction or be an existing mechanical or electrical room) The 2-hour enclosure shall include the following support equipment, devices, and communication ports:
 - a) One spare 110V/120V Duplex Electrical Outlet
 - b) One LAN Connection Outlet
 - c) One Telephone Connection outlet
 - d) One RED "Fire Alarm System Documents" Storage Can

1.03 SYSTEM ABBREVIATIONS AND DEFINITIONS

- | | | |
|----|------------|---|
| A. | Accessible | Capable of being reached or accessed with the use of ladders or without climbing, or crawling under, through, or over obstacles such as mechanical or electrical equipment, building members, or structure, piping, and ductwork. |
| B. | ADA: | Americans with Disabilities Act. |
| C. | ADAAG: | Americans with Disabilities Act Accessibility Guidelines. |
| D. | AFF: | Above Finished Floor. |
| E. | AHJ: | Authority Having Jurisdiction. |
| F. | Approved: | Unless otherwise stated, materials, equipment or submittals approved by The University or Engineer. In no case will "approval" be interpreted as a release of |

the Contractor from responsibility to fulfill requirements of contract documents and code requirements.

G.	Certify:	Attest to proper planning and installation of the fire alarm system.
H.	Circuit:	Wire path from a group of devices or appliances to a control panel or transponder.
I.	Concealed	Embedded in masonry or other construction, installed behind a wall furring or within partitions, or installed above suspended ceilings. Where used with conduit and accessories, shall mean "hidden from sight".
J.	Contractor	The company awarded the prime contract for this work and any of its subcontractors, vendors, suppliers, or fabricators.
K.	CPU:	The central processor or computer of a multiplex fire alarm or voice command control system.
L.	Direct Supervision:	The control of work as it is being performed on the fire alarm system by a licensed individual.
M.	Engineer:	Owner's fire alarm consultant.
N.	Executive Software	Control and supervisory program which manages the execution of all other programs and directly or indirectly causes the required functions of the product to be performed. Executive software is sometimes referred to as firmware, BIOS or executive program.
O.	FACP:	Fire Alarm Control Panel.
P.	FCR:	Fire Control Room.
Q.	Furnish:	Supply and deliver to project site, ready for unloading, unpacking, assembly, installation, etc., as applicable in each instance.
R.	HVAC:	Heating Ventilating and Air Conditioning.
S.	IDC:	Initiating Device Circuit.
T.	Install:	Unloading, unpacking, assembly, erection, placing, anchoring, applying, working to dimension, finishing, curing, protecting, cleaning and similar operation.
U.	Intelligible	Capable of being understood, comprehensible, clear.
V.	LED:	Light Emitting Diode.
W.	Listed:	Materials or equipment included in a list published by a nationally recognized laboratory that maintains periodic inspection of production of listed equipment and materials.

X.	LCD:	Liquid Crystal Display.
Y.	NICET	National Institute for Certification in Engineering Technologies
Z.	NFPA:	National Fire Protection Association.
AA.	NAC:	Notification Appliance Circuit.
BB.	Network:	Peer-to-peer communication between nodes, with direct point control from any authorized node on the communication path.
CC.	Plan:	To layout, detail, draw, devise, calculate, or arrange and assembly of fire alarm or detection devices, equipment, and appurtenances in accordance with applicable codes and standards.
DD.	Provide:	Furnish and install, complete and ready for intended use, as applicable in each instance.
EE.	RPS:	Remote Notification Appliance Power Supply.
FF.	RTP:	Remote Transponder Panel.
GG.	RTU:	Rooftop Unit.
HH.	Shop Drawings	Documents that provide information pertaining to the system, such as property location, scaled floor plan, equipment wiring details, typical equipment installation details, riser details, conduit/conductor size and routing information, and other information necessary for the installer to complete the fire alarm installation.
II.	Site Specific Software	Program that is separate from, but controlled by, the executive software which allows inputs, outputs and system configuration to be selectively defined to meet the needs of a specific installation. Typically it defines the type and quantity of hardware, customized labels and the specific operating features of the system.
JJ.	SLC:	Signaling Line Circuit.
KK.	Style 4:	As defined in NFPA 72, 2010 edition. Also known as Class B.
LL.	Style 7:	As defined in NFPA 72, 2010 edition. Also known as Class A.
MM.	Style B:	As defined in NFPA 72, 2010 edition. Also known as Class B.
NN.	Style Y:	As defined in NFPA 72, 2010 edition. Also known as Class B.
OO.	Transponder:	Single or multiple zone/point data collection panel used

within a multiplex system.

- PP. UL: Underwriters Laboratories, Inc.
- QQ. UL Listed: Materials or equipment listed by Underwriters Laboratories and included in the most recent edition of the UL Fire Protection Equipment Directory.
- RR. Zone: Combination of one or more circuits or devices in a defined building area, (e.g. 3 notification circuits on a floor combined to form a single zone.)

1.04 RELATED WORK

- A. Materials furnished and wired in this section but installed by Others:
1. None.
- B. Existing materials wired by this Contractor:
1. Sprinkler waterflow devices, valve supervisory devices and other sprinkler supervisory devices are existing. The Fire Alarm Contractor shall wire these devices to the fire alarm system.
 2. Pre-action System is located in the building.
 3. The existing emergency generator shall be monitored by the fire alarm system for generator failure, generator run and generator battery failure.
 4. Existing electric door locks shall have an override switch installed at the FACP by the Fire Alarm Contractor. The Fire Alarm Contractor shall wire these locks to the fire alarm system for door release.
 5. Existing electric magnetic door hold open devices shall be wired to the fire alarm system by the Fire Alarm Contractor.
 6. Existing elevator controls shall be wired to the fire alarm system for elevator recall functions and power shunt trip disconnect. The Fire Alarm Contractor shall retain the services of The University's Elevator Contractor to perform final connections to the elevator controls.
 7. Existing HVAC control equipment shall be wired to the fire alarm control system by the Fire Alarm Contractor.

1.05 PERFORMANCE REQUIREMENTS

- A. Provide a UL listed, analog point addressable, multiplex voice evacuation fire alarm system. Approved manufacturers are listed in Part 2 - Products section. The system shall include the following:
1. The main fire alarm control panel shall be in a location approved by the AHJ as shown on the drawings.
 2. Provide a remote alpha-numeric fire alarm annunciator and a remote microphone cabinet with speaker zone switches on the 1st level as shown on drawings.
 3. Remote transponder panels located throughout the facility as required.

4. Building is to report independently to Central FACU over a dedicated single-mode fiber optic line connected to the existing Fire Alarm Network.
5. At a minimum, the same control switches/circuits as the existing fire alarm control panel for the following:
 - a. Enable / Disable Door Locks
 - b. Enable / Disable Door Holders
 - c. Enable / Disable All Air Handling Units
 - d. Enable / Disable Elevator Recall / Shunt Trip All Elevators
 - e. Enable / Disable All Waterflow Switches
 - f. Enable / Disable All Notification Appliances
 - g. Enable / Disable Notification Appliances by floor.
 - h. Enable / Disable Stairwell Speakers.
 - i. Enable / Disable Outdoor Mass Notification Speakers.
6. Smoke detectors, heat detectors, waterflow devices, supervisory devices, and other initiating devices; notification appliances; control relays; and monitoring relays.
7. Install notification appliances on the ceiling except where physical constraints necessitate wall mounting.
8. Install smoke and heat detectors in ceiling locations where they are easily accessed for functional testing in accordance with NFPA 72.
9. Smoke detection above the fire alarm control panel, remote transponder panels, remote power supplies and off-site transmitting equipment.
10. Duct detectors on all supply and return air systems over 2,000 CFM.
11. Duct smoke detectors shall be furnished, installed and wired to the fire alarm system by the Fire Alarm Contractor. The Fire Alarm Contractor shall be responsible for determining the location, sizing sampling tubes for proper coverage of HVAC ducts. Provide a keyed remote test switch for each duct smoke detector to evaluate performance during annual Compliance testing.
12. Enabling of alarm verification feature if permitted by Campus EHS and/or AHJ.
13. Twenty percent (20%) expansion of the listed capacity the fire alarm panel, transponder panels and remote notification appliance power supplies and on each circuit to allow for future expansion by The University.
14. User controls to silence public alarm and auxiliary functions to allow for maintenance and testing to minimize disruption of normal activities, i.e. walk test or service group functions.
15. All systems must be listed and approved as a smoke detector sensitivity test set and be capable of providing drift compensation. Drift compensation is considered equal to adjustability at the detector.
16. Smoke detectors shall have their analog sensors measurements transformed into a digital signal that are combined and processed by special algorithms. The computation enables the smoke detector to respond faster to a fire situation and the ability to discriminate between normal ambient changes in a building.
17. All systems must be field programmable for all changes, alterations, modifications, additions, deletions and hardware and software upgrades.

18. All systems must be capable of generating comprehensive reports for sensitivity, verification counts and address registers.
19. Surge protection for each circuit powering fire alarm control equipment.
20. Addressable isolator modules shall automatically isolate wire to wire short circuits on an SLC loop. The isolator module will be self-resetting upon correction to the shorted circuit. Provide an isolator module for each level of the building, for each fire zone or as shown on the drawings.
21. Fiber-optic modems for connecting the fire alarm control panel to the existing Campus-wide fiber-optic monitoring network

B. Systems Circuit Wiring:

1. All multiplex data transmission circuits shall be NFPA 72, Style 7 supervised signaling line circuits from the remote transponder panels to the FACP.
2. All fire alarm point addressable circuits shall be NFPA 72, Style 4 supervised signaling line circuits from the FACP, remote transponder panels to the point addressable sensors or point addressable interface modules.
3. All fire alarm initiating device circuits shall be NFPA 72, Style B electrically supervised circuits from the FACP, remote transponder panels or point addressable interface modules to the devices.
4. All strobe notification appliance circuits shall be NFPA 72, Style Y electrically supervised circuits from the FACP, voice command transponder panels to the strobe notification appliances.
5. All wiring subject to damage or visible below the acoustic ceiling shall be installed in conduit.

1.06 SYSTEM OPERATION

- A. The point addressable fire alarm and supervisory signaling system shall perform the following functions:
1. Continuous monitoring of the status of all fire alarm and supervisory signal initiating devices.
 2. Visible point annunciation of all fire alarm point trouble conditions at the FACP.
 3. Continuous monitoring of all fire alarm transponders.
 4. Operation of indicated control functions.
- B. Change in status of any initiating device on the system shall:
1. Activate audible and visible status change indicators and display the system point number, point description, status and message associated with the point on the system's operator terminal.
 2. Permanently record the change in status, time, date, point description and message associated with the point in fire alarm system historical event memory.

3. Notify the monitoring center through the Campus-wide Monitoring Network.
 4. Device Activation must clearly show the device and its location on a graphical floor plan simultaneously displayed on the workstation fire alarm control units in the UTPD Dispatch, Central Control Room, and EHS Office.
- C. Activation of any manual station, waterflow, smoke detector, heat detector, kitchen hood extinguishing system, supervisory or other initiating device will cause the following functions to occur:
1. Manual station operation shall:
 - a. Activate audible and visible status change indicators, display the system point number, point description, and message associated with the point on the system's operator terminal.
 - b. Permanently record the change in status, time, date, point description and message associated with the point in fire alarm system historical event memory.
 - c. When any initiation device is activated, ONLY notification devices on the floor in distress will sound (annunciate). Notification devices on floors above and below the one in distress are to automatically activate when the original alarm stays active for ten minutes or more.
 - d. Activate door unlocking system.
 - e. Release magnetic door hold open devices.
 - f. Notify the monitoring center through the Campus-wide Monitoring Network.
 - g. Device Activation must clearly show the device and its location on a graphical floor plan simultaneously displayed on the workstation fire alarm control units in the UTPD Dispatch, Central Control Room, and EHS Office.
 2. Waterflow switch operation shall:
 - a. Activate audible and visible status change indicators, display the system point number, point description, and message associated with the point on the system's operator terminal.
 - b. Permanently record the change in status, time, date, point description and message associated with the point in fire alarm system historical event memory.
 - c. When any initiation device is activated, ONLY notification devices on the floor in distress will sound (annunciate). Notification devices on floors above and below the one in distress are to automatically activate when the original alarm stays active for ten minutes or more.
 - d. Activate door unlocking system.
 - e. Release magnetic door hold open devices.
 - f. Activate stair pressurization fans.
 - g. Notify the monitoring center through the Campus-wide Monitoring Network.

- h. Device Activation must clearly show the device and its location on a graphical floor plan simultaneously displayed on the workstation fire alarm control units in the UTPD Dispatch, Central Control Room, and EHS Office.
- 3. Spot type heat detector or spot smoke detector operation shall:
 - a. Activate audible and visible status change indicators, display the system point number, point description, and message associated with the point on the system's operator terminal.
 - b. Permanently record the change in status, time, date, point description and message associated with the point in fire alarm system historical event memory.
 - c. When any initiation device is activated, ONLY notification devices on the floor in distress will sound (annunciate). Notification devices on floors above and below the one in distress are to automatically activate when the original alarm stays active for ten minutes or more.
 - d. Activate door unlocking system.
 - e. Release door magnetic door hold open devices.
 - f. Notify the monitoring center through the Campus-wide Monitoring Network.
 - g. Device Activation must clearly show the device and its location on a graphical floor plan simultaneously displayed on the workstation fire alarm control units in the UTPD Dispatch, Central Control Room, and EHS Office.
- 4. Duct smoke detector or mechanical room spot smoke detector activation shall:
 - a. Activate audible and visible status change indicators, display the system point number, point description, and message associated with the point on the system's operator terminal.
 - b. Permanently record the change in status, time, date, point description and message associated with the point in fire alarm system historical event memory.
 - c. Send a supervisory signal to the FACP.
 - d. Shut down the fan unit associated with the duct detector.
 - e. Notify the monitoring center through the Campus-wide Monitoring Network.
 - f. Device Activation must clearly show the device and its location on a graphical floor plan simultaneously displayed on the workstation fire alarm control units in the UTPD Dispatch, Central Control Room, and EHS Office.
- 5. Elevator lobby smoke detector operation shall:
 - a. Activate audible and visible status change indicators, display the system point number, point description, and message associated with the point on the system's operator terminal.
 - b. Permanently record the change in status, time, date, point description and message associated with the point in fire alarm system historical event memory.

- c. Immediately recall the affected elevators to the lobby level. If the alarm is on this level, recall the elevators to the alternate level.
 - d. When any initiation device is activated, ONLY notification devices on the floor in distress will sound (annunciate). Notification devices on floors above and below the one in distress are to automatically activate when the original alarm stays active for ten minutes or more.
 - e. Activate the door unlocking system.
 - f. Release magnetic door hold open devices.
 - g. Notify the monitoring center through the Campus-wide Monitoring Network.
 - h. Device Activation must clearly show the device and its location on a graphical floor plan simultaneously displayed on the workstation fire alarm control units in the UTPD Dispatch, Central Control Room, and EHS Office.
6. Elevator hoistway or elevator machine room smoke detector operation shall:
- a. Activate audible and visible status change indicators, display the system point number, point description, and message associated with the point on the system's operator terminal.
 - b. Permanently record the change in status, time, date, point description and message associated with the point in fire alarm system historical event memory.
 - c. Immediately recall the affected elevators to the lobby level. If the alarm is on this level, recall the elevators to the alternate level.
 - d. Send a signal to the elevator control equipment for fire fighter's notification.
 - e. When any initiation device is activated, ONLY notification devices on the floor in distress will sound (annunciate). Notification devices on floors above and below the one in distress are to automatically activate when the original alarm stays active for ten minutes or more.
 - f. Activate the door unlocking system.
 - g. Release magnetic door hold open devices.
 - h. Notify the monitoring center through the Campus-wide Monitoring Network.
 - i. Device Activation must clearly show the device and its location on a graphical floor plan simultaneously displayed on the workstation fire alarm control units in the UTPD Dispatch, Central Control Room, and EHS Office.
7. Elevator machine room or hoistway heat detector operation shall:
- a. Activate audible and visible status change indicators, display the system point number, point description, and message associated with the point on the system's operator terminal.
 - b. Permanently record the change in status, time, date, point description and message associated with the point in fire alarm system historical event memory.
 - c. Activate elevator power shunt trip operation.

- d. When any initiation device is activated, ONLY notification devices on the floor in distress will sound (annunciate). Notification devices on floors above and below the one in distress are to automatically activate when the original alarm stays active for ten minutes or more.
 - e. Activate door unlocking system.
 - f. Release magnetic door hold open devices.
 - g. Notify the monitoring center through the Campus-wide Monitoring Network.
 - h. Device Activation must clearly show the device and its location on a graphical floor plan simultaneously displayed on the workstation fire alarm control units in the UTPD Dispatch, Central Control Room, and EHS Office.
- 8. Sprinkler valve supervisory device, fire pump monitoring point, generator monitoring point, shunt trip power monitoring point or other supervisory device activation shall:
 - a. Activate audible and visible status change indicators, display the system point number, point description, and message associated with the point on the system's operator terminal.
 - b. Permanently record the change in status, time, date, point description and message associated with the point in fire alarm system historical event memory.
 - c. Send a supervisory signal to the FACP.
 - d. Notify the monitoring center through the Campus-wide Monitoring Network.
 - e. Device Activation must clearly show the device and its location on a graphical floor plan simultaneously displayed on the workstation fire alarm control units in the UTPD Dispatch, Central Control Room, and EHS Office.
- D. Removal of any device, wiring disarrangement or system component failure shall:
 - 1. Activate audible and visible status change indicators, display the system point number, point description, and message associated with the point on the system's operator terminal.
 - 2. Permanently record the change in status, time, date, point description and message associated with the point in fire alarm system historical event memory.
 - 3. Notify the monitoring center through the Campus-wide Monitoring Network.
 - 4. Device Activation must clearly show the device and its location on a graphical floor plan simultaneously displayed on the workstation fire alarm control units in the UTPD Dispatch, Central Control Room, and EHS Office.
- E. When any point in the system returns to normal, the CPU shall:
 - 1. Activate audible and visible status change indicators, display the system point number, point description, and message associated with the point on the system's operator terminal.
 - 2. Permanently record the change in status, time, date, point description and message associated with the point in fire alarm system historical event memory.

3. Acknowledgment of "system return to normal" will record the time, date, point identification and message in fire alarm system historical event memory. The acknowledgment will also silence all audible indicators associated with the point at the CPU.
 4. Notify the monitoring center through the Campus-wide Monitoring Network.
- F. The emergency voice evacuation notification system shall perform the following functions:
1. Continuous monitoring of all electrically supervised evacuation strobe and horn signaling circuits.
 2. Local visible zone annunciation of speaker and strobe circuit trouble conditions.
 3. When any initiation device is activated, only notification appliances on the floor in alarm shall sound. Notification appliances on the floors above and below the floor in alarm are to automatically activate when the original floor of alarm stays active for ten minutes or more.
 4. Operation of all visible notification appliances as indicated.
 5. Removal of any notification appliance from its circuit, wiring disarrangement or system component failure shall display on the main fire alarm control panel the change in status, time, date, zone or circuit description associated with the element, circuit or zone and notify the monitoring center through the Campus-wide Monitoring Network.

1.07 APPLICABLE STANDARDS

The following standards and guides (of the issue indicated) are hereby made a part of this work by reference thereto:

- A. NFPA 70 - National Electrical Code, 2011 edition.
- B. NFPA 72 - National Fire Alarm Code, 2010 edition.
- C. NFPA 90A - Air Conditioning and Ventilating Systems, latest edition.
- D. NFPA 101 – Life Safety Code, 2009 edition.
- E. NFPA 110 - Emergency and Standby Power Systems, latest edition.
- F. UL Standard 268, Smoke Detectors for Fire Protective Signaling Systems, latest edition.
- G. UL Standard 268A, Smoke Detectors for Duct Application, latest edition.
- H. UL Standard 346, Waterflow Indicators for Fire Protective Signaling Systems, latest edition.
- I. UL Standard 521, Heat Detectors for Fire Protective Signaling Systems, latest edition.
- J. UL Standard 864, Control Units for Fire Protective Signaling Systems, 9th edition.
- K. UL Standard 1424, Cables for Power-Limited Fire Protective Signaling Systems, latest edition.
- L. UL Standard 464 Audible Signal Appliances.
- M. UL Standard 1481, Power Supplies for Fire Protective Signaling Systems, latest edition.

- N. UL Standard 1971, Signaling Devices for the Hearing Impaired, latest edition.
- O. UL Standard 1711, Amplifiers for Fire Protective Signaling Systems, latest edition.
- P. UL Standard 2196, Standard for Tests for Fire Resistive Cables, latest edition.
- Q. NECA 1, Standard Practice for Good Workmanship in Electrical Contracting, 2000 edition.
- R. NECA 305-2001, Standard for Fire Alarm System Job Practices, latest edition.
- S. International Building Code, 2009 edition.
- T. Americans with Disabilities Act Accessibility Guidelines (ADAAG), 1990 edition.
- U. Americans with Disabilities Act Accessibility Guidelines (ADAAG), Bulletin #2, 2003 edition.
- V. Texas Accessibility Code, latest edition.
- W. American Society of Mechanical Engineers (ASME)/American National Standards Institute (ANSI) A17.1, Elevator Code, latest edition.
- X. American Society of Mechanical Engineers (ASME)/American National Standards Institute (ANSI) A17.3, Elevator Code for Existing Elevators, latest edition.
- Y. Texas Insurance Code Chapter 6002, Fire Alarm Rules.

1.08 SUBMITTALS

- A. The Contractor is fully responsible to completely plan the fire alarm system and certify the submittals meet the applicable codes and standards.
- B. Submit the following equipment information:
 - 1. Manufacturer's data sheets with equipment to be used clearly indicated by arrows or other suitable means and non-applicable portions clearly deleted or crossed out,
 - 2. Manufacturer's installation wiring guidelines for all the equipment,
 - 3. Wiring diagrams of all equipment,
 - 4. Installation instructions for all equipment,
 - 5. Equipment dimensions,
 - 6. Equipment testing procedures,
 - 7. Equipment maintenance manuals and
 - 8. Wire data sheets.
 - 9. Conduit, fittings, boxes, hangers, supports and anchors.
- C. Submit the following software information:
 - 1. Proposed point numbers,

2. Point descriptors and
 3. Complete sequence of operation with input/output matrix for all points.
- D. Submit newly prepared information created with an AutoCAD program and drawn accurately to scale. Clearly indicate deviations from the Contract Documents. Deviations shall be provided as a separate submittal item labeled Contract Deviations. Deviations shall also be clearly noted on the shop drawings and in the manufacturer's literature. Do not reproduce Contract Documents (electronic or hardcopy) or copy standard information as the basis of Shop Drawings. Standard information prepared without specific reference to the Project is not a Shop Drawing. Submit shop drawing information required by the applicable building / fire code, NFPA 72 (including Annex A) and the following:
1. Complete panel layout showing all field terminations,
 2. Complete panel layout showing location of all modules, power supplies and batteries,
 3. Complete system riser diagrams,
 4. Main panel elevations,
 5. Complete floor plans showing all devices with point numbers for both initiating and notification devices and all wire between devices,
 6. Candela rating for each strobe labeled adjacent to the strobe.
 7. Wattage rating for each speaker labeled adjacent to the speaker.
- E. Submit the following system calculations:
1. Standby battery capacity for fire alarm control panels (identifying both the nonalarm and alarm load associated with each, and demonstrate conformance to the requirements of these specifications),
 2. Standby battery capacity for all remote panels (identifying both the nonalarm and alarm load associated with each, and demonstrate conformance to the requirements of these specifications),
 3. Voltage drop calculations for each type of circuit (identifying all mathematical formulas, variables, constants, and sources of the mathematical constants). Sufficient voltage shall be available for proper operation of the system and all components at the minimum rated voltage of the system operating on batteries.
 4. Strobe light intensity calculations for strobe lights spacing not listed in NFPA 72 tables.
 5. Strobe zone/circuit loading,
 6. Normal 120 VAC fire alarm panel(s) circuit loading,
 7. Normal 120 VAC notification appliance power supply circuit loading.
 8. Normal 120 VAC remote panel circuit loading.
- F. Submittal packages shall be signed by State of Texas Alarm Planning Superintendent (Certified NICET III in Fire Alarm Systems) or signed and sealed by a Professional Engineer (P.E.) registered in the State of Texas.

- G. Prior to start of construction, submit the information outlined in B, C, D and E above to the following:
 - 1. Provide one (1) pdf submittal to Aon Fire Protection Engineering Corporation for review. Submit one electronic copy of dwf files for The University to review.
 - 2. PARTIAL SUBMITTALS ARE UNACCEPTABLE.
- H. The submittals will be reviewed for conformance with the bid documents. If submittals are found not to conform to the requirements of the bid documents, the Contractor shall be required to resubmit with modifications. The Contractor shall be responsible for extra expenses for the subsequent review(s) of the rejected submittals. Approval of the submittals shall in no case relieve the Contractor of the responsibility to meet the requirements of the bid documents and the requirements of the AHJ.
- I. Costs incurred by The University for the Engineer to review additional submittals resulting from an initial rejection shall be the responsibility of the submitting Contractor.

1.09 WARRANTY

- A. This Contractor shall provide a one year written warranty against defects in material and workmanship furnished under this Contract. The costs of such warranty shall be part of the purchase price. The warranty commences when the system and installation are accepted by The University.
- B. The warranty shall include all necessary material, travel, labor, and parts to replace defective components or materials at the job site. This Contractor shall commence repair of any "in warranty" defects within 8 hours of notification of such defects.
- C. The warranty shall include all necessary factory and field software required to perform the specified tasks. This item does not include software installed after system acceptance unless the defective software was installed at the direction of the system manufacturer.
- D. If The University experiences more than two spurious or unexplained false alarms or troubles in any 48 hour period while the system is under warranty, the Contractor shall provide the necessary labor, materials, and technical expertise to promptly correct the problem(s) without additional cost.
- E. The Contractor shall include, as part of the warranty, a test and inspection of the entire fire alarm and voice system within one month prior to the expiration of the construction warranty. The Contractor shall provide a written report of any deficiencies and repair all of the deficiencies. The test and report shall conform to the certification described in NFPA 72.

1.10 UNIT PRICES

- A. The Contractor shall provide with his bid unit prices for the following list. The unit prices shall include the device, installation, wire, programming, taxes, profit, supervision, design and any other required work. The unit prices shall be used for device additions and device deducts.
 - 1. Analog spot smoke detector including base.
 - 2. Analog duct smoke detector including 10-foot sampling tube.
 - 3. Remote test station.
 - 4. Remote indicator.

5. Analog spot type heat detector including base.
6. Conventional spot type heat detector including base.
7. Point addressable manual station.
8. Conventional manual station.
9. Point addressable monitor module.
10. Point addressable "mini" monitor module.
11. Point addressable control module.
12. Point addressable strobe control module.
13. Remote notification appliance power supply.
14. Conventional hardwired step-down relay.
15. ADA Combination speaker strobe (UL1971)
16. ADA strobe (UL 1971).
17. Speaker, indoor type.
18. Speaker, weather-proof, outdoor rated
19. Remote alphanumeric annunciator.
20. Magnetic door holder.
21. 30 feet of conduit.

1.11 SERVICE AGREEMENT

- A. Provide a separate annual test and service agreement recurring amount to be contracted by The University at their option, and paid directly to the equipment supplier. This annual cost shall be guaranteed firm (or with stated maximum annual percentage escalation) for a period of three years upon expiration of the warranty. The test and maintenance agreement service contract starts after the warranty period.
 1. The service agreement proposal shall be submitted at the time the installation cost proposal is presented.
 2. Fire alarm tests shall be performed in accordance with NFPA 72. Upon the completion of all periodic tests, the Contractor shall provide a completed test form that complies with NFPA 72 and is signed by the individual and company performing the final test.
- B. The Contractor shall provide emergency service as part of the test and maintenance agreement.
- C. Service Definitions:
 1. Emergency Services: Emergency service is a request for assistance from The University that necessitates a special trip or labor. A request to advance a regularly scheduled site visit is not emergency service. Emergency service shall commence within 4 hours of notification.

2. Quoted Service Rates: Quote service rates refer to the service labor rates quoted on the bid form or to adjusted rates which shall be supplied to The University at the beginning of each new contract term. In absence of the contract, the rates shall be the Contractor's and manufacturer's currently published rates.

1.12 DELIVERY, STORAGE AND HANDLING OF MATERIALS

- A. Contractor will deliver all materials to an area designated by Owner. Vehicles shall not block fire lanes or fire doors during delivery of materials.
- B. The University will designate an area for storage of all materials. At the end of each working day, all materials shall be returned to the designated area. Material, equipment, tools, etc. will not be left outside the storage area without the consent of The University.
- C. The cost of all material handling, delivery and freight is the Contractor's responsibility. The University will not be responsible for materials delivered to the site.
- D. The Contractor is responsible for providing adequate protection for all equipment during construction.
- E. Maintain premises free from accumulation of waste materials or rubbish caused by this work. At the completion of the work, remove all surplus materials, tools, etc., and leave the premises clean to The University's satisfaction.

1.13 QUALITY ASSURANCE:

- A. The fire alarm system Contractor shall maintain a fully staffed branch office including application engineers, drafters and technical service personnel within the San Antonio, Texas metropolitan area.
- B. The Contractor shall have successfully completed three (3) projects of similar size and complexity within the past 5 years.
- C. All supplied equipment shall be standard products of the manufacturer and regularly stocked within the Contractor's branch office.
- D. The installing Contractor shall hold a current license issued by the State of Texas Department of Insurance to plan, install, service, inspect, test, certify and maintain fire alarm or fire detection devices.
- E. The installing Contractor shall employ a person holding a current license issued by the State of Texas Department of Insurance to plan, install, service inspect, test, certify and maintain fire alarm or fire detection devices.
- F. The Contractor shall provide direct supervision of the fire alarm system installation and testing.
- G. All technical service personnel shall be regularly employed by the fire alarm system manufacturer or an authorized distributor.
- H. All electrical installation of the fire alarm system, including wire installation and terminations, if performed by electricians shall be under the supervision of the Fire Alarm Contractor. Installation personnel shall be supervised by persons who are qualified and experienced in the installation, inspection and testing of fire alarm systems. The Fire Alarm Contractor assumes full responsibility of the installation and shall certify the installation upon completion.

- I. Any subcontractors used to install portions of the system shall be approved by The University and the Engineer prior to commencement of the installation.
- J. The Contractor shall perform security background checks for all personnel that will be on site.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Provide a UL listed point addressable multiplex fire alarm control system in the Ground Level main entry lobby. Acceptable supplier is Johnson Controls or owner approved equal.
- B. Provide panel equal to: Johnson Controls IFC2-3030 Intelligent Fire Control Panel.
- C. Products for this project shall be of the latest design. Obsolete or discontinued models are not acceptable.
- D. All equipment supplied shall be UL listed for the required function.
- E. All fire alarm control equipment shall be a product of one system manufacturer.
- F. Notification appliances shall be System Sensor per UTHSCSA AHJ.
- G. All locking panels (FACP, RTP, RPS, etc.) shall be keyed alike.

2.02 FIRE ALARM CONTROL PANEL (FACP)

- A. The FACP shall be wall mounted, semi-flush and installed in the Ground Level main entry lobby near the security kiosk. The FACP shall be equipped with locked enclosures having removable access panels for servicing of electronic components. The FACP shall be completely prewired requiring only the connection of incoming field wiring and the plugging in of accessory modules such as additional memory, printer interface boards, etc. All controls and displays shall be mounted at heights allowing easy access by operating personnel. The FACP shall include, but not be limited to, the following major components, some of which may be physically separate from the main cabinet:
 - 1. Central processing equipment.
 - 2. Normal AC power supplies.
 - 3. Data transmission equipment.
 - 4. Network communications equipment.
 - 5. Emergency power supplies.
 - 6. Single-mode fiber-optic modems.
- B. The central processing unit (CPU) shall be a "mini" or "micro" computer, listed in accordance with UL 864. The main memory system shall be adequately sized to provide display, printout and control of 150 percent of the actual alarm and command points as described herein and indicated on the drawings. All basic alarm and control software shall be included. The CPU shall be completely field programmable and all data entered shall reside in the system memory.
- C. The CPU shall be equipped with a nonvolatile main memory system of EPROM, battery protected RAM, or EEPROM memory system.

- D. The system operating terminal shall be the liquid crystal display (LCD) type. The LCD shall include, at a minimum, control function keys, digital display window, programming keys and key-operated lockout capability. The time shall be permanently displayed on the LCD and shall be visible at all times. The LCD shall allow the operator to perform the following minimum tasks:
1. Inquire point status.
 2. Start or stop equipment manually.
 3. Test and reset equipment manually.
 4. Bypass control points during manual system tests.
 5. Initiate control by event sequences.
 6. Manually request "logs" of system status.
 7. Acknowledge status changes.
 8. Silence local alarm sounder.
 9. Monitor and control smoke detector sensitivity.
- E. Normal operating power for the FACP shall be 120 volt AC supplied from dedicated circuits of the local emergency power panel. All circuits shall be protected by circuit breakers of proper size. The Contractor is required to provide primary operating power to all panels. The Contractor shall update panel directories to indicate circuits providing power to fire alarm equipment.
- F. The fire alarm system shall be provided with an emergency standby power system consisting of backup batteries. Batteries shall be sealed lead-acid or gel cell type of sufficient capacity to provide 24-hour standby operation plus 15 minutes in full alarm condition. All calculations shall allow a minimum of 20% safety factor for battery degradation. Batteries may be mounted in a separate vented enclosure. The installation date shall be clearly marked on each battery. The emergency power circuit shall recharge the unit to normal capacity within 48 hours of restoration of normal power.
- G. The FACP shall supervise each individual device on an intelligent circuit such that trouble, normal, alarm, and supervisory outputs are individually annunciated.
- H. The FACP shall accommodate all specified initiating device, notification appliance and command points plus 20% expansion of the listed capacity for each.
- I. Provide smoke detection above the FACP.
- J. UL listed for releasing device service where required.
- K. Provide single-mode fiber-optic modems for communications with the Campus-wide monitoring network.

2.03 VOICE COMMUNICATION SYSTEM

- A. Provide a UL listed (864) audio paging/evacuation multiplex voice control system. This system shall be fabricated and produced by the same manufacturer as the main fire alarm system. The control system shall be modular in design, electrically supervised and mounted in the Basement Level mechanical room as shown on drawing FA0.

- B. The audio control panel shall include, but not be limited to, the following modules and functions:
1. The master microphone module shall provide a means of issuing voice message instructions to specific zones, groups of zones or all zones. The microphone and press to talk switches shall be supervised.
 2. Speaker circuit zone selector switch modules to be activated individually or in any combination. An "all call" feature shall be provided to allow all zones to be paged simultaneously. Each zone shall have an individual selector switch.
 3. A voice message module with the voice message designated herein.
 4. An LED for each evacuation zone to identify the active or inactive status of the zone.
- C. Normal operating power for the voice system shall be 120 volt AC supplied from dedicated circuits of the local emergency power panel. All circuits shall be protected by circuit breakers of proper size. The Contractor is required to provide primary operating power to all panels. The Contractor shall update electrical panel directories to indicate circuits providing power to the fire alarm equipment.
- D. The voice system shall be provided with an emergency standby power system consisting of backup batteries. Batteries shall be sealed lead-acid or gel cell type of sufficient capacity to provide 24 -hour standby operation plus 15 minutes in full alarm condition. All calculations shall allow a minimum of 20% safety factor for battery degradation. Batteries may be mounted in a separate vented enclosure. The manufacture and installation date shall be clearly marked on each battery. Emergency power circuit shall recharge the unit to normal capacity within 48 hours of restoration of normal power.
- E. The voice communication panels shall accommodate all specified speaker circuits and strobe circuits. Each notification appliance circuit shall allow a 20 percent expansion of the listed capacity.
- F. Provide, at a minimum, a separate speaker circuit for each level, each stairwell and the outdoor mass notification speakers and as required by the AHJ.
- G. Audio power amplifiers shall be provided centrally at the main fire alarm control panel. The power amplifiers shall be sized to provide for required speakers, plus 10 watts per floor expansion. All amplifiers shall be electrically supervised and be UL listed for fire alarm signaling use.
- H. The amplifiers shall be listed to UL Standard 1711 and designed to normally operate from 120 VAC power and 24 VDC provided by standby batteries of the voice control panel if normal power is not present. The amplifier shall provide an output voltage of 70 or 25 VRMS.
- I. The voice system shall be capable of reproduction of a prerecorded, synthesized for live message with voice intelligibility.
- J. Provide digital voice message read-only memory voice message units to provide the automatic voice messages required.
- K. The evacuation alert tone shall be a single frequency temporal pattern.
- L. The voice message units shall provide prerecorded messages to be transmitted to the fire floor, the floor above and the floor below the fire floor. Messages shall be approved by the Authority Having Jurisdiction.
- M. Audio system shall provide a minimum of 2 channels.

- N. Provide smoke detection above voice communication panels.

2.04 REMOTE TRANSPONDER PANELS

- A. Remote multiplex transponder panels (RTP) shall be provided where required. The cabinets shall be surface mounted with a locking door or cover.
- B. The RTP panels shall accommodate all specified initiating device, notification appliance and command points plus 20 percent expansion of the listed capacity for each. All assemblies within the RTP panels shall be modular to allow for expansion and servicing of equipment. All power supplies, standby power, motherboards and terminal strips shall be included to accommodate specified future expansion so that expansion can be accomplished by simple installation of circuit boards and wiring to remote devices.
- C. Normal system power shall be 120 volt AC power provided by dedicated circuits from the local emergency power panel. All circuits shall be protected by circuit breakers of proper size. The Contractor is required to provide primary operating power to all panels.
- D. The RTP panels shall be provided with an emergency standby power system consisting of backup batteries. Batteries shall be sealed lead-acid or gel cell type of sufficient capacity to provide 24-hour standby operation plus 15 minutes in full alarm condition. All calculations shall allow a minimum of 20% safety factor for battery degradation. Batteries may be mounted in a separate vented enclosure. The installation date shall be clearly marked on each battery. Emergency power circuit shall recharge the unit to normal capacity within 48 hours of restoration of normal power. One emergency power supply unit may power more than one RTP cabinet if all such cabinets are at one location. The loss of AC or DC power at any RTP shall cause a distinct power failure signal.
- E. The RTP cabinets shall accept input/output (initiating, supervision, notification and/or command) modules for the specified points, zones and spares. The type of input/output modules shall include, but not be limited to the following:
1. Waterflow alarm modules providing electrically supervised Style B initiating circuits.
 2. Alarm initiating modules providing power to smoke detectors, sprinkler supervision and electrical supervision of Style B initiating circuits. Smoke detection modules shall be equipped with alarm verification circuitry.
 3. Equipment command control modules shall provide the functions of start/stop, on/off, bypass/normal and test/reset as required for the equipment to be controlled.
 4. Addressable device data transmission, supervision, control, and power.
 5. UL listed for releasing device service where required.
 6. Speaker and strobe supervision, synchronization and control circuit modules providing Style Y electrically supervised circuits. Power supplies and modules that do not provide individual circuit troubles at the main network control panel are not acceptable.
 7. Addressable device data transmission, supervision, control, and power.
- F. The RTP panels shall accommodate all specified speaker circuits and strobe circuits. Each notification appliance circuit shall allow a 20 percent expansion of the listed capacity. All assemblies within the RTP panels shall be modular to allow for expansion and servicing of equipment. All power supplies, standby power, motherboards, amplifiers and terminal strips shall

be included to accommodate specified future expansion so that expansion can be accomplished by simple installation of circuit boards and wiring to remote devices.

- G. Each remote transponder panel shall be capable of degraded mode operation. In this mode, the system shall receive an alarm from any analog or conventional initiating device and, at a minimum, activate all indicating appliances and control devices served from the panel.
- H. Provide smoke detection above remote transponder panels.
- I. Remote Power Supplies shall include:
 - 1. A minimum of four notification appliance circuits.
 - 2. Strobe synchronization modules.
 - 3. Normal system power shall be 120 volt AC power provided by dedicated circuits from the local emergency power panel. All circuits shall be protected by circuit breakers of proper size. The Contractor is required to provide primary operating power to all panels. The Contractor shall update panel directories to indicate circuits providing power to fire alarm equipment.
 - 4. Power supply with battery charger and standby batteries. Batteries shall be sized to meet the standby requirements of the FACP. The installation date shall be clearly marked on each battery. Emergency power circuit shall recharge the unit to normal capacity within 48 hours of restoration of normal power.
 - 5. Supervision and activation by the main fire alarm system. Trouble conditions for each power supply shall be supervised by a separate point addressable monitor module that is independent from the associated trigger circuit or control module.
 - 6. Provide a smoke detection above remote power supplies.

2.05 POINT ADDRESSABLE SYSTEM SOFTWARE

- A. As part of the initial system installation, provide all executive system software for the fire alarm system including, but not limited to, the following:
 - 1. Basic alarm processing programs.
 - 2. Control by event programs.
 - 3. System point scanning routines.
 - 4. Password control routines.
 - 5. Emergency file display routines.
 - 6. Printer routines.
 - 7. Smoke detector sensitivity routines.
- B. Provide as part of the system all preparation and installation of site specific software files including, but not limited to, the following:
 - 1. Point descriptions.
 - 2. Control by event sequences.

3. Emergency file statements.
 4. Print statements.
 5. Password installation.
- C. System emergency file statements shall be assigned to individual points/zones to assist operator response to an emergency condition. The emergency file shall consist of English language statements that adequately define the desired action. The use of look-up tables is expressly forbidden.

2.06 ALARM INITIATING DEVICES

- A. Point addressable manual stations shall be double-action type, red with white lettering:
1. Surface mounted stations shall mount on a UL listed, red, smooth sided back box provided by the manufacturer. Semi-flush mounted stations shall mount on a standard electrical box.
 2. Operation of a manual station shall cause its contacts to manually lock-in and visibly indicate that the station was activated until manually reset.
 3. Where separate point addressable monitoring modules are used to monitor manual stations, the monitoring modules shall be located in the manual station's back box.
 4. Manual stations in parking structures or other unconditioned spaces shall be conventional hardwired devices with the point monitoring module mounted in a conditioned space.
- B. Vane type waterflow devices shall contain a suitable, adjustable retard device, and actuate upon flow from a single sprinkler. Waterflow devices shall be housed in a substantial metal housing with a gasketed cover. The devices shall be initially adjusted to actuate within 90 seconds after the inspector's test valve is opened. Existing devices shall be reused if the devices are in good operating condition.
- C. Pressure type waterflow devices shall be provided on all dry pipe sprinkler systems. The waterflow devices shall actuate immediately upon tripping of the dry valve. Existing devices shall be reused if the devices are in good operating condition.
- D. Point addressable, analog, photoelectric type smoke detectors shall be provided with integral LEDs to indicate detectors in alarm. The detector shall provide a "maintenance alert" feature whereby the detector shall initiate a trouble condition should the unit's sensitivity approach the outside limits of the normal sensitivity window. Line transient and RFI protection shall be built into the detector. Concealed detectors shall be provided with a permanent label located on the ceiling below the detector or on the floor above the detector. The label shall have the device description and identification address.
- E. Point addressable, analog, photoelectric type duct mounted smoke detectors shall be listed under UL Standard 268A, shall be provided with approved duct housings mounted on the exterior of the duct, and shall have perforated sampling tubes extending across the width of the duct and protrude through the opposite side of the duct to facilitate testing. The sampling tube shall slant away from the detector. The detector shall also be listed for the complete range of air velocity, temperature, and humidity possible when the air handler is running. Provide a removable plug at the end of the sampling tube and seal any sampling holes not in the duct. Each mounted detector that is more than 10-feet AFF or in arrangements where the detector's alarm indicator is not visible shall have a remote indicator light / test switch accessible from the floor. Concealed detectors shall be provided with a permanent label located on the ceiling below the detector or on

the floor above the detector. The label shall have the device description and identification address. Provide an auxiliary DPDT load, addressable control relay for fan shutdown control.

- F. Point addressable heat detectors, listed under UL Standard 521, shall be rate of rise and fixed temperature. Temperature ratings of the heat detectors shall be appropriate for the area protected. Where ambient conditions exceed the addressable detector's listing, conventional hardwired type heat detectors shall be used with point addressable monitoring modules located in a conditioned space. The detectors shall have a listed spacing for coverage up to 2,500 square feet.
- G. Conventional hardwired rate of rise and fixed temperature heat detectors, listed under UL Standard 521, and shall be appropriate for the area protected. Temperature ratings of the heat detector shall be appropriate for the area protected.
- H. Addressable point monitoring modules shall be used to monitor the waterflow devices, beam type smoke detectors, conventional hardwired heat detectors, kitchen hood extinguishing systems and similar alarm initiating device relays. The interface modules shall provide Style B electrical supervision of monitored devices and be equipped with terminal strips or terminal blocks.

2.07 SUPERVISORY INITIATING DEVICES

- A. Valve supervisory devices shall be provided for all sprinkler control valves. The valves to be supervised may be OS&Y or butterfly-type, or a combination of both. All switches shall be SPDT with gasketed rain-tight enclosures. The valve supervisory devices shall be installed to transmit a supervisory signal within the first two turns of the control valve handle. Wiring the sprinkler supervisory devices on the same initiating device circuit with the waterflow switch is forbidden. Existing devices shall be reused if the devices are in good operating condition.
- B. Electrical generators shall be supervised for running and malfunction conditions. If dry contacts are not provided at the generator, provide accessory SPDT relays for the required supervision. Existing relays shall be reused if the relays are in good operating condition.
- C. High and low air pressure devices shall be provided for all dry sprinkler systems. These devices will be monitored by point addressable monitoring modules. Existing relays shall be reused if the relays are in good operating condition.
- D. Air compressors for all dry sprinkler systems shall be monitored for failure by point addressable interface modules.
- E. Addressable point monitoring modules shall be used to monitor all supervisory points. The monitoring modules shall provide Style B electrical supervision of monitored devices. The interface modules shall provide Style B electrical supervision of monitored devices and be equipped with terminal strips or terminal blocks.

2.08 ALARM NOTIFICATION APPLIANCES

- A. Strobe units, listed to UL Standard 1971, shall be semi-flush type, wall mounted or ceiling mounted. The units shall operate on 24 volt DC polarized power. All strobes shall be synchronized from the FACP, RTP or RPS. Strobes shall be sized to provide a minimum of .0375 lumens per square foot in the area or room of installation excluding corridors. Strobes shall have the following features:
 - 1. Corrosion, vibration and vermin resistance.
 - 2. Screw terminals for in/out wiring.
 - 3. The color of the strobe cover shall be white.

4. Mount on a standard electrical box.
 5. Surface mounting back boxes shall be smooth sided, without knockouts and painted to match the color of the strobe.
 6. System Sensor is the only acceptable notification appliance manufacturer per the UTHSCSA AHJ.
 7. All strobes shall be tapped at a minimum of 30 candela per the UTHSCSA AHJ.
 8. Outdoor strobe units shall be UL listed 1638 (Standard for Visual Signaling Appliances) for Indoor/Outdoor use and have a temperature range of -31°F to 150°F. The candela rating shall be displayed at its lowest UL listed temperature.
- B. Speakers shall be UL listed to Standard 1480 for fire alarm system use and have multi-tap matching transformers providing individual audio power settings from 1/4 watt to at least 2 watts for ceiling or wall mounting. The Contractor may provide a speaker with lower audio power settings, but must provide the required sound pressure levels in all areas or provide additional speakers at no additional cost to The University. Mounting shall be flush in finished areas and surface in unfinished areas. Speakers shall have the following features:
1. Corrosion, vibration and vermin resistance.
 2. Multi-tap power selection.
 3. Screw terminals for in/out wiring.
 4. The color of the speaker plate shall be white.
 5. Mount on a standard electrical box.
 6. Strobes may be combined with speakers.
 7. Surface mounting back boxes shall be smooth sided, without knockouts and painted to match the color of the speaker.
 8. Indoor speakers shall be tapped at a minimum setting of 1 watt per the UTHSCSA AHJ.
 9. Outdoor speakers shall be UL-Listed for an exterior environment and be capable of being tapped at a minimum of a 7 watt setting per the UTHSCSA AHJ.
 10. System Sensor is the only acceptable notification appliance manufacturer per the UTHSCSA AHJ.
- C. The notification appliances shall provide the following minimum sound pressure levels:
1. 15 dBA above ambient sound levels.
 2. 5 dBA above maximum sound levels.
 3. 90 dBA in mechanical areas.
 4. Sound levels shall not exceed 110 dBA.
- D. Unless otherwise indicated in these bid documents the fire alarm system shall be designed using the average ambient sound pressure levels as shown in NFPA 72 Section A.7.4.2.

2.09 CONTROL DEVICES

- A. Provide control relays/contacts in the fire alarm control panel for fan shutdown control sequence. The control relays/contacts shall be 24-volt DC low voltage type, each with number of contacts as required and housed in metal enclosure. The contacts shall be rated as required for continuous duty.
- B. Provide control relays/contacts for elevator control functions. The control relays/contacts shall be 24-volt DC low voltage type, each with number of contacts required and housed in metal enclosure located adjacent to the elevator equipment. The contacts shall be rated as required for continuous duty.
- C. Provide control relays/contacts for elevator power shunt trip. The control relays/contacts shall be 24-volt DC low voltage type, each with number of contacts required and housed in metal enclosure located adjacent to the shunt trip breaker. The contacts shall be rated as required for continuous duty.
- D. Electro-magnetic door hold open devices shall be powered by 24-volt DC circuits provided from the fire alarm system.
- E. Power supplies used for operation of control relays, contacts, step-down relays or similar applications shall be supervised by the fire alarm system for trouble conditions.
- F. Addressable point control devices shall be used to provide required control functions. Control devices used for activation of fire suppression systems or similar releasing equipment shall be listed for Releasing Service. Control relays connected to unsupervised circuits shall be located within 3 feet of the controlled device.

2.10 DOOR UNLOCKING SYSTEM

- A. All electric locks, strikes and power supplies for this subsystem are existing.
- B. Point addressable control module electric lock release circuits shall be installed to allow the fire alarm system to override all security functions on any fire alarm signal.
- C. Point addressable control modules shall be combined electronically to provide one master electric door lock switch that shall be mounted in the FCR.

2.11 REMOTE ANNUNCIATORS:

- A. The remote liquid crystal display (LCD) annunciator shall include, at a minimum, control function keys, digital display window, programming keys and key-operated lockout capability. The time shall be permanently displayed on the LCD and shall be visible at all times. The LCD shall be supervised by the FACP, backlit, and display a minimum of two lines with 80 alphanumeric characters. The LCD annunciator shall be equipped with an internal sounder that may be silenced locally.

PART 3 EXECUTION

3.01 INSTALLATION

- A. All equipment shall be installed in accordance with the manufacturer's recommendations and UL listing limitations.
- B. The Fire Alarm System Supplier shall furnish on-the-job supervision for the proper installation of their devices in cooperation with, or as may be required by, other trades. The supervisor shall be

qualified and experienced in the installation, inspection and testing of the fire alarm system. This supervision shall include, but not be limited to, the following:

1. Provide specific on-site instructions to others on mounting and installation of each type of device by physically observing the mounting of one or more of each type of device, as required, to assure that the installer is properly instructed in the work.
 2. Provide other supervision as required by the trades to properly perform alarm installation work.
 3. Perform a complete test of the system, certifying that all devices have been activated and that the devices and systems perform in accordance with the requirements of these specifications and applicable codes.
 4. Install, test, trouble-shoot and correct all system software provided under these specifications. This includes, but is not limited to, actual keyboard entry, reprogramming required to meet these specifications and any other task associated with the system software.
 5. Provide record drawings and detailed wiring diagrams as required by these specifications and applicable codes.
- C. The Fire Alarm Contractor shall furnish all material and labor to provide a complete and functional system that operates in accordance with the requirements of these specifications and applicable codes. This shall include, but not be limited to, the following:
1. Conduit, raceway and wiring systems as indicated herein.
 - a. The use of plenum cable is acceptable.
 - b. All wiring shall be concealed. No wiring shall be visible in any public spaces.
 - c. Boxes exposed to weather, moisture, at or adjacent to water or steam connections, at sprinkler waterflow switches and supervisory switches shall be corrosion-resistant, cast-metal weatherproof boxes of types, shapes, and sizes, including depth of boxes with threaded conduit ends, cast metal face plates suitable for each application, including face plate gaskets and corrosion resistant fasteners. Indented or setscrew fittings are not allowed.
 - d. Where portions of a cable raceway or sleeve is known to be subjected to different temperatures or where condensation is known to be a problem as in cold storage areas of buildings or where passing from the interior to the exterior of the building, the raceway or sleeve shall be filled with an approved material to prevent the circulation of warm air to a colder section of the raceway or sleeve.
 - e. Conduit shall not enter the control panels or back boxes except where entry is specified by the manufacturer.
 - f. All riser wiring and wiring between floors shall be installed in conduit.
 - g. All floor conduit penetrations shall include core sleeves that extend a minimum of 2" AFF per UTHSCSA AHJ.
 - h. Install the fire alarm system conduit or approved raceway, parallel to building structure and follow the building contours as much as practical to present a neat appearance.

- i. All conduit, fittings, boxes, fasteners, etc. shall have corrosion resistance suitable for the environment in which they are installed.
- j. All wire shall be new and be UL listed for use in fire alarm systems.
- k. Strap or bundle all cables and wires inside equipment enclosures and terminal cabinets, parallel to the enclosure sides.
- l. Install conduit in exposed ceiling area (at structure) of electrical rooms, mechanical rooms and in other similar rooms where ceilings are not called for.
- m. Wires not installed in raceways shall be concealed above the ceiling and shall not be strapped, taped or attached by any means to conduit or the fire sprinkler system for support. Wiring shall be attached to the building structure and installed above all equipment, piping, and ducts. Wiring shall not be installed touching the ceiling.
- n. An insulating type bushing shall be installed where fire alarm cable or conductors emerge from a conduit or raceway.
- o. Wires not installed in raceways passing through either factory or field punched, cut or drilled slots or holes in metal framing members shall be protected by bushings or grommets securely fastened in place prior to installation of the cable.
- p. Wires not installed in raceways shall be supported independent of the ceiling assembly and associated support wires.
- q. Wire:
 - (1) Wire used for 120 VAC power circuits shall be minimum size of 12 AWG stranded copper conductors.
 - (2) Wire used for 24 VDC power circuits and strobe circuits shall be minimum size of 14 AWG solid copper conductors and UL listed for fire alarm use.
 - (3) Wire used for point addressable, signaling line circuits, and Network transmission systems shall be minimum size of 18 AWG solid copper conductor, UL listed for fire alarm system use.
 - (4) Wire shall be UL listed for use in fire alarm signaling systems or as required by NFPA 70, Article 760.
 - (5) All wire shall be a solid conductor of copper, minimum size of No. 18 AWG.
 - (6) All wire shall meet the requirements and recommendations of the system manufacturer.

2. Power Supplies:

- a. Dedicated primary 120 VAC power from the nearest emergency power panel shall be connected to each fire alarm control panel, remote transponder panel and strobe power supply panels. A single 120 VAC circuit may provide power to more than one panel and to more than one level.
- b. Dedicated lockable breakers shall be provided for fire alarm system power circuits and marked with red. Existing breakers shall be provided with a locking device.

- c. Contractor shall update panel directories to indicate circuits providing power to fire alarm equipment.
 - d. No fire alarm system 120 VAC primary power circuit shall be loaded beyond 80 percent of the circuit's rated capacity.
 - e. Design load connected to any power supply/standby battery shall not exceed 80% of its rated capacity.
- 3. Conduit:
 - a. New conduit shall be 3/4-inch minimum size and be EMT type except where otherwise required by local code or these specifications.
 - b. All EMT conduit fittings shall be compression type unless otherwise indicated.
 - c. All conduit fittings shall be threaded with plastic inserts or bushings.
 - d. Flexible conduit and associated junction boxes connecting sprinkler waterflow and supervisory switches shall be water resistant when subject to moisture.
 - e. Use conduit expansion fittings or flexible raceways across all building expansion joints.
- 4. Junction Boxes:
 - a. Sectional boxes shall not be used.
 - b. Each box shall be large enough to accommodate required splices and conduit in accordance with the NFPA 70.
 - c. All box covers shall be painted red.
- 5. Field Terminal Cabinets (FTC):
 - a. FTC shall be UL listed for use in electrical wiring systems.
 - b. FTC minimum size shall be 12 inches by 12 inches by 4 inches with hinged lockable cover or plate cover attached with tamper resistant screws.
 - c. FTC shall be painted red with label "Fire Alarm Equipment" stenciled on cover.
 - d. UL listed terminal strips shall be provided for all wiring splices in terminal boxes. All terminals shall be permanently labeled. The use of wire nuts to make wiring splices in the FTC is strictly prohibited.
- 6. All conductor terminations in the FACP, RTP and RPS panels and splices inside the FTC shall be identified with a means that is neat, legible, and permanent such as by tags, pressure sensitive tape or cable ties.
- 7. Patching of all walls, floors and ceilings that are penetrated or damaged during construction and returning the surface to a condition matching existing adjacent surfaces.
 - a. All slab penetrations shall be completely sealed and made watertight.
 - b. Restore all firewalls to rated conditions.

8. Repairing and patching surfaces to match existing finish.
 9. X-raying or Ground Penetrating Radar scans of floor areas prior to core drilling.
 10. All coring and sleeving required.
- D. Mounting:
1. Manual stations in finished areas shall be mounted in flush boxes unless otherwise noted. Manual stations located in unfinished areas shall be surface mounted on back boxes provided by the device manufacturer. All manual stations shall be mounted between 42 and 48 inches AFF as measured to the pull lever. The minimum clear floor space at each manual pull station shall be 30"x 48" centered on the station: For frontal approach, the 48" dimension shall be oriented perpendicular to the wall; for parallel approach, the 48" dimension shall be oriented parallel to the wall.
 2. Wall mounted strobe lights shall be located between 80 inches and 96 inches AFF in all areas.
 3. Wall mounted speakers shall be mounted a minimum of 90 inches AFF. Where combination horn/strobes are provided, they shall be mounted between 80 inches and 96 inches AFF.
 4. All alarm devices shall be mounted in accordance with the manufacturer's installation instructions and use the manufacturer's suggested mounting box.
 5. Surface mounted back boxes for speakers and strobes shall be smooth sided, without knockouts and painted to match the color of the device. Use of standard electrical boxes for surface mounted equipment is prohibited.
 6. Point addressable monitor modules and control modules shall be securely mounted in back boxes or mounted on rails within a larger enclosure. The use of wire nuts to make connections to these modules is strictly prohibited.
 7. Panels including Fire Alarm, Annunciators and Remote Transponders shall be mounted so that no control switch or visible indicator will be installed less than 36 inches AFF or greater than 72 inches AFF.
 8. All flush and semi-flush devices or panels shall be installed with trim rings or cover plates.
 9. Locations in ceilings or walls where existing devices have been removed shall be covered with custom cover plates finished to match the decor. Locations on granite walls shall have stainless steel cover plates. The cover plates shall fully cover the opening by at least ½-inch on all sides. Where the cover plate does not cover the opening, the Contractor shall paint and patch the opening. Locations in lay in ceilings where existing devices have been removed shall have the ceiling tile replaced.
 10. All panels visible to the public or noted on the drawings shall be finished as approved by the Architect or Owner.
- E. Repairing and patching surfaces to match existing finish.
- F. X-raying or Ground Penetrating Radar scans of floor areas prior to core drilling.
- G. All coring and sleeving required.

- H. Pay for all fees and charges required for this work. This shall include, but not be limited to, the following:
 - 1. Costs associated with disposal of ionization type smoke detectors and equipment removal.
- I. The existing building fire alarm system shall remain operational during the installation of the new fire alarm system. As new equipment is installed, it shall be labeled "NOT IN SERVICE" until the new equipment is accepted. Upon acceptance of the new fire alarm system and placement into service, all new equipment shall have tags removed and the existing equipment shall be tagged "NOT IN SERVICE" until removed from the building.
- J. At no time shall the fire alarm system or sprinkler system be out of service without written notification to The University.
- K. Remove designated devices and repair surface to match the existing area.
- L. Removed equipment shall be given to The University by the Fire Alarm Contractor. If The University refuses the equipment the Fire Alarm Contractor is responsible for disposal.
- M. The Contractor is responsible for replacing all removed ceiling tiles at the end of each work day.

3.02 PAINTING, PATCHING AND FIRESTOPPING

- A. Repair and patch surfaces to match existing finish.
- B. The Contractor shall patch the opening so that the area to be patched is not readily apparent to the casual viewer.
- C. Painted surfaces shall be painted by the Contractor to the nearest angled surface. The painted surface shall not be readily apparent to the casual viewer.
- D. Where small fire alarm system devices (manual pull stations, fire fighter's phone jacks, etc.) are removed, provide a stainless steel or other painted to match plastic cover plate.
- E. Where devices are removed from lay-in ceiling tiles, the Contractor shall provide matching replacement tiles.
- F. Firestopping shall be installed wherever the conduits penetrate floors and fire walls. The firestopping material shall meet the requirements of UL 1479.
- G. Installation of firestopping:
 - 1. Install firestopping in accordance with the manufacturer's recommendations and as necessary to meet the specified fire rating requirements.
 - 2. Where firestopping is used to seal around penetration through waterproof membranes, install to maintain integrity of waterproof barrier.
 - 3. Contractor shall document specific fire stopping systems and methods used for each location. Documentation shall be issued to the Engineer prior to field inspections.
- H. Patching of all walls, floors and ceilings that are penetrated or damaged during construction and returning the surface to a condition matching existing adjacent surfaces.

1. All slab penetrations shall be completely sealed and made watertight. All floor conduit penetrations shall include core sleeves that extend a minimum of 2" AFF per UTHSCSA AHJ.
2. Restore all firewalls to rated conditions.

3.03 TESTS/FIELD QUALITY CONTROL

- A. The final alarm acceptance test shall be coordinated with the Engineer. Prior to the acceptance test, the Contractor shall conduct a full pre-test of the system to certify proper operation. A letter certifying that the installation is complete and fully operational shall be forwarded to The University and Engineer.
- B. Prior to the start of acceptance testing the Contractor shall provide the Engineer a system printout documenting pretesting of each device. The documentation shall be delivered to the Engineer to allow sufficient time to allow review the document prior to the start of the acceptance testing. If the as-built conditions have changed from the original submittal drawing, the Contractor shall provide updated as-built drawings as a reference to the testing printout.
- C. Prior to the start of acceptance testing, the Contractor shall provide the Engineer with a printout of the system point numbers, point descriptions, English messages, event control description and sequence of system operation.
- D. Prior to the start of the acceptance test, the Contractor shall measure all circuits and record resistance, stray voltage, and other items required by NFPA 72. Measurement records shall be issued to the Engineer at the start of the test.
- E. Prior to the start of the acceptance test, the Contractor shall measure all duct smoke detector pressure differential readings as required by NFPA 72. Measurement records shall be issued to the Engineer prior to the start of the test.
- F. Prior to the start of the acceptance test, the Contractor shall measure the dBA readings in all of the rooms and all the corridors for the minimum sound pressure levels.
- G. The University, Fire Alarm Contractor, Fire Alarm System Supplier, the Engineer and an authorized representative from each supplier of equipment shall be in attendance at the final acceptance test to make necessary adjustments. A final test shall be conducted in accordance with NFPA 72 and the Fire Prevention Bureau requirements. The test shall include, but not be limited to:
 1. A test of the complete system for grounded, open and shorted circuits.
 2. A test of each alarm-initiating device for functions specified and for the required alarm actions.
 3. A test to verify smoke entry into sensing chamber of smoke detectors.
 4. A test of the system for electrical supervision.
 5. A test to verify that the emergency power source is capable of operating the system for specified periods.
 6. A test to verify that alarm signals will operate under specified trouble conditions.
 7. A test to verify that the system will operate under specified trouble conditions.
 8. A test to verify that the system will perform all specified tasks.

9. A test to verify that audible sound level coverage has been achieved.
 10. A test to verify that sound uniformity of the voice alarm system has been achieved and is intelligible in all areas of coverage, including outdoor systems.
 11. A test to verify remote monitoring transmission will operate as required.
 12. A test to verify alarm conditions are received at these locations: UT Police Emergency Communications Center, Facilities Management Control Room, and Environmental Health & Safety office.
- H. During the system testing, the Contractor shall provide at the site a wide carriage printer or laptop computer connected to the FACP to document system testing. The Contractor shall provide a copy of the printed record to the Engineer.
- I. The Contractor shall provide all materials, equipment, coordination and personnel necessary to perform and document all required tests. All test equipment shall be subject to approval by The University and Engineer.
- J. If the system requires a retest by the Engineer or The University, all costs of the retest shall be the responsibility of the Fire Alarm Contractor.
- K. The Contractor shall be responsible to coordinate and pay for cost for all personnel and Contractors to complete pre-tests and final tests.
- L. Acceptance testing must be conducted in a professional manner which does not impact essential business operations. Coordinate testing schedule with UTHSCSA FM construction manager.

3.04 TRAINING

- A. Provide training of operating personnel in proper system operation and required user maintenance procedures.
- B. Three (3) hard copy and one (1) electronic copy of operating manuals detailed in Specification 01700 Section 1.05.E.
- C. Two separate 4-hour training sessions for operating personnel. These sessions are to cover proper operating and response procedures. These instructions shall be sufficient to enable a previously untrained person to properly operate the system. Video and sound recording of new fire alarm system training shall be provided.
- D. Provide three (3) hard copy and one (1) electronic copy of software manuals containing a listing of all points, event programs, basic programming and instructions, and software trouble-shooting information.

3.05 RECORD DOCUMENTS

- A. Provide documentation in accordance with Division 1 and the following.
- B. Provide three (3) blackline prints, and a set of disks in AutoCAD 2000 of drawings, floor plans with device locations, device addresses, wire routing and wiring diagrams reflecting "as-built" conditions to The University.
- C. Provide three (3) complete hard copy sets and one (1) electronic copy of "as-built" data sheets for all system-connected equipment to The University.

- D. Provide three (3) complete hard copy sets and one (1) electronic copy of "as-built" software listing of all data files, event programs, print statements, points' lists, etc. to The University.
- E. Provide the complete site-specific project-programming software file on diskette with passwords to The University.
- F. Provide one (1) copy of the project specifications, including addenda and contract modifications to The University.
- G. Provide three (3) hard copy sets and one (1) electronic copy of customized "as-built" operating manuals to The University.
- H. Update fire alarm graphics to show device location on master fire alarm network.
- I. Provide NFPA 72 Fire Alarm System Record of Completion form.
- J. Provide NFPA 72 Installation and Testing Form.
- K. Texas Department of Insurance Fire Alarm Installation Certificate (FML-009A form).
- L. Texas Department of Insurance Fire Alarm System Installation Inspection Form.
- M. Provide one (1) electronic copy of all forms listed in Sections 3.05.G, H, I and J.
- N. All items of this section shall be provided prior to final payment request.

3.06 SPARE PARTS

- A. All spare parts shall be directly interchangeable with the corresponding components of the installed systems.
 - 1. Two point addressable manual stations.
 - 2. Two point addressable spot smoke detectors and bases.
 - 3. One point addressable spot type heat detector and base.
 - 4. One point addressable duct smoke detector with housing.
 - 5. One duct detector remote test switch.
 - 6. Two point addressable monitoring modules.
 - 7. Two speakers of each type.
 - 8. Two strobe lights of each type.
 - 9. Two point addressable control modules.
 - 10. Three sets of keys for each type of lock.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 31 00 00 00 - GEOTECHNICAL REPORT AND GUIDELINES FOR THE RESULTING FOUNDATION DESIGN**31 00 00 001: GENERAL****1.01 Scope of Standard**

A. This standard provides general guidance concerning the specific preferences of the UTHSCSA for the preparation of a geotechnical report and guidelines for the resulting foundation design.

B. UT recognizes that project conditions and requirements vary, thus precluding the absolute adherence to the items identified herein in all cases. However, unless there is adequate written justification, it is expected that these guidelines will govern the design and specifications for UT projects.

1.02 Related Standards

A. Structural Systems (currently The UTHSCSA Office of Facilities Planning and Construction Owner's Design Guidelines, Section K, Structural Criteria).

B. Cast-in-place Concrete.

1.03 General Requirements

A. Review copies of any available geotechnical reports at or near the location(s) of proposed construction. The scope of work for the geotechnical engineer retained to provide the investigation and report shall be based on the available information and preliminary design information for the proposed structure(s), including layout, column or continuous loadings, loading types and conditions, subgrade depth, and/or any other information that would make the recommendations included in the final report more specific to the design.

B. Coordinate with the UTHSCSA Utilities engineering to determine all current or future obstructions that may affect the foundation design. This coordination effort shall be initiated as soon as possible before beginning design work to assure that obstructions are accounted for in the design.

C. Maximum foundation loads shall include all proposed or current loading, as well as any anticipated loading due to renovations or additions to the structure(s). Coordinate with the UTHSCSA.

D. Coordinate all work on campus. This shall include Parking & Traffic, UTPD, any other entities who might be effected by work.

PART 2: PRODUCTS**2.01 Geotechnical Report**

A. The geotechnical report shall be prepared and sealed by a registered geotechnical engineer with five (5) years of continuous related work in the Austin area.

Geotechnical Report and Guidelines for the Resulting
Foundation Design

May 2013

B. All geotechnical work and recommendations shall be supervised by a professional engineer registered in the state of Texas.

C. As a minimum, the geotechnical report shall test, study, discuss, indicate on drawings, and/or present in charts, tables, or graphs the following:

1. Background information.

- a. The general topography of the site as it affects the foundation design and construction, including surface conditions, site irregularities, or other elements that could affect the foundation design.
- b. The general geology of the site with particular emphasis on the main geological formations underlying the proposed structure(s).
- c. The location of utilities or other known obstructions.
- d. The previous known construction history at or near the site and, where applicable, any known problems or failures attributable to the site conditions and subgrade.
- e. Any special conditions, such as faults, seasonal fluctuations, erosion, etc.
- f. Test methods.

2. Boring location plan.

3. Generalized subsurface profiles, indicating stratigraphic and structural relationships.

4. General foundation construction requirements including loading capabilities and construction limitations.

5. Evaluation of groundwater conditions, including the anticipated effects on construction, the performance of the completed structure(s), and the recommended method(s) for handling groundwater during construction and in the completed structure(s).

6. 25, 100, and 500 year flood plains.

7. Recommendations for earthwork, subgrade preparation, and fill placement and compaction.

8. The acceptability of on-site materials for construction.

9. Excavation procedures.

10. Any other items that could effect construction or the long-term performance of the foundation.

D. As applicable to specific project requirements, the geotechnical report shall test for, study, discuss, indicate on drawings, and/or present in charts, tables, or graphs the following:

1. Lateral earth pressures, both active and passive.

2. Temporary construction procedures and support systems.
3. Dewatering procedures and equipment.
4. Subgrade drainage.
5. Trench safety.
6. Subgrade stabilization.
7. Piling, drilled shafts, and sheet piling.

E. The number, depths, and locations of borings shall be determined based on the proposed structure and in coordination with the geotechnical engineer retained.

2.02 Miscellaneous Materials

- A. Polyethylene sheeting shall be used below all slabs-on-grade. The sheeting shall be a minimum of 6 mils and overlapped a minimum five (5) feet at joints.
- B. For structures that will be subject to high plasticity soils, use a foundation isolation system.
- C. Provide a subgrade drainage system at the perimeter of all foundation elements that will have occupied spaces on one side and exposed earth on the other side. The system may be required to drain into water-recovery system. Subgrade drainage shall be as recommended by the geotechnical report and shall include the following:
 1. Drainage pipe, draining to a well-point system or free drainage.
 2. Course filter material in a drainage trench surrounding the drainage pipe.
 3. Drainage fabric surrounding the drainage pipe and course filter material.
 4. Drainage backfill over the drainage trench, to a depth as recommended by the geotechnical report
 5. Other methods and products as recommended by the geotechnical engineer and as approved by the UTHSCSA.

PART 3: EXECUTION

3.01 Excavation

- A. Photo document site prior to commencement of work.
- B. Protect adjacent structures.
- C. Blasting is not permitted.

Geotechnical Report and Guidelines for the Resulting
Foundation Design

May 2013

D. Provide protection at open excavation work and trenches.

3.02 Foundation Design

The foundation drawings shall include the following as a minimum:

A. Limits of the required work.

B. Existing and final contours coordinated with established benchmarks.

C. Locations, inverts, gradients, and dimensions of new utilities and trenches where related to the foundation elements.

D. Locations of exiting utilities or obstructions to remain or be demolished as a part of the foundation work.

E. Plan and details of all foundation elements.

F. Subgrade drainage.

G. Any specialized construction detailing.

END OF STANDARD

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 31 05 13 00 - EARTHWORK**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 DEFINITIONS

- A. Excavation consists of removal of material encountered to subgrade elevations indicated and subsequent disposal of materials removed.
- B. Subgrade: The uppermost surface of an excavation or the top surface of a fill or backfill immediately below subbase, drainage fill, or topsoil materials.
- C. Borrow: Soil material obtained off Site when sufficient approved soil material is not available from excavations.
- D. Subbase Course: The layer placed between the subgrade and base course in a paving system or the layer placed between the subgrade and surface of a pavement or walk.
- E. Base Course: The layer placed between the subbase and surface pavement in a paving system.
- F. Drainage Fill: Course of washed granular material supporting slab on grade placed to cut off upward capillary flow of pore water.
- G. Unauthorized excavation consists of removal of materials beyond indicated subgrade elevations or dimensions without specific direction of Owner. Unauthorized excavation, as well as remedial work directed by Owner, shall be at Contractor's expense.
 - 1. Under footings, foundation bases, or retaining walls, fill unauthorized excavation by extending indicated bottom elevation of footing or base to excavation bottom, without altering required top elevation. Lean concrete fill may be used to bring elevations to proper position, when acceptable to Owner.
 - 2. In locations other than those above, backfill and compact unauthorized excavations as specified for authorized excavations of same classification, unless otherwise directed by Owner.

- H. Additional Excavation: When excavation has reached required subgrade elevations, notify Owner, who will make an inspection of conditions. If Owner determines that bearing materials at required subgrade elevations are unsuitable, continue excavation until suitable bearing materials are encountered and replace excavated material as approved by Owner. The Contract Sum may be adjusted by an appropriate Contract Modification.
 - 1. Removal of unsuitable material and its replacement as directed will be paid on basis of Conditions of the Contract relative to changes in work.
- I. Subgrade: The undisturbed earth or the compacted soil layer immediately below granular subbase, drainage fill, or topsoil materials.
- J. Structure: Buildings, foundations, slabs, tanks, curbs, or other man made stationary features occurring above or below ground surface.

1.04 QUALITY ASSURANCE

- A. Codes and Standards: Perform excavation work in compliance with applicable requirements of authorities having jurisdiction.
- B. Testing and Inspection Service: Owner will employ and pay for a qualified independent geotechnical testing and inspection laboratory to perform soil testing and inspection service during earthwork operations.
- C. Testing Laboratory Qualifications: To qualify for acceptance, the geotechnical testing laboratory must demonstrate to Owner's satisfaction, based on evaluation of laboratory submitted criteria conforming to ASTM E 699, that it has the experience and capability to conduct required field and laboratory geotechnical testing without delaying the progress of the Work.

1.05 PROJECT CONDITIONS

- A. Site Information: Data in subsurface investigation reports was used for the basis of the design and are available to the Contractor for information only. Conditions are not intended as representations or warranties of accuracy or continuity between soil borings. The University will not be responsible for interpretations or conclusions drawn from this data by Contractor.
 - 1. Additional test borings and other exploratory operations may be performed by Contractor, at the Contractor's option; however, no change in the Contract Sum will be authorized for such additional exploration.
- B. Existing Utilities: Locate existing underground utilities in areas of excavation work. If utilities are indicated to remain in place, provide adequate means of support and protection during earthwork operations.
 - 1. Should uncharted, or incorrectly charted, piping or other utilities be encountered during excavation, consult utility Owner immediately for directions. Cooperate with Owner and utility companies in keeping respective services and facilities in operation. Repair damaged utilities to satisfaction of utility Owner.
 - 2. Do not interrupt existing utilities serving facilities occupied by Owner or others, during occupied hours, except when permitted in writing by Owner and then only after acceptable temporary utility services have been provided.
 - a. Provide minimum of 48 hour notice to Owner, and receive written notice to proceed before interrupting any utility.
 - 3. Demolish and completely remove from Site existing underground utilities indicated to be removed. Coordinate with utility companies for shutoff of services if lines are active.

- C. The use of explosives is not permitted.
- D. Barricade open excavations occurring as part of this work and post with warning lights.
 - 1. Operate warning lights as recommended by authorities having jurisdiction.
 - 2. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations.
 - 3. Perform excavation by hand within dripline of large trees to remain. Protect root systems from damage or dryout to the greatest extent possible. Maintain moist condition for root system and cover exposed roots with moistened burlap.

PART 2 - PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 SOIL MATERIALS

- A. Provide approved borrow soil materials from off Site when sufficient approved soil materials are not available from excavations.
- B. Satisfactory Soil Materials: ASTM D 2487 soil classification groups GW, GP, GM, SW, SP, and SM; free of rock or gravel larger than 2 inches in any dimension, debris, waste, frozen materials, vegetation and other deleterious matter.
- C. Unsatisfactory Soil Materials: ASTM D 2487 soil classification groups GC, SC, ML, MH, CL, CH, OL, OH, and PT.
- D. Backfill and Fill Materials: Satisfactory soil materials.
- E. Select Fill Material: Sandy clay or clayey sand with a Plasticity Index of between 7 and 20, with a minimum Liquid Limit of 30, with less than 50 percent by weight passing a No. 200 sieve, and free of rock or gravel larger than 2 inches in any dimension, debris, waste, vegetable, or other deleterious matter.
- F. Base Material: Uniformly graded mixture of natural or crushed gravel, or crushed stone, or crushed slag, or natural or crushed sand, conforming to the fine aggregate (Concrete Sand) requirements of ASTM C 33 with 100 percent passing a ¼ inch sieve and 2 percent to 10 percent passing a No. 100 sieve.
- G. Subbase Material: Uniformly graded mixture of natural or crushed gravel, or crushed stone, or crushed slag, or natural or crushed sand, conforming to the fine aggregate (Concrete Sand) requirements of ASTM C 33 with 100 percent passing a ¼ inch sieve and 2 percent to 10 percent passing a No. 100 sieve.
- H. Bedding Material: Subbase or base materials with 100 percent passing a 1 inch sieve and not more than 8 percent passing a No. 200 sieve.
- I. Drainage Fill: Uniformly graded mixture of natural or crushed gravel, crushed stone, and natural sand, conforming to the fine aggregate (Concrete Sand) requirements of ASTM C 33, with 100 percent passing a ¼ inch sieve and 2 percent to 10 percent passing a No. 100 sieve.

- J. Filtering Material: Evenly graded mixture of natural or crushed gravel or crushed stone and natural sand, with 100 percent passing a 1½ inch sieve and 0 to 5 percent passing a No. 50 sieve.
- K. Impervious Fill: Lean clay with a Liquid Limit of less than 50 and capable of compacting to a dense composite.
- L. Cement Stabilized Sand Backfill Material: Uniformly graded mixture of natural or crushed stone, crushed slag or natural or crushed sand conforming to the fine aggregate (Concrete Sand) requirements of ASTM C 33 with 100 percent passing a ¼ inch sieve and less than 15 percent passing a No. 200 sieve and not less than 1½ sacks of portland cement conforming to ASTM C 150, Type 1 requirements per cu. yd. of mixture and enough water free of deleterious materials to produce a mix suitable for mechanical hand compaction. Stamp batch tickets at plant with time of loading. Material not compacted in place 1 1/2 hours after loading or material which has taken an initial set will be rejected and shall be removed from the Project Site.

2.03 FOUNDATION DRAINAGE SYSTEM MATERIALS

- A. Drainage Fill: Uniformly graded mixture of natural or crushed gravel, crushed stone, and natural sand, conforming to the fine aggregate (Concrete Sand) requirements of ASTM C 33, with 100 percent passing a ¼ inch sieve and 2 percent to 10 percent passing a No. 100 sieve.
- B. Filtering Material: Uniformly graded mixture of natural or crushed gravel, or crushed stone and natural sand conforming to ASTM C 33, Coarse Aggregate Size No. 67, with 100 percent passing a 1 inch sieve and 0 percent to 5 percent passing a No. 8 sieve.
- C. Drainage Pipe: Provide 4 inch diameter PVC SDR 21 plastic pipe complying with ASTM D 2241, and with 0.125 inch wide slots spaced uniformly around drainage pipe to provide a minimum 10 percent open area, based on the surface area of the pipe.
- D. Filter Fabric: Mirafi No. 140N or equivalent accepted by Owner.
- E. Prefabricated Drainage Structure: Mirafi "Miradrain" or equivalent accepted by Owner.

2.04 ACCESSORIES

- A. Detectable Warning Tape: Acid and alkali resistant polyethylene film warning tape manufactured for marking and identifying underground utilities, 6 inches wide and 4 mils thick minimum, continuously inscribed with a description of the utility, with metallic core encased in a protective jacket for corrosion protection, detectable by metal detector when tape is buried up to thirty inches deep.
 - 1. Provide tape colors to utilities as follows:
 - a. Red: Electric
 - b. Yellow: Gas, oil, steam, and dangerous materials
 - c. Orange: Telephone and other communications
 - d. Blue: Water systems
 - e. Green: Sewer systems

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

3.02 EXCAVATION

- A. Excavation is unclassified and includes excavation to subgrade elevations indicated, regardless of character of materials and obstructions encountered.

3.03 STABILITY OF EXCAVATIONS

- A. Comply with local codes, ordinances, and requirements of agencies having jurisdiction.
- B. Slope sides of excavations to comply with local codes, ordinances, and requirements of agencies having jurisdiction. Shore and brace where sloping is not possible because of space restrictions or stability of material excavated. Maintain sides and slopes of excavations in safe condition until completion of backfilling.
- C. Shoring and Bracing: Provide materials for shoring and bracing, such as sheet piling, uprights, stringers, and cross braces, in good serviceable condition. Maintain shoring and bracing in excavations regardless of time period excavations will be open. Extend shoring and bracing as excavation progresses.
 - 1. Provide permanent steel sheet piling or pressure creosoted timber sheet piling wherever subsequent removal of sheet piling might permit lateral movement of soil under adjacent structures. Cut off tops a minimum of thirty inches below final grade and leave permanently in place.

3.04 DEWATERING

- A. Prevent surface water and subsurface or ground water from flowing into excavations and from flooding Project Site and surrounding area.
 - 1. Do not allow water to accumulate in excavations. Remove water to prevent softening of foundation bottoms, undercutting footings, and soil changes detrimental to stability of subgrades and foundations. Provide and maintain pumps, well points, sumps, suction and discharge lines, and other dewatering system components necessary to convey water away from excavations.
 - 2. Establish and maintain temporary drainage ditches and other diversions outside excavation limits to convey rain water and water removed from excavations to collecting or runoff areas. Do not use trench excavations as temporary drainage ditches.

3.05 STORAGE OF EXCAVATED MATERIALS

- A. Stockpile excavated materials acceptable for backfill and fill where directed. Place, grade, and shape stockpiles for proper drainage.
 - 1. Locate and retain soil materials away from edge of excavations. Do not store within drip line of trees indicated to remain.
 - 2. Dispose of excess excavated soil material and materials not acceptable for use as backfill or fill.

3.06 EXCAVATION FOR STRUCTURES

- A. Conform to elevations and dimensions shown within a tolerance of plus or minus 0.10 foot, and extending a sufficient distance from footings and foundations to permit placing and removal of concrete formwork, installation of services, and other construction and for inspection.
 - 1. Excavations for footings and foundations: Do not disturb bottom of excavation. Excavate by hand to final grade just before concrete reinforcement is placed. Trim bottoms to required lines and grades to leave solid base to receive other work.
 - 2. For pile foundations, stop excavations from 6 inches to 12 inches above bottom of footing before piles are placed. After piles have been driven, remove loose and displaced material. Excavate to final grade, leaving solid base to receive concrete pile caps.
 - 3. Excavation for Underground Tanks, Basins, and Mechanical or Electrical Structures: Conform to elevations and dimensions indicated within a tolerance of plus or minus 0.10 foot; plus a sufficient distance to permit placing and removal of concrete formwork, installation of services, and other construction and for inspection. Do not disturb bottom of excavations, intended for bearing surface.

3.07 EXCAVATION FOR PAVEMENTS

- A. Cut surface under pavements to comply with cross sections, elevations and grades as indicated.

3.08 TRENCH EXCAVATION FOR PIPES AND CONDUIT

- A. Excavate trenches to uniform width, sufficiently wide to provide ample working room and a minimum of 6 to 9 inches of clearance on both sides of pipe or conduit.
- B. Excavate trenches and conduit to depth indicated or required to establish indicated slope and invert elevations and to support bottom of pipe or conduit on undisturbed soil. Beyond building perimeter, excavate trenches to allow installation of top of pipe below frost line.
 - 1. Where rock is encountered, carry excavation 6 inches below required elevation and backfill with a 6 inch layer of crushed stone or gravel prior to installation of pipe.
 - 2. For pipes or conduit less than 6 inches in nominal size, and for flat bottomed, multiple duct conduit units, do not excavate beyond indicated depths. Hand excavate bottom cut to accurate elevations and support pipe or conduit on undisturbed soil.
 - 3. For pipes and equipment 6 inches or larger in nominal size, shape bottom of trench to fit bottom of pipe for 90 degrees (bottom 1/4 of the circumference). Fill depressions with tamped sand backfill. At each pipe joint, dig bell holes to relieve pipe bell of loads ensure continuous bearing of pipe barrel on bearing surface.

3.09 EXCAVATING AND PLACING FOUNDATION DRAINAGE SYSTEM

- A. Excavate for foundation drainage system after subgrade material has been compacted but before drainage fill course has been placed. Provide a clear horizontal distance between drain pipe and trench wall on both sides not less than 2 times the diameter of the drain pipe, unless otherwise shown. Grade the bottom of trench excavations to required slope and compact to a firm, solid bed for drain system. Place and compact impervious fill material to raise low areas or where unsatisfactory bearing soil may occur.
- B. After concrete footings have been cured and forms removed, place impervious fill material on the subgrade adjacent to the bottom of the footing. Place and compact impervious fill to the dimensions indicated or, if not indicated, 6 inches deep and 12 inches wide.

1. Place a supporting layer of drainage fill material over compacted subgrade where drainage pipe is to be laid to the depth indicated or, if not indicated, to a compacted depth of not less than 3 inches, followed by a 6 inch layer of compacted filtering material below pipe.
 2. Place sufficient width of filter fabric in trench to cover perimeter of drainage material plus overlap. Place a supporting layer of drainage fill material over filter fabric where drainage pipe is to be laid to the depth indicated or, if not indicated, to a compacted depth of not less than 2 inches.
- C. Lay drain pipe solidly bedded in <filtering><drainage fill> material. Provide full bearing for each pipe section throughout its length, to true grades and alignment, and continuous slope in the direction of flow.
1. Lay perforated pipe with perforations down and joints tightly closed in accordance with pipe manufacturer's recommendations. Provide collars and couplings as required.
 2. Provide recesses in the excavation bottom to receive bells for drain pipe having bell and spigot ends. Lay pipe with bells facing up the slope with spigot end entered fully into adjacent bell. Seal joint in accordance with local practices having jurisdiction.
- D. Test or check lines before backfilling to assure free flow. Remove obstructions, replace damaged components, and retest system until satisfactory.
- E. After testing of drain lines, place additional <filtering><drainage fill> material as follows:
1. At exterior perimeter drainage system, completely cover drain lines to a width of at least 6 inches on each side and 12 inches above top of pipe with material unless more coverage is indicated on the Drawings. Place material in layers not exceeding 3 inches in loose depth and compact each layer placed.
 2. At under slab drainage system, provide a minimum of 6 inches on top of drains and 12 inches around sides of drains.
 3. Unless otherwise indicated, backfill exterior perimeter drainage system with drainage fill material over filtering material to within 18 inches of indicated finished grade elevations.
 4. Place drainage fill material over underslab drainage system (maximum 6 inch lifts) and compact.
- F. Apply impervious fill material over compacted drainage fill material at exterior perimeter drains, placing the material in layers not exceeding 6 inches in loose depth and thoroughly compacting each layer. Carry impervious fill to indicated finish elevations (except carry to 6 inches below finished grade where indicated to receive topsoil) and slope away from building perimeter.

3.10 BACKFILL AND FILL

- A. Place soil material in layers to required subgrade elevations, for each area classification listed below, using materials specified in Part 2 of this Section.
1. Under grassed areas, use satisfactory excavated or borrow material.
 2. Under walks and pavements, use subbase material, satisfactory excavated or borrow material, or a combination.
 3. Under steps, use subbase material.
 4. Under building slabs, use drainage fill material.
 5. Under piping and conduit and equipment, use subbase materials where required over rock bearing surface and for correction of unauthorized excavation. Shape excavation bottom to fit bottom 90 degrees of cylinder.

6. Backfill trenches with concrete where trench excavations pass within 18 inches of column or wall footings and that are carried below bottom of such footings or that pass under wall footings. Place concrete to level of bottom of adjacent footing.
 - a. Do not backfill trenches until tests and inspections have been made and backfilling is authorized by Owner. Use care in backfilling to avoid damage or displacement of pipe systems.
 7. Provide 4 inch thick concrete base slab support for piping or conduit less than thirty inches below surface of roadways. After installation and testing of piping or conduit, provide minimum 4 inch thick encasement (sides and top) of concrete prior to backfilling or placement of roadway subbase.
- B. Install warning tape directly above utilities, 12 inches below finished grade, except 6 inches below subgrade under pavements and slabs.
- C. Backfill excavations as promptly as work permits, but not until completion of the following:
1. Acceptance of construction below finish grade including, where applicable, dampproofing, waterproofing, and perimeter insulation.
 2. Inspection, testing, approval, and recording locations of underground utilities have been performed and recorded.
 3. Removal of concrete formwork.
 4. Removal of shoring and bracing, and backfilling of voids with satisfactory materials. Cut off temporary sheet piling driven below bottom of structures and remove in manner to prevent settlement of the structure or utilities, or leave in place if required.
 5. Removal of trash and debris from excavation.
 6. Permanent or temporary horizontal bracing is in place on horizontally supported walls.

3.11 PLACEMENT AND COMPACTION

- A. Ground Surface Preparation: Remove vegetation, debris, unsatisfactory soil materials, obstructions, and deleterious materials from ground surface prior to placement of fills. Plow strip, or break up sloped surfaces steeper than 1 vertical to 4 horizontal so that fill material will bond with existing surface.
1. When existing ground surface has a density less than that specified under "Compaction" for particular area classification, break up ground surface, pulverize, moisture condition to optimum moisture content, and compact to required depth and percentage of maximum density.
- B. Place backfill and fill materials in layers not more than 8 inches in loose depth for material compacted by heavy compaction equipment, and not more than 4 inches in loose depth for material compacted by hand operated tampers.
- C. Before compaction, moisten or aerate each layer as necessary to provide optimum moisture content. Compact each layer to required percentage of maximum dry density or relative dry density for each area classification. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.
- D. Place backfill and fill materials evenly adjacent to structures, piping, or conduit to required elevations. Prevent wedging action of backfill against structures or displacement of piping or conduit by carrying material uniformly around structure, piping, or conduit to approximately same elevation in each lift.

- E. Control soil and fill compaction, providing minimum percentage of density specified for each area classification indicated below. Correct improperly compacted areas or lifts as approved by Owner if soil density tests indicate inadequate compaction.
1. Percentage of Maximum Density Requirements: Compact soil to not less than the following percentages of maximum density, in accordance with ASTM D 1557:
 - a. Under structures, building slabs and steps, and pavements, compact top 12 inches of subgrade and each layer of backfill or fill material at 95 percent maximum density.
 - b. Under lawn or unpaved areas, compact top 6 inches of subgrade and each layer of backfill or fill material at 90 percent maximum density.
 - c. Under walkways, compact top 6 inches of subgrade and each layer of backfill or fill material at 95 percent maximum density.
 2. Moisture Control: Where subgrade or layer of soil material must be moisture conditioned before compaction, uniformly apply water to surface of subgrade or layer of soil material. Apply water in minimum quantity as necessary to prevent free water from appearing on surface during or subsequent to compaction operations.
 - a. Remove and replace, or scarify and air dry, soil material that is too wet to permit compaction to specified density.
 - b. Stockpile or spread soil material that has been removed because it is too wet to permit compaction. Assist drying by discing, harrowing, or pulverizing until moisture content is reduced to a satisfactory value.

3.12 GRADING

- A. Uniformly grade areas within limits of grading under this section, including adjacent transition areas. Smooth finished surface within specified tolerances, compact with uniform levels or slopes between points where elevations are indicated or between such points and existing grades.
- B. Grading Outside Building Lines: Grade areas adjacent to building lines to drain away from structures and to prevent ponding. Finish surfaces free from irregular surface changes and as follows:
 1. Lawn or Unpaved Areas: Finish areas to receive topsoil to within not more than 0.10 foot above or below required subgrade elevations.
 2. Walks: Shape surface of areas under walks to line, grade, and cross section, with finish surface not more than 0.10 foot above or below required subgrade elevation.
 3. Pavements: Shape surface of areas under pavement to line, grade, and cross section, with finish surface not more than ½ inch above or below required subgrade elevation.
- C. Grading Surface of Fill under Building Slabs: Grade smooth and even, free of voids, compacted as specified, and to required elevation. Provide final grades within a tolerance of 1/2 inch when tested with a 10 foot straightedge.
- D. Compaction: After grading, compact subgrade surfaces to the depth and indicated percentage of maximum or relative density for each area classification.

3.13 PAVEMENT BASE COURSE

- A. Base course consists of placing base material, in layers of specified thickness, over subgrade surface to support a pavement base course.
- B. During construction, maintain lines and grades including crown and cross slope of subbase course.

- C. Place shoulders along edges of subbase course to prevent lateral movement. Construct shoulders of acceptable soil materials, placed in such quantity to compact to thickness of each subbase course layer. Compact and roll at least a 12 inch width of shoulder simultaneous with the compaction and rolling of each layer of subbase course.
- D. Place subbase course material on prepared subgrade in layers of uniform thickness, conforming to indicated cross section and thickness. Maintain optimum moisture content for compacting subbase material during placement operations.
 - 1. When a compacted subbase course is indicated to be 6 inches thick or less, place material in a single layer. When indicated to be more than 6 inches thick, place material in equal layers, except no single layer more than 6 inches or less than 3 inches in thickness when compacted.

3.14 BUILDING SLAB DRAINAGE COURSE

- A. Drainage course consists of placement of drainage fill material, in layers of indicated thickness, over subgrade surface to support concrete building slabs.
- B. Place drainage fill material on prepared subgrade in layers of uniform thickness, conforming to indicated cross section and thickness. Maintain optimum moisture content for compacting material during placement operations.
 - 1. When a compacted drainage course is indicated to be 6 inches thick or less, place material in a single layer. When indicated to be more than 6 inches thick, place material in equal layers, except no single layer more than 6 inches or less than 3 inches in thickness when compacted.

3.15 FIELD QUALITY CONTROL

- A. Quality Control Testing During Construction: Allow testing service to inspect and approve each subgrade and fill layer before further backfill or construction work is performed.
 - 1. Perform field in place density tests according to ASTM D 1556 (sand cone method), ASTM D 2167 (rubber balloon method), or ASTM D 2937 (drive cylinder method), as applicable.
 - a. Field in place density tests may also be performed by the nuclear method according to ASTM D 2922, provided that calibration curves are periodically checked and adjusted to correlate to tests performed using ASTM D 1556. With each density calibration check, check the calibration curves furnished with the moisture gages according to ASTM D 3017.
 - b. When field in place density tests are performed using nuclear methods, make calibration checks of both density and moisture gages at beginning of work, on each different type of material encountered, and at intervals as approved by The University.
 - 2. Footing Subgrade: At footing subgrades, perform at least one test of each soil stratum to verify design bearing capacities. Subsequent verification and approval of other footing subgrades may be based on a visual comparison of each subgrade with related tested strata when acceptable to The University.
 - 3. Paved and Building Slab Areas: At subgrade and at each compacted fill and backfill layer, perform at least one field in place density test for every 2,000 square feet or less of paved area or building slab, but in no case fewer than three tests.
 - 4. Foundation Wall Backfill: In each compacted backfill layer, perform at least one field in place density test for each 100 feet or less of wall length, but no fewer than two tests along a wall face.
 - 5. Trench Backfill: In each compacted initial and final backfill layer, perform at least one field in place density test for each 150 feet or less of trench, but no fewer than two tests.

- B. When testing agency reports that subgrades, fills, or backfills are below specified density, scarify and moisten or aerate, or remove and replace soil to the depth required, recompact and retest until required density is obtained.

3.16 EROSION CONTROL

- A. Provide erosion control methods in accordance with requirements of authorities having jurisdiction.

3.17 MAINTENANCE

- A. Protect newly graded areas from traffic and erosion. Keep free of trash and debris.
- B. Repair and reestablish grades in settled, eroded, and rutted areas to specified tolerances.
- C. Where completed compacted areas are disturbed by subsequent construction operations or adverse weather, scarify surface, reshape, and compact to required density prior to further construction.
- D. Where settling is measurable or observable at excavated areas during general Project warranty period, remove surface (pavement, lawn, or other finish), add backfill material, compact, and replace surface treatment. Restore appearance, quality, and condition of surface or finish to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.18 DISPOSAL OF EXCESS AND WASTE MATERIALS

- A. Removal to Designated Areas on Owner's Property: Transport acceptable excess excavated material to designated soil storage areas on Owner's property. Stockpile soil or spread as approved by Owner.
 - 1. Transport waste material, including unacceptable excavated material, trash, and debris to designated spoil areas on Owner's property and dispose of as directed.
- B. Removal from Owner's Property: Remove waste materials, including unacceptable excavated material, trash, and debris, and dispose of it off Owner's property.
 - 1. Remove excess excavated material, trash, debris, and waste materials and dispose of it off Owner's property.

SECTION 31 11 00 00 - SITE CLEARING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 PROJECT CONDITIONS

- A. Traffic: Conduct Site clearing operations to ensure minimum interference with roads, streets, walks, and other adjacent occupied or used facilities. Do not close or obstruct streets, walks, or other occupied or used facilities without permission from authorities having jurisdiction.
- B. Consult with Owner and coordinate existing improvements, trees, and vegetation to remain.
- C. Provide protections necessary to prevent damage to existing improvements.
 - 1. Protect improvements on adjoining properties and on Owner's property.
 - 2. Restore damaged improvements to their original condition, as acceptable to Owner.
- D. Protect existing trees and other vegetation to remain in place against unnecessary cutting, breaking or skinning of roots, skinning or bruising of bark, smothering of trees by stockpiling construction materials or excavated materials within drip line, excess foot or vehicular traffic, or parking of vehicles within drip line. Provide temporary guards to protect trees and vegetation to be left standing.
 - 1. Water trees and other vegetation to remain within limits of contract work as required maintaining their health during course of construction operations.
 - 2. Provide protection for roots over 1½ inch in diameter that are cut during construction operations. Coat cut faces with emulsified asphalt or other acceptable coating formulated to use on damaged plant tissues. Temporarily cover exposed roots with wet burlap to prevent roots from drying out; cover with earth as soon as possible.
 - 3. Repair or replace trees and vegetation indicated to remain that are damaged by construction operations in a manner acceptable to Architect. Employ a licensed arborist to repair damage to trees and shrubs.
 - 4. Replace trees that cannot be repaired and restored to full growth status, as determined by arborist.

- E. Improvements on Adjoining Property: Authority for performing removal and alteration work on property adjoining Owner's property will be obtained by Owner prior to award of contract.

1. Extent of work on adjacent property is indicated on Drawings.

- F. Carefully remove items indicated to be salvaged and store on Owner's premises where indicated or directed.

1.04 EXISTING SERVICES

- A. Indicated locations are approximate; determine exact locations before commencing Work.
- B. Arrange and pay for disconnecting, removing, capping, and plugging utility services. Notify affected utility companies in advance and obtain approval before starting this Work.
- C. Place markers to indicate location of disconnected services. Identify service lines and capping locations on Project Record Documents.

PART 2 - PRODUCTS

2.01 GENERAL

- A. Not Applicable

PART 3 - EXECUTION

3.01 SITE CLEARING

- A. Remove trees, shrubs, grass, and other vegetation, improvements, or obstructions, as required, to permit installation of new construction. Remove similar items elsewhere on Site or premises as specifically indicated. Removal includes digging out and off Site disposal of stumps and roots.
1. Remove all matter to a minimum depth of 2 feet below new finish grade or 2 feet below new construction, whichever is greater.
2. Cut minor roots and branches of trees indicated to remain in a clean and careful manner where such roots and branches obstruct installation of new construction.
- B. Topsoil is defined as friable clay loam surface soil found in a depth of not less than 4 inches. Satisfactory topsoil is reasonably free of subsoil, clay lumps, stones, and other objects over 2 inches in diameter, and without weeds, roots, and other objectionable material.
1. Strip topsoil to whatever depths encountered in a manner to prevent intermingling with underlying subsoil or other objectionable material. Remove heavy growths of grass from areas before stripping.
- a. Where existing trees are indicated to remain, leave existing topsoil in place within drip lines to prevent damage to root system.
2. Stockpile topsoil in storage piles in areas indicated or directed. Construct storage piles to provide free drainage of surface water. Cover storage piles, if required, to prevent wind erosion.
3. Dispose of unsuitable or excess topsoil as specified for disposal of waste material.
- C. Clear Site of trees, shrubs, and other vegetation, except for those indicated to be left standing.
1. Completely remove stumps, roots, and other debris protruding through ground surface.

2. Use only hand methods for grubbing inside drip line of trees indicated to remain.
3. Fill depressions caused by clearing and grubbing operations with satisfactory soil material, unless further excavation or earthwork is indicated.
 - a. Place fill material in horizontal layers not exceeding 6 inches loose depth, and thoroughly compact each layer to a density equal to adjacent original ground.
- D. Remove existing above grade and below grade improvements as indicated and as necessary to facilitate new construction.
 1. Remove abandoned underground piping or conduits interfering with construction to a point 5 feet outside line of new work. Plug or cap ends of abandoned lines. Plug concrete, clay tile, and cast iron pipe with 2500 psi concrete.

3.02 DISPOSAL OF WASTE MATERIALS

- A. Remove waste materials and unsuitable or excess topsoil from Owner's property.
- B. Burning is not permitted on Owner's property.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 31 23 16 13 - EXCAVATION SUPPORT AND PROTECTION**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for excavation support and protection. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Performance Requirements

1. Design, **as directed**, furnish, install, monitor, and maintain excavation support and protection system capable of supporting excavation sidewalls and of resisting soil and hydrostatic pressure and superimposed and construction loads.
 - a. Delegated Design: Design excavation support and protection system, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
 - b. Prevent surface water from entering excavations by grading, dikes, or other means.
 - c. Install excavation support and protection systems without damaging existing buildings, structures, and site improvements adjacent to excavation.
 - d. Monitor vibrations, settlements, and movements.

C. Submittals

1. Shop Drawings: For excavation support and protection system.
2. Delegated-Design Submittal: For excavation support and protection system indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

D. Quality Assurance

1. Preinstallation Conference: Conduct conference at Project site.

E. Project Conditions

1. Interruption of Existing Utilities: Do not interrupt any utility serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility according to requirements indicated:
 - a. Notify The University no fewer than two days in advance of proposed interruption of utility.
 - b. Do not proceed with interruption of utility without The University's written permission.
2. Survey Work: Engage a qualified land surveyor or professional engineer to survey adjacent existing buildings, structures, and site improvements; establish exact elevations at fixed points to act as benchmarks. Clearly identify benchmarks and record existing elevations.
 - a. During installation of excavation support and protection systems, regularly resurvey benchmarks, maintaining an accurate log of surveyed elevations and positions for comparison with original elevations and positions. Promptly notify The University if changes in elevations or positions occur or if cracks, sags, or other damage is evident in adjacent construction.

1.2 PRODUCTS**A. Materials**

1. General: Provide materials that are either new or in serviceable condition.
2. Structural Steel: ASTM A 36/A 36M, ASTM A 690/A 690M, or ASTM A 992/A 992M.
3. Steel Sheet Piling: ASTM A 328/A 328M, ASTM A 572/A 572M, or ASTM A 690/A 690M; with continuous interlocks.

- a. Corners: Site-fabricated mechanical interlock **OR** Roll-formed corner shape with continuous interlock, **as directed**.
- 4. Wood Lagging: Lumber, mixed hardwood, nominal rough thickness of size and strength required for application, **OR** 3 inches (75 mm) **OR** 4 inches (100 mm), **as directed**.
- 5. Shotcrete: Comply with Division 03 Section "Shotcrete" for shotcrete materials and mixes, reinforcement, and shotcrete application.
- 6. Cast-in-Place Concrete: ACI 301, of compressive strength required for application.
- 7. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), deformed.
- 8. Tiebacks: Steel bars, ASTM A 722/A 722M.
- 9. Tiebacks: Steel strand, ASTM A 416/A 416M.

1.3 EXECUTION

A. Preparation

- 1. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards that could develop during excavation support and protection system operations.
 - a. Shore, support, and protect utilities encountered.
- 2. Install excavation support and protection systems to ensure minimum interference with roads, streets, walks, and other adjacent occupied and used facilities.
 - a. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Owner and authorities having jurisdiction. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.
- 3. Locate excavation support and protection systems clear of permanent construction so that forming and finishing of concrete surfaces are not impeded.
- 4. Monitor excavation support and protection systems daily during excavation progress and for as long as excavation remains open. Promptly correct bulges, breakage, or other evidence of movement to ensure that excavation support and protection systems remain stable.
- 5. Promptly repair damages to adjacent facilities caused by installing excavation support and protection systems.

B. Soldier Piles And Lagging

- 1. Install steel soldier piles before starting excavation. Extend soldier piles below excavation grade level to depths adequate to prevent lateral movement. Space soldier piles at regular intervals not to exceed allowable flexural strength of wood lagging. Accurately align exposed faces of flanges to vary not more than 2 inches (50 mm) from a horizontal line and not more than 1:120 out of vertical alignment.
- 2. Install wood lagging within flanges of soldier piles as excavation proceeds. Trim excavation as required to install lagging. Fill voids behind lagging with soil, and compact.
- 3. Install wales horizontally at locations indicated on Drawings and secure to soldier piles.

C. Sheet Piling

- 1. Before starting excavation, install one-piece sheet piling lengths and tightly interlock to form a continuous barrier. Accurately place the piling, using templates and guide frames unless otherwise recommended in writing by the sheet piling manufacturer. Limit vertical offset of adjacent sheet piling to 60 inches (1500 mm). Accurately align exposed faces of sheet piling to vary not more than 2 inches (50 mm) from a horizontal line and not more than 1:120 out of vertical alignment. Cut tops of sheet piling to uniform elevation at top of excavation.

D. Tiebacks

- 1. Tiebacks: Drill, install, grout, and tension tiebacks. Test load-carrying capacity of each tieback and replace and retest deficient tiebacks.
 - a. Test loading shall be observed by a qualified professional engineer responsible for design of excavation support and protection system.

- b. Maintain tiebacks in place until permanent construction is able to withstand lateral soil and hydrostatic pressures.
- E. Bracing
 - 1. Bracing: Locate bracing to clear columns, floor framing construction, and other permanent work. If necessary to move brace, install new bracing before removing original brace.
 - a. Do not place bracing where it will be cast into or included in permanent concrete work unless otherwise approved by The University.
 - b. Install internal bracing, if required, to prevent spreading or distortion of braced frames.
 - c. Maintain bracing until structural elements are supported by other bracing or until permanent construction is able to withstand lateral earth and hydrostatic pressures.
- F. Removal And Repairs
 - 1. Remove excavation support and protection systems when construction has progressed sufficiently to support excavation and bear soil and hydrostatic pressures. Remove in stages to avoid disturbing underlying soils or damaging structures, pavements, facilities, and utilities.
 - a. Remove excavation support and protection systems to a minimum depth of 48 inches (1200 mm) below overlaying construction and abandon remainder.
 - b. Fill voids immediately with approved backfill compacted to density specified in Division 31 Section "Earth Moving".
 - c. Repair or replace, as approved by The University, adjacent work damaged or displaced by removing excavation support and protection systems.
 - 2. Leave excavation support and protection systems permanently in place.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 32 00 00 00 - PIPED UNDERGROUND OR SURFACE SYSTEMS WITH PIPING, SPRINKLER HEADS, VALVES, AND CONTROLS, CONSTRUCTION STANDARD**PART 1: GENERAL****1.01 Scope of Standard**

- A. This standard provides general guidance concerning the specific preferences of the University of Texas HSCSA for piped underground or surface systems with piping, sprinkler heads, valves, and controls.
- B. UTHSCSA recognizes that project conditions and requirements vary, thus precluding the absolute adherence to the items identified herein in all cases. However, unless there is adequate written justification, it is expected that these guidelines will govern the design and specifications for UT projects.
- C. Irrigation systems shall be supplied from COA mains through a separate water meter from domestic water, unless otherwise directed by Owner.
- D. The minimum available COA water pressure can be assumed to be 60 psi at elevation 550 feet above sea level. This is in the UTHSCSA mains, before any backflow-prevention devices. Water pressure drops by 1 psi for every 2.3 feet of elevation increase. City water pressure can vary by more than 17 psi over a 3-day period.
- E. Include a 2" pressure gauge, 0 to 100 psi, on the irrigation header downstream of any backflow-prevention device.

1.02 Quality Control

- A. Irrigation System: All irrigation system equipment must be compatible with Rain Bird Maxicom.
- B. All irrigation systems must be coordinated with the UT-HSCSA campus computer system communications network for operations. Therefore, a telephone connection must be provided to the irrigation controller.

1.03 General Requirements

- A. Irrigation Room: It is preferred that there be a designated room, with access to the exterior, to contain the building site's irrigation system valves and controllers. If not possible to provide this room, it is preferred that the valves be clustered together below grade, or mounted out of view on the side of the building. The valves must be freeze protected at these locations. It is also preferred that the controllers be located nearby. Provide an electric disconnect near the controller.
- B. Design criteria: It is preferred that the appropriate UT-HSCSA Landscape Services personnel review design documents prior to the completion of the documents.
- C. Where appropriate to the application, it is preferred that Low -angle sprays be utilized as much as possible in an effort to prevent water overspray.

PART 2: PRODUCTS

Piped Underground or Surface Systems with Piping,
Sprinkler Heads, Valves, and Controls, Construction
Standard

May 2013

2.01 Sprinkler Heads

A. Sprinkler heads shall be manufactured by Rain Bird, an equal or better. Piping shall be schedule 40 PVC, and valves must be constructed of brass. All heads should be installed on swing joints.

2.02 Irrigation Room Manifold

A. Approved material for fabrication of the irrigation manifold in the irrigation room is copper. The manifold should consist of automatic brass valves with pressure regulation for each irrigation section, a brass master control valve, a back flow preventer, flow sensor, pulse decoder, and pulse transmitter

PART 3: EXECUTION – NOT USED

END OF SECTION 32 00 00 00

SECTION 32 00 00 00a - UTHSCSA LANDSCAPE GUIDELINES, CONSTRUCTION STANDARD**Trees and Natural Area Protection**

- A. All trees and natural areas to be preserved shall be protected during construction with chain link fence. Location of fences and installation details shall be included in construction documents.
- B. Protective fences shall be installed prior to the start of any site preparation work (clearing, grubbing or grading), and shall be maintained throughout all phased of the construction project.
- C. Erosion and sedimentation control barriers shall be installed or maintained in a manner, which does not result in soil build-up within tree drip lines.
- D. Protective fences shall surround trees or groups of trees and shall be located at the outermost limit of branches (drip line), or natural areas. Protective fences shall follow the limit of construction line, in order to prevent the following:
 - 1. Soil compaction in the root zone resulting from vehicular traffic or storage of equipment or materials.
 - 2. Root zone disturbances due to grade changes (greater than 6" cut or fill), or trenching not reviewed or authorized.
 - 3. Wounds to exposed roots, trunk or limbs by mechanical equipment.
 - 4. Other activities detrimental to trees such as chemical storage, concrete truck cleaning and fires.
- E. Exceptions to installing fences at tree drip lines may be permitted in the following cases:
 - 1. Where there is to be an approved grade change, impermeable paving surface, tree well, or other such site development, erect the fence approximately 2 to 4 feet behind the area in question.
 - 2. Where permeable paving is to be installed within a tree's drip line, erect the fence at the outer limits of the permeable paving area prior to grading to minimize root damage.
 - 3. Where trees are close to proposed building consult a licensed Arborist and the University Project Representative for the best protection procedures.
 - 4. Where there are severe space constraints due to tract size, or other special requirements, contact the University Project Representative and consult a licensed Arborist to discuss Alternatives.
 - 5. For protection of natural areas, no exceptions to installing fences at the limit of construction line shall be permitted.
- F. Where any of the above exceptions result in a fence being closer than 4 feet to a trunk, protect the trunk with strapped on planking to a height of 8 feet (or to the limits of the lower branching) in addition to the fencing provided.
- G. Trees approved for removal shall be removed in a manner, which does not impact trees to be preserved.
- H. Any roots exposed by construction activity shall be pruned flush with the soil. Backfill root areas with good quality topsoil as soon as possible. If exposed root areas are not back filled within 2 days, cover them with organic material in a manner, which reduces soil temperature and minimizes water loss due to evaporation.
- I. Any trenching required for the installation of the landscape irrigation shall be placed as far from existing tree trunks as possible.
- J. No landscape topsoil dressing greater than 4 inches shall be permitted within the drip line of trees. No soil is permitted on the root flares of any trees.
- K. Pruning to provide clearance for structures, vehicle traffic and equipment shall take place before damage occurs (ripping of branches, etc.).

- L. All tree work shall be accomplished by a licensed Arborist. All pruning shall be done according to recognized, approved standards of the industry (reference the National Arborist Association Pruning Standards for Shade trees). All pruning cuts on oak tree will be covered with pruning paint.
- M. Prior to excavation of grade cutting within tree drip lines, make a clean cut between the disturbed root zones with a rock saw or similar equipment to minimize damage to remaining roots.
- N. Where any of the above exceptions to fencing at a tree's drip line results in areas of unprotected root zones (under the drip lines) and heavy traffic or material storage is expected, cover those areas with 6 inches of organic mulch to minimize compaction. The depth of 6 inches of organic mulch shall be maintained through the completion of the project.
- O. All grading within protected root zone areas shall be done by hand or with small equipment to minimize root damage.
- P. Trees shall be maintained by watering deeply once a week during hot dry weather. Tree crowns shall be sprayed with water periodically to reduce dust accumulation on the leaves.
- Q. No dumping of waste materials shall occur under the drip lines of trees. This includes washing of concrete trucks.

SECTION 32 01 17 61 - CRACK SEALING OF BITUMINOUS PAVEMENTS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for crack sealing of bituminous pavements. Products shall match existing materials and/or shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Manufacturer's Recommendations: Where installation procedures, or any part thereof, are required to be in accordance with the manufacturer's recommendations, printed copies of these recommendations shall be submitted to The University. Installation of the material will not be allowed until the recommendations are received. Failure to furnish these recommendations can be cause for rejection of the material.
2. Schedules/Construction Equipment List: List of proposed equipment to be used in performance of construction work including descriptive data shall be submitted to The University.
3. Samples: Samples of the materials (sealant, primer if required, and backup material), in sufficient quantity for testing and approval shall be submitted to The University. No material will be allowed to be used until it has been approved.

C. Safety: Joint sealant shall not be placed within 25 feet of any liquid oxygen (LOX) equipment, LOX storage, or LOX piping. Joints in this area shall be thoroughly cleaned and left unsealed.**D. Test Requirements:** The joint sealant and backup or separating material shall be tested for conformance with the referenced applicable material specification. Testing of the materials shall be performed in an approved independent laboratory and certified copies of the test reports shall be submitted and approved prior to the use of the materials at the job site. Samples will be retained by The University for possible future testing should the materials appear defective during or after application. Conformance with the requirements of the laboratory tests specified will not constitute final acceptance of the materials. Final acceptance will be based on the performance of the in-place materials.**E. Equipment:** Machines, tools, and equipment used in the performance of the work required by this section shall be approved before the work is started and shall be maintained in satisfactory condition at all times.**1.2 PRODUCTS****A. Materials**

1. Liquid Asphalt: ASTM D 2027, Grade MC-250.
2. Emulsified Asphalt: ASTM D 977, Grade AS-2.
3. Sealing Compound: ASTM D 3405.
4. Backer Rod: ASTM D 5249.
5. Fine Aggregate: Natural sand or crusher dust having a maximum size of not more than 1/8 inch and be free of clay or organic-matter.

1.3 EXECUTION**A. Preparation:**

1. All cracks to be sealed shall be cleaned of dirt and debris, and moisture shall be removed.

2. Crack Cleaning Equipment shall consist of a portable air compressor with hose and nozzles for directing air directly into cracks and stiff bristle brooms.
3. Heating Equipment for Liquid Asphalt shall be mobile and shall be equipped with an agitating device for stirring material during heating, a thermometer, regulating equipment for heat control, and a gravity-type draw-off valve.
4. Heating Equipment for Sealing Compound: Unless otherwise required by the manufacturer's recommendations, the equipment shall be mobile and shall consist of double-boiler, agitator-type kettles with oil medium in the outer space for heat transfer. The applicator unit shall be so designed that the sealant will circulate through the delivery hose and return to the inner kettle when not sealing cracks.
5. Application Equipment shall have a spout or nozzle of such size that the sealing material will be placed in the cracks without entrapping air in cracks or spreading material on adjacent pavement surface.

B. Installation:

1. Backer Rod: Install backer in accordance with manufacturer's instructions where required under sealing compound.
2. Sealing Compound: All cracks 1/8 inch wide and wider shall be sealed. The application temperature for sealing compound shall comply with ASTM C 1193. Cracks 1/2 inch wide and wider shall be filled with a slurry of fine sand and an emulsified asphalt or liquid asphalt. After the slurry has cured, cracks shall be sealed with liquid asphalt or emulsified asphalt and lightly sanded.
3. Liquid and Emulsified Asphalt Sealer: The temperature shall be varied so that it flows freely into cracks and completely fills cracks without entrapping air. Cracks shall be free of moisture before filling and shall be filled slightly above the pavement surface. When excess sealer has been removed, the sealer shall be covered with fine sand.
4. Traffic Control: Traffic will not be permitted over sealed cracks until the sealer has cooled so that it is not picked up by vehicle tires. The Contractor will be responsible for all barricades and flagmen necessary to control traffic.

END OF SECTION 32 01 17 61

SECTION 32 01 17 61a - SPRAY APPLICATIONS, SEAL COATS, AND SURFACE TREATMENTS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for the spray applications, seal coats, and surface treatments of asphalt concrete pavements. Products shall match existing materials and/or shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Product Data: For each type of product indicated.

1.2 PRODUCTS

- A. Bituminous Material:** Bituminous material shall be liquid asphalt complying with ASTM D 2028, Grade RC-250, or tar complying with ASTM D 490, Grade RT-6.

- B. Aggregate:** Aggregates shall consist of crushed stone, crushed gravel, or crushed slag. The moisture content of the aggregate shall be such that the aggregate will be readily coated with the bituminous material. Aggregate gradations shall be in compliance with ASTM C 136.

C. Construction Equipment

1. Bituminous Distributor shall be designed and equipped to distribute the bituminous material uniformly at even heat on variable widths of surface at readily determined and controlled rates and pressures recommended by the manufacturer and with an allowable variation from any specified rate not exceeding 5 percent.
2. Single-Pass Surface Treatment Machine shall be capable of distributing the bituminous material and aggregates uniformly in controlled amounts in a single-pass operation over the surface to be sealed.
3. Heating Equipment for Storage Tanks shall consist of steam coils, hot oil coils, or electrical coils. If steam or hot oil coils are used, the coils must be so designed and maintained that the bituminous material cannot become contaminated.
4. Power Rollers shall be the self-propelled tandem and three-wheel type rollers, weighing not less than 5 tons and shall be suitable for rolling bituminous pavements.
5. Self-Propelled Pneumatic-Tired rollers shall have a total compacting width of not less than 60 inches. The gross weight shall be adjustable within the ranges of 200 to 350 lb/in. of compacting width.
6. Spreading Equipment: Aggregate spreading equipment shall be adjustable and capable of spreading aggregate at controlled amounts per square yard.
7. Drags: Broom drags shall consist of brooms mounted on a frame, designed to spread fine aggregate uniformly over the surface of a bituminous pavement. Towing equipment shall have pneumatic tires.
8. Brooms and Blowers shall be of the power type and shall be suitable for cleaning surfaces of bituminous pavements.

1.3 EXECUTION**A. Installation**

1. Spreading Aggregate: Application of seal aggregate shall immediately follow the application of bituminous material, and in no case shall the time to application exceed 15 minutes.

2. Brooming and Rolling: Begin the rolling operations immediately following the application of cover aggregate. Rolling shall be accomplished with pneumatic-tired rollers; steel-wheeled rollers shall be used in a supplementary capacity only. All surplus aggregate shall be swept off the surface and removed not less than 26 hours or more than four days after rolling is completed.

END OF SECTION 32 01 17 61a

Task	Specification	Specification Description

SECTION 32 01 17 63 - BITUMINOUS PAVING-REPAIR AND RESURFACING**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials repair and resurfacing of bituminous pavements. Products shall match existing materials and/or shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Reports: Copies of test results, within 24 hours after completion of tests.
2. Waybills and Delivery Tickets: Copies of waybills or delivery tickets, during the progress of the work.

1.2 PRODUCTS:**A. Asphaltic Concrete:**

1. Hot-Mixed, Hot-Mixed Asphaltic Concrete and Emulsified asphalt shall comply with requirements of ASTM D 3515.
2. Plant-Mixed, Stockpiled Asphalt Cold Mixes shall comply with the requirements of Asphalt Institute Specification PM-2.

B. Bituminous Prime: Bituminous primer shall comply with ASTM D 2027.**C. Base Course: Base course material shall comply with State highway department specification for dense-graded, high-quality material.****D. Bituminous Tack Coat: Bituminous tack coat shall comply with ASTM D 2027.****1.3 EXECUTION:****A. Preparation of Areas for Patching:**

1. Pot Holes: Trim the perimeter of each hole to a vertical face with a carborundum blade in a square or rectangular pattern at least 18 inches from ragged edge. Remove material to a depth that provides a uniform well-compacted bottom surface. Remove all loose material resulting from trimming or otherwise existing in the hole. If subbase is disturbed, reestablish in a like manner to adjacent substrate. Areas to be repaired shall be dry before repair is started.
2. Alligator-Cracked and Rutted Areas: The pavement shall be sawed or cut with pavement breakers to a smooth vertical face 18 inches outside of the alligator-cracked area. Unsatisfactory material shall be removed in a manner not to disturb the sides of the excavated area.
3. Slippage Areas: Saw a rectangular area around the slippage area that overlaps into the well-bonded material by at least 18 inches. The depth of the saw cut shall be equal to the thickness of the layer of material that is slipping. The surface where slipping is occurring shall be broomed clean and all loose material removed.

B. Installation:

1. Application Temperatures: Application temperatures for all asphalt material shall comply with provisions of the Asphalt Institute Publications and the applicable ASTM Standards.

2. Base Course: Place base course material in layers not exceeding a compacted thickness of 6 inches. After placing, compact each layer by mechanical compactors to a density of not less than the density of the corresponding layer of the adjacent pavement structure.
3. Prime Coat: Prime base course with MC-70 liquid asphalt at a rate of 0.20 to 0.30 gallon per sq. yd. Bolt excess prime with sand before the surfacing material is applied.
4. Tack Coat: Give the edges of existing asphaltic concrete or surfaces of Portland cement concrete and asphaltic concrete a tack coat of MC-70 liquid asphalt at a rate of 0.05 to 0.15 gallon per sq. yd. Allow the material to cure before placing the surfacing material.
5. Hot-Mixed Asphaltic Concrete: Place the material in layers not exceeding 2-1/2 inches in thickness and compact to a density equal to the density of the adjacent asphaltic concrete.
6. Stockpiled Cold Mixes: The compacted thickness of each layer of material shall not exceed 2 inches. Before compaction, the material shall be allowed to aerate, if necessary, until the proper amount of cohesion has developed to obtain adequate compaction. When more than one layer is used, each layer shall be thoroughly cured before the succeeding layer is placed.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 32 11 16 00 - HOT MIXED ASPHALT PAVING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

1.02 REFERENCE STANDARDS

- A. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- B. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
- C. All materials, installation and workmanship shall comply with all applicable requirements and standards.

1.03 QUALITY ASSURANCE

- A. Conform to applicable standards of authorities having jurisdiction for asphalt paving work on public property.
- B. Comply with AI's "The Asphalt Handbook," except where more stringent requirements are indicated.

1.04 SUBMITTALS

- A. Material Certificates signed by material producer and Contractor, certifying that each material item complies with or exceeds specified requirements.
- B. Submit Test Reports from an independent Testing Laboratory certifying that the asphaltic concrete paving mix proposed for use on this project conforms to specified requirements.
- C. Pavement marking plan indicating lane separations and defined parking spaces. Note dedicated handicapped spaces with international graphics symbol.

1.05 SITE CONDITIONS

- A. Apply prime and tack coats when ambient temperature is above 50 degrees F (10 degrees C) and when temperature has not been below 35 degrees F (1 degrees C) for 12 hours immediately prior to application. Do not apply when base is wet or contains an excess of moisture.
- B. Construct hot mixed asphalt surface course when atmospheric temperature is above 40 degrees F (4 degrees C) and when base is dry. Base course may be placed when air temperature is above 30 degrees F (minus 1 degrees C) and rising.

PART 2 - PRODUCTS**2.01 GENERAL**

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.

2.02 MATERIALS

A. Asphaltic Concrete Paving, surface course, (Hot Mix)

1. Bituminous Hot-Mix Surface Course: Conform to the requirements of the Texas State Department of Highways and Public Transportation Standard Specification, Item 340, "Hot-Mix Asphaltic Concrete Pavement", as applicable to this Project.
 - a. Asphalt Material for the Surface Course: Asphalt cement AC-10 conforming to SDHPT Standard Specification for "Asphalts, Oils and Emulsion", Item 300.
 - b. Paving Mixture: Type "D".

B. Primer and Tack Coat Materials:

1. Asphaltic Materials: Conform to SDHPT Standard Specification, Item 300. Materials delivered to the job: Come from a source approved from use by the SDHPT. Certification is required for compliance.
 - a. Prime Coat Asphalt: MC-30.
 - b. Tack Coat Asphalt: RC-250

2.03 RELATED MATERIALS

- A. Herbicide Treatment: Commercial chemical for weed control, registered by Environmental Protection Agency. Provide granular, liquid, or wettable powder form.
- B. Lane Marking Paint: Alkyd-Resin FS TT-P-1952.
 1. Color: As Directed
 2. Provide blue color for "Handicapped Accessible" graphics where applicable.
- C. Wheel Stops: 2,500 psi compressive strength precast, air entrained concrete, approximately 6 inches high, 9 inches wide, and 7 feet long. Provide chamfered corners and drainage slots on underside.

2.04 ASPHALT AGGREGATE MIXTURE

- A. Hot-Mix Asphalt: Provide dense, hot-laid, hot-mix asphalt plant mixed approved by authorities having jurisdiction; designed according to procedures in AI's "Mix Design Methods for Asphalt Concrete and Other Hot-Mix Types"; and complying with the following requirements:
 1. Provide mixes with a history of satisfactory performance in geographical area where Project is located.
 2. Provide mixes complying with the composition, grading, and tolerance requirements of ASTM D 3515 for the following nominal, maximum aggregate sizes:
 - a. Base Course: 1 inch (25 mm)
 - b. Surface Course: 1/2 inch (13 mm)
- B. Emulsified-Asphalt Slurry: ASTM D 3910, consisting of emulsified asphalt, fine aggregates, and mineral fillers and as follows:
 1. Composition: Type 1
 2. Composition: Type 2

3. Composition: Type 3

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. All installation shall be in accordance with manufacturer's published recommendations.

3.02 SURFACE PREPARATION

- A. Remove loose material from compacted subbase surface immediately before applying herbicide treatment or prime coat.
- B. Proof roll prepared subbase surface to check for unstable areas and areas requiring additional compaction.
- C. Notify Contractor of unsatisfactory conditions. Do not begin paving work until deficient subbase areas have been corrected and are ready to receive paving.
- D. Herbicide Treatment: Apply chemical weed control agent in strict compliance with manufacturer's recommended dosages and application instructions. Apply to compacted, dry subbase prior to application of prime coat.
- E. Prime Coat: Apply uniformly over surface of compacted-aggregate base at a rate of 0.15 to 0.50 gal./sq. yd. (0.7 to 2.3 L/sq. m). Apply enough material to penetrate and seal, but not flood, surface. Allow prime coat to cure for 72 hours minimum.
 - 1. If prime coat is not entirely absorbed within 24 hours after application, spread sand over surface to blot excess asphalt. Use just enough sand to prevent pickup under traffic. Remove loose sand by sweeping before pavement is placed and after volatiles have evaporated.
 - 2. Protect primed substrate from damage until ready to receive paving.

3.03 PLACING MIX

- A. Place hot mixed asphalt mixture on prepared surface, spread, and strike off. Spread mixture at minimum temperature of 225 degrees F (107 degrees C). Place areas inaccessible to equipment by hand. Place each course to required grade, cross section, and compacted thickness.
- B. Paver Placing: Place in strips not less than 10 feet wide, unless otherwise acceptable to Owner. After first strip has been placed and rolled, place succeeding strips and extend rolling to overlap previous strips. Complete base course for a section before placing surface course.
- C. Immediately correct surface irregularities in finish course behind paver. Remove excess material forming high spots with shovel or lute.
- D. Make joints between old and new pavements, or between successive days' work, to ensure continuous bond between adjoining work. Construct joints to have same texture, density, and smoothness as other sections of hot mixed asphalt course. Clean contact surfaces and apply tack coat.
- E. Curbs: Construct curbs over compacted pavement surfaces. Apply a light tack coat unless pavement surface is still tacky and free from dust.

- F. Place curb materials to cross section indicated or, if not indicated, to local standard shapes, by machine or by hand in wood or metal forms. Tamp hand placed materials and screed to smooth finish. Remove forms as soon as material has cooled.

3.04 COMPACTION

- A. Begin compaction as soon as placed hot-mix paving will bear roller weight without excessive displacement. Compact hot-mix paving with hot, hand tampers or vibratory-plate compactors in areas inaccessible to rollers.
 - 1. Complete compaction before mix temperature cools to 185 degrees F (85 degrees C).
- B. Breakdown Rolling: Accomplish breakdown or initial rolling immediately after rolling joints and outside edge. Examine surface immediately after breakdown rolling for indicated crown, grade, and smoothness. Repair surfaces by loosening displaced material, filling with hot-mix asphalt, and rerolling to required elevations.
- C. Intermediate Rolling: Begin intermediate rolling immediately after breakdown rolling, while hot-mix asphalt is still hot enough to achieve specified density. Continue rolling until hot-mix asphalt course has been uniformly compacted to the following density:
 - 1. Average Density: 96 percent of reference laboratory density according to ASTM D 1559, but not less than 94 percent nor greater than 100 percent.
 - 2. Average Density: 92 percent of reference maximum theoretical density according to ASTM D 2041, but not less than 90 percent nor greater than 96 percent.
- D. Finish Rolling: Finish roll paved surfaces to remove roller marks while hot-mix asphalt is still warm.
- E. Edge Shaping: While surface is being compacted and finished, trim edges of pavement to proper alignment. Bevel edges while still hot, with back of rake or smooth iron. Compact thoroughly using tamper or other satisfactory method.
 - 1. Asphalt paving: Completely compact asphalt paving at pavement edges. Exercise caution at transition to concrete surfaces to avoid damaging concrete. Provide additional asphalt topping to maintain level of concrete if required.
- F. Patching: Remove and replace paving areas mixed with foreign materials and defective areas. Cut out such areas and fill with fresh, hot hot mixed asphalt. Compact by rolling to specified surface density and smoothness.
- G. Protection: After final rolling, do not permit vehicular traffic on pavement until it has cooled and hardened.
- H. Erect barricades to protect paving from traffic until mixture has cooled enough not to become marked.

3.05 TRAFFIC AND LANE MARKINGS

- A. Sweep and clean surface to eliminate loose material and dust.
- B. Use chlorinated rubber base traffic lane marking paint, factory mixed, quick drying, and non-bleeding.
- C. Do not apply traffic and lane marking paint until layout and placement have been verified with Owner.
- D. Apply paint with mechanical equipment to produce uniform straight edges. Apply at manufacturer's recommended rates to provide minimum 12 to 15 mils dry thickness.

3.06 WHEEL STOPS

- A. Secure wheel stops to hot mixed asphalt surface with not less than two 3/4 inch diameter galvanized steel dowels embedded in precast concrete at 1/3 points. Size length of dowel to penetrate at least 1/2 hot mixed asphalt depth.

3.07 FIELD QUALITY CONTROL

- A. Testing in place hot mixed asphalt courses for compliance with requirements for thickness and surface smoothness will be done by Owner's testing laboratory. Repair or remove and replace unacceptable paving as approved by Owner.
- B. In place compacted thickness tested in accordance with ASTM D 3549 will not be acceptable if exceeding following allowable variations:
 - 1. Base Course: Plus or minus ½ inch.
 - 2. Surface Course: Plus or minus ¼ inch.
- C. Surface Smoothness: Test finished surface of each hot mixed asphalt course for smoothness, using 10 foot straightedge applied parallel with and at right angles to centerline of paved area. Surfaces will not be acceptable if exceeding the following tolerances for smoothness:
 - 1. Base Course Surface: ¼ inch.
 - 2. Wearing Course Surface: 3/16 inch.
 - 3. Crowned Surfaces: Test with crowned template centered and at right angle to crown. Maximum allowable variance from template is ¼ inch.
- D. Check surface areas at intervals as approved by Owner.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 32 13 73 00 - PAVEMENT JOINT SEALANTS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for pavement joint sealants. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Cold-applied joint sealants.
 - b. Cold-applied, jet-fuel-resistant joint sealants.
 - c. Hot-applied joint sealants.
 - d. Hot-applied, jet-fuel-resistant joint sealants.

C. Preconstruction Testing

1. Preconstruction Compatibility and Adhesion Testing: Submit to joint-sealant manufacturers, eight, Samples of materials that will contact or affect joint sealants. Use ASTM C 1087 **OR** manufacturer's standard test method, **as directed**, to determine whether priming and other specific joint-preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.

D. Submittals

1. Product Data: For each joint-sealant product indicated.
2. Samples: For each kind and color of joint sealant required.
3. Pavement-Joint-Sealant Schedule: Include the following information:
 - a. Joint-sealant application, joint location, and designation.
 - b. Joint-sealant manufacturer and product name.
 - c. Joint-sealant formulation.
 - d. Joint-sealant color.
4. Product certificates.
5. Product test reports.
6. Preconstruction compatibility and adhesion test reports.

E. Quality Assurance

1. Testing Agency Qualifications: An independent testing agency qualified according to ASTM C 1021.
2. Preinstallation Conference: Conduct conference at Project site.

F. Project Conditions

1. Do not proceed with installation of joint sealants under the following conditions:
 - a. When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer or are below 40 deg F (5 deg C).
 - b. When joint substrates are wet.
 - c. Where joint widths are less than those allowed by joint-sealant manufacturer for applications indicated.
 - d. Where contaminants capable of interfering with adhesion have not yet been removed from joint substrates.

1.2 PRODUCTS

A. Materials

1. Compatibility: Provide joint sealants, backing materials, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer based on testing and field experience.
2. Colors of Exposed Joint Sealants: As selected from manufacturer's full range.

B. Cold-Applied Joint Sealants

1. Single-Component, Nonsag, Silicone Joint Sealant for Concrete: ASTM D 5893, Type NS.
2. Single-Component, Self-Leveling, Silicone Joint Sealant for Concrete: ASTM D 5893, Type SL.
3. Multicomponent, Pourable, Traffic-Grade, Urethane Joint Sealant for Concrete: ASTM C 920, Type M, Grade P, Class 25, for Use T.

C. Cold-Applied, Jet-Fuel-Resistant Joint Sealants

1. Jet-Fuel-Resistant, Single-Component, Pourable, Traffic-Grade, Modified-Urethane Joint Sealant for Concrete: ASTM C 920, Type S, Grade P, Class 25, for Use T.
2. Jet-Fuel-Resistant, Multicomponent, Pourable, Traffic-Grade, Modified-Urethane Joint Sealant for Concrete: ASTM C 920, Type M, Grade P, Class 12-1/2, for Use T.
3. Jet-Fuel-Resistant, Multicomponent, Pourable, Traffic-Grade, Modified-Urethane Joint Sealant for Concrete: ASTM C 920, Type M, Grade P, Class 25, for Use T.

D. Hot-Applied Joint Sealants

1. Hot-Applied, Single-Component Joint Sealant for Concrete: ASTM D 3406.
2. Hot-Applied, Single-Component Joint Sealant for Concrete and Asphalt: ASTM D 6690, Types I, II, and III.

E. Hot-Applied, Jet-Fuel-Resistant Joint Sealants

1. Hot-Applied, Jet-Fuel-Resistant, Single-Component Joint Sealant for Concrete: ASTM D 7116, Type I.
2. Hot-Applied, Jet-Fuel-Resistant, Single-Component Joint Sealant for Concrete and Tar Concrete: Single-component formulation complying with ASTM D 3581.

F. Joint-Sealant Backer Materials

1. General: Provide joint-sealant backer materials that are nonstaining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated by joint-sealant manufacturer based on field experience and laboratory testing.
2. For use in joints such as contraction joints cut partially through paving material:
 - a. Round Backer Rods for Cold- and Hot-Applied Joint Sealants: ASTM D 5249, Type 1, of diameter and density required to control sealant depth and prevent bottom-side adhesion of sealant.
 - b. Round Backer Rods for Cold-Applied Joint Sealants: ASTM D 5249, Type 3, of diameter and density required to control joint-sealant depth and prevent bottom-side adhesion of sealant.
3. For use in joints such as expansion joints extending through the full depth of the pavement:
 - a. Backer Strips for Cold- and Hot-Applied Joint Sealants: ASTM D 5249; Type 2; of thickness and width required to control joint-sealant depth, prevent bottom-side adhesion of sealant, and fill remainder of joint opening under sealant.

G. Primers

1. Primers: Product recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.

1.3 EXECUTION

A. Installation Of Joint Sealants

1. General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated unless more stringent requirements apply.
2. Cleaning of Joints: Clean out joints immediately before installing joint sealants.
3. Joint-Sealant Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.
4. Install joint-sealant backings of kind indicated to support joint sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.
 - a. Do not leave gaps between ends of joint-sealant backings.
 - b. Do not stretch, twist, puncture, or tear joint-sealant backings.
 - c. Remove absorbent joint-sealant backings that have become wet before sealant application and replace them with dry materials.
5. Install joint sealants using proven techniques that comply with the following and at the same time backings are installed:
 - a. Place joint sealants so they directly contact and fully wet joint substrates.
 - b. Completely fill recesses in each joint configuration.
 - c. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.
6. Tooling of Nonsag Joint Sealants: Immediately after joint-sealant application and before skinning or curing begins, tool sealants according to the following requirements to form smooth, uniform beads of configuration indicated; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint:
 - a. Remove excess joint sealant from surfaces adjacent to joints.
 - b. Use tooling agents that are approved in writing by joint-sealant manufacturer and that do not discolor sealants or adjacent surfaces.
7. Provide joint configuration to comply with joint-sealant manufacturer's written instructions unless otherwise indicated.

B. Cleaning

1. Clean off excess joint sealant or sealant smears adjacent to joints as the Work progresses, by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

C. Protection

1. Protect joint sealants, during and after curing period, from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately and replace with joint sealant so installations in repaired areas are indistinguishable from the original work.

SECTION 32 16 13 13 - CEMENT CONCRETE PAVEMENT**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for cement concrete pavement. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Driveways.
 - b. Roadways.
 - c. Parking lots.
 - d. Curbs and gutters.
 - e. Walks.

C. Definitions

1. Cementitious Materials: Portland cement alone or in combination with one or more of blended hydraulic cement, fly ash and other pozzolans, and ground granulated blast-furnace slag.

D. Submittals

1. Product Data: For each type of product indicated.
2. LEED Submittals:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating costs for each product having recycled content.
 - b. Design Mixtures for Credit ID 1.1: For each concrete mixture containing fly ash as a replacement for portland cement or other portland cement replacements. For each design mixture submitted, include an equivalent concrete mixture that does not contain portland cement replacements, to determine amount of portland cement replaced.
3. Shop Drawings: Indicate pavement markings, lane separations, and defined parking spaces. Indicate, with international symbol of accessibility, spaces allocated for people with disabilities.
4. Samples: For each type of product or exposed finish, prepared as Samples of size indicated below:
 - a. Exposed Aggregate: 10-lb (4.5-kg) Sample of each mix.
 - b. Wheel Stops: 6 inches (150 mm) long showing cross section; with fasteners.
 - c. Preformed Traffic-Calming Devices: 6 inches (150 mm) long showing cross section; with fasteners.
5. Other Action Submittals:
 - a. Design Mixtures: For each concrete paving mixture. Include alternate design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.
6. Qualification Data: For qualified Installer of detectable warnings, ready-mix concrete manufacturer and testing agency.
7. Material Certificates: For the following, from manufacturer:
 - a. Cementitious materials.
 - b. Steel reinforcement and reinforcement accessories.
 - c. Fiber reinforcement.
 - d. Admixtures.
 - e. Curing compounds.
 - f. Applied finish materials.

- g. Bonding agent or epoxy adhesive.
- h. Joint fillers.
- 8. Material Test Reports: For each of the following:
 - a. Aggregates. Include service-record data indicating absence of deleterious expansion of concrete due to alkali-aggregate reactivity.
- 9. Field quality-control reports.

E. Quality Assurance

- 1. Detectable Warning Installer Qualifications: An employer of workers trained and approved by manufacturer of stamped concrete paving systems.
- 2. Ready-Mix-Concrete Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94/C 94M requirements for production facilities and equipment.
 - a. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities" (Quality Control Manual - Section 3, "Plant Certification Checklist").
- 3. Testing Agency Qualifications: Qualified according to ASTM C 1077 and ASTM E 329 for testing indicated.
 - a. Personnel conducting field tests shall be qualified as ACI Concrete Field Testing Technician, Grade 1, according to ACI CP-1 or an equivalent certification program.
- 4. Concrete Testing Service: Engage a qualified testing agency to perform material evaluation tests and to design concrete mixtures.
- 5. ACI Publications: Comply with ACI 301 (ACI 301M) unless otherwise indicated.
- 6. Preinstallation Conference: Conduct conference at Project site.

F. Project Conditions

- 1. Traffic Control: Maintain access for vehicular and pedestrian traffic as required for other construction activities.
- 2. Pavement-Marking Paint: Proceed with pavement marking only on clean, dry surfaces and at a minimum ambient or surface temperature of 40 deg F (4.4 deg C) for oil-based materials **OR** 55 deg F (12.8 deg C) for water-based materials, **as directed**, and not exceeding 95 deg F (35 deg C).

1.2 PRODUCTS

A. Forms

- 1. Form Materials: Plywood, metal, metal-framed plywood, or other approved panel-type materials to provide full-depth, continuous, straight, and smooth exposed surfaces.
 - a. Use flexible or uniformly curved forms for curves with a radius of 100 feet (30.5 m) or less. Do not use notched and bent forms.
- 2. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and that will not impair subsequent treatments of concrete surfaces.

B. Steel Reinforcement

- 1. Recycled Content: Provide steel reinforcement with an average recycled content of steel so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 percent.
- 2. Plain-Steel Welded Wire Reinforcement: ASTM A 185/A 185M, fabricated from as-drawn steel **OR** galvanized-steel, **as directed**, wire into flat sheets.
- 3. Deformed-Steel Welded Wire Reinforcement: ASTM A 497/A 497M, flat sheet.
- 4. Epoxy-Coated Welded Wire Reinforcement: ASTM A 884/A 884M, Class A, plain steel.
- 5. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (Grade 420); deformed.
- 6. Galvanized Reinforcing Bars: ASTM A 767/A 767M, Class II zinc coated, hot-dip galvanized after fabrication and bending; with ASTM A 615/A 615M, Grade 60 (Grade 420) deformed bars.

7. Epoxy-Coated Reinforcing Bars: ASTM A 775/A 775M or ASTM A 934/A 934M; with ASTM A 615/A 615M, Grade 60 (Grade 420) deformed bars.
8. Steel Bar Mats: ASTM A 184/A 184M; with ASTM A 615/A 615M, Grade 60 (Grade 420), deformed bars; assembled with clips.
9. Plain-Steel Wire: ASTM A 82/A 82M, as drawn **OR** galvanized, **as directed**.
10. Deformed-Steel Wire: ASTM A 496/A 496M.
11. Epoxy-Coated-Steel Wire: ASTM A 884/A 884M, Class A coated, plain **OR** deformed, **as directed**.
12. Joint Dowel Bars: ASTM A 615/A 615M, Grade 60 (Grade 420) plain-steel bars; zinc coated (galvanized) after fabrication according to ASTM A 767/A 767M, Class I coating, **as directed**. Cut bars true to length with ends square and free of burrs.
13. Epoxy-Coated, Joint Dowel Bars: ASTM A 775/A 775M; with ASTM A 615/A 615M, Grade 60 (Grade 420), plain-steel bars.
14. Tie Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), deformed.
OR
Hook Bolts: ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6), internally and externally threaded. Design hook-bolt joint assembly to hold coupling against paving form and in position during concreting operations, and to permit removal without damage to concrete or hook bolt.
15. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars, welded wire reinforcement, and dowels in place. Manufacture bar supports according to CRSI's "Manual of Standard Practice" from steel wire, plastic, or precast concrete of greater compressive strength than concrete specified, and as follows:
 - a. Equip wire bar supports with sand plates or horizontal runners where base material will not support chair legs.
 - b. For epoxy-coated reinforcement, use epoxy-coated or other dielectric-polymer-coated wire bar supports.
16. Epoxy Repair Coating: Liquid, two-part, epoxy repair coating, compatible with epoxy coating on reinforcement.
17. Zinc Repair Material: ASTM A 780.

C. Concrete Materials

1. Cementitious Material: Use the following cementitious materials, of same type, brand, and source throughout Project:
 - a. Portland Cement: ASTM C 150, gray **OR** white, **as directed**, portland cement Type I **OR** Type II **OR** Type I/II **OR** Type III **OR** Type V, **as directed**. Supplement with the following, **as directed**:
 - 1) Fly Ash: ASTM C 618, Class C or Class F.
 - 2) Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.
 - b. Blended Hydraulic Cement: ASTM C 595, Type IS, portland blast-furnace slag **OR** Type IP, portland-pozzolan, **as directed**, cement.
2. Normal-Weight Aggregates: ASTM C 33, Class 4S **OR** Class 4M **OR** Class 1N, **as directed**, uniformly graded. Provide aggregates from a single source with documented service-record data of at least 10 years' satisfactory service in similar paving applications and service conditions using similar aggregates and cementitious materials, **as directed**.
 - a. Maximum Coarse-Aggregate Size: 1-1/2 inches (38 mm) **OR** 1 inch (25 mm) **OR** 3/4 inch (19 mm), **as directed**, nominal.
 - b. Fine Aggregate: Free of materials with deleterious reactivity to alkali in cement.
3. Exposed Aggregate: Selected, hard, and durable; washed; free of materials with deleterious reactivity to cement or that cause staining; from a single source, with gap-graded coarse aggregate as follows:
 - a. Aggregate Sizes: 3/4 to 1 inch (19 to 25 mm) **OR** 1/2 to 3/4 inch (13 to 19 mm) **OR** 3/8 to 5/8 inch (10 to 16 mm), **as directed**, nominal.
 - b. Aggregate Source, Shape, and Color: **As required to meet Project requirements**.
4. Water: Potable and complying with ASTM C 94/C 94M.
5. Air-Entraining Admixture: ASTM C 260.

6. Chemical Admixtures: Admixtures certified by manufacturer to be compatible with other admixtures and to contain not more than 0.1 percent water-soluble chloride ions by mass of cementitious material.
 - a. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
 - b. Retarding Admixture: ASTM C 494/C 494M, Type B.
 - c. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
 - d. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
 - e. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
 - f. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M, Type II.
 7. Color Pigment: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures; color stable, free of carbon black, **as directed**, nonfading, and resistant to lime and other alkalis.
- D. Fiber Reinforcement
1. Synthetic Fiber: Monofilament or fibrillated polypropylene fibers engineered and designed for use in concrete paving, complying with ASTM C 1116/C 1116M, Type III, 1/2 to 1-1/2 inches (13 to 38 mm) long.
- E. Curing Materials
1. Absorptive Cover: AASHTO M 182, Class 3, burlap cloth made from jute or kenaf, weighing approximately 9 oz./sq. yd. (305 g/sq. m) dry or cotton mats.
 2. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.
 3. Water: Potable.
 4. Evaporation Retarder: Waterborne, monomolecular, film forming, manufactured for application to fresh concrete.
 5. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, dissipating.
 6. White, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 2, Class B, dissipating.
- F. Related Materials
1. Joint Fillers: ASTM D 1751, asphalt-saturated cellulosic fiber or ASTM D 1752, cork or self-expanding cork in preformed strips.
 2. Slip-Resistive Aggregate Finish: Factory-graded, packaged, rustproof, nonglazing, abrasive aggregate of fused aluminum-oxide granules or crushed emery aggregate containing not less than 50 percent aluminum oxide and not less than 20 percent ferric oxide; unaffected by freezing, moisture, and cleaning materials.
 3. Bonding Agent: ASTM C 1059, Type II, non-redispersible, acrylic emulsion or styrene butadiene.
 4. Epoxy Bonding Adhesive: ASTM C 881/C 881M, two-component epoxy resin capable of humid curing and bonding to damp surfaces; of class suitable for application temperature, of grade complying with requirements, and of the following types:
 - a. Types I and II, non-load bearing **OR** Types IV and V, load bearing, **as directed**, for bonding hardened or freshly mixed concrete to hardened concrete.
 5. Chemical Surface Retarder: Water-soluble, liquid, set retarder with color dye, for horizontal concrete surface application, capable of temporarily delaying final hardening of concrete to a depth of 1/8 to 1/4 inch (3 to 6 mm).
 6. Pigmented Mineral Dry-Shake Hardener: Factory-packaged, dry combination of portland cement, graded quartz aggregate, color pigments, and plasticizing admixture. Use color pigments that are finely ground, nonfading mineral oxides interground with cement.
 7. Rock Salt: Sodium chloride crystals, kiln dried, coarse gradation with 100 percent passing 3/8-inch (9.5-mm) sieve and 85 percent retained on a No. 8 (2.36-mm) sieve.
- G. Detectable Warning Materials
1. Detectable Warning Stamp: Semirigid polyurethane mats with formed underside capable of imprinting detectable warning pattern on plastic concrete; perforated with a vent hole at each dome.

- a. Size of Stamp: One piece matching detectable warning area shown on Drawings **OR** 24 by 24 inches (610 by 610 mm) **OR** 24 by 36 inches (610 by 914 mm) **OR** 24 by 48 inches (610 by 1220 mm) **OR** 26 by 26 inches (660 by 660 mm) **OR** 26 by 36 inches (660 by 914 mm), **as directed**.
 2. Liquid Release Agent: Manufacturer's standard, clear, evaporating formulation designed to facilitate release of stamp mats.
- H. Pavement Markings
 1. Pavement-Marking Paint: Alkyd-resin type, lead and chromate free, ready mixed, complying with AASHTO M 248, Type N **OR** Type F **OR** Type S, **as directed**; colors complying with FS TT-P-1952.
 - a. Color: White **OR** Yellow **OR** Blue **OR** As indicated, **as directed**.
 2. Pavement-Marking Paint: MPI #32 Alkyd Traffic Marking Paint.
 - a. Color: White **OR** Yellow **OR** Blue **OR** As indicated, **as directed**.
 3. Pavement-Marking Paint: Latex, waterborne emulsion, lead and chromate free, ready mixed, complying with FS TT-P-1952, Type II, with drying time of less than three **OR** 45, **as directed**, minutes.
 - a. Color: White **OR** Yellow **OR** Blue **OR** As indicated, **as directed**.
 4. Pavement-Marking Paint: MPI #97 Latex Traffic Marking Paint.
 - a. Color: White **OR** Yellow **OR** Blue **OR** As indicated, **as directed**.
 5. Glass Beads: AASHTO M 247, Type 1 **OR** FS TT-B-1325, Type 1A, **as directed**.
- I. Wheel Stops
 1. Wheel Stops: Precast, air-entrained concrete, 2500-psi (17.2-MPa) minimum compressive strength, 4-1/2 inches (115 mm) high by 9 inches (225 mm) wide by 72 inches (1820 mm) long. Provide chamfered corners and drainage slots on underside and holes for anchoring to substrate.
 - a. Dowels: Galvanized steel, 3/4 inch (19 mm) in diameter, 10-inch (254-mm) minimum length.
 2. Wheel Stops: Solid, integrally colored, 96 percent recycled HDPE, or commingled postconsumer and postindustrial recycled rubber or plastic; UV stabilized; 4 inches (100 mm) high by 6 inches (150 mm) wide by 72 inches (1820 mm) long. Provide chamfered corners and drainage slots on underside and holes for anchoring to substrate.
 - a. Color: Black **OR** Yellow **OR** Gray **OR** Green **OR** Blue, **as directed**.
 - b. Dowels: Galvanized steel, 3/4 inch (19 mm) in diameter, 10-inch (254-mm) minimum length.
 - c. Adhesive: As recommended by wheel stop manufacturer for application to concrete pavement.
- J. Preformed Traffic-Calming Devices
 1. Speed Bumps **OR** Humps **OR** Cushions, **as directed**: Solid, integrally colored, 100 percent postconsumer or commingled postconsumer and postindustrial recycled rubber or plastic; UV stabilized. Provide holes for anchoring to substrate.
 - a. Bump Size: Modular 2 inches (50 mm) high by 10 inches (254 mm) wide by 72 inches (1800 mm) long, with overall length as dimensioned on Drawings.
 - b. Hump **OR** Cushion, **as directed**, Size: Modular assemblies 3 inches (75 mm) high by 12 feet (3.7 m) in overall width **OR** 4 inches (100 mm) high by 14 feet (4.3 m) in overall width, **as directed**, with overall length as dimensioned on Drawings.
 - c. Color: Black **OR** Yellow, **as directed**.
 - d. Mounting Hardware: Galvanized-steel lag screw, shield, and washers; 1/2-inch (13-mm) diameter, 8-inch (200-mm) minimum length **OR** hardware as standard with device manufacturer for use with concrete paving, **as directed**.
 - e. Adhesive: As recommended by device manufacturer.
- K. Concrete Mixtures

1. Prepare design mixtures, proportioned according to ACI 301 (ACI 301M), for each type and strength of normal-weight concrete, and as determined by either laboratory trial mixtures or field experience.
 - a. Use a qualified independent testing agency for preparing and reporting proposed concrete design mixtures for the trial batch method.
 - b. When automatic machine placement is used, determine design mixtures and obtain laboratory test results that meet or exceed requirements.
2. Proportion mixtures to provide normal-weight concrete with the following properties:
 - a. Compressive Strength (28 Days): 4500 psi (31 MPa) **OR** 4000 psi (27.6 MPa) **OR** 3500 psi (24.1 MPa) **OR** 3000 psi (20.7 MPa), **as directed**.
 - b. Maximum Water-Cementitious Materials Ratio at Point of Placement: 0.45 **OR** 0.50, **as directed**.
 - c. Slump Limit: 4 inches (100 mm) **OR** 5 inches (125 mm) **OR** 8 inches (200 mm), **as directed**, plus or minus 1 inch (25 mm).
3. Add air-entraining admixture at manufacturer's prescribed rate to result in normal-weight concrete at point of placement having an air content as follows:
 - a. Air Content: 5-1/2 **OR** 4-1/2 **OR** 2-1/2, **as directed**, percent plus or minus 1.5 percent for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - b. Air Content: 6 **OR** 4-1/2 **OR** 3, **as directed**, percent plus or minus 1.5 percent for 1-inch (25-mm) nominal maximum aggregate size.
 - c. Air Content: 6 **OR** 5 **OR** 3-1/2, **as directed**, percent plus or minus 1.5 percent for 3/4-inch (19-mm) nominal maximum aggregate size.
4. Limit water-soluble, chloride-ion content in hardened concrete to 0.15 **OR** 0.30, **as directed**, percent by weight of cement.
5. Chemical Admixtures: Use admixtures according to manufacturer's written instructions.
 - a. Use water-reducing admixture **OR** high-range, water-reducing admixture **OR** high-range, water-reducing and retarding admixture **OR** plasticizing and retarding admixture, **as directed**, in concrete as required for placement and workability.
 - b. Use water-reducing and retarding admixture when required by high temperatures, low humidity, or other adverse placement conditions.
6. Cementitious Materials: Limit percentage by weight of cementitious materials other than portland cement according to ACI 301 (ACI 301M) requirements for concrete exposed to deicing chemicals **OR** as follows, **as directed**:
 - a. Fly Ash or Pozzolan: 25 percent.
 - b. Ground Granulated Blast-Furnace Slag: 50 percent.
 - c. Combined Fly Ash or Pozzolan, and Ground Granulated Blast-Furnace Slag: 50 percent, with fly ash or pozzolan not exceeding 25 percent.
7. Synthetic Fiber: Uniformly disperse in concrete mixture at manufacturer's recommended rate, but not less than 1.0 lb/cu. yd. (0.60 kg/cu. m) **OR** 1.5 lb/cu. yd. (0.90 kg/cu. m), **as directed**.
8. Color Pigment: Add color pigment to concrete mixture according to manufacturer's written instructions and to result in hardened concrete color consistent with approved mockup.

L. Concrete Mixing

1. Ready-Mixed Concrete: Measure, batch, and mix concrete materials and concrete according to ASTM C 94/C 94M and ASTM C 1116/C 1116M, **as directed**. Furnish batch certificates for each batch discharged and used in the Work.
 - a. When air temperature is between 85 and 90 deg F (30 and 32 deg C), reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F (32 deg C), reduce mixing and delivery time to 60 minutes.
2. Project-Site Mixing: Measure, batch, and mix concrete materials and concrete according to ASTM C 94/C 94M. Mix concrete materials in appropriate drum-type batch machine mixer.
 - a. For concrete batches of 1 cu. yd. (0.76 cu. m) or smaller, continue mixing at least 1-1/2 minutes, but not more than 5 minutes after ingredients are in mixer, before any part of batch is released.
 - b. For concrete batches larger than 1 cu. yd. (0.76 cu. m), increase mixing time by 15 seconds for each additional 1 cu. yd. (0.76 cu. m).

- c. Provide batch ticket for each batch discharged and used in the Work, indicating Project identification name and number, date, mixture type, mixing time, quantity, and amount of water added.

1.3 EXECUTION

A. Examination

1. Examine exposed subgrades and subbase surfaces for compliance with requirements for dimensional, grading, and elevation tolerances.
2. Proof-roll prepared subbase surface below concrete paving to identify soft pockets and areas of excess yielding.
 - a. Completely proof-roll subbase in one direction and repeat in perpendicular direction, **as directed**. Limit vehicle speed to 3 mph (5 km/h).
 - b. Proof-roll with a pneumatic-tired and loaded, 10-wheel, tandem-axle dump truck weighing not less than 15 tons (13.6 tonnes).
 - c. Correct subbase with soft spots and areas of pumping or rutting exceeding depth of 1/2 inch (13 mm) according to requirements in Division 31 Section "Earth Moving".
3. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Preparation

1. Remove loose material from compacted subbase surface immediately before placing concrete.

C. Edge Forms And Screed Construction

1. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides to required lines, grades, and elevations. Install forms to allow continuous progress of work and so forms can remain in place at least 24 hours after concrete placement.
2. Clean forms after each use and coat with form-release agent to ensure separation from concrete without damage.

D. Steel Reinforcement

1. General: Comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.
2. Clean reinforcement of loose rust and mill scale, earth, ice, or other bond-reducing materials.
3. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement. Maintain minimum cover to reinforcement.
4. Install welded wire reinforcement in lengths as long as practicable. Lap adjoining pieces at least one full mesh, and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.
5. Zinc-Coated Reinforcement: Use galvanized-steel wire ties to fasten zinc-coated reinforcement. Repair cut and damaged zinc coatings with zinc repair material.
6. Epoxy-Coated Reinforcement: Use epoxy-coated steel wire ties to fasten epoxy-coated reinforcement. Repair cut and damaged epoxy coatings with epoxy repair coating according to ASTM D 3963/D 3963M.
7. Install fabricated bar mats in lengths as long as practicable. Handle units to keep them flat and free of distortions. Straighten bends, kinks, and other irregularities, or replace units as required before placement. Set mats for a minimum 2-inch (50-mm) overlap of adjacent mats.

E. Joints

1. General: Form construction, isolation, and contraction joints and tool edges true to line, with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline unless otherwise indicated.
 - a. When joining existing paving, place transverse joints to align with previously placed joints unless otherwise indicated.

2. Construction Joints: Set construction joints at side and end terminations of paving and at locations where paving operations are stopped for more than one-half hour unless paving terminates at isolation joints.
 - a. Continue steel reinforcement across construction joints unless otherwise indicated. Do not continue reinforcement through sides of paving strips unless otherwise indicated.
 - b. Provide tie bars at sides of paving strips where indicated.
 - c. Butt Joints: Use bonding agent **OR** epoxy bonding adhesive, **as directed**, at joint locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
 - d. Keyed Joints: Provide preformed keyway-section forms or bulkhead forms with keys unless otherwise indicated. Embed keys at least 1-1/2 inches (38 mm) into concrete.
 - e. Doweled Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or coat with asphalt one-half of dowel length to prevent concrete bonding to one side of joint.
3. Isolation Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, other fixed objects, and where indicated.
 - a. Locate expansion joints at intervals of 50 feet (15.25 m) unless otherwise indicated.
 - b. Extend joint fillers full width and depth of joint.
 - c. Terminate joint filler not less than 1/2 inch (13 mm) or more than 1 inch (25 mm) below finished surface if joint sealant is indicated.
 - d. Place top of joint filler flush with finished concrete surface if joint sealant is not indicated.
 - e. Furnish joint fillers in one-piece lengths. Where more than one length is required, lace or clip joint-filler sections together.
 - f. During concrete placement, protect top edge of joint filler with metal, plastic, or other temporary preformed cap. Remove protective cap after concrete has been placed on both sides of joint.
4. Contraction Joints: Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-fourth of the concrete thickness, as follows, to match jointing of existing adjacent concrete paving:
 - a. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint with grooving tool to a 1/4-inch (6-mm) **OR** 3/8-inch (10-mm), **as directed**, radius. Repeat grooving of contraction joints after applying surface finishes. Eliminate grooving-tool marks on concrete surfaces, **as directed**.
 - 1) Tolerance: Ensure that grooved joints are within 3 inches (75 mm) either way from centers of dowels.
 - b. Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch- (3-mm-) wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before developing random contraction cracks.
 - 1) Tolerance: Ensure that sawed joints are within 3 inches (75 mm) either way from centers of dowels.
 - c. Doweled Contraction Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or coat with asphalt one-half of dowel length to prevent concrete bonding to one side of joint.
 - d. Edging: After initial floating, tool edges of paving, gutters, curbs, and joints in concrete with an edging tool to a 1/4-inch (6-mm) **OR** 3/8-inch (10-mm), **as directed**, radius. Repeat tooling of edges after applying surface finishes. Eliminate edging-tool marks on concrete surfaces, **as directed**.

F. Concrete Placement

1. Before placing concrete, inspect and complete formwork installation, steel reinforcement, and items to be embedded or cast-in.
2. Remove snow, ice, or frost from subbase surface and steel reinforcement before placing concrete. Do not place concrete on frozen surfaces.
3. Moisten subbase to provide a uniform dampened condition at time concrete is placed. Do not place concrete around manholes or other structures until they are at required finish elevation and alignment.

4. Comply with ACI 301 (ACI 301M) requirements for measuring, mixing, transporting, and placing concrete.
5. Do not add water to concrete during delivery or at Project site. Do not add water to fresh concrete after testing.
6. Deposit and spread concrete in a continuous operation between transverse joints. Do not push or drag concrete into place or use vibrators to move concrete into place.
7. Consolidate concrete according to ACI 301 (ACI 301M) by mechanical vibrating equipment supplemented by hand spading, rodding, or tamping.
 - a. Consolidate concrete along face of forms and adjacent to transverse joints with an internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Use only square-faced shovels for hand spreading and consolidation. Consolidate with care to prevent dislocating reinforcement, dowels, and joint devices.
8. Screed paving surface with a straightedge and strike off.
9. Commence initial floating using bull floats or darbies to impart an open-textured and uniform surface plane before excess moisture or bleed water appears on the surface. Do not further disturb concrete surfaces before beginning finishing operations or spreading surface treatments.
10. Curbs and Gutters: Use design mixture for automatic machine placement. Produce curbs and gutters to required cross section, lines, grades, finish, and jointing.
11. Slip-Form Paving: Use design mixture for automatic machine placement. Produce paving to required thickness, lines, grades, finish, and jointing.
 - a. Compact subbase and prepare subgrade of sufficient width to prevent displacement of slip-form paving machine during operations.
12. Cold-Weather Placement: Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing, or low temperatures. Comply with ACI 306.1 and the following:
 - a. When air temperature has fallen to or is expected to fall below 40 deg F (4.4 deg C), uniformly heat water and aggregates before mixing to obtain a concrete mixture temperature of not less than 50 deg F (10 deg C) and not more than 80 deg F (27 deg C) at point of placement.
 - b. Do not use frozen materials or materials containing ice or snow.
 - c. Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators unless otherwise specified and approved in design mixtures.
13. Hot-Weather Placement: Comply with ACI 301 (ACI 301M) and as follows when hot-weather conditions exist:
 - a. Cool ingredients before mixing to maintain concrete temperature below 90 deg F (32 deg C) at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated in total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
 - b. Cover steel reinforcement with water-soaked burlap so steel temperature will not exceed ambient air temperature immediately before embedding in concrete.
 - c. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade moisture uniform without standing water, soft spots, or dry areas.

G. Float Finishing

1. General: Do not add water to concrete surfaces during finishing operations.
2. Float Finish: Begin the second floating operation when bleed-water sheen has disappeared and concrete surface has stiffened sufficiently to permit operations. Float surface with power-driven floats or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Cut down high spots and fill low spots. Refloat surface immediately to uniform granular texture.
 - a. Burlap Finish: Drag a seamless strip of damp burlap across float-finished concrete, perpendicular to line of traffic, to provide a uniform, gritty texture.
 - b. Medium-to-Fine-Textured Broom Finish: Draw a soft-bristle broom across float-finished concrete surface perpendicular to line of traffic to provide a uniform, fine-line texture.
 - c. Medium-to-Coarse-Textured Broom Finish: Provide a coarse finish by striating float-finished concrete surface 1/16 to 1/8 inch (1.6 to 3 mm) deep with a stiff-bristled broom, perpendicular to line of traffic.

H. Special Finishes

1. **Monolithic Exposed-Aggregate Finish:** Expose coarse aggregate in paving surface as follows:
 - a. Immediately after float finishing, spray-apply chemical surface retarder to paving according to manufacturer's written instructions.
 - b. Cover paving surface with plastic sheeting, sealing laps with tape, and remove when ready to continue finishing operations.
 - c. Without dislodging aggregate, remove mortar concealing the aggregate by lightly brushing surface with a stiff, nylon-bristle broom. Do not expose more than one-third of the average diameter of the aggregate and not more than one-half of the diameter of the smallest aggregate.
 - d. Fine-spray surface with water and brush. Repeat cycle of water flushing and brushing until cement film is removed from aggregate surfaces to depth required.
2. **Seeded Exposed-Aggregate Finish:** Immediately after initial floating, spread a single layer of aggregate uniformly on paving surface. Tamp aggregate into plastic concrete and float finish to entirely embed aggregate with mortar cover of 1/16 inch (1.6 mm).
 - a. Spray-apply chemical surface retarder to paving according to manufacturer's written instructions.
 - b. Cover paving surface with plastic sheeting, sealing laps with tape, and remove sheeting when ready to continue finishing operations.
 - c. Without dislodging aggregate, remove mortar concealing the aggregate by lightly brushing surface with a stiff, nylon-bristle broom. Do not expose more than one-third of the average diameter of the aggregate and not more than one-half of the diameter of the smallest aggregate.
 - d. Fine-spray surface with water and brush. Repeat cycle of water flushing and brushing until cement film is removed from aggregate surfaces to depth required.
3. **Slip-Resistive Aggregate Finish:** Before final floating, spread slip-resistive aggregate finish on paving surface according to manufacturer's written instructions and as follows:
 - a. Uniformly spread 25 lb/100 sq. ft. (12 kg/10 sq. m) **OR** 40 lb/100 sq. ft. (19.5 kg/10 sq. m) **OR** 60 lb/100 sq. ft. (29 kg/10 sq. m), **as directed**, of dampened, slip-resistive aggregate over paving surface in two applications. Tamp aggregate flush with surface using a steel trowel, but do not force below surface.
 - b. Uniformly distribute approximately two-thirds of slip-resistive aggregate over paving surface with mechanical spreader, allow to absorb moisture, and embed by power floating. Follow power floating with a second slip-resistive aggregate application, uniformly distributing remainder of material at right angles to first application to ensure uniform coverage, and embed by power floating.
 - c. Cure concrete with curing compound recommended by slip-resistive aggregate manufacturer. Apply curing compound immediately after final finishing.
 - d. After curing, lightly work surface with a steel wire brush or abrasive stone and water to expose nonslip aggregate.
4. **Rock-Salt Finish:** After initial floating **OR** troweling **OR** brooming, **as directed**, uniformly spread rock salt over paving surface at the rate of 5 lb/100 sq. ft. (0.2 kg/10 sq. m).
 - a. Embed rock salt into plastic concrete with roller or magnesium float.
 - b. Cover paving surface with 1-mil- (0.025-mm-) thick polyethylene sheet and remove sheet when concrete has hardened and seven-day curing period has elapsed.
 - c. After seven-day curing period, saturate concrete with water and broom-sweep surface to dissolve remaining rock salt, thereby leaving pits and holes.
5. **Pigmented Mineral Dry-Shake Hardener Finish:** After initial floating, apply dry-shake materials to paving surface according to manufacturer's written instructions and as follows:
 - a. Uniformly spread dry-shake hardener at a rate of 100 lb/100 sq. ft. (49 kg/10 sq. m), unless greater amount is recommended by manufacturer to match paving color required.
 - b. Uniformly distribute approximately two-thirds of dry-shake hardener over the concrete surface with mechanical spreader; allow hardener to absorb moisture and embed it by power floating. Follow power floating with a second application of pigmented mineral dry-shake hardener, uniformly distributing remainder of material at right angles to first application to ensure uniform color, and embed hardener by final power floating.
 - c. After final power floating, apply a hand-trowel finish followed by a broom finish.

- d. Cure concrete with curing compound recommended by dry-shake hardener manufacturer. Apply curing compound immediately after final finishing.
- I. Detectable Warnings
1. Blockouts: Form blockouts in concrete for installation of detectable paving units specified in Division 32 Section "Unit Paving".
 - a. Tolerance for Opening Size: Plus 1/4 inch (6 mm), no minus.
 2. Stamped Detectable Warnings: Install stamped detectable warnings as part of a continuous concrete paving placement and according to stamp-mat manufacturer's written instructions.
 - a. Before using stamp mats, verify that the vent holes are unobstructed.
 - b. Apply liquid release agent to the concrete surface and the stamp mat.
 - c. Stamping: While initially finished concrete is plastic **OR** After application and final floating of pigmented mineral dry-shake hardener, **as directed**, accurately align and place stamp mats in sequence. Uniformly load, gently vibrate, and press mats into concrete to produce imprint pattern on concrete surface. Load and tamp mats directly perpendicular to the stamp-mat surface to prevent distortion in shape of domes. Press and tamp until mortar begins to come through all of the vent holes. Gently remove stamp mats.
 - d. Trimming: After 24 hours, cut off the tips of mortar formed by the vent holes.
 - e. Remove residual release agent according to manufacturer's written instructions, but no fewer than three days after stamping concrete. High-pressure-wash surface and joint patterns, taking care not to damage stamped concrete. Control, collect, and legally dispose of runoff.
- J. Concrete Protection And Curing
1. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures.
 2. Comply with ACI 306.1 for cold-weather protection.
 3. Evaporation Retarder: Apply evaporation retarder to concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching 0.2 lb/sq. ft. x h (1 kg/sq. m x h) before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying concrete but before float finishing.
 4. Begin curing after finishing concrete but not before free water has disappeared from concrete surface.
 5. Curing Methods: Cure concrete by moisture curing, moisture-retaining-cover curing, curing compound, or a combination of these as follows:
 - a. Moisture Curing: Keep surfaces continuously moist for not less than seven days with the following materials:
 - 1) Water.
 - 2) Continuous water-fog spray.
 - 3) Absorptive cover, water saturated and kept continuously wet. Cover concrete surfaces and edges with 12-inch (300-mm) lap over adjacent absorptive covers.
 - b. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover, placed in widest practicable width, with sides and ends lapped at least 12 inches (300 mm) and sealed by waterproof tape or adhesive. Immediately repair any holes or tears occurring during installation or curing period using cover material and waterproof tape.
 - c. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas that have been subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating, and repair damage during curing period.
- K. Paving Tolerances
1. Comply with tolerances in ACI 117 and as follows:
 - a. Elevation: 3/4 inch (19 mm).
 - b. Thickness: Plus 3/8 inch (10 mm), minus 1/4 inch (6 mm).
 - c. Surface: Gap below 10-foot- (3-m-) long, unleveled straightedge not to exceed 1/2 inch (13 mm).

- d. Alignment of Tie-Bar End Relative to Line Perpendicular to Paving Edge: 1/2 inch per 12 inches (13 mm per 300 mm) of tie bar.
 - e. Lateral Alignment and Spacing of Dowels: 1 inch (25 mm).
 - f. Vertical Alignment of Dowels: 1/4 inch (6 mm).
 - g. Alignment of Dowel-Bar End Relative to Line Perpendicular to Paving Edge: 1/4 inch per 12 inches (6 mm per 300 mm) of dowel.
 - h. Joint Spacing: 3 inches (75 mm).
 - i. Contraction Joint Depth: Plus 1/4 inch (6 mm), no minus.
 - j. Joint Width: Plus 1/8 inch (3 mm), no minus.
- L. Pavement Marking
- 1. Do not apply pavement-marking paint until layout, colors, and placement have been verified with The University.
 - 2. Allow concrete paving to cure for a minimum of 28 days and be dry before starting pavement marking.
 - 3. Sweep and clean surface to eliminate loose material and dust.
 - 4. Apply paint with mechanical equipment to produce markings of dimensions indicated with uniform, straight edges. Apply at manufacturer's recommended rates to provide a minimum wet film thickness of 15 mils (0.4 mm).
 - a. Apply graphic symbols and lettering with paint-resistant, die-cut stencils, firmly secured to concrete surface. Mask an extended area beyond edges of each stencil to prevent paint application beyond stencil. Apply paint so that it cannot run beneath stencil.
 - b. Broadcast glass beads uniformly into wet markings at a rate of 6 lb/gal. (0.72 kg/L).
- M. Wheel Stops
- 1. Install wheel stops in bed of adhesive applied as recommended by manufacturer.
 - 2. Securely attach wheel stops to paving with not less than two steel **OR** galvanized-steel, **as directed**, dowels located at one-quarter to one-third points. Install dowels in drilled holes in the paving and bond dowels to wheel stop. Recess head of dowel beneath top of wheel stop.
- N. Preformed Traffic-Calming Devices
- 1. Install preformed speed bumps **OR** humps **OR** cushions, **as directed**, in bed of adhesive applied as recommended by manufacturer for heavy traffic.
 - 2. Securely attach preformed speed bumps **OR** humps **OR** cushions, **as directed**, to paving with hardware spaced as recommended by manufacturer for heavy traffic. Recess head of hardware beneath top surface.
- O. Field Quality Control
- 1. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
 - 2. Testing Services: Testing of composite samples of fresh concrete obtained according to ASTM C 172 shall be performed according to the following requirements:
 - a. Testing Frequency: Obtain at least one composite sample for each 100 cu. yd. (76 cu. m) **OR** 5000 sq. ft. (465 sq. m), **as directed**, or fraction thereof of each concrete mixture placed each day.
 - 1) When frequency of testing will provide fewer than five compressive-strength tests for each concrete mixture, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.
 - b. Slump: ASTM C 143/C 143M; one test at point of placement for each composite sample, but not less than one test for each day's pour of each concrete mixture. Perform additional tests when concrete consistency appears to change.
 - c. Air Content: ASTM C 231, pressure method; one test for each composite sample, but not less than one test for each day's pour of each concrete mixture.
 - d. Concrete Temperature: ASTM C 1064/C 1064M; one test hourly when air temperature is 40 deg F (4.4 deg C) and below and when it is 80 deg F (27 deg C) and above, and one test for each composite sample.
 - e. Compression Test Specimens: ASTM C 31/C 31M; cast and laboratory cure one set of three standard cylinder specimens for each composite sample.

- f. Compressive-Strength Tests: ASTM C 39/C 39M; test one specimen at seven days and two specimens at 28 days.
 - 1) A compressive-strength test shall be the average compressive strength from two specimens obtained from same composite sample and tested at 28 days.
 - 3. Strength of each concrete mixture will be satisfactory if average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than 500 psi (3.4 MPa).
 - 4. Test results shall be reported in writing to The University, concrete manufacturer, and Contractor within 48 hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.
 - 5. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by The University but will not be used as sole basis for approval or rejection of concrete.
 - 6. Additional Tests: Testing and inspecting agency shall make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as approved by The University.
 - 7. Concrete paving will be considered defective if it does not pass tests and inspections.
 - 8. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
 - 9. Prepare test and inspection reports.
- P. Repairs And Protection
- 1. Remove and replace concrete paving that is broken, damaged, or defective or that does not comply with requirements in this Section. Remove work in complete sections from joint to joint unless otherwise approved by The University.
 - 2. Drill test cores, where directed by The University, when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory paving areas with portland cement concrete bonded to paving with epoxy adhesive.
 - 3. Protect concrete paving from damage. Exclude traffic from paving for at least 14 days after placement. When construction traffic is permitted, maintain paving as clean as possible by removing surface stains and spillage of materials as they occur.
 - 4. Maintain concrete paving free of stains, discoloration, dirt, and other foreign material. Sweep paving not more than two days before date scheduled for Substantial Completion inspections.

END OF SECTION 32 16 13 13

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 32 16 13 13a - STEEL CURBS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of steel curbs. Products shall match existing materials and/or shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Product Data: For each type of product indicated.

1.2 PRODUCTS

- #### A. Standard Steel Curb Sections: Noncorrosive steel sections as required to match existing.

- #### B. Coating: Steel curb sections shall be zinc coated.

C. Joint Materials

1. Expansion Joint Fillers: ASTM D 1751 or ASTM D 1752.
2. Joint Sealers: ASTM D 1850.

- #### D. Concrete: Concrete shall have a minimum compressive strength of 3,000 psi. The maximum size of aggregate shall be 1-1/2 inches. Concrete shall have a slump of not more than 3 inches and an air content by volume of concrete of 3 to 6 percent.

1.3 EXECUTION

- #### A. Preparation: The subgrade shall be constructed to grade and cross section. The subgrade shall be of materials equal in bearing quality to the subgrade under the adjacent pavement and shall be compacted. The subgrade shall be maintained in a smooth, compacted condition, in conformity with the required section and established grade until the concrete is placed. The subgrade shall be in a moist condition when concrete is placed.

B. Installation

1. Steel Curb Setting: Steel curbs shall be carefully set to alignment and grade and to conform to the dimensions of the curb.
2. Concrete Placement And Finishing: Concrete shall be placed in layers not to exceed 6 inches. Concrete shall be thoroughly consolidated. Floated surfaces shall then be brushed with longitudinal strokes. The top surface of the entrance shall be finished to grade with a wood float. Expansion joints and contraction joints shall be constructed at right angles to the line of curb. Contraction joints shall be constructed by means of 1/8-inch thick separators, of a section conforming to the cross section of the curb and gutter. Contraction joints shall match joints in abutting Portland cement concrete pavement. At other pavements, construction joints shall be placed at not less than 5 feet nor greater than 15 feet apart. Expansion joints shall be formed by means of preformed expansion joint filler material cut and shaped to the cross section of curb. Expansion joints shall be provided in curb at the end of all returns. Expansion joints shall match expansion joints of abutting Portland cement concrete pavement. At other pavements, expansion joints at least 1/2 inch in width shall be provided at intervals not exceeding 45 feet. Exposed concrete surfaces shall be cured for not less than 7 days.

3. Backfilling: After curing, debris shall be removed and the area adjoining the concrete shall be backfilled, graded, and compacted.
4. Sealing Joints: Expansion joints and the top 1-inch depth of contraction joints shall be sealed with joint sealer. The joint opening shall be thoroughly cleaned before the sealing material is placed. Excess material on exposed surfaces of the concrete shall be removed immediately and exposed concrete surfaces cleaned.

END OF SECTION 32 16 13 13a

Task	Specification	Specification Description
32 16 13 13	32 00 00 00	Piped Underground or Surface Systems with Piping, Sprinkler Heads, Valves, and Controls, Construction Standard

Heads, Valves, and Controls, Construction Standard

SECTION 32 84 23 00 - IRRIGATION SYSTEMS**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for irrigation systems. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Piping.
 - b. Encasement for piping.
 - c. Manual valves.
 - d. Pressure-reducing valves.
 - e. Automatic control valves.
 - f. Automatic drain valves.
 - g. Transition fittings.
 - h. Dielectric fittings.
 - i. Miscellaneous piping specialties.
 - j. Sprinklers.
 - k. Quick couplers.
 - l. Drip irrigation specialties.
 - m. Controllers.
 - n. Boxes for automatic control valves.

C. Definitions

1. Circuit Piping: Downstream from control valves to sprinklers, specialties, and drain valves. Piping is under pressure during flow.
2. Drain Piping: Downstream from circuit-piping drain valves. Piping is not under pressure.
3. Main Piping: Downstream from point of connection to water distribution piping to, and including, control valves. Piping is under water-distribution-system pressure.
4. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.

D. Performance Requirements

1. Irrigation zone control shall be automatic operation with controller and automatic control **OR** manual operation with manual, **as directed**, valves.
2. Location of Sprinklers and Specialties: Design location is approximate. Make minor adjustments necessary to avoid plantings and obstructions such as signs and light standards. Maintain 100 percent irrigation coverage of areas indicated.
3. Delegated Design: Design 100 percent coverage irrigation system, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
 - a. Available land records indicate the following soil conditions:
 - 1) Type: Coarse **OR** Medium **OR** Fine, **as directed**.
 - 2) Texture:
 - a) Sand: as approved by The University.
 - b) Silt: as approved by The University.
 - c) Clay: as approved by The University.
 - 3) Particle Size:
 - a) Sand: as approved by The University.
 - b) Silt: as approved by The University.

- c) Clay: as approved by The University.
 - 4) Structure: Single grained **OR** Granular **OR** Platy **OR** Blocky, **as directed**.
 - 5) Density: as approved by The University.
 - 6) Moisture Content: as approved by The University.
 - 7) Infiltration Rate: as approved by The University.
- 4. Minimum Working Pressures: The following are minimum pressure requirements for piping, valves, and specialties unless otherwise indicated:
 - a. Irrigation Main Piping: 200 psig (1380 kPa).
 - b. Circuit Piping: 150 psig (1035 kPa).

E. Submittals

- 1. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- 2. Wiring Diagrams: For power, signal, and control wiring.
- 3. Delegated-Design Submittal: For irrigation systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- 4. Zoning Chart: Show each irrigation zone and its control valve.
- 5. Controller Timing Schedule: Indicate timing settings for each automatic controller zone.
- 6. Field quality-control reports.
- 7. Operation and maintenance data.

F. Quality Assurance

- 1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

G. Delivery, Storage, And Handling

- 1. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.
- 2. Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.

H. Project Conditions

- 1. Interruption of Existing Water Service: Do not interrupt water service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water service according to requirements indicated:
 - a. Notify The University no fewer than two days in advance of proposed interruption of water service.
 - b. Do not proceed with interruption of water service without The University's written permission.

1.2 PRODUCTS

A. Pipes, Tubes, And Fittings

- 1. Comply with requirements in the piping schedule for applications of pipe, tube, and fitting materials, and for joining methods for specific services, service locations, and pipe sizes.
- 2. Galvanized-Steel Pipe: ASTM A 53/A 53M, Standard Weight, Type E, Grade B.
 - a. Galvanized-Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M or ASTM A 106/A 106M, Standard Weight, seamless-steel pipe with threaded ends.
 - b. Galvanized, Gray-Iron Threaded Fittings: ASME B16.4, Class 125, standard pattern.
 - c. Malleable-Iron Unions: ASME B16.39, Class 150, hexagonal-stock body with ball-and-socket, metal-to-metal, bronze seating surface, and female threaded ends.
 - d. Cast-Iron Flanges: ASME B16.1, Class 125.
- 3. Ductile-Iron Pipe with Mechanical Joints: AWWA C151, with mechanical-joint bell and spigot ends.

- a. Mechanical-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.
 - 1) Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron glands, rubber gaskets, and steel bolts.
 4. Ductile-Iron Pipe with Push-on Joint: AWWA C151, with push-on-joint bell and spigot ends.
 - a. Push-on-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.
 - 1) Gaskets: AWWA C111, rubber.
 5. Soft Copper Tube: ASTM B 88, Type L (ASTM B 88M, Type B), water tube, annealed temper.
 - a. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper solder-joint fittings. Furnish wrought-copper fittings if indicated.
 - b. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end.
 - c. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces and solder-joint or threaded ends.
 6. Hard Copper Tube: ASTM B 88, Type L (ASTM B 88M, Type B), and ASTM B 88, Type M (ASTM B 88M, Type C), water tube, drawn temper.
 - a. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper solder-joint fittings. Furnish wrought-copper fittings if indicated.
 - b. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end.
 - c. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces and solder-joint or threaded ends.
 7. PE Pipe with Controlled ID: ASTM F 771, PE 3408 compound; SDR 11.5 and SDR 15.
 - a. Insert Fittings for PE Pipe: ASTM D 2609, nylon or propylene plastic with barbed ends. Include bands or other fasteners.
 8. PE Pipe with Controlled OD: ASTM F 771, PE 3408 compound, SDR 11.
 - a. PE Butt, Heat-Fusion Fittings: ASTM D 3261.
 - b. PE Socket-Type Fittings: ASTM D 2683.
 9. PE Pressure Pipe: AWWA C906, with DR of 7.3, 9, or 9.3 and PE compound number required to give pressure rating not less than 160 psig (1100 kPa) **OR** 200 psig (1380 kPa), **as directed**.
 - a. PE Butt, Heat-Fusion Fittings: ASTM D 3261.
 - b. PE Socket-Type Fittings: ASTM D 2683.
 10. PVC Pipe: ASTM D 1785, PVC 1120 compound, Schedule 40 **OR** Schedule 80, **as directed**.
 - a. PVC Socket Fittings: ASTM D 2466, Schedule 40 **OR** Schedule 80, **as directed**.
 - b. PVC Threaded Fittings: ASTM D 2464, Schedule 80.
 - c. PVC Socket Unions: Construction similar to MSS SP-107, except both headpiece and tailpiece shall be PVC with socket ends.
 11. PVC Pipe, Pressure Rated: ASTM D 2241, PVC 1120 compound, SDR 21 and SDR 26.
 - a. PVC Socket Fittings: ASTM D 2467, Schedule 80.
 - b. PVC Socket Unions: Construction similar to MSS SP-107, except both headpiece and tailpiece shall be PVC with socket or threaded ends.
- B. Piping Joining Materials
1. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 1/8 inch (3.2 mm) thick unless otherwise indicated; full-face or ring type unless otherwise indicated.
 2. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.
 3. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for general-duty brazing unless otherwise indicated.
 4. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.
 5. Solvent Cements for Joining PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.
 6. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer unless otherwise indicated.
- C. Encasement For Piping
1. Standard: ASTM A 674 or AWWA C105.
 2. Form: Sheet **OR** Tube, **as directed**.

3. Material: LLDPE film of 0.008-inch (0.20-mm) **OR** LLDPE film of 0.008-inch (0.20-mm) minimum thickness or high-density, cross-laminated PE film of 0.004-inch (0.10-mm) **OR** High-density, cross-laminated PE film of 0.004-inch (0.10-mm), **as directed**, minimum thickness.
4. Color: Black **OR** Natural, **as directed**.

D. Manual Valves

1. Curb Valves:
 - a. Description:
 - 1) Standard: AWWA C800.
 - 2) NPS 1 (DN 25) and Smaller Pressure Rating: 100 psig (690 kPa) minimum **OR** 150 psig (1035 kPa), **as directed**.
 - 3) NPS 1-1/4 to NPS 2 (DN 32 to DN 50) Pressure Rating: 80 psig (550 kPa) minimum **OR** 150 psig (1035 kPa), **as directed**.
 - 4) Body Material: Brass or bronze with ball or ground-key plug.
 - 5) End Connections: Matching piping.
 - 6) Stem: With wide-tee head.
2. Curb-Valve Casing:
 - a. Standard: Similar to AWWA M44 for cast-iron valve casings.
 - b. Top Section: Telescoping, of length required for depth of burial of curb valve.
 - c. Barrel: Approximately 3-inch (75-mm) diameter.
 - d. Plug: With lettering "WATER."
 - e. Bottom Section: With base of size to fit over valve.
 - f. Base Support: Concrete collar **OR** wood frame, **as directed**.
3. Shutoff Rods for Curb-Valve Casings: Furnish one **OR** two, **as directed**, steel, tee-handle shutoff rod(s) with one pointed end, stem of length to operate deepest buried valve, and slotted end matching curb valve for Project.
4. Brass Ball Valves:
 - a. Description:
 - 1) Standard: MSS SP-110.
 - 2) SWP Rating: 150 psig (1035 kPa).
 - 3) CWP Rating: 600 psig (4140 kPa).
 - 4) Body Design: Two piece.
 - 5) Body Material: Forged brass.
 - 6) Ends: Threaded or solder joint if indicated.
 - 7) Seats: PTFE or TFE.
 - 8) Stem: Brass.
 - 9) Ball: Chrome-plated brass.
 - 10) Port: Full **OR** regular, but not reduced, **as directed**.
5. Bronze Ball Valves:
 - a. Description:
 - 1) Standard: MSS SP-110.
 - 2) SWP Rating: 150 psig (1035 kPa).
 - 3) CWP Rating: 600 psig (4140 kPa).
 - 4) Body Design: Two piece.
 - 5) Body Material: Bronze.
 - 6) Ends: Threaded or solder joint if indicated.
 - 7) Seats: PTFE or TFE.
 - 8) Stem: Bronze.
 - 9) Ball: Chrome-plated brass.
 - 10) Port: Full **OR** regular, but not reduced, **as directed**.
6. Iron Ball Valves:
 - a. Description:
 - 1) Standard: MSS SP-72.
 - 2) CWP Rating: 200 psig (1380 kPa).
 - 3) Body Design: Split body.
 - 4) Body Material: ASTM A 126, gray iron.
 - 5) Ends: Flanged.

- 6) Seats: PTFE or TFE.
- 7) Stem: Stainless steel.
- 8) Ball: Stainless steel.
- 9) Port: Full.
7. Plastic Ball Valves:
 - a. Description:
 - 1) Standard: MSS SP-122.
 - 2) Pressure Rating: 125 psig (860 kPa) minimum **OR** 150 psig (1035 kPa), **as directed**.
 - 3) Body Material: PVC.
 - 4) Type: Union.
 - 5) End Connections: Socket or threaded.
 - 6) Port: Full.
8. Bronze Gate Valves:
 - a. Description:
 - 1) Standard: MSS SP-80, Type 2.
 - 2) Class: 125.
 - 3) CWP Rating: 200 psig (1380 kPa).
 - 4) Body Material: ASTM B 62 bronze with integral seat and screw-in bonnet.
 - 5) Ends: Threaded or solder joint.
 - 6) Stem: Bronze, nonrising.
 - 7) Disc: Solid wedge; bronze.
 - 8) Packing: Asbestos free.
 - 9) Handwheel: Malleable iron, bronze, or aluminum.
9. Iron Gate Valves, Resilient Seated:
 - a. Description:
 - 1) Standard: AWWA C509.
 - 2) Pressure Rating: 200 psig (1380 kPa) **OR** 250 psig (1725 kPa), **as directed**, minimum.
 - 3) Body Material: Ductile or gray iron with bronze trim.
 - 4) End Connections: Mechanical joint or push-on joint.
 - 5) Interior Coating: Comply with AWWA C550.
 - 6) Body Design: Nonrising stem.
 - 7) Operator: Stem nut.
 - 8) Disc: Solid wedge with resilient coating.
10. Iron Gate Valve Casings:
 - a. Standard: AWWA M44 for cast-iron valve casings.
 - b. Top Section: Adjustable extension of length required for depth of burial of valve.
 - c. Barrel: Approximately 5-inch (125-mm) diameter.
 - d. Plug: With lettering "WATER."
 - e. Bottom Section: With base of size to fit over valve.
 - f. Base Support: Concrete collar **OR** wood frame, **as directed**.
11. Operating Wrenches for Iron Gate Valve Casings: Furnish one **OR** two, **as directed**, steel, tee-handle operating wrench(es) with one pointed end, stem of length to operate deepest buried valve, and socket matching valve operating nut for Project.
12. Iron Gate Valves, NRS:
 - a. Description:
 - 1) Standard: MSS SP-70, Type I.
 - 2) CWP Rating: 200 psig (1380 kPa).
 - 3) Body Material: ASTM A 126, gray iron with bolted bonnet.
 - 4) Ends: Flanged.
 - 5) Trim: All bronze.
 - 6) Disc: Solid wedge.
 - 7) Packing and Gasket: Asbestos free.
13. Iron Gate Valves, OS&Y:
 - a. Description:
 - 1) Standard: MSS SP-70, Type I.

- 2) CWP Rating: 200 psig (1380 kPa).
- 3) Body Material: ASTM A 126, gray iron with bolted bonnet.
- 4) Ends: Flanged.
- 5) Trim: All bronze.
- 6) Disc: Solid wedge.
- 7) Packing and Gasket: Asbestos free.

E. Pressure-Reducing Valves

1. Water Regulators:

a. Description:

- 1) Standard: ASSE 1003.
- 2) Body Material: Bronze for NPS 2 (DN 50) and smaller; cast iron with interior lining complying with AWWA C550 or that is FDA approved for NPS 2-1/2 and NPS 3 (DN 65 and DN 80).
- 3) Pressure Rating: Initial pressure of 150 psig (1035 kPa).
- 4) End Connections: Threaded for NPS 2 (DN 50) and smaller; flanged for NPS 2-1/2 and NPS 3 (DN 65 and DN 80).

2. Water Control Valves:

- a. Description: Pilot-operation, diaphragm-type, single-seated main water control valve. Include small pilot control valve, restrictor device, specialty fittings, and sensor piping.
- 1) Main Valve Body: Cast- or ductile-iron body with AWWA C550 or FDA-approved, interior epoxy coating; or stainless-steel body.
 - 2) Pattern: Angle-valve **OR** Globe-valve, **as directed**, design.
 - 3) Trim: Stainless steel.
 - 4) Pressure Rating: Initial pressure of 150 psig (1035 kPa) minimum.
 - 5) End Connections: Threaded for NPS 2 (DN 50) and smaller; flanged for NPS 2-1/2 (DN 65) and larger.

F. Automatic Control Valves

1. Bronze, Automatic Control Valves:

- a. Description: Cast-bronze body, normally closed, diaphragm type with manual-flow adjustment, and operated by 24-V ac solenoid.

2. Plastic, Automatic Control Valves:

- a. Description: Molded-plastic body, normally closed, diaphragm type with manual-flow adjustment, and operated by 24-V ac solenoid.

G. Automatic Drain Valves

1. Description: Spring-loaded-ball type of corrosion-resistant construction and designed to open for drainage if line pressure drops below 2-1/2 to 3 psig (17 to 20 kPa).

H. Transition Fittings

1. General Requirements: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.
2. Transition Couplings:

a. Description: AWWA C219, metal sleeve-type coupling for underground pressure piping.
3. Plastic-to-Metal Transition Fittings:

a. Description: PVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-socket or threaded end.
4. Plastic-to-Metal Transition Unions:

a. Description: MSS SP-107, PVC four-part union. Include one brass or stainless-steel threaded end, one solvent-cement-joint or threaded plastic end, rubber O-ring, and union nut.

I. Dielectric Fittings

1. General Requirements: Assembly of copper alloy and ferrous materials or ferrous material body with separating nonconductive insulating material suitable for system fluid, pressure, and temperature.
 2. Dielectric Unions:
 - a. Description: Factory-fabricated union, NPS 2 (DN 50) and smaller.
 - 1) Pressure Rating: 150 psig (1035 kPa) minimum **OR** 250 psig (1725 kPa), **as directed**, at 180 deg F (82 deg C).
 - 2) End Connections: Solder-joint copper alloy and threaded ferrous; threaded ferrous.
 3. Dielectric Flanges:
 - a. Description: Factory-fabricated, bolted, companion-flange assembly, NPS 2-1/2 to NPS 4 (DN 65 to DN 100) and larger.
 - 1) Pressure Rating: 150 psig (1035 kPa) minimum **OR** 175 psig (1200 kPa) minimum **OR** 300 psig (2070 kPa), **as directed**.
 - 2) End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.
 4. Dielectric-Flange Kits:
 - a. Description: Nonconducting materials for field assembly of companion flanges, NPS 2-1/2 (DN 65) and larger.
 - 1) Pressure Rating: 150 psig (1035 kPa) minimum.
 - 2) Gasket: Neoprene or phenolic.
 - 3) Bolt Sleeves: Phenolic or polyethylene.
 - 4) Washers: Phenolic with steel backing washers.
 5. Dielectric Couplings:
 - a. Description: Galvanized-steel coupling.
 - 1) Pressure Rating: 300 psig (2070 kPa) at 225 deg F (107 deg C).
 - 2) End Connections: Female threaded.
 - 3) Lining: Inert and noncorrosive, thermoplastic lining.
 6. Dielectric Nipples:
 - a. Description: Electroplated steel nipple complying with ASTM F 1545.
 - 1) Pressure Rating: 300 psig (2070 kPa) at 225 deg F (107 deg C).
 - 2) End Connections: Male threaded or grooved.
 - 3) Lining: Inert and noncorrosive, propylene.
- J. Miscellaneous Piping Specialties
1. Water Hammer Arresters: ASSE 1010 or PDI WH 201, with bellows or piston-type pressurized cushioning chamber and in sizes complying with PDI WH 201, Sizes A to F.
 2. Pressure Gages: ASME B40.1. Include 4-1/2-inch- (115-mm-) diameter dial, dial range of two times system operating pressure, and bottom outlet.
- K. Sprinklers
1. General Requirements: Designed for uniform coverage over entire spray area indicated at available water pressure.
 2. Metal, Exposed, Impact-Drive Rotary Sprinklers:
 - a. Description:
 - 1) Construction: Brass and other corrosion-resistant metals.
 - 2) Mounting: Aboveground, exposed on riser.
 3. Plastic, Exposed, Impact-Drive Rotary Sprinklers:
 - a. Description:
 - 1) Construction: ABS and corrosion-resistant metals.
 - 2) Mounting: Aboveground, exposed on riser.
 4. Plastic, Pop-up, Gear-Drive Rotary Sprinklers:
 - a. Description:
 - 1) Body Material: ABS.
 - 2) Nozzle: ABS **OR** Brass, **as directed**.
 - 3) Retraction Spring: Stainless steel.
 - 4) Internal Parts: Corrosion resistant.
 5. Metal, Pop-up, Impact-Drive Rotary Sprinklers:

- a. Description:
 - 1) Case: Brass.
 - 2) Body Material: Brass.
 - 3) Pop-up Height: Approximately 3 inches (75 mm).
 - 4) Sprinkler Construction: Brass and other corrosion-resistant metals.
6. Plastic, Pop-up, Impact-Drive Rotary Sprinklers:
 - a. Description:
 - 1) Case: ABS.
 - 2) Pop-up Height: Approximately 3 inches (75 mm).
 - 3) Sprinkler Construction: ABS and other corrosion-resistant metals.
7. Metal, Surface Spray Sprinklers:
 - a. Description:
 - 1) Body Material and Flange: Brass.
 - 2) Nozzle: Brass.
 - 3) Pattern: Fixed, with flow adjustment.
8. Plastic, Surface Spray Sprinklers:
 - a. Description:
 - 1) Body Material and Flange: ABS.
 - 2) Pattern: Fixed, with flow adjustment.
9. Metal, Surface, Pop-up Spray Sprinklers:
 - a. Description:
 - 1) Body Material and Flange: Brass.
 - 2) Nozzle: Brass.
 - 3) Pattern: Fixed, with flow adjustment.
10. Plastic, Surface, Pop-up Spray Sprinklers:
 - a. Description:
 - 1) Body Material and Flange: ABS.
 - 2) Pattern: Fixed, with flow adjustment.
11. Plastic, Pop-up Spray Sprinklers:
 - a. Description:
 - 1) Body Material: ABS.
 - 2) Nozzle: ABS **OR** Brass, **as directed**.
 - 3) Retraction Spring: Stainless steel.
 - 4) Internal Parts: Corrosion resistant.
 - 5) Pattern: Fixed, with flow adjustment.
12. Metal Shrub Sprinklers:
 - a. Description:
 - 1) Body Material: Brass.
 - 2) Nozzle: Brass.
 - 3) Pattern: Fixed, with flow adjustment.
13. Plastic Shrub Sprinklers:
 - a. Description:
 - 1) Body Material: ABS or other plastic.
 - 2) Pattern: Fixed, with flow adjustment.

L. Quick Couplers

1. Description: Factory-fabricated, bronze or brass, two-piece assembly. Include coupler water-seal valve; removable upper body with spring-loaded or weighted, rubber-covered cap; hose swivel with ASME B1.20.7, 3/4-11.5NH threads for garden hose on outlet; and operating key.
 - a. Locking-Top Option: Vandal-resistant locking feature. Include one **OR** two, **as directed**, matching key(s).

M. Drip Irrigation Specialties

1. Freestanding Emitters: Device to deliver water at approximately 20 psig (138 kPa).
 - a. Body Material: PE or vinyl, with flow control.
 - b. Riser to Emitter: PE or PVC flexible tubing.
2. Manifold Emitter Systems: Manifold with tubing and emitters.

- a. Manifold: With multiple outlets to deliver water to emitters.
 - 1) Body Material: Plastic.
 - 2) Outlet Caps: Plastic, for outlets without installed tubing.
 - 3) Operation: Automatic pressure compensating.
- b. Tubing: PE or PVC; 1/8-inch (3-mm) minimum ID.
- c. Emitter: Device to deliver water at approximately 20 psig (138 kPa).
 - 1) Body Material: PE or vinyl, with flow control.
3. Multiple-Outlet Emitter Systems: Emitter with tubing and button-type outlets.
 - a. Emitter: With multiple outlets to deliver water to remote outlets.
 - 1) Body Material: Plastic, with flow control.
 - 2) Outlet Caps: Plastic, for outlets without installed tubing.
 - 3) Operation: Automatic pressure compensating.
 - 4) Emitters: Devices to deliver water at approximately 20 psig (138 kPa).
 - b. Tubing: PE or PVC; 1/8-inch (3-mm) minimum ID.
4. Drip Tubes with Direct-Attached Emitters:
 - a. Tubing: Flexible PE or PVC with plugged end.
 - b. Emitters: Devices to deliver water at approximately 20 psig (138 kPa).
 - 1) Body Material: PE or vinyl, with flow control.
 - 2) Mounting: Inserted into tubing at set intervals.
5. Drip Tubes with Remote Discharge:
 - a. Tubing: Flexible PE or PVC with plugged end.
 - b. Emitters: Devices to deliver water at approximately 20 psig (138 kPa).
 - 1) Body Material: PE or vinyl, with flow control.
 - 2) Mounting: Inserted into tubing at set intervals.
6. Off-Ground Supports: Plastic stakes.
7. Application Pressure Regulators: Brass or plastic housing, NPS 3/4 (DN 20), with corrosion-resistant internal parts; capable of controlling outlet pressure to approximately 20 psig (138 kPa).
8. Filter Units: Brass or plastic housing, with corrosion-resistant internal parts; of size and capacity required for devices downstream from unit.
9. Air Relief Valves: Brass or plastic housing, with corrosion-resistant internal parts.
10. Vacuum Relief Valves: Brass or plastic housing, with corrosion-resistant internal parts.

N. Controllers

1. Description:
 - a. Controller Stations for Automatic Control Valves: Each station is variable from approximately 5 to 60 minutes. Include switch for manual or automatic operation of each station.
 - b. Exterior Control Enclosures: NEMA 250, Type 4, weatherproof, with locking cover and two matching keys; include provision for grounding.
 - 1) Body Material: Enameled-steel sheet metal **OR** Stainless-steel sheet metal **OR** Molded plastic, **as directed**.
 - 2) Mounting: Freestanding type for concrete base **OR** Surface type for wall, **as directed**.
 - c. Interior Control Enclosures: NEMA 250, Type 12, dripproof, with locking cover and two matching keys.
 - 1) Body Material: Enameled-steel sheet metal **OR** Stainless-steel sheet metal **OR** Molded plastic, **as directed**.
 - 2) Mounting: Freestanding type for concrete base **OR** Surface type for wall, **as directed**.
 - d. Control Transformer: 24-V secondary, with primary fuse.
 - e. Timing Device: Adjustable, 24-hour, 14-day clock, with automatic operations to skip operation any day in timer period, to operate every other day, or to operate two or more times daily.
 - 1) Manual or Semiautomatic Operation: Allows this mode without disturbing preset automatic operation.
 - 2) Nickel-Cadmium Battery and Trickle Charger: Automatically powers timing device during power outages.

- 3) Surge Protection: Metal-oxide-varistor type on each station and primary power.
- f. Moisture Sensor: Adjustable from one to seven days, to shut off water flow during rain.
- g. Wiring: UL 493, Type UF multiconductor, with solid-copper conductors; insulated cable; suitable for direct burial.
 - 1) Feeder-Circuit Cables: No. 12 AWG minimum, between building and controllers.
 - 2) Low-Voltage, Branch-Circuit Cables: No. 14 AWG minimum, between controllers and automatic control valves; color-coded different from feeder-circuit-cable jacket color; with jackets of different colors for multiple-cable installation in same trench.
 - 3) Splicing Materials: Manufacturer's packaged kit consisting of insulating, spring-type connector or crimped joint and epoxy resin moisture seal; suitable for direct burial.
- h. Concrete Base: Reinforced precast concrete not less than 36 by 24 by 4 inches (900 by 600 by 100 mm) thick, and 6 inches (150 mm) greater in each direction than overall dimensions of controller. Include opening for wiring.

O. Boxes For Automatic Control Valves

- 1. Plastic Boxes:
 - a. Description: Box and cover, with open bottom and openings for piping; designed for installing flush with grade.
 - 1) Size: As required for valves and service.
 - 2) Shape: Round **OR** Square **OR** Rectangular, **as directed**.
 - 3) Sidewall Material: PE **OR** PE, ABS, or FRP, **as directed**.
 - 4) Cover Material: PE **OR** PE, ABS, or FRP, **as directed**.
 - a) Lettering: "VALVE BOX" **OR** "IRRIGATION," **as directed**.
- 2. Polymer-Concrete Boxes:
 - a. Description: Box and cover, with open bottom and openings for piping; designed for installing flush with grade.
 - 1) Size: As required for valves and service.
 - 2) Shape: Round **OR** Square **OR** Rectangular, **as directed**.
 - 3) Sidewall Material: Polymer concrete with lateral and vertical sidewall design loading of 5000 lb (2268 kg) **OR** 10,000 lb (4536 kg) **OR** 15,000 lb (6800 kg), **as directed**, minimum over 10 by 10 inches (254 by 254 mm) square.
 - 4) Cover Material: Polymer concrete **OR** Reinforced polymer concrete, **as directed**, with cover design loading of 5000 lb (2268 kg) **OR** 10,000 lb (4536 kg) **OR** 15,000 lb (6800 kg), **as directed**, minimum over 10 by 10 inches (254 by 254 mm) square.
 - a) Lettering: "VALVE BOX" **OR** "IRRIGATION," **as directed**.
- 3. Drainage Backfill: Cleaned gravel or crushed stone, graded from 3/4 inch (19 mm) minimum to 3 inches (75 mm) maximum.

1.3 EXECUTION

A. Earthwork

- 1. Excavating, trenching, and backfilling are specified in Division 31 Section "Earth Moving".
- 2. Install warning tape directly above pressure piping, 12 inches (300 mm) below finished grades, except 6 inches (150 mm) below subgrade under pavement and slabs.
- 3. Drain Pockets: Excavate to sizes indicated. Backfill with cleaned gravel or crushed stone, graded from 3/4 to 3 inches (19 to 75 mm), to 12 inches (300 mm) below grade. Cover gravel or crushed stone with sheet of asphalt-saturated felt and backfill remainder with excavated material.
- 4. Provide minimum cover over top of underground piping according to the following:
 - a. Irrigation Main Piping: Minimum depth of 36 inches (900 mm) below finished grade, or not less than 18 inches (450 mm) below average local frost depth, whichever is deeper.
 - b. Circuit Piping: 12 inches (300 mm).
 - c. Drain Piping: 12 inches (300 mm)
 - d. Sleeves: 24 inches (600 mm).

B. Piping Installation

1. Location and Arrangement: Drawings indicate location and arrangement of piping systems. Install piping as indicated unless deviations are approved on Coordination Drawings.
2. Install piping at minimum uniform slope of 0.5 percent down toward drain valves.
3. Install piping free of sags and bends.
4. Install groups of pipes parallel to each other, spaced to permit valve servicing.
5. Install fittings for changes in direction and branch connections.
6. Install unions adjacent to valves and to final connections to other components with NPS 2 (DN 50) or smaller pipe connection.
7. Install flanges adjacent to valves and to final connections to other components with NPS 2-1/2 (DN 65) or larger pipe connection.
8. Install underground thermoplastic piping according to ASTM D 2774 and ASTM F 690.
9. Install expansion loops in control-valve boxes for plastic piping.
10. Lay piping on solid subbase, uniformly sloped without humps or depressions.
11. Install ductile-iron piping according to AWWA C600.
12. Install PVC piping in dry weather when temperature is above 40 deg F (5 deg C). Allow joints to cure at least 24 hours at temperatures above 40 deg F (5 deg C) before testing.
13. Install water regulators with shutoff valve and strainer on inlet and pressure gage on outlet. Install shutoff valve on outlet. Install aboveground or in control-valve boxes.
14. Water Hammer Arresters: Install between connection to building main and circuit valves aboveground or in control-valve boxes.
15. Install piping in sleeves under parking lots, roadways, and sidewalks.
16. Install sleeves made of Schedule 40 **OR** Schedule 80, **as directed**, PVC pipe and socket fittings, and solvent-cemented joints.
17. Install transition fittings for plastic-to-metal pipe connections according to the following:
 - a. Underground Piping:
 - 1) NPS 1-1/2 (DN 40) and Smaller: Plastic-to-metal transition fittings.
 - 2) NPS 2 (DN 50) and Larger: AWWA transition couplings.
 - b. Aboveground Piping:
 - 1) NPS 2 (DN 50) and Smaller: Plastic-to-metal transition fittings **OR** unions, **as directed**.
 - 2) NPS 2 (DN 50) and Larger: Use dielectric flange kits with one plastic flange.
18. Install dielectric fittings for dissimilar-metal pipe connections according to the following:
 - a. Underground Piping:
 - 1) NPS 2 (DN 50) and Smaller: Dielectric coupling or dielectric nipple.
 - 2) NPS 2-1/2 (DN 65) and Larger: Prohibited except in control-valve box.
 - b. Aboveground Piping:
 - 1) NPS 2 (DN 50) and Smaller: Dielectric union.
 - 2) NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Dielectric flange.
 - 3) NPS 5 (DN 125) and Larger: Dielectric flange kit.
 - c. Piping in Control-Valve Boxes:
 - 1) NPS 2 (DN 50) and Smaller: Dielectric union.
 - 2) NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Dielectric flange.
 - 3) NPS 5 (DN 125) and Larger: Dielectric flange kit.

C. Joint Construction

1. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
2. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
3. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
 - a. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
 - b. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
4. Flanged Joints: Select rubber gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.
5. Ductile-Iron Piping Gasketed Joints: Comply with AWWA C600 and AWWA M41.

6. Copper-Tubing Brazed Joints: Construct joints according to CDA's "Copper Tube Handbook," using copper-phosphorus brazing filler metal.
 7. Copper-Tubing Soldered Joints: Apply ASTM B 813 water-flushable flux to tube end unless otherwise indicated. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy (0.20 percent maximum lead content) complying with ASTM B 32.
 8. PE Piping Fastener Joints: Join with insert fittings and bands or fasteners according to piping manufacturer's written instructions.
 9. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D 2657.
 - a. Plain-End PE Pipe and Fittings: Use butt fusion.
 - b. Plain-End PE Pipe and Socket Fittings: Use socket fusion.
 10. PVC Piping Solvent-Cemented Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
 - a. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
 - b. PVC Pressure Piping: Join schedule number, ASTM D 1785, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D 2855.
 - c. PVC Nonpressure Piping: Join according to ASTM D 2855.
- D. Valve Installation
1. Underground Curb Valves: Install in curb-valve casings with tops flush with grade.
 2. Underground Iron Gate Valves, Resilient Seat: Comply with AWWA C600 and AWWA M44. Install in valve casing with top flush with grade.
 - a. Install valves and PVC pipe with restrained, gasketed joints.
 3. Aboveground Valves: Install as components of connected piping system.
 4. Pressure-Reducing Valves: Install in boxes for automatic control valves or aboveground between shutoff valves. Install full-size valved bypass, **as directed**.
 5. Throttling Valves: Install in underground piping in boxes for automatic control valves.
 6. Drain Valves: Install in underground piping in boxes for automatic control valves.
- E. Sprinkler Installation
1. Install sprinklers after hydrostatic test is completed.
 2. Install sprinklers at manufacturer's recommended heights.
 3. Locate part-circle sprinklers to maintain a minimum distance of 4 inches (100 mm) from walls and 2 inches (50 mm) from other boundaries unless otherwise indicated.
- F. Drip Irrigation Specialty Installation
1. Install freestanding emitters on pipe riser to mounting height indicated.
 2. Install manifold emitter systems with tubing to emitters. Plug unused manifold outlets. Install emitters on off-ground supports at height indicated.
 3. Install multiple-outlet emitter systems with tubing to outlets. Plug unused emitter outlets. Install outlets on off-ground supports at height indicated.
 4. Install drip tubes with direct-attached emitters on ground.
 5. Install drip tubes with remote-discharge on ground with outlets on off-ground supports at height indicated.
 6. Install off-ground supports of length required for indicated mounted height of device.
 7. Install application pressure regulators and filter units in piping near device being protected, and aboveground **OR** in control-valve boxes, **as directed**.
 8. Install air relief valves and vacuum relief valves in piping, and aboveground **OR** in control-valve boxes, **as directed**.
- G. Automatic Irrigation-Control System Installation
1. Equipment Mounting: Install interior controllers on floor **OR** concrete bases **OR** wall, **as directed**.
 - a. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

- b. Install anchor bolts to elevations required for proper attachment to supported equipment.
 2. Equipment Mounting: Install exterior freestanding controllers on precast concrete bases.
 - a. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - b. Install anchor bolts to elevations required for proper attachment to supported equipment.
 3. Install control cable in same trench as irrigation piping and at least 2 inches (51 mm) below or beside piping. Provide conductors of size not smaller than recommended by controller manufacturer. Install cable in separate sleeve under paved areas.
- H. Connections
 1. Comply with requirements for piping specified in Division 22 Section "Facility Water Distribution Piping" for water supply from exterior water service piping, water meters, protective enclosures, and backflow preventers. Drawings indicate general arrangement of piping, fittings, and specialties.
 2. Install piping adjacent to equipment, valves, and devices to allow service and maintenance.
 3. Connect wiring between controllers and automatic control valves.
- I. Identification
 1. Identify system components. Comply with requirements for identification specified in Division 22 Section "Identification For Plumbing Piping And Equipment".
 2. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplates and signs on each automatic controller.
 - a. Text: In addition to identifying unit, distinguish between multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations.
 3. Warning Tapes: Arrange for installation of continuous, underground, detectable warning tapes over underground piping during backfilling of trenches. See Division 31 Section "Earth Moving" for warning tapes.
- J. Field Quality Control
 1. Perform tests and inspections.
 2. Tests and Inspections:
 - a. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - b. Operational Test: After electrical circuitry has been energized, operate controllers and automatic control valves to confirm proper system operation.
 - c. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 3. Any irrigation product will be considered defective if it does not pass tests and inspections.
 4. Prepare test and inspection reports.
- K. Adjusting
 1. Adjust settings of controllers.
 2. Adjust automatic control valves to provide flow rate at rated operating pressure required for each sprinkler circuit.
 3. Adjust sprinklers and devices, except those intended to be mounted aboveground, so they will be flush with, or not more than 1/2 inch (13 mm) above, finish grade.
- L. Cleaning
 1. Flush dirt and debris from piping before installing sprinklers and other devices.
- M. Piping Schedule
 1. Install components having pressure rating equal to or greater than system operating pressure.
 2. Piping in control-valve boxes and aboveground may be joined with flanges or unions instead of joints indicated.
 3. Aboveground irrigation main piping, NPS 4 (DN 100) and smaller, shall be one of the following:

- a. Galvanized-steel pipe and galvanized-steel pipe nipples; galvanized, gray-iron threaded fittings; and threaded joints.
- b. Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube, wrought- or cast-copper fittings, and brazed **OR** soldered, **as directed**, joints.
- c. Schedule 40 **OR** Schedule 80, **as directed**, PVC pipe; socket-type PVC fittings; and solvent-cemented joints.
- d. Schedule 80, PVC pipe; Schedule 80, threaded PVC fittings; and threaded joints.
4. Aboveground irrigation main piping, NPS 5 (DN 125) and larger, shall be one of the following:
 - a. Galvanized-steel pipe and galvanized-steel pipe nipples; galvanized, gray-iron threaded fittings; and threaded joints.
 - b. Schedule 40 **OR** Schedule 80, **as directed**, PVC pipe and socket fittings; and solvent-cemented joints.
 - c. Schedule 80, PVC pipe; Schedule 80, threaded PVC fittings; and threaded joints.
5. Underground irrigation main piping, NPS 4 (DN 100) and smaller, shall be one of the following:
 - a. NPS 3 and NPS 4 (DN 80 and DN 100) ductile-iron, mechanical-joint pipe; ductile-iron, mechanical-joint fittings, glands, bolts, and nuts; and gasketed joints.
 - b. NPS 3 and NPS 4 (DN 80 and DN 100) ductile-iron, push-on-joint pipe; ductile-iron, push-on-joint fittings and gaskets; and gasketed joints.
 - c. Type L (Type B) soft copper tube, wrought-copper fittings, and brazed joints.
 - d. NPS 4 (DN 100) PE pressure pipe; PE butt, heat-fusion or socket-type fittings; and heat-fusion joints.
 - e. Schedule 40 **OR** Schedule 80, **as directed**, PVC pipe and socket fittings, and solvent-cemented joints.
 - f. Schedule 80, PVC pipe; Schedule 80, threaded PVC fittings; and threaded joints.
 - g. SDR 21, PVC, pressure-rated pipe; Schedule 80, PVC socket fittings; and solvent-cemented joints.
6. Underground irrigation main piping, NPS 5 (DN 125) and larger, shall be one of the following:
 - a. NPS 6 (DN 150) and larger ductile-iron, mechanical-joint pipe; ductile-iron, mechanical-joint fittings, glands, bolts, and nuts; and gasketed joints.
 - b. NPS 6 (DN 150) and larger ductile-iron, push-on-joint pipe; ductile-iron, push-on-joint fittings and gaskets; and gasketed joints.
 - c. PE pressure pipe; PE butt, heat-fusion fittings; and heat-fusion joints.
 - d. Schedule 40 **OR** Schedule 80, **as directed**, PVC pipe and socket fittings; and solvent-cemented joints.
 - e. SDR 21, PVC, pressure-rated pipe; Schedule 80, PVC socket fittings; and solvent-cemented joints.
7. Circuit piping, NPS 2 (DN 50) and smaller, shall be one of the following:
 - a. SDR 7 **OR** SDR 9, **as directed**, PE, controlled ID pipe; insert fittings for PE pipe; and fastener joints.
 - b. DR 9 **OR** DR 11, **as directed**, PE, controlled OD pipe; PE butt, heat-fusion, or PE socket-type fittings; and heat-fusion joints.
 - c. Schedule 40, PVC pipe and socket fittings; and solvent-cemented joints.
 - d. SDR 26, PVC, pressure-rated pipe; Schedule 40, PVC socket fittings; and solvent-cemented joints.
8. Circuit piping, NPS 2-1/2 to NPS 4 (DN 65 to DN 100), shall be one of the following:
 - a. SDR 7 **OR** SDR 9, **as directed**, PE, controlled ID pipe; insert fittings for PE pipe; and banded or fastener joints.
 - b. DR 9 **OR** DR 11, **as directed**, PE, controlled OD pipe; PE socket or butt-fusion fittings; and heat-fusion joints. NPS 3 (DN 80) pipe and fittings if NPS 2-1/2 (DN 65) pipe and fittings are not available.
 - c. Schedule 40, PVC pipe and socket fittings; and solvent-cemented joints.
 - d. SDR 26, PVC, pressure-rated pipe; Schedule 40, PVC socket fittings; and solvent-cemented joints.
9. Underground Branches and Offsets at Sprinklers and Devices: Schedule 80, PVC pipe; threaded PVC fittings; and threaded joints.
 - a. Option: Plastic swing-joint assemblies, with offsets for flexible joints, manufactured for this application.

10. Risers to Aboveground Sprinklers and Specialties: Type L (Type B) **OR** Type M (Type C), **as directed**, hard copper tube, wrought-copper fittings, and brazed **OR** soldered, **as directed**, joints.
11. Risers to Aboveground Sprinklers and Specialties: Schedule 80, PVC pipe and socket fittings; and solvent-cemented joints.
12. Drain piping shall be one of the following:
 - a. SDR 9, 11.5, or 15, PE, controlled ID pipe; insert fittings for PE pipe; and banded or fastener joints.
 - b. Schedule 40, PVC pipe and socket fittings; and solvent-cemented joints.
 - c. SDR 21, 26, or 32.5, PVC, pressure-rated pipe; Schedule 40, PVC socket fittings; and solvent-cemented joints.

N. Valve Schedule

1. Underground, Shutoff-Duty Valves: Use the following:
 - a. NPS 2 (DN 50) and Smaller: Curb valve, curb-valve casing, and shutoff rod.
 - b. NPS 3 (DN 80) and Larger: Iron gate valve, resilient seated; iron gate valve casing; and operating wrench(es).
2. Aboveground, Shutoff-Duty Valves:
 - a. NPS 2 (DN 50) and Smaller: Brass **OR** Bronze **OR** Plastic, **as directed**, ball valve.
 - b. NPS 2 (DN 50) and Smaller: Bronze gate valve.
 - c. NPS 2-1/2 (DN 65) and Larger: Iron ball valve.
 - d. NPS 2-1/2 (DN 65) and Larger: Iron gate valve, NRS **OR** OS&Y, **as directed**.
3. Throttling-Duty Valves:
 - a. NPS 2 (DN 50) and Smaller: Bronze **OR** Plastic, **as directed**, automatic control valve.
 - b. NPS 2 (DN 50) and Smaller: Brass **OR** Bronze **OR** Plastic, **as directed**, ball valve.
 - c. NPS 2-1/2 and NPS 3 (DN 65 and DN 80): Bronze **OR** Plastic, **as directed**, automatic control valve.
 - d. NPS 2-1/2 and NPS 3 (DN 65 and DN 80): Iron ball valve.
4. Drain Valves:
 - a. NPS 1/2 and NPS 3/4 (DN 15 and DN 20): Automatic drain valve.
 - b. NPS 1/2 and NPS 3/4 (DN 15 and DN 20): Brass **OR** Bronze **OR** Plastic, **as directed**, ball valve.
 - c. NPS 1/2 and NPS 3/4 (DN 15 and DN 20): Bronze gate valve.
 - d. NPS 1 to NPS 2 (DN 25 to DN 50): Brass **OR** Bronze **OR** Plastic, **as directed**, ball valve.
 - e. NPS 1 to NPS 2 (DN 25 to DN 50): Bronze gate valve.

SECTION 32 93 53 00 - TREE PROTECTION AND TRIMMING**1.1 GENERAL****A. Description Of Work**

1. This specification covers the furnishing and installation of materials for tree protection and trimming. Products shall be as follows or as approved by The University. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section includes general protection and pruning of existing trees and plants that are affected by execution of the Work, whether temporary or permanent construction.

C. Definitions

1. Caliper: Diameter of a trunk measured by a diameter tape or the average of the smallest and largest diameters at 6 inches (150 mm) above the ground for trees up to, and including, 4-inch (100-mm) size; and 12 inches (300 mm) above the ground for trees larger than 4-inch (100-mm) size.
2. Plant-Protection Zone: Area surrounding individual trees, groups of trees, shrubs, or other vegetation to be protected during construction, and indicated on Drawings.
3. Tree-Protection Zone: Area surrounding individual trees or groups of trees to be protected during construction, and indicated on Drawings **OR** defined by a circle concentric with each tree with a radius 1.5 times the diameter of the drip line unless otherwise indicated, **as directed**.
4. Vegetation: Trees, shrubs, groundcovers, grass, and other plants.

D. Submittals

1. Product Data: For each type of product indicated.
2. Tree Pruning Schedule: Written schedule detailing scope and extent of pruning of trees to remain that interfere with or are affected by construction.
3. Qualification Data: For qualified arborist and tree service firm.
4. Certification: From arborist, certifying that trees indicated to remain have been protected during construction according to recognized standards and that trees were promptly and properly treated and repaired when damaged.
5. Maintenance Recommendations: From arborist, for care and protection of trees affected by construction during and after completing the Work.
6. Existing Conditions: Documentation of existing trees and plantings indicated to remain, which establishes preconstruction conditions that might be misconstrued as damage caused by construction activities.
 - a. Use sufficiently detailed photographs or videotape.
 - b. Include plans and notations to indicate specific wounds and damage conditions of each tree or other plants designated to remain.

E. Quality Assurance

1. Arborist Qualifications: Certified Arborist as certified by ISA **OR** Certified Arborist-Municipal Specialist as certified by ISA **OR** Licensed arborist in jurisdiction where Project is located **OR** Current member of ASCA **OR** Registered Consulting Arborist as designated by ASCA, **as directed**.
2. Tree Service Firm Qualifications: An experienced tree service firm that has successfully completed temporary tree and plant protection work similar to that required for this Project and that will assign an experienced, qualified arborist to Project site during execution of the Work.
3. Preinstallation Conference: Conduct conference at Project site.

F. Project Conditions

1. The following practices are prohibited within protection zones:
 - a. Storage of construction materials, debris, or excavated material.
 - b. Parking vehicles or equipment.
 - c. Foot traffic.
 - d. Erection of sheds or structures.
 - e. Impoundment of water.
 - f. Excavation or other digging unless otherwise indicated.
 - g. Attachment of signs to or wrapping materials around trees or plants unless otherwise indicated.
2. Do not direct vehicle or equipment exhaust toward protection zones.
3. Prohibit heat sources, flames, ignition sources, and smoking within or near protection zones and organic mulch.

1.2 PRODUCTS

A. Materials

1. Topsoil: Natural or cultivated top layer of the soil profile or manufactured topsoil; containing organic matter and sand, silt, and clay particles; friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects more than 1 inch (25 mm) in diameter; and free of weeds, roots, and toxic and other nonsoil materials.
 - a. Obtain topsoil only from well-drained sites where topsoil is 4 inches (100 mm) deep or more; do not obtain from bogs or marshes.

OR

Topsoil: Stockpiled topsoil from location shown on Drawings **OR** Imported or manufactured topsoil complying with ASTM D 5268, **as directed**.
2. Organic Mulch: Free from deleterious materials and suitable as a top dressing for trees and shrubs, consisting of one of the following:
 - a. Type: Shredded hardwood **OR** Ground or shredded bark **OR** Wood and bark chips, **as directed**.
 - b. Size Range: 3 inches (76 mm) maximum, 1/2 inch (13 mm) minimum.
3. Protection-Zone Fencing: Fencing fixed in position and meeting one of the following requirements, **as directed**. Previously used materials may be used when approved by The University.
 - a. Chain-Link Protection-Zone Fencing: Galvanized-steel **OR** Polymer-coated steel **OR** Polymer-coated galvanized-steel, **as directed**, fencing fabricated from minimum 2-inch (50-mm) opening, 0.148-inch- (3.76-mm-) diameter wire chain-link fabric; with pipe posts, minimum 2-3/8-inch- (60-mm-) OD line posts, and 2-7/8-inch- (73-mm-) OD corner and pull posts; with 1-5/8-inch- (42-mm-) OD top rails **OR** with 0.177-inch- (4.5-mm-) diameter top tension wire, **as directed**, and 0.177-inch- (4.5-mm-) diameter bottom tension wire; with tie wires, hog ring ties, and other accessories for a complete fence system.
 - 1) Height: 4 feet (1.2 m) **OR** 6 feet (1.8 m) **OR** 8 feet (2.4 m), **as directed**.
 - 2) Polymer-Coating Color (if polymer coating is required): Dark green **OR** Olive green **OR** Brown **OR** Black, **as directed**.
 - b. Plywood Protection-Zone Fencing: Plywood framed with four 2-by-4-inch (50-by-100-mm) rails, with 4-by-4-inch (100-by-100-mm) preservative-treated wood posts spaced not more than 8 feet (2.4 m) apart.
 - 1) Height: 4 feet (1.2 m) **OR** 6 feet (1.8 m), **as directed**.
 - 2) Plywood and Lumber: Comply with requirements in Division 06 Section "Rough Carpentry" **OR** Division 06 Section "Miscellaneous Rough Carpentry", **as directed**.
 - c. Wood Protection-Zone Fencing: Constructed of two 2-by-4-inch (50-by-100-mm) horizontal rails, with 4-by-4-inch (100-by-100-mm) preservative-treated wood posts spaced not more than 8 feet (2.4 m) apart, and lower rail set halfway between top rail and ground.
 - 1) Height: 4 feet (1.2 m).
 - 2) Lumber: Comply with requirements in Division 06 Section "Rough Carpentry" **OR** Division 06 Section "Miscellaneous Rough Carpentry", **as directed**.

- d. Plastic Protection-Zone Fencing: Plastic construction fencing constructed of high-density extruded and stretched polyethylene fabric with 2-inch (50-mm) maximum opening in pattern and weighing a minimum of 0.4 lb/ft. (0.6 kg/m); remaining flexible from minus 60 to plus 200 deg F (minus 16 to plus 93 deg C); inert to most chemicals and acids; minimum tensile yield strength of 2000 psi (13.8 MPa) and ultimate tensile strength of 2680 psi (18.5 MPa); secured with plastic bands or galvanized-steel or stainless-steel wire ties; and supported by tubular or T-shape galvanized-steel posts spaced not more than 8 feet (2.4 m) apart.
 - 1) Height: 4 feet (1.2 m).
 - 2) Color: High-visibility orange, nonfading.
- e. Gates: Single **OR** Double, **as directed**, swing access gates matching material and appearance of fencing, to allow for maintenance activities within protection zones; leaf width 24 inches (610 mm) **OR** 36 inches (914 mm) **OR** As indicated, **as directed**.
- 4. Protection-Zone Signage: Shop-fabricated, rigid plastic or metal sheet with attachment holes prepunched and reinforced; legibly printed with nonfading lettering and as follows:
 - a. Size and Text: As shown on Drawings.
 - b. Lettering: 3-inch- (75-mm-) high minimum, white **OR** black, **as directed**, characters on white **OR** red, **as directed**, background.

1.3 EXECUTION

A. Examination

- 1. Erosion and Sedimentation Control: Examine the site to verify that temporary erosion- and sedimentation-control measures are in place. Verify that flows of water redirected from construction areas or generated by construction activity do not enter or cross protection zones.
- 2. For the record, prepare written report, endorsed by arborist, listing conditions detrimental to tree and plant protection.

B. Preparation

- 1. Locate and clearly identify trees, shrubs, and other vegetation to remain or to be relocated. Flag **OR** Tie a 1-inch (25-mm) blue-vinyl tape around, **as directed**, each tree trunk at 54 inches (1372 mm) above the ground.
- 2. Protect tree root systems from damage caused by runoff or spillage of noxious materials while mixing, placing, or storing construction materials. Protect root systems from ponding, eroding, or excessive wetting caused by dewatering operations.
- 3. Tree-Protection Zones: Mulch areas inside tree-protection zones and other areas indicated.
 - a. Apply 4-inch (100-mm) **OR** 6-inch (150-mm), **as directed**, average thickness of organic mulch. Do not place mulch within 6 inches (150 mm) of tree trunks.

C. Tree- And Plant-Protection Zones

- 1. Protection-Zone Fencing: Install protection-zone fencing along edges of protection zones before materials or equipment are brought on the site and construction operations begin in a manner that will prevent people and animals from easily entering protected area except by entrance gates. Construct fencing so as not to obstruct safe passage or visibility at vehicle intersections where fencing is located adjacent to pedestrian walkways or in close proximity to street intersections, drives, or other vehicular circulation.
 - a. Chain-Link Fencing: Install to comply with ASTM F 567 and with manufacturer's written instructions.
 - b. Posts: Set or drive posts into ground one-third the total height of the fence without concrete footings. Where a post is located on existing paving or concrete to remain, provide appropriate means of post support acceptable to The University.
 - c. Access Gates: Install where indicated; adjust to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.

2. Protection-Zone Signage: Install protection-zone signage in visibly prominent locations in a manner approved by The University. Install one sign spaced approximately every 20 feet (6 m) **OR** 35 feet (10.5 m) **OR** 50 feet (15 m), **as directed**, on protection-zone fencing, but no fewer than four signs with each facing a different direction.
3. Maintain protection zones free of weeds and trash.
4. Repair or replace trees, shrubs, and other vegetation indicated to remain or be relocated that are damaged by construction operations, in a manner approved by The University.
5. Maintain protection-zone fencing and signage in good condition as acceptable to The University and remove when construction operations are complete and equipment has been removed from the site.
 - a. Do not remove protection-zone fencing, even temporarily, to allow deliveries or equipment access through the protection zone.
 - b. Temporary access is permitted subject to preapproval in writing by arborist if a root buffer effective against soil compaction is constructed as approved by arborist. Maintain root buffer so long as access is permitted.

D. Excavation

1. General: Excavate at edge of protection zones and for trenches indicated within protection zones according to requirements in Division 31 Section "Earth Moving".
2. Trenching near Trees: Where utility trenches are required within protection zones, hand excavate under or around tree roots or tunnel under the roots by drilling, auger boring, or pipe jacking. Do not cut main lateral tree roots or taproots; cut only smaller roots that interfere with installation of utilities. Cut roots as required for root pruning.
3. Redirect roots in backfill areas where possible. If encountering large, main lateral roots, expose roots beyond excavation limits as required to bend and redirect them without breaking. If encountered immediately adjacent to location of new construction and redirection is not practical, cut roots approximately 3 inches (75 mm) back from new construction and as required for root pruning.
4. Do not allow exposed roots to dry out before placing permanent backfill. Provide temporary earth cover or pack with peat moss and wrap with burlap. Water and maintain in a moist condition. Temporarily support and protect roots from damage until they are permanently relocated and covered with soil.

E. Root Pruning

1. Prune roots that are affected by temporary and permanent construction. Prune roots as follows:
 - a. Cut roots manually by digging a trench and cutting exposed roots with sharp pruning instruments; do not break, tear, chop, or slant the cuts. Do not use a backhoe or other equipment that rips, tears, or pulls roots.
 - b. Cut Ends: Do not paint cut root ends **OR** Coat cut ends of roots more than 1-1/2 inches (38 mm) in diameter with an emulsified asphalt or other coating formulated for use on damaged plant tissues and that is acceptable to arborist, **as directed**.
 - c. Temporarily support and protect roots from damage until they are permanently redirected and covered with soil.
 - d. Cover exposed roots with burlap and water regularly.
 - e. Backfill as soon as possible according to requirements in Division 31 Section "Earth Moving".
2. Root Pruning at Edge of Protection Zone: Prune roots 12 inches (300 mm) outside **OR** 12 inches (300 mm) inside **OR** 6 inches (150 mm) outside **OR** 6 inches (150 mm) inside **OR** flush with the edge, **as directed**, of the protection zone, by cleanly cutting all roots to the depth of the required excavation.
3. Root Pruning within Protection Zone: Clear and excavate by hand to the depth of the required excavation to minimize damage to root systems. Use narrow-tine spading forks, comb soil to expose roots, and cleanly cut roots as close to excavation as possible.

F. Crown Pruning

1. Prune branches that are affected by temporary and permanent construction. Prune branches as follows:

- a. Prune trees to remain to compensate for root loss caused by damaging or cutting root system. Provide subsequent maintenance during Contract period as recommended by arborist.
- b. Pruning Standards: Prune trees according to ANSI A300 (Part 1) and the following:
 - 1) Type of Pruning: Cleaning **OR** Thinning **OR** Raising **OR** Reduction, **as directed**.
 - 2) Specialty Pruning: Restoration **OR** Vista **OR** Palm **OR** Utility, **as directed**.
- c. Cut branches with sharp pruning instruments; do not break or chop.
- d. Do not apply pruning paint to wounds.
2. Chip removed branches and spread over areas identified by The University **OR** stockpile in areas approved by The University **OR** dispose of off-site, **as directed**.

G. Regrading

1. Lowering Grade: Where new finish grade is indicated below existing grade around trees, slope grade beyond the protection zone. Maintain existing grades within the protection zone.
OR
Lowering Grade within Protection Zone: Where new finish grade is indicated below existing grade around trees, slope grade away from trees as recommended by arborist unless otherwise indicated.
 - a. Root Pruning: Prune tree roots exposed by lowering the grade. Do not cut main lateral roots or taproots; cut only smaller roots. Cut roots as required for root pruning.
2. Raising Grade: Where new finish grade is indicated above existing grade around trees, slope grade beyond the protection zone. Maintain existing grades within the protection zone.
OR
Minor Fill within Protection Zone: Where existing grade is 2 inches (50 mm) or less below elevation of finish grade, fill with topsoil. Place topsoil in a single uncompacted layer and hand grade to required finish elevations.

H. Field Quality Control

1. Inspections: Engage a qualified arborist to direct plant-protection measures in the vicinity of trees, shrubs, and other vegetation indicated to remain and to prepare inspection reports.

I. Repair And Replacement

1. General: Repair or replace trees, shrubs, and other vegetation indicated to remain or be relocated that are damaged by construction operations, in a manner approved by The University.
 - a. Submit details of proposed root cutting and tree and shrub repairs.
 - b. Have arborist perform the root cutting, branch pruning, and damage repair of trees and shrubs.
 - c. Treat damaged trunks, limbs, and roots according to arborist's written instructions.
 - d. Perform repairs within 24 hours.
 - e. Replace vegetation that cannot be repaired and restored to full-growth status, as determined by The University.
2. Trees: Remove and replace trees indicated to remain that are more than 25 **OR** 66, **as directed**, percent dead or in an unhealthy condition before the end of the corrections period or are damaged during construction operations that The University determines are incapable of restoring to normal growth pattern.
 - a. Provide new trees of same size and species as those being replaced for each tree that measures 6 inches (150 mm) **OR** 4 inches (100 mm), **as directed**, or smaller in caliper size.
OR
Provide one **OR** two, **as directed**, new tree(s) of 6-inch (150-mm) **OR** 4-inch (100-mm), **as directed**, caliper size for each tree being replaced that measures more than 6 inches (150 mm) **OR** 4 inches (100 mm), **as directed**, in caliper size.
 - 1) Species: Species selected by The University.
 - b. Plant and maintain new trees as specified in Division 32 Section "Plants".
3. Soil Aeration: Where directed by The University, aerate surface soil compacted during construction. Aerate 10 feet (3 m) beyond drip line and no closer than 36 inches (900 mm) to tree

trunk. Drill 2-inch- (50-mm-) diameter holes a minimum of 12 inches (300 mm) deep at 24 inches (600 mm) o.c. Backfill holes with an equal mix of augered soil and sand.

J. Disposal Of Surplus And Waste Materials

1. Disposal: Remove excess excavated material, displaced trees, trash and debris, and legally dispose of them off Owner's property.
